ū	" " <i>unite</i> .		
ū	" " <i>cut</i> , <i>but</i> .		
ū	" " <i>full</i> , <i>put</i> , or as <i>oo</i> in <i>foot</i> , <i>book</i> .		
ū	" " <i>urn</i> , <i>burn</i> .		
y	" " <i>yet</i> , <i>yield</i> .		
v	" " Spanish <i>Habana</i> , <i>Córdoba</i> , where it is like English <i>v</i> but made with the lips alone.		

An apostrophe ['] is sometimes used as in *tā'b'l* (*table*), *kāz'm* (*chasm*), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as *g*, *h*, *k*, *x*, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

GLACIAL (glä'shəl) **DRIFT.** See **DRIFT.**

GLACIAL PERIOD, PLEISTOCENE (plis'tò-sēn) **PERIOD,** or **ICE AGE.** A division of geologic time, comprising the earliest part of the Quaternary period. The term gains its significance from a remarkable episode in which abnormal conditions of climate were involved. In late Tertiary times there seems to have been a gradual lowering of temperatures throughout the north temperate zone, and this change progressed steadily until at the opening of the Glacial period the climate was essentially arctic. Within the continental areas enormous glaciers and ice sheets then formed, which advanced southward, filling the river and lake basins, covering the mountains, and burying the lowlands beneath a vast *mer de glace*. One field of ice extended over Canada and the north-eastern part of the United States. Its northern limits have not yet been defined, but on the east it reached the Atlantic Ocean, and southward it advanced well into New Jersey, Pennsylvania, and the States between the Ohio and Missouri rivers. New England, New York, and the region of the Great Lakes were completely covered by the ice sheet. In the White Mountains the rocks bear evidence of having been striated and polished almost to the summits of the highest elevations, and the same phenomena have been recorded for the Adirondacks and Catskills, showing that the ice in places was several thousand feet thick. The mountains of western North America were also the scenes of great glacial activity, of which the snow fields of the present day are but wasted relics. Glaciers descended from the Rocky Mountains of Colorado and from the Sierra Nevadas of California far into the river valleys, while those of Alaska and British Columbia were so extensive as to form practically a single field.

The change in temperature seems to have been no less marked in the Old than in the New World. An ice sheet covered the whole of northern Europe; it filled up the basin of the Baltic on its way from Scandinavia to the plains of north Germany, and it crossed the North Sea to the Scottish Highlands, whence it moved northward and westward into the Atlantic. The whole of England north of the Thames, as well as Scotland and Ireland, was buried beneath the ice, which attained a thickness in some locali-

ties of 5000 feet. On the Continent the sheet spread over Scandinavia, Denmark, Holland, and parts of Germany, Belgium, and Russia, and comprised an area of about 800,000 square miles, or several times larger than the Greenland ice cap. South of its limits there were smaller snow fields and glaciers in the Carpathians, Alps, Jura, Pyrenees, and the Central Plateau of France. The present Alpine glaciers are shrunken remnants of the field that covered Switzerland during this period. The high mountain systems of Asia also show evidence of having been glaciated. In the Southern Hemisphere the glaciers of Patagonia were once enlarged so as to extend across the peninsula to the Atlantic shores, and New Zealand was overrun by the ice; but it has not been definitely established that the period of glaciation here was contemporaneous with that of the Northern Hemisphere.

Effects of Glaciation. The general configuration of continental lands has not changed appreciably since the opening of the Glacial period. The mountain systems had acquired their elevation before that time, and in a general way the drainage was directed towards the same channels that now carry the surface waters seaward. The ice exerted a powerful influence, however, upon minor land forms or types of scenery. In its progress from north to south and from highland to lowland it pushed along the soil and disintegrated rock, the accumulations of long periods of subaërial decay, and deposited them in great moraines, which still give a peculiar aspect to the scenery of glaciated regions. At the same time the sand and stones incorporated in the mass of moving ice were efficient agents of erosion: rock surfaces, wherever exposed, were smoothed and striated, prominences assumed a more rounded form, and the valleys were widened and deepened. The rock striations show that the direction of flow was influenced by mountain ranges of considerable elevation, although small inequalities in the surface caused no deviation. Most of the lakes in northern Europe and America had their origin in this period. Lake basins were scooped out by erosion, and temporary lakes were formed by obstruction of valleys during the retreat of the ice sheet. One of the largest temporary basins, which has been surveyed by means of the old beach lines, extended from the northern parts of Minnesota and North Dakota far into Canada, and covered an area exceeding that of

all the Great Lakes combined. All lakes which are of preglacial origin show evidence of having been expanded during this period. The Great Lakes are bordered by a succession of terraces, the highest of which stand nearly 500 feet above the present water level. The ice sheet for a time stretched across the St. Lawrence valley, turning the drainage of Lake Ontario into the Mohawk and Hudson; and Lake Michigan, obstructed at its outlet, overflowed towards the southwest into the Illinois River.

A further important result wrought during the Glacial period was the removal of the soil that had been derived *in situ* by weathering and the substitution of a covering of "drift" (q.v.). This glacial material was spread very unevenly over the land. In the Laurentian highlands of Canada, where the ice sheet formed, the surface is bare rock or at most thinly covered with soil. Farther south the drift accumulated along lines marking the advance and retreat of the ice in great heaps of boulders, gravel, sand, and clay. Such terminal moraines are strongly developed in New England, New York, Ohio, and the Northern States as far west as Kansas. A second portion of the transported material was distributed beneath the ice sheet as "boulder clay" (see **BOULDER CLAY**) or "fill," in the form of a ground moraine. The boulder clay is a compact, tenacious clay containing boulders of varying size and generally unstratified, although traces of bedding are sometimes present. It rests directly upon the rock, which is usually smooth and striated. The boulder clay is distributed unevenly, gathering into smoothly arched ridges and mounds called "eskers" and "drumlins" (qq.v.), and at times thinning out so as to leave the rock formations exposed.

The extraordinary changes of climate indicated by the Glacial period led to migrations of the fauna and flora inhabiting the Arctic and temperate zones. As the temperature fell, such animals as were unable to endure extreme cold worked southward, while some species found their way from the far north into regions from which they have long since disappeared; remains of the polar bear, reindeer, and Arctic fox occur in the glacial deposits of southern Europe. With the retreat of the ice the Arctic fauna and flora were able to adjust themselves to the changing conditions by withdrawing from southern latitudes or by ascending the slopes of mountains. The oscillation of the climate was thus accompanied by a variation of the life forms in each particular region.

Divisions of the Glacial Period. A detailed study of the glacial deposits shows that they were not laid down continuously or under uniform conditions. On the other hand, the deposits are frequently divided into sections by intercalated beds of peat, and by variations in the relative degree of weathering which lead to the assumption that the ice advanced and retreated more than once. The evidences as to the number and extent of such fluctuations have not, as yet, been correlated successfully for different regions, and there is still much difference of opinion on the subject. The glacial deposits of the interior of North America are divided, according to the more recent views of geologists, into four and possibly six stages, each of which represents a period of glacial advance, with intervals of ice recession between each member. The stages are not all present in any one place, and they probably denote widely variant

periods of time, the earlier being the longer. Beginning with the oldest, they are: (1) Jerseyan, (2) Kansan, (3) Illinoian, (4) Wisconsin. The presence of two other stages—the one (Iowan) preceding and the other (Later Wisconsin) following the Wisconsin—is advocated by some authorities.

Estimates of Time. The Glacial invasion was the last important geological event preceding the present epoch that exerted a wide influence upon the physical features of the earth. Just how long ago it occurred cannot be stated, but estimates based on different data seem to indicate that the ice retreated from the northern United States at least 25,000 years ago. The time diminishes, of course, with increasing latitude and in Sweden it is calculated that the ice extended over the southern part as late as 12,000 years ago. The duration of the entire period from the first advance of the ice could not have been much less than 500,000 years and may have been two or three times that figure. It is certain that man existed during the later stages.

Causes of Glacial Climate. Various theories have been proposed to account for the cold climate of the Glacial period. A sufficient cause may be found in terrestrial changes, such, e.g., as would lead to a variation in the distribution of land and water. The formation of glaciers is influenced by precipitation and thus by the proximity of warm waters to areas of cold land. It is conceivable that the poles may have been surrounded by a large land area which would exert a cooling effect upon the climate, and that the flow of ocean currents may have been so directed as to increase precipitation, but such a view is unsupported by geological evidence. A second theory, based upon terrestrial changes, ascribes the cold climate to a general elevation of the land surface in the north temperate zone, possibly accompanied by a diversion of the Gulf Stream across the present Isthmus of Central America into the Pacific. This theory fails in the same particular as the first, i.e., there are no evidences of such great vicissitudes. While either of these theories would account for the cold, it is also difficult to bring them into consonance with the view now commonly accepted by geologists, that the Glacial period was marked by periodical variations in the climate. One of the most ingenious explanations that have yet been proposed is based upon the relative positions of the earth and sun at distant periods of time. It is known that the eccentricity of the earth's orbit is subject to secular variations. With a maximum of eccentricity the earth is 14,000,000 miles nearer the sun during perihelion than in aphelion, and the difference in the amount of direct heat received from the sun between these positions is about one-fifth. If now, by precession of the equinoxes, winter in the Northern Hemisphere should occur when the earth is in aphelion, the effect would be to lengthen this season by 22 days and to shorten the summer by an equal period. This coincidence of maximum eccentricity with aphelion winter would perhaps result in the refrigeration of the climate in the Northern Hemisphere. This theory, developed by Dr. James Croll, gained considerable favor for a time, but like the other theories is not without its defects. The most serious objection to its application is that it apparently limits the duration of the glacial stage to the precessional period of

21,000 years, altogether too brief for the results accomplished by the ice. More recently the trend of opinion has rather favored the influence of atmospheric agencies, such as those of the winds, the relative variations of moisture and of carbonic-acid gas in the air. No single explanation yet advanced seems to meet all the conditions of the problem, and it appears quite probable that the real cause of the Glacial period may lie in a concurrence of several different factors.

Bibliography. Geikie, *Great Ice Age and its Relation to the Antiquity of Man* (New York, 1895); Bonney, *Ice Work Present and Past* (ib., 1896); Herrmann, *Glacialerscheinungen in der geologischen Vergangenheit* (Hamburg, 1896); Wright, *Ice Age in North America* (New York, 1891); Dawson, *Canadian Ice Age* (ib., 1894); Lewis, *Papers and Notes on the Glacial Geology of Great Britain and Ireland* (London, 1894); Heim and Penck, *On the District of the Ancient Glaciers of the Isar and Linth* (ib., 1886); Lyell, *Geological Evidence of the Antiquity of Man* (4th ed., ib., 1873); Croll, *Climate and Time* (Edinburgh, 1885); Penck and Brückner, *Die Alpen im Eiszeitalter* (Leipzig, 1901-09); Leverett, "Glacial Formations and Drainage Features of the Erie and Ohio Basins," in *United States Geological Survey, Monograph XLI* (Washington, 1902); Fairchild, "Pleistocene Geology of New York State," in *Bulletin of the Geological Society of America*, vol. xxiv (ib., 1913). See GEOLOGY; GLACIER; PLEISTOCENE PERIOD.

GLACIER, glä'shēr or gläs'y-ēr (Fr., from *glace*, Lat. *glacies*, ice). Many valleys of the Alps and of other high mountain ranges are filled with ice which extends from the snow fields above to well below the tree line. This mass of ice is called a glacier. The winter's snow, falling on the lower part of the glacier, melts away the following summer and exposes the ice, which also melts to some extent, and which, if there were not some source of supply, would entirely disappear. In the snow fields above, the annual snowfall is not all melted in summer, and there is an accumulation of snow. It is evident that in time the snow would grow indefinitely high if there were no means of relief. The necessary relief is found in the flow of the ice, which carries off the surplus snowfall of the snow fields, consolidated into ice, to the lower part of the glacier. A glacier, therefore, has two distinct parts—a *reservoir*, where the snow is collected, and a *dissipator*, where the ice is melted. The line separating these two regions is usually called the *névé* line. We are thus led to the following definition: A glacier is a body of ice and snow formed in a region where the snowfall is greater than the waste, and flowing to a region where the waste is greater than the snowfall.

Distribution. Whenever there is an annual snowfall greater than the annual waste, glaciers must exist. We find them on all high mountains subject to moist winds, such as those on the western coast of North and South America, the Scandinavian mountains, the Alps, the Pyrenees, the Caucasus, the Himalayas, and the mountain chains to the north, and the New Zealand Alps. One glacier is known in Mexico, on Mount Iztaccihuatl, and a number in equatorial Africa, on Mount Kenia, on Mount Kilimanjaro, and on the Ruwenzori Range. In the Arctic regions Grinnell Land, Greenland, Iceland, Jan

Mayen Land, Spitzbergen, and Franz Josef Land are more or less covered with glacial ice; and the Antarctic lands are almost entirely ice-covered.

Classification. Glaciers may be divided into the following classes:

1. Continental glaciers, or inland ice, such as the great masses of ice that cover Greenland and the Antarctic Continent.
2. Plateau glaciers, or local ice caps, similar to continental glaciers, but of comparatively small extent. Examples of this class are found in Norway, in Spitzbergen, and on the borders of Greenland.
3. Alpine glaciers, the more familiar forms, which occupy valleys.
4. Piedmont glaciers. This form occurs when Alpine glaciers debouch and spread out on a plain. The best example is the Malaspina Glacier, at the foot of the St. Elias Alps in Alaska.
5. Hanging glaciers, which rest on shelves on the mountain side. They are usually small and steep.
6. Débris glaciers (*glaciers romants* of the French), formed not from snow, but from ice falling from a higher glacier. They are usually small and unimportant.

Glaciers may be complete or incomplete. A complete glacier has a reservoir where the snow is accumulated and a dissipator where the ice is all melted; an incomplete glacier either has its ice supplied directly, as in class 6, or loses some of its ice at the lower end by breakage, as in glaciers which break off at a cliff, or those which reach the sea and form icebergs.

Motion. If a glacier is in equilibrium—i.e., neither growing larger nor smaller—the ice annually flowing through any cross section of the glacier must exactly equal the total annual accumulation above and the waste below that section. As the accumulation above and the waste below a section through the *névé* line is greater than for any other section, the flow, under uniform conditions, is the greatest there; and it is less and less through sections more and more distant from the *névé* line, whether they are higher in the reservoir or lower in the dissipator.

That the ice of glaciers is in motion down the valley has long been known, both from the observation that large stones are carried down on the surface of the ice and from the general reasoning given above. It was not, however, until Agassiz and Forbes began their classical researches that any quantitative value of the motion of the ice was obtained. Since then many measurements have been made on various glaciers, and we now have a fair knowledge of this matter. It has been found that at any section the velocity of the ice is greatest at the centre and diminishes as we approach the sides. When, however, a glacier has a sinuous course, the greatest velocity is not in the exact centre, but is displaced towards the convex side, so that the line of maximum velocity is more sinuous than the glacier itself. The velocity diminishes also from the surface of the ice towards the bed of the glacier. The observations on which this statement rests are neither numerous nor satisfying; nevertheless, they are sufficient to establish the fact. It will appear that, as Forbes said, the flow of a glacier is very much like that of a river; if we consider a river which is flowing into a sandy region, where the water is gradually lost by seepage, the analogy is still more striking. In valley glaciers of fairly uniform slope the velocity is greatest at the

névé line and diminishes as we ascend or descend from there. This law is subject to many exceptions; if the valley contracts in descending, there must be an increase in velocity; if the slope of the valley increases, this will also increase the velocity; in glaciers which reach the sea and break off in bergs the velocity increases as we approach the end, as a result of the lack of support in front. There is also a slight movement into the glacier in the reservoir, which is greatest where the accumulation is greatest, and one towards the surface in the dissipator, which is greatest where the waste is greatest. As to actual values in velocities, we find that the Mer de Glace has the greatest velocity of all glaciers in the Alps, its maximum amounting to $35\frac{1}{2}$ inches a day. The greatest velocity of the Aletsch, the largest glacier of the Alps, is 20 inches a day. For other Alpine glaciers we find various velocities down to an inch or two a day, or even less for the smaller ones. Of larger glaciers, the Muir in Alaska has a velocity of about 7 feet, near where it reaches tidewater; and one of the larger ice streams of Greenland, the Upernivik, was found to have a velocity of 99 feet a day at one point near its end.

Cause of Glacial Motion. Many theories have been advanced to explain why the ice of glaciers, which is apparently so very brittle, should flow like a plastic substance. There are two questions to be answered, viz., What is the force causing the ice to move, and what property of ice enables it to move as it does? There is a general unanimity at present in the belief that the weight of the ice itself is the only force causing the motion, but there is not so much unanimity in answering the second question. Three explanations still hold their ground: First, according to Forbes and Rendu, the ice, in spite of the fact that it is very brittle to any rapid change of shape, is truly plastic to slow changes; just as shoemaker's wax will break under a sharp blow, but will allow a bullet by its own weight to sink slowly through it. This has been abundantly proved by the experiments of Pfaff, Andrews, Main, McConnell, and Kidd. Experiments on single ice crystal show that the crystal is plastic in planes at right angles to the optic axis. This is the *plastic* or *viscous* theory.

PLAN OF GLACIER.

Second, Tyndall considered ice to be devoid of true plasticity, but thought that in a glacier it is continually shattered and refrozen. He was led to this idea by the fact which Faraday dis-

covered, that two pieces of ice when brought into contact will freeze together. He showed by many experiments that ice could be crushed and forced through curved tubes and come out clear ice, the fragments having entirely coalesced. This is the *fracture* and *regelation* theory. Third, James Thomson discovered that the freezing point of ice is lowered $.0075^{\circ}$ C. from an increase of one atmosphere of pressure, and applied this fact to the explanation of glacial motion. He supposed that at any point where, by the movement of the ice, the pressure becomes a little greater than the average, the freezing point will be lowered and a small amount of ice melted; the pressure being thus relieved, the ice will move slightly, and the pressure will be transferred to other points; the water thus formed will be squeezed through crevices in the ice to other points where the pressure is less, and will there freeze. A continuation of this process will result in the general progression of the ice down its valley. This is the *pressure* and *regelation* theory.

Crevasses. Although the ice of glaciers can suffer some distortion without breaking, if the rate of distortion is too great the ice will crack and great crevasses form. Crevasses can be divided into distinct classes: *Marginal* crevasses, which occur on the sides of glaciers and point upstream at an angle of about 45° ; they are the result of increasing velocity from the sides to the centre of the glacier. There must also be a tendency to the formation of crevasses at the bottom of the glacier pointing upstream, but it is extremely probable that the weight of the ice is sufficient to prevent their forming except occasionally very near the end of the glacier. *Transverse* crevasses are formed when the slope of the bed increases. *Longitudinal* crevasses form near the end of the glacier, especially when the ice spreads out on a plain; they are due to the pressure of the ice behind and are usually arranged radially. Irregular crevasses may be formed as the result of some irregularity in the bed of the glacier. There is usually a very large crevasse, called the *bergschund*, at the upper margin of the reservoir; it is due to the more rapid motion of ice of the reservoir pulling it away from the ice clinging to the mountain slopes. In the dissipator the crevasses are in full view, but in the reservoir they are frequently covered with snow; this makes traveling above the snow line very dangerous, except for parties of several persons properly roped together. When crevasses first form they are mere cracks, which afterward widen out as the result of the motion of the ice and the melting of their sides, until they sometimes are 50 or even 100 feet wide. They may be half a mile or more in length, but the great depths which they are supposed to reach are exaggerated; they are rarely so much as 200 feet deep, and probably never as deep as 300 feet.

Moraines. The rocks and débris which fall upon the surface of the glacier and are carried down by it, and the material pushed along under the ice, are called *moraines*. They cannot be seen in the reservoir, as they are there covered by the snow, but they are very striking features of the dissipator. *Lateral* moraines are formed by the rocks falling from the mountains upon the sides of the glacier. When two tributary glaciers unite to form a trunk glacier, two of the lateral moraines unite to form a *medial* moraine, which from a distance looks like a great dark

GLACIERS

1. Forno Glacier, Switzerland.
2. Seabee Island, Glacier Bay, Alaska, showing rock glaciated by Muir Glacier when it was larger.

2. View showing moraines.

line drawn upon the surface of the white ice marking out the direction of motion. The ice under the moraine, being protected from the air and sun, does not melt as rapidly as the unprotected ice, and, therefore, is left by the general waste of the surface as a great ridge rising sometimes 100 feet above the general level of the ice. *Reservoir* moraines, so called from their origin, are formed by material falling upon the reservoir, where it is covered by the snow and later brought to the surface of the dissipator by the motion of the ice and the melting. Moraines which can hardly be distinguished from reservoir moraines may sometimes be formed from the material plucked from a projecting point in the bed of the glacier and carried along in the body of the ice, to be exposed later at the surface by the melting. The material pushed along under the ice is called the *ground moraine*; it is made up of *débris* fallen under the glacier at the sides or through crevasses or the *bergschrund*, and material plucked from the bed of the glacier.

Structure of the Ice. The origin of the glacial ice is the snow that falls in the reservoir. By thawing and freezing, this soon changes into a turbid ice filled with many air bubbles. Crystallization starts from numerous centres, around which the molecules of ice gradually rearrange themselves until the whole mass is made up of crystals of clear ice (though still containing many air bubbles) with their respective optical axes turned in various directions. The crystals at this stage are about the size of peas and adjoin one another in surfaces which bear no relation to the geometric crystalline faces. By a process of recrystallization some of these crystals grow at the expense of their neighbors until finally many of them become 4 or 5 inches in diameter. During this process the ice is moving down the valley, so that we find the crystals of increasing age, and therefore increasing size, mixed in with smaller ones as we go from the *névé* fields down the glacier. The sun's rays penetrating the ice for a short distance melt the ice along the junctions of the crystals, which can then readily be separated. The sun's rays also cause melting in the interior of the crystals at various points; the cavities thus formed are flat disks or six-angled stars; as the water occupies less space than the ice from which it was melted, each of these cavities contains a small vacuum which is more easily visible than the sides of the cavity. These cavities are known as Tyndall's figures, and always lie with their

flat sides at right angles to the optical axis of the crystal, whose direction may thus be easily determined.

Stratification and Banded Structure. On the sides of crevasses in the reservoir the layers of hardening snow, due to successive seasons, can be readily distinguished, and the outcrops of these strata can be followed for a short distance into the dissipator; but their appearance soon

changes, and the majority of observers claim that as the ice becomes consolidated the marks of stratification are obliterated. In the lower part of the dissipator, where the ice is thoroughly consolidated, it is found to be composed of bands of bluer and whiter ice, the color being caused by the amount of the contained air bubbles. These bands, as described by Forbes and others, follow the general shape of the bowl of a spoon pointing downstream. Each tributary has its own system of bands, though but one system is usually found at the end of the glacier. They are prominent at the sides, near the end, and at the line of junction where two glaciers unite. Three explanations have been given of their origin. Agassiz considered them the modified form of stratification. Forbes looked upon them as surfaces where the principal amount of differential motion took place. Tyndall thought they were caused by pressure and were analogous to the slaty cleavage of rock. Forbes's idea has been practically discarded, and glacialists are divided between the explanations of Agassiz and of Tyndall.

Temperature. Theory and, so far as they go, observations indicate that the body of the glacier is at the temperature of melting ice.

Variations. The relative sizes of the reservoir and dissipator are determined by the condition that the accumulation in the first must equal the waste in the second. The accumulation depends upon the size of the reservoir and the snowfall, and the waste on the size of the dissipator and the rate of melting. The melting is due principally to direct radiation from the sun and to condensation of water vapor from the air; it will readily be seen that in cold wet periods glaciers will advance, and in warm dry periods they will retreat. Glaciers are, therefore, indicators of climatic variations. In the last 30 years much attention has been given to the study of the variations of glaciers. It has been discovered that in the Alps the glaciers have made no permanent change within the last 300 years, but that they have grown larger and smaller in size, making a complete fluctuation on the average once in 35 years. Records of the glaciers of Iceland and of Scandinavia show that in the seventeenth century they were much smaller than they are at present; early in the eighteenth century a general advance began which continued well into the nineteenth century, and was characterized by a very marked increase in the extent of the ice; since then there has been a small retreat. The same general order has been followed in southeastern Alaska, though the dates cannot be definitely determined. It is probable that the glaciers of other Arctic regions have experienced similar variations. With few exceptions, the glaciers in all parts of the world are now in retreat.

Work of Glaciers. The moraines are carried along by the glacier and deposited on the sides of its valley and at the end of the ice. Some rocks become embedded in the ice and act like graving tools in making long, straight scratches in the bed rock, whose surface is also smoothed by finer material moved by the ice. A region which has been covered by a glacier usually shows smooth and rounded rock surfaces marked with parallel scratches; heaps of rocks, more or less angular, are dumped irregularly about, frequently forming small lakes. These rocks are often of a different kind from the underlying country rock, showing that they have been trans-

ported from a distance, and their angular or subangular forms show that they have not been transported by water. They are called *erratics*. Among them some will have smoothed and scratched surfaces. It is by studying the distribution of scratches, smoothed surfaces, and erratics, that geologists have been able to show the existence of a former ice age when large parts of Europe and of North America were covered by great sheets of ice.

The power of glaciers to erode valleys or lake basins has been greatly discussed, without a conclusion commanding general assent being reached. Leading geologists entertain diametrically opposite opinions on this subject. Fiords show the effects of ice erosion to a greater or less extent, although in most cases they were originally narrow stream valleys. The work of the ice has consisted in deepening the channels, particularly in the central part which often is lower than the outlet. The mere wear or abrasive action of a glacier on its bed may be relatively slight; on the other hand the ice doubtless exerts a strong plucking force upon rocks, sufficient to tear away any fissured or loosened material.

Bibliography. For general description and theoretical discussion of glaciers, consult: Shaler and Davis, *Glaciers* (Boston, 1881); Agassiz, *Etudes sur les glaciers* (Neuchâtel, 1840); Schmidt, "Eine neue Glacialtheorie," in *Petermann's Mittheilungen*, vol. xlii (Gotha, 1898); Agassiz, *Nouvelles études et expériences sur les glaciers actuels* (Paris, 1847); id., *Untersuchungen über die Gletscher* (Solothurn, 1841); Huim, *Handbuch der Gletscherkunde* (Stuttgart, 1885); Rendu, *Theory of the Glaciers of the Savoy*, trans. by Wills (London, 1874); Forbes, *Occasional Papers on the Theory of Glaciers* (ib., 1859); Agassiz, *Geological Sketches* (Boston, 1890); Gilbert, *Glaciers and Glaciation* (Washington, 1910); Hobbs, *Characteristics of Existing Glaciers* (New York, 1911). Descriptions of individual localities may be found in Reid, *Studies of the Muir Glacier, Alaska* (Washington, 1892); id., "Glacier Bay and its Glaciers," in *United States Geological Survey Report* (ib., 1895); Russell, *Glaciers of North America* (Boston, 1897); Tyndall, *The Glaciers of the Alps* (London, 1860); Martin, *Glaciers and Glaciation in College Fiord, Alaska* (Berlin, 1913). GLACIER BAY. A glacial fiord extending 60 miles northward from Icy Strait, Alaska. Glacier Bay penetrates the St. Elias Range, which discharges nine great glaciers into the fiord, five having a sea front of 1 mile or more (Map: Alaska, M 6). The largest glacier, named for Professor Muir, is enormous in its proportions. It is over 200 feet high, 3 miles broad at the sea, and is equal in area to the State of Rhode Island. Innumerable icebergs discharge annually, and the bay is so ice-encumbered, for years at a time, as to be dangerous for navigation.

GLACIER BEAR. The small gray bear (*Ursus emmonsii*) of the St. Elias Alps, Alaska. See BEAR.

GLACK'ENS, WILLIAM J. (1874-). An American portrait, landscape, and figure painter, born in Philadelphia. He studied in his native city and in Paris, where he was strongly influenced by the great modern Frenchmen. His art developed through contact with the best of his contemporaries and yet remained personal

and original. In the field of illustration, which occupied his attention for some time after his return to America, his remarkable sense of character, expressed in drawing of masterly quality, soon placed him at the head of the profession. His painting was even more important and brought him membership in the Society of American Artists (1905), and an associate membership in the National Academy (1906) and in the Association of American Painters and Sculptors (1911). Among his awards were a gold medal at the Pan-American Exposition at Buffalo (1900) and another at the St. Louis Exposition (1904). Portraits, landscapes, and figure compositions were all handled successfully by Mr. Glackens. From the observation of the daily life of the American city, his interest turned to more specifically esthetic problems. Among his best-known paintings are "May Day Party," the best picture of its kind thus far painted by an American artist, and "Girls Bathing" (1911).

GLADBACH, glätbâch, or **BERGISCH-GLADBACH**, bërghesh-. A town of the Rhine Province, Prussia, 8 miles northeast of Cologne (Map: Germany, B 3). It has four large paper mills, employing 1200 hands; produces cigars, coco-fibre mats, lumber, dyewood, iron ore, machinery and other iron products, powder, and fire brick. Pop., 1900, 11,435; 1910, 15,207.

GLADBACH, or **MÜNCHEN-** (mjún'ken) **GLADBACH**. A manufacturing town of the Prussian Rhine Province, 16 miles west of Düsseldorf (Map: Germany, B 3). Among its many churches is the Münsterkirche, a fine old structure with a Gothic choir dating from the twelfth century, and an eighth-century crypt. There are three monasteries, a synagogue, and a teachers' seminary. Gladbach is the centre of the cotton industry in the Rhine Province. There are establishments for the manufacture of silk and woolen goods, dye and print goods, and thread; also soap, shoes, chocolate, confectionery, wagons, brushes, paper, leather, furniture, machinery, hosiery, books, rope, bricks, and meal. The number of persons employed in the factories is over 16,000. Gladbach had its origin in the Benedictine abbey founded originally in the eighth century, and abolished at the beginning of the nineteenth. Pop., 1900, 58,023; 1910, 66,414, mostly Roman Catholics.

GLADDEN, WASHINGTON (1836-1918). An American Congregational clergyman and writer, born in Pottsgrove, Pa. He prepared for college at the Owego (N. Y.) Academy, and graduated at Williams College in 1859. He was pastor of Congregational churches in Brooklyn, N. Y., Morrisania, N. Y., North Adams, Mass., and Springfield, Mass., from 1860 until 1882, when he removed to Columbus, Ohio, to become pastor of the First Congregational Church there. As an editor, he was connected with the *Independent* from 1871 to 1875, and with the *Sunday Afternoon* (Springfield, Mass.) from 1878 to 1880. He received the degree of D.D. from Roanoke College, Virginia, and that of LL.D. from the University of Wisconsin and Notre Dame University, Indiana, a Catholic institution. His sermons and books show vigorous, direct, and practical thought, and a gift of graceful expression. He put into practice his frequently expressed convictions regarding the duties of citizenship by serving in the city council of Columbus from 1900 to 1902. On Jan. 1, 1914, he retired from active work and became pastor

emeritus. His books, sensible and scholarly discussions of social and civil reforms, and of the application of Christianity to everyday life, include: *Plain Thoughts on the Art of Living* (1868); *Workingmen and their Employers* (1876); *Being a Christian* (1876); *The Christian Way* (1877); *The Lord's Prayer* (1880); *The Christian League of Connecticut* (1883); *Things New and Old* (1884); *The Young Men and the Churches* (1885); *Applied Christianity* (1887); *Parish Problems* (1888); *Burning Questions* (1889); *Who Wrote the Bible?* (1891); *Santa Claus on a Lark* (1892); *Tools and the Man* (1893); *The Cosmopolis City Club* (1893); *The Church and the Kingdom* (1894); *Ruling Ideas of the Present Age* (1895); *Seven Puzzling Bible Books* (1897); *Social Facts and Forces* (1897); *The Christian Pastor and the Working Church* (1898); *How Much is Left of the Old Doctrines* (1899); *Social Salvation* (1902); *Witnesses of the Light* (1903), the W. B. Noble lectures at Harvard; *Where Does the Sky Begin?* (1904); *The New Idolatry* (1905); *Christianity and Socialism* (1906); *The Church and Modern Life* (1908); *The Labor Question* (1911); *Present Day Theology* (1913); *Live and Learn* (1914). Consult his *Recollections* (Boston, 1909).

GLADHEIM, gläd'hëym (Icel., bright abode). In Norse mythology, the dwelling place of Odin, the largest and noblest of edifices. In this home is Valhalla (the hall of heroes), radiant with gold, to which are conducted all who fall in battle. The ceiling is formed of spears, the roof of shields, and the benches are strewn with coats of mail. According to the *Elder Edda* it has 540 gates, through each of which 800 men can go abreast.

GLADIATOR, gläd't-i'tor (Lat., swordsman). One who in antiquity fought in the arena, at the amphitheatre in Rome, and in other cities, for the amusement of the public. The gladiators were generally captives, or condemned criminals, or, more often, slaves bought and trained for the purpose by masters (called *lanistæ*) who made this their business. The custom was borrowed by the Romans from the Etruscans. It had its origin in the practice of human sacrifices, or that of taking at funerals the lives of captives or prisoners of war, in honor of heroes who had died in battle.

After a time all great funerals of distinguished men were solemnized by human sacrifices, which took the form of combats, in which, to increase the interest of the spectators, the prisoners were required to kill one another; and as prisoners, and afterward other slaves, were kept for this purpose, they were trained to fight with skill and courage, to make the spectacle more impressive. In time these shows, instead of being a funeral rite, became a common amusement. The first gladiatorial combat we read of in Roman history was a contest of three pairs of gladiators, given by Marcus and Decimus Brutus, on the death of their father, in 264 B.C. In 217 B.C. the first Scipio Africanus diverted his army at New Carthage with a gladiatorial exhibition. In 207 B.C. a show of 22 pairs was given in the Forum. The exhibition of gladiators rapidly became popular. Magistrates, public officers, and candidates gave shows to the people, which consisted chiefly of these encounters. The emperors exceeded all others in the extent and magnificence of these spectacles. Julius Cæsar gave a show of 320

pairs; Titus gave a show of gladiators, wild beasts, and sea fights for 100 days; Trajan gave a show of 123 days, in which 2000 men fought with one another or with wild beasts for the amusement of the Romans assembled in the Coliseum. A vast number of slaves from all parts of the world were kept in Rome, and trained for these exhibitions. Efforts were made to limit the number of gladiators, and diminish the frequency of these shows. The Emperor Augustus forbade more than two shows in a year; he ordered also that no gladiatorial show should be given by a man with a property of less than half a million sesterces. But it was difficult to restrain what had become a passion, and men even had such contests for the amusement of their guests at ordinary feasts. More than once, especially under Spartacus, Clodius, and Milo, the gladiators menaced the peace of Rome.

These shows were announced by show bills and pictures. The gladiators were trained and sworn to fight to the death. If they showed cowardice, they were killed with tortures. They fought at first with wooden swords, and then with steel. When one of the combatants was disarmed, or upon the ground, the victor looked to the Emperor, if present, or to the people, for further directions; if they completely concealed their thumbs, the defeated gladiator was spared; if they turned their thumbs downward, towards the defeated man, he was killed. (On this much-discussed subject, consult an important article by Post, "Pollice Verso," in *American Journal of Philology*, xiii, New York, 1892.) A victorious gladiator was rewarded not only with a branch of palm, but in more substantial ways; sometimes, too, he received his freedom. Though the gladiators at first were slaves, freemen afterward entered the profession. Senators and knights fought in the shows of Nero, and women in those of Domitian. The Emperor Constantine prohibited the contests of gladiators, 325 A.D.; but they could not at once be abolished. In the reign of Honorius a monk, Telemachus, went into the arena to stop the fight, but the people stoned him. Gladiatorial contests were finally abolished by Theodoric (500 A.D.).

The kinds of gladiators most frequently mentioned are the following: the *retiarius*, or net man (Lat. *rete*, net), who wore only a short tunic, and had as his weapon a net, attached to which was a rope, and a trident. He flung his net and, if successful in getting it over the head of his foe, easily dispatched him with his trident; if he failed in his cast, he drew in, if possible, the net with the rope, and fled. His adversary pursued, and so was called *secutor* (Lat., follower). (For these two kinds of gladiators, consult Bulwer, *Last Days of Pompeii*, near the end.) The *Sannites* fought with Samnite weapons—an oblong shield, short sword, plumed helmet. The *Thracians* had a small shield and a sword or dagger curved somewhat like a scythe; they fought against the *mirmillones*, gladiators with Gallic armor, who had a representation of a fish as a sort of crest on their helmets. The *cssædurii* fought on chariots (Lat. *cssædum*, a British war chariot). The gladiators who fought with wild beasts were known as *bestiarii* (from Lat. *bestia*, a beast, as marked by size or ferocity or both). The contest between men and beasts in the amphitheatre was called *venatio*, a hunt.

For an elaborate account of the gladiatorial combats, gladiators, etc., consult Friedländer,

Darstellungen aus der Sittengeschichte Roms (8th ed., Leipzig, 1910), vol. ii, translated as vol. ii of *Roman Life and Manners under the Early Empire*, 4 vols. (New York, 1909).

GLADIATOR, THE. A tragedy by Robert Montgomery Bird (1841), in which Edwin Forrest frequently took the part of Spartacus.

GLADIATORS' WAR. See **SPARTACUS**.

GLADIOLUS (Lat., diminutive of *gladius*, sword; so called from the form of the leaves). A genus of plants of the family Iridaceæ, with a tubular perianth, the limb of which is divided into six unequal threadlike segments; the stigmas are undivided; and the seeds are winged. The roots are bulbous; the leaves linear or sword-shaped. The Cape of Good Hope produces the greater number of the known species, as also several allied forms once included in this genus. Most of the species have flowers of great beauty. Some of the improved varieties have spikes 2 to 3 feet long and are among the finest ornaments of flower borders and greenhouses. They are propagated either by seed or by offset corms; and in the former way many new varieties have been produced. In the garden culture of gladiolus the corms are planted out in early spring, preferably in sandy loam soil. The flowers open in July and August, and the blooming season can be prolonged by successive plantings in spring and early summer. In the fall the corms are dug and kept in a cold cellar over winter. Formerly southern Europe supplied the world with gladiolus, but the United States now supplies the great bulk of the crop. The gladiolus now has several societies devoted to its welfare. See **PLATE OF IRIS FAMILY**.

GLADSTONE, A city in Delta Co., Mich., 9 miles north of Escanaba, on the Minneapolis, St. Paul, and Sault Ste. Marie Railway, on the Escanaba River, and on Little Bay de Nocquet, an inlet of Green Bay (Map: Michigan, C 3). It has a shipping trade in coal and flour and has a cooperage, machine shops, manufactories of veneers, guns, and sporting goods, and lumber mills. Under a revised charter of 1904, the government is vested in an annually elected mayor and a unicameral council. The city owns and operates its water works and electric-light plant. Pop., 1000, 3380; 1910, 4211.

GLADSTONE, glád'stūn, HERBERT JOHN GLADSTONE, first Viscount (1854-). An English politician, youngest son of William Ewart Gladstone. He was born in London; was educated at Eton and at University College, Oxford; was lecturer on modern history at Keble College from 1877 to 1880; and was private secretary to his father in 1880-81. He was a member of Parliament for Leeds from 1880 to 1885, and for Leeds, West, until 1909. From 1881 to 1885 he was Junior Lord of the Treasury, and he served also as Financial Secretary to the War Office (1886), Under Home Secretary (1892-94), and First Commissioner of Works (1894-95). He was chief Liberal whip from 1899 to December, 1905, and in 1905-10 was Home Secretary in the Campbell-Bannerman ministry. In 1909 he was named the first Governor-General and High Commissioner of South Africa. He was made Viscount in 1910, also G. C. M. G., and in 1914 G. C. B. In February, 1914, he resigned the governor-generalship of South Africa (after a good deal of trouble over labor and racial difficulties).

GLADSTONE, JOHN HALL (1827-1902). A British physicist and chemist, born at Hackney,

London. He studied at University College, London, and graduated as Ph.D. from the University of Giessen. He lectured at St. Thomas's Hospital in 1850-52; served on the lighthouse commission in 1858-61 and the War Office committee in 1864-68; and was professor of chemistry at the Royal Institution in 1874-77. He was one of the first investigators in the field of physical chemistry, notably in the relation of optics and spectroscopy to chemistry. With his assistant, Alfred Tribe, he is responsible for the copper-zinc couple. Actively interested in educational reform, he especially advocated changes in spelling. In 1853 he was elected a fellow of the Royal Society, which awarded him the Davy medal in 1897, and was first president of the Physical Society in 1874 and president of the Chemical Society in 1877-79. Besides a great number of scientific papers he wrote books and pamphlets on Christian evidence and apologetics, and also *Michael Faraday* (1872); *Spelling Reform* (1878; 2d ed., 1879); *Object Teaching* (1882).

GLADSTONE, WILLIAM EWART (1809-98). A British statesman. He was born Dec. 29, 1809, of Scottish parentage, in the city of Liverpool, where his father was a wealthy merchant, a member of Parliament, and a baronet. In 1821 he was sent to Eton, and in 1828 he entered Christ Church College, Oxford. Both at Eton and Oxford, Gladstone was distinguished for application to his studies, for his religious tendencies, his love of outdoor life, and his fondness for oratory and debate. He was successively secretary and president of the Oxford Debating Union, and in that society he delivered a powerful oration against the Reform Bill, which had been introduced into the House of Commons in 1831. In that year he took a double first in classics and mathematics.

Gladstone left Oxford in the spring of 1832, and after spending six months in Italy, entered Parliament as a member for Newark. The House of which he was a member was the first to be seated under the Reform Bill, which he had attacked while in college. He naturally attached himself to the Tory opposition under Sir Robert Peel, and waited for that party to come into power to win advancement. He delivered his maiden speech on June 3, 1833, in vindication of his father from charges brought against him concerning his conduct towards the slaves on his plantation in Demerara. In the last week of 1834 Peel came into power, and in January, 1835, he appointed Gladstone a Junior Lord of the Treasury, and in the following month Undersecretary for the Colonies. The Parliament elected in February, however, had a Liberal majority; on April 8 the Tory government went out and Gladstone again became a private member, which he remained until 1841, when, on Sir Robert Peel's coming back into power, he was appointed Vice President of the Board of Trade and Master of the Mint. In May, 1843, he became President of the Board of Trade, and so gained his first seat in a cabinet. Both as Vice President and as President he took a leading share in the work of reforming the tariff, and thus got his first lesson in finance. Already he gave unmistakable signs of genius in this direction, both in the work of arranging schedules and in the defense of his proposals on the floor of the House in exposition and debate. For a moment he endangered his career by resigning his office through uncertainty as to

WILLIAM EWART GLADSTONE
FROM A PHOTOGRAPH TAKEN IN 1896

the support he should give an important government measure concerning an increased grant to Maynooth College, the Irish training school for Catholic priests. To Gladstone this seemed opposed to the principles he had supported in a book on the relations of the church and state, published by him in 1839, in which he had stood for a single church establishment under the control of the state, of which it should be the conscience. Rather than run the risk of compromising himself before his own conscience he resigned his office (Jan. 28, 1845) and became once more a private member of the House.

In December, 1845, he was appointed by Peel to the office of Colonial Secretary. To accept this he had to vacate his seat. This was the one break in a parliamentary career extending over more than half a century. Gladstone now gave Peel his assistance in formulating his free-trade measures which led to the repeal of the Corn Laws in 1846. In 1847 Gladstone resumed his seat in the House as Tory member for Oxford. In 1850 Peel died, and the first period in Gladstone's career, the period of apprenticeship to this great master, was terminated.

The new period extending from 1850 to 1868 may be called Gladstone's period of independent political reform. In 1852 he first came into conflict with his great rival, Disraeli, whose budget in that year he completely annihilated, thus bringing about the fall of the Derby ministry (December 17). In 1853 he presented his own first budget as Chancellor of the Exchequer in Aberdeen's coalition cabinet, and scored the first great personal triumph of his career. This budget was a masterpiece of equable and efficient taxation. It increased the revenues of the state and placed the burden of the impositions where they could best be supported. His plans, however, especially in the matter of the income tax, which he was proposing by gradual steps to abolish completely, were somewhat interfered with by the intervention of the Crimean War, which demanded a new budget with increased taxation. In this budget Gladstone insisted that all the funds needed for the prosecution of the war should be raised by taxation, and not by the negotiation of loans. The conduct of the war, however, hurt the prestige of the Aberdeen government, and on Jan. 29, 1855, the ministry resigned. But Gladstone was the "inevitable" Chancellor for any administration, and he accepted the same office in Lord Palmerston's cabinet, resigning it, however, at the end of three weeks. He remained out of office for three years, during which time he published his *Studies on Homer* (1858) and undertook a mission to the Ionian Islands, where a strong agitation was being carried on for the cessation of British rule and annexation to Greece. In 1859 he returned to the Exchequer in the cabinet of Lord Palmerston, and in 1860 and 1861 he issued budgets that were marvels of financial statesmanship. He had now allied himself completely with Bright and Cobden, the latter of whom he had heartily supported in his attempt to negotiate a commercial treaty with France. This was accomplished in January, 1860. By his masterly tactics Gladstone won a complete victory over the House of Lords in 1861 after it had defeated his measure for the abolition of the tax on paper in the previous year. This was a great victory for popular education and the free press, and from that time dates the era of cheap newspapers for the people in England.

In July, 1865, Gladstone was defeated for Parliament at Oxford, but returned from South Lancashire. Lord Russell (q.v.) became head of the ministry and made Gladstone Chancellor of the Exchequer and leader in the House of Commons. In 1866 Lord Russell brought forward his first bill for the extension of suffrage and the redistribution of seats in the House of Commons. The support of this measure marks the beginning of Gladstone's adhesion to the Liberal party, towards which he had long been tending. His acceptance of office under Palmerston while still professing Tory principles was the first step in this direction. His defeat by his Oxford constituents because of his Liberal affiliations and tendencies strengthened his resolution to make his abandonment of Toryism definite. As for the bill itself, Disraeli and others united to defeat it, and the Liberal government was forced to resign (June 19). Lord Derby and Disraeli on their accession to power introduced another reform bill even more radical than that of Gladstone, who gave the new measure his hearty support, helping to carry it through in 1867.

In December, 1867, Gladstone succeeded Lord Russell as leader of the Liberal party. In this capacity he vigorously assailed the Conservative ministry, which after Feb. 26, 1868, was headed by Disraeli. In November the ministry appealed to the country on the question of the disestablishment of the Irish church, which had been made by Gladstone a party issue, and in the new Parliament the Liberals gained an overwhelming majority. On Dec. 4, 1868, Gladstone became Prime Minister and started in at once on a campaign of reform in Irish affairs. The disestablishment of the Irish church was effected in July, 1869, after a bitter struggle in the House of Lords. The next thing he essayed was to reform the Irish land system. This bill, though moderate in character, was nevertheless a step forward in the direction of giving the tenants more rights and keeping them from being crushed at pleasure by their landlords. This bill was carried in 1870. He also sought to establish an Irish National University that would satisfy the just demands of the Catholics of Ireland. This measure was defeated and he resigned (March, 1873). Disraeli refused to form a ministry, so Gladstone was forced to resume office for a time, though his strength was insufficient to carry any important reform measure. In January, 1874, he called for a dissolution in order to increase, if he could, the strength of his party in the House by a general election. The election brought defeat instead, and Disraeli returned to power. Gladstone, wearied with the weight of affairs, resigned (1875) his leadership and retired from official life.

The news of the Bulgarian horrors (1876) brought Gladstone once more into public life. By his speeches and pamphlets he aroused public feeling to the highest pitch of excitement, and throughout the Russo-Turkish War he denounced the pro-Ottoman policy of Lord Beaconsfield, acting once more as the leader of his party. On the issue of the Russo-Turkish War the Liberals carried the country in 1880, and Gladstone, elected from Midlothian, on April 23 became Prime Minister. Gladstone now resumed his position at the head of the Liberal party. He started in at once to continue the work of his first ministry. He introduced a second Irish Land Bill, which was thrown out of the House

of Lords. Ireland began to grow impatient and the Nationalist leaders in Parliament restive. The Home Rule movement took a new lease of life under Parnell, Dillon, and others, but as yet Gladstone had nothing in common with their cause. His ministry lost prestige in the conduct of affairs both in Ireland and abroad. The assassination (1882) in Phoenix Park, Dublin, of the Chief Secretary for Ireland, Lord Frederick Cavendish, and his undersecretary, Burke, followed by repressive legislation on the part of the government, alienated the Irish members in Parliament. The defeat of Majuba Hill (1881), and the generous terms of peace conceded the Boers, aroused public dissatisfaction. The failure to relieve Khartum, and the tragic death of General Gordon (1885), were fatal blows to the ministry. On June 8, 1885, Gladstone resigned and was succeeded by Lord Salisbury. The elections of November showed a slight preponderance of Conservatives and Parnellites over Liberals. To gain the support of the latter, Gladstone announced his adhesion to Home Rule; the Conservative government was overthrown, and on Feb. 1, 1886, Gladstone succeeded to the premiership for the third time. In April a Home Rule bill was brought into Parliament. (See HOME RULE.) The measure met with opposition from all sides. The Irish members objected to the clause which deprived Ireland of representatives to the Imperial Parliament. A serious defection occurred in the Liberal ranks, Lord Hartington and Mr. Goschen refusing to support the government, and being supported in their action by John Bright and Joseph Chamberlain. On June 7 the bill failed to pass a second reading, 93 Liberal votes being cast against it. Parliament was dissolved on June 26, but the elections resulted in the decisive defeat of the Liberal party, and on July 20 the ministry resigned. The elections of 1892 showed a majority of 40 for Home Rule, and on August 15 began Gladstone's fourth and last ministry. In 1893 a new and amended bill was brought before the House, and Gladstone, making the last great official fight of his life, triumphantly carried it. The House of Lords, however, threw out the measure (September 8), and the last stage of Gladstone's life work ended in apparent failure. Weary of the tumults of parliamentary life, he laid down his office on March 3, 1894, being succeeded by his colleague Lord Rosebery.

The last participation of Gladstone in public affairs was in connection with the Armenian massacres in 1896. He addressed meetings throughout the country and aroused public feeling, as he had done in 1876 over the Bulgarian atrocities. In 1898, on the 19th of May, he died in the eighty-ninth year of his life. He lies buried in the statesmen's corner of Westminster Abbey.

Gladstone was the greatest of the long line of Victorian political leaders and prime ministers. His only rival was Disraeli; but he had moral qualities which Disraeli lacked, and these more than made up for the superior brilliancy of the other, who looked with some contempt on Gladstone's principles and seriousness. Gladstone has been called an opportunist, and it is true that he more than once changed his position and went over to those against whom he had fought previously; but for any one who has studied Gladstone's career carefully these changes were not without a law of their own in Gladstone's intel-

lectual development. Each change bore a relation to a previous change, and viewing his career in the large we perceive a steady, gradual, and consistent progress. This is more than can be said of Disraeli, who, reversing his position quite as completely as Gladstone, did it to serve his own private ambitions. Gladstone cared too little for power, refused office too often, and incurred the anger of his constituents too readily by disregarding their wishes in matters of foreign and domestic policy, for it to be thought that he would ever have sacrificed his convictions to insure his own success. It was against his inclinations that he had entered public life in the first place. If once in the battle he stayed there, it was from a sense of duty characteristic of his moral seriousness. He always preferred his leisure, and more than once he withdrew from public affairs only to reënter the arena at the first recall.

Little has been said of Gladstone's literary labors, which were enormous. He was a scholar of the old type, caring only for literature and nothing for natural science. Many of his ideas were antiquated, for in literature he always remained the Tory, whatever he became in politics; that is to say, he believed in the principle of authority. To him the Bible was always the word of God and the law of Moses the law of Moses, while Homer was a real man describing real historic events. Still it is well to remember that Gladstone stood for an attitude towards the classics and the Scriptures which is associated with the high influence these works of antiquity have had for the race's civilization. There is something to be said for Gladstone's conservatism, perhaps even as against his radicalism in politics.

As to what Gladstone accomplished with his reforms in politics, it is too early to pass a complete judgment. It is as a reformer in finance and as a defender of the liberties of all classes of the English people that he stands forth most strikingly in history. Free trade, equal taxation, popular education, manhood suffrage—these are the great causes with whose beneficial results he is identified to his greatest glory. It is in his foreign policy that he was weakest. Domestic questions interested him almost to the exclusion of foreign matters, excepting when a race or a nation was suffering from oppression or tyranny. The wrongdoings of the Turks in particular called forth his denunciation, and he was always preaching, as it were, a holy war against the Moslem. He contributed to the independence and union of Italy by his letter about the political crimes of the rulers of the Two Sicilies. Mention has been made of his efforts on behalf of Bulgaria and the Armenians. On the other hand, because he cared nothing for foreign policies as such or for England's national prestige, he incurred the opprobrium of the people through what appeared to be his neglect of Gordon at Khartum, his submission to the Boers in South Africa, his willingness to submit to arbitration with the United States, and other matters in all of which he was content if he could avoid war and maintain an honorable peace. Personally Gladstone was a man full of charm and grace in his early years and full of dignity and grandeur in his old age. Justin McCarthy spoke well when he said that the House of Commons was no longer the same place without him.

Gladstone contributed articles on literary and

political topics to the *Quarterly Review* and other magazines. Most of these were published under the title, *Gleanings from Past Years* (8 vols., 1879-90).

In 1839 Gladstone married Catherine, the elder daughter of Sir Stephen Richard Glynne, of Hawarden Castle. She died on June 14, 1900. Four sons and four daughters were born, of whom the eldest, William Henry Gladstone, died in 1891, after sitting in Parliament from 1865 to 1885; Stephen Edward Gladstone is rector of Hawarden; the youngest son, Herbert John (q.v.), became member of Parliament in 1880. The youngest daughter, Helen, was for a few years vice principal of Newnham College, Cambridge.

Bibliography. Morley, *Life of William Ewart Gladstone* (3 vols., London, 1903; new ed., 1911), is a masterly work. Consult also: Archer, *William Ewart Gladstone and his Contemporaries* (ib., 1883); Russell, *Biography of W. E. Gladstone* (ib., 1891); Leech, *W. E. Gladstone: Life in Speeches and Public Letters* (ib., 1893); Robbins, *Early Public Life of Mr. Gladstone* (ib., 1894); McCarthy, *The Story of Gladstone's Life* (ib., 1897); Bryce, *Gladstone: His Characteristics as Man and Statesman* (New York, 1898); Williamson, *W. E. Gladstone, Statesman and Scholar* (London, 1898); Paul, *The Life of W. E. Gladstone* (ib., 1901); Smith, *My Memory of Gladstone* (New York, 1905); Slicer, *From Poet to Premier* (ib., 1909); Eversley, *Gladstone and Ireland* (London, 1912).

GLAGOLITSA, glăg'ô-lit'să. One of the old Slavic alphabets, which contains characters arranged in the same order as in the Kirillitsa or Cyrillic (q.v.) alphabet. The shape as well as the numerical value of its letters is different from that of the Kirillitsa. The name is not derived from the fourth letter of the alphabet, *glagol*, but it is so called since it is a collection of significant, telling signs (from OChurch Slav. *glagolati*, to speak). Kirillitsa is chronologically an earlier name, but there are good reasons to believe that it was the original name of what is now known as Glagolitsa. Jagić upholds the very plausible theory that Cyril invented Glagolitsa. Taylor (*Archiv für slavische Philologie*, vol. v, Leipzig, 1881) and Jagić derive it from the cursive (Greek (not uncials) of the eighth and ninth centuries. Only the following can be set down as positive facts: Glagolitsa began to spread not later than Kirillitsa, among both the southern and the western Slavs. Then it went out of use completely in the south; in the West it was also superseded by the Roman alphabet in Bohemia; while in Croatia and Dalmatia it long maintained its existence with difficulty, and Pope Leo XIII shortly before his death sanctioned the publication of ecclesiastical books in Glagolitsa characters. The Bulgarian dialect of the Glagolitsa is round, while the Croatian is more angular. The earliest Glagolitic manuscript extant belongs to the eleventh century. It is in the collection of Count Clotz, published at Vienna by Copitar in 1836 and known as *Glagolitsa Clotzianus*. On account of the difficulty of reading, the Glagolitic monuments are usually printed transliterated in the Cyrillic alphabet. Consult: Taylor, *The Alphabet*, vol. ii (1899); the various papers by Jagić enumerated in his *Festschrift* (Berlin, 1908); Leskien, "Zur glagolitischen Schrift," in *Archiv für slavische Philologie* (ib., 1905), and his *Grammatik der albulgarischen Sprache*

(Heidelberg, 1909); Murko, *Geschichte der älteren südslavischen Literaturen* (Leipzig, 1908); Geitler, *Die albanesischen und slavischen Schriften* (Vienna, 1883, with facsimiles).

GLAIS-BIZOIN, glă'bê'zwân', ALEXANDRE (1800-77). A French legislator, born at Quintin (Côtes-du-Nord). After participating in the opposition to the government of the Restoration, he was elected deputy from Loudéac in 1831, served in that capacity for 17 years, and in 1848 became a member of the Moderate Republican party in the Constituent Assembly. He was in the Corps Législatif from 1863 to 1870, and then was appointed a member of the provisional government. In May, 1871, he was arrested and imprisoned for a short time during the reign of the Commune. His *Dictature de cinq mois* (1872) discusses the national defense during the Franco-German War.

GLAISHER, glă'shēr, JAMES (1809-1903). An English meteorologist and aeronaut, born in London. In 1850 he established the Meteorological Society, serving for many years as its secretary, and in 1866 was one of the founders of the Aeronautical Society of Great Britain. He is remembered especially for the balloon ascensions which he made between 1862 and 1866 in the interest of science. During his seventh ascension, Sept. 5, 1862, he and his pilot Coxwell attained an unprecedented height for a balloon carrying passengers. The best recent recomputations put the height he then attained at 8500-8700 meters, or 27,887-28,543 feet—an altitude that has been only slightly exceeded by modern aeronauts (9155 meters, or 30,025 feet, by Berson on Dec. 4, 1894) provided with artificial supplies of oxygen for overcoming the rarity of the atmosphere at these great heights. He held many important positions and published numerous books and papers on various topics connected with the mathematical sciences. His best-known work is *Travels in the Air* (1800). For a critical discussion of his famous high ascension of September, 1862, consult *Wissenschaftliche Luftfahrten* by Assmann and Berson (3 vols., Brunswick, 1899-1900).

GLAISHER, JAMES WHITTREAD LEE (1848-). An English mathematician, born in Lewisham, Kent, a son of the preceding. He was educated at Trinity College, Cambridge, of which he became a fellow in 1871, was tutor in 1883-93, and lecturer in 1871-1901. He became editor of the *Messenger of Mathematics* in 1871 and of the *Quarterly Journal of Pure and Applied Mathematics* in 1878, was a prominent member of several English mathematical and astronomical societies, and wrote, in their *Proceedings* and elsewhere, many papers on pure mathematics, especially on the theory of numbers.

GLAIZE, glăz, AUGUSTE (1807-93). A French historical and genre painter and lithographer, born at Montpellier. He studied painting and lithography in Paris as the pupil of Eugène and Achille Devéria. After a few early works, such as "Dante Writing his 'Divine Comedy'" (1847), he turned his attention to the representation of abstract ideas in philosophy and ethics. His most important canvases in this manner are "The Drama of Human Folly" (1872; Arras Museum); "The Pillory" (Marseilles Museum); "What One Sees at Twenty" (Montpellier Museum). His work displays powerful color effects and abundant invention. He further executed several frescoes in the churches of Saint-Sulpice, Saint-Eustache, and others.

His son, PIERRE PAUL JEAN (1842-), was born in Paris and was a pupil of his father and of Gérôme. His best-known painting is "Fugitives from Athens" (Amiens Museum), which, like all his work, is graceful and effective in design.

GLAMMIS (gläms or gläm's) **CASTLE**. The imaginary scene of the murder of Duncan in Shakespeare's *Macbeth*. It is an ancient castle, the seat of the Earl of Strathmore, near Strathmore, Scotland, and is a fine example of the Scottish baronial castles.

GLAMOR/GANSHIRE (Welsh *Gwlad Morgannwg, Morgannwg*). The southernmost county of Wales, bounded on the north by the County of Brecon, on the east by Monmouth, on the south and southwest by the Bristol Channel, and on the west by the County of Carmarthen (Map: Wales, C 5). The county is remarkable for its coal beds and its great iron industry. It also produces a considerable amount of grain, as well as large numbers of cattle, sheep, horses, and hogs. The chief towns are Cardiff, the capital, Merthyr-Tydvil, and Swansea. Area, 809 square miles. Pop., 1901, 859,931; 1911, 1,120,910.

GLAMOR/GAN TREATY. A compact made with the Irish Roman Catholics by the Earl of Glamorgan on Aug. 25, 1645. By it Charles I was to receive military aid, and Roman Catholicism was promised a more formal recognition by the government.

GLANCE (Eng. equivalent of Ger. *Glanz*, glitter, used in the same sense). A name formerly applied to minerals which have a lustre similar to that of metals. The following are some of the more important of these minerals: *antimony glance*, which is the mineral *stibnite*, or antimony trisulphide; *bismuth glance*, which is *bismuthinite*, or bismuth trisulphide; *copper glance*, which is *chalcocite*, or cuprous sulphide; *glance blende*, which is *albandite*, or manganese sulphide; *glance coal*, which is *anthracite*, or hard coal; *glance cobalt*, which is applied both to *cobaltite*, or cobalt sulpharsenide, and to *smaltite*, or cobalt diarsenide; *gold glance*, which is *pyrite*, or gold and silver telluride; *lead glance*, which is *galena*, or lead sulphide; and *silver glance*, which is *argentite*, or silver sulphide. The name *glance wood* has been applied to an exceedingly hard variety of wood that is found in the tropics and is used for making tools.

GLANCE COAL. A popular term for any hard lustrous variety of coal, but usually applying to anthracite.

GLAND (Lat. *glans*, acorn). A term applied to a secreting organ. Glands are divided by anatomists into two great classes, viz., true secreting glands and ductless glands. The first class constitute special organs which are destined for the production of the chief secretions; as, e.g., the lachrymal, mammary, and salivary glands, the liver, pancreas, and kidneys; while the suprarenal capsules, the spleen, the thymus, and the thyroid belong to the second class.

Secreting Glands. A secreting gland consists of an aggregation of follicles (small tubes or sacs), all of which open into a common duct, by which the glandular product is discharged. The follicles are lined with epithelial cells, placed upon a hyaline basement membrane, which in turn is surrounded by a network of capillaries. These furnish the blood from which is elaborated the secretion by the cell substance or protoplasm of the epithelia, according to one

theory. Some assert that the secretion is composed of transformed cell substance. The secretion of a gland is either mucous (like saliva), serous (like tears), sebaceous (like the oil of the skin), or albuminous. The secretions of the testicle and ovary (not properly termed glands) are notable for containing living cells, the spermatozoa and the ova respectively. The simplest form of gland is the inversion of the surface of a secreting membrane into follicles, which discharge their contents upon it by separate mouths. Of this we have examples in the gastric glands and follicles of Lieberkühn, described under **Digestion, Organs of**. Secreting glands are divided into: (1) *tubular*, consisting of cylindrical tubes, single or branching; and (2) *saccular*, composed of numerous sacs arranged about a short tube which joins other similar tubes. The sacs are called *acini*, and such glands are also called *racemose* (Lat. *racemus*, a bunch of grapes). To understand the structure of a complex gland like the liver or kidney, it must be followed from the simplest form in which it is known to occur through its various degrees of evolution. In this way the liver may be traced, from the lowest mollusca (where it exists as simple follicles, lodged in the walls of the stomach, and pouring their product into its cavity by separate orifices) up to man, in whom it is a highly complex organ; and similarly in the early fetal state of the higher animals, the liver and other secreting organs more or less resemble the persistent state of those parts in animals lower in the scale. In the same way the mammary gland, which is a structure of considerable complexity in the higher animals, presents a very simple arrangement in the lowest type of this class, the ornithorhynchus, being merely a cluster of areolar follicles, each of which discharges its contents by its own orifice. Sometimes a gland has several ducts (as, e.g., the lachrymal gland), but as a general rule the most important glands have only a single canal, formed by the union of the individual ducts, which conveys the product of the secreting action of the whole mass.

Ductless Glands. Glands of the second class resemble those of the first class in external conformation and in the possession of a solid parenchymatous tissue, but differ from them in the absence of a duct or opening for the removal of the products of secretion; and indeed, except in the case of the thymus, no material resembling a secreted product is yielded by any of them. In all of them the tissue mainly consists of cells and nuclei, with a great abundance of blood vessels. They furnish necessary material to the body in some yet unascertained way. If they are removed by operation, or absent from birth, or atrophied during life, the result is a condition of disease.

The *thyroid* (weight, 30-40 grams) is a very vascular gland, lying on the front and sides of the larynx, composed of connective tissue and follicles containing a viscid colloid substance, the product of the cells. It is a storage gland containing chemically large amounts of iodine combinations. Thyroid secretions have trophic functions with special reference to the nervous system. Absence of the thyroid gland in childhood is characteristic of cretinism (q.v.). Atrophy of the gland in adults causes myxedema (q.v.). Hypertrophy of the thyroid causes Basedow's disease (q.v.). After thyroidectomy there is diminished albumen and fat metabolism and lessened assimilation of sugar.

The *parathyroids* are smaller glands, closely connected with the thyroid anatomically, but having different functions. The parathyroids may be thought of as a neuromuscular balance wheel, or control. They have antitoxic functions also. If they are removed, tetany results. When the thyroid is absent, its functions may be replaced by administering the thyroid gland from sheep or the extract of it. Cretinism is so treated and cured universally.

The *pituitary body*, or *hypophysis*, is a gland of five grams' weight at the base of the brain. It is composed of two portions, seeming to have different functions not yet determined. In some way they preside over the nutrition, especially of the skeleton. Hypertrophy of this gland is associated with acromegaly (q.v.).

The *thymus gland* lies in the neck of the infant and behind the sternum. At birth it weighs 14 grams, at 14 years 27 grams, and then gradually atrophies. It is supposed to regulate nutrition and control blood pressure. Hypertrophy of the thymus has been given as the cause of sudden death in infants. In *situs thymico-lymphaticus* the heart and arteries are very weak, the patient anemic and generally sluggish. The condition predisposes to tuberculosis, and more than half of such subjects are found to die early of infectious diseases.

The *suprarenal glands* weigh about four grams and lie above the kidneys. They consist of medullary and cortical substance, the latter the most important. The internal secretion of these glands is essential to life. Their function is to control pigmentation of the skin, to arrest the action of poisons found in the body, and to govern the vasomotor system regulating blood pressure. An extract of the glands occurs as a definite chemical substance in the form of white crystals. This extract administered to man or other animals produces constriction of the blood vessels.

Addison's disease (q.v.) is a condition in which there is destruction of the adrenals with deep bronzing of the skin and great weakness. Administering adrenalin continuously will relieve it.

Mention should be made of the *urotid*, *sacral*, and *abdominal-aortic paraganglion*, etc., though their function is unknown. Consult: Luciani, *Human Physiology* (1913); Sajous, *The Internal Secretions* (6th ed., Philadelphia, 1914); Wm. H. Thomson, *Clinical Medicine* (1914). *The Internal Secretory Organs*, by Biell (1913), contains a voluminous bibliography. See SUPRARENAL CAPSULES.

The so-called *lymphatic glands* belong to a different class of structures and will be described in the article under LYMPHATIC. They are not glands, but nutritive organs. See BARTHOLIN'S GLANDS; BRUNNER'S GLANDS; COWPER'S GLANDS; BREAST; LIVER; PANCREAS; KIDNEY; THYROID GLAND, COMPARATIVE ANATOMY OF. Consult: Gray, *Anatomy, Descriptive and Applied* (Philadelphia, 1913); Heitzmann, *Atlas der descriptiven Anatomie des Menschen* (Leipzig, 1902); Frechorn, *Notes on Normal Histology* (New York, 1901); Stoeck and Lewis, *A Text-Book of Histology* (Philadelphia, 1913); Cunningham, *Textbook of Anatomy* (New York, 1913).

GLAND. In plants, a single cell or group of cells especially adapted to form and secrete some substances. Glandular cells are usually distinguished from others by the granular character of their protoplasm, especially when in the active state. Glands may be superficial or internal.

Superficial glands may consist of a few cells or even a single cell, in which case they are often raised upon stalks and constitute the so-called glandular hairs, as upon the leaves of geraniums and primroses; they may have the form of disks upon short stalks, in which case the structure is known as a glandular scale; they may be groups of epidermal cells covering cushions of tissue, as in the so-called nectary (q.v.) in many flowers; they may be flush with the surface, pouring their secretion into gland-lined pits or depressions which may be narrow and deep or even branched canals, as in the nectar glands of some lily flowers. *Internal glands* in their simplest form consist of cells in which the secretion is formed and retained until released by the rupture or crushing of the tissues, as in the gland cells of capers. Not uncommonly the gland cells are destroyed by the plant itself, in which case the freed secretion occupies their place, as in the oil glands of the orange and lemon rind; in other cases they line an internal spherical or tubular reservoir, into which the secretion is poured, as in the resin tubes of pines (see figure).

Regarding the process of secretion nothing is definitely known. The secretion in most cases is formed by the protoplasm and within the cell wall; in others it may be developed at the surface, the materials for it being secreted by the protoplasm. In superficial glands the secretion is sometimes pushed through the cell wall as far as the cuticle, which it cannot penetrate, but which it lifts into a blister, e.g., the volatile oils secreted by many leaves.

Glands are named for the most prominent material which they secrete, as water, lime, nectar, oil, and resin glands.

GLAND OF ORANGE RIND.

The gland cells form a globular mass, secrete an essential oil, and finally become disorganized, leaving the oil free in the space they formerly occupied. The contents of the cells are not shown.

GLAND, COMPARATIVE ANATOMY OF. Neither a definition nor a classification of glands has yet been agreed on by comparative anatomists. Since the word itself offers no clew to its real meaning, we must attempt to define it from universally accepted examples. Among these may be mentioned salivary glands, lachrymal glands, sweat glands, and poison glands. All of these are organs which produce some particular substance from the blood with which they are supplied; furthermore, this substance is not cellular nor living, but is a mere chemical product. These facts give us a clew to our definition, and we may say that a gland is any cell or group of cells whose function is the production of a chemical substance, usually fluid, pe-

cular to itself. Such a definition will not include all those organs to which the name "gland" is given, but it will include all to which it ought to be applied. As an example of the incorrect use of the term, we may refer to "reproductive" or "genital" gland, as applied to the testis or ovary. These organs are not in any true sense glands, for they do not produce any chemical substance peculiar to themselves, but are simply the portions of the body where those cells are formed from which the next generation arises. So also the use of "gland" in connection with the suprarenal capsule, the pituitary body, and the pineal body is incorrect and confusing.

Various classifications for glands have been proposed based on their structure, whether unicellular or multicellular, simple or branched, etc.; but it is perhaps as natural and certainly as convenient to arrange them according to their function. Thus we may class those which open on the surface of the body and are developed in the skin as tegumentary glands; those connected with the process of digestion as digestive glands; those connected with the blood system as vascular glands; those associated with the respiration as respiratory glands; and those connected with the reproductive organs as reproductive glands. The tegumentary glands may well be grouped according to their structure, as unicellular and multicellular glands, and the same classification is often applied to all glands.

Unicellular glands are everywhere abundant in invertebrates, but in vertebrates they are confined almost entirely to the lower forms. Multicellular glands are to be regarded as aggregations of unicellular glands in one region. Soon the multicellular gland differentiates into a secretory and an efferent part, or duct. Multicellular glands with ducts are tubular or acinous. Globular glands also occur in the epidermis of Amphibia. The tubular glands may be simple, branched, or anastomosing. Tubular glands first occur in the Amphibia in a few cases, but they are very abundant as sweat glands in mammals. Acinous glands first appear in birds as uropygial glands, where they occur on the rudimentary tail and produce the oil for oiling the feathers. Among mammals acinous glands are highly developed and are of two kinds, viz., sebaceous glands and milk glands. The sebaceous glands open on the rim of the eyelid and on other special parts of the body, in intimate relation with hairs. In addition to oiling the hair, these glands probably have a sexual function in mammals, since their secretion has a decided odor.

Milk glands, characteristic of the mammalia, have probably a common ancestry with sebaceous glands, or they may even consist, indeed, of a group of highly specialized sebaceous glands. The glands of *Echidna* occur in the mammary pocket. Into this pocket the immature hatched young are placed, and there they are nourished by a secreted substance which is not like the milk of other mammals. The glands are in connection with hair follicles. Among marsupials there is a larger number of mammary pockets; but these pockets have lost their protective function, which latter function is assumed by the marsupium. In *Ornithodelphia* the nutritive function is subserved by the secretions of sweat glands. The region of the integument, at which the glands open, is usually modified for the purpose of transmitting to the young the secretion

of the glands. There are three types of these openings. The athelous type is found only in the lowest mammals: here the glands open diffusely on the surface without a true nipple. In the second type the glands open at the base of an elevated crater, and in the third the region of their opening is elevated to the apex of a cone. To the second type belong the glands of the carnivores and ungulates, and to the third class belong those of marsupials and primates. The number of these glands varies in different kinds of animals and with the number of young produced in a litter. In man two is the normal number, but in a number of cases supernumerary nipples have been recorded both for males and females. Such cases are atavistic and point back to the condition which existed in man's ancestor.

The liver and pancreas are recognized as the largest of the digestive glands, to which group also belong the salivary glands, gastric glands, and intestinal glands. The poison glands of snakes, as modified salivary glands, also belong here. Of vascular glands the kidneys are decidedly the most important, while respiratory glands include the arytenoid and tracheal. Of reproductive glands we find a great variety among both invertebrates and vertebrates, such as the yolk and shell glands, and in mammals the Cowper's and prostate glands.

Any attempt to classify glands according to the substances they produce is unsatisfactory. Thus, if we attempt to separate secreting from excreting glands, we find that, while the kidneys clearly belong in the latter class, the liver belongs to both, though chiefly secretory, and sebaceous glands are also difficult to classify. Perhaps the most obscure organs of this class are the so-called "ductless" glands, the spleen, thyroid, and thymus. They seem to produce some substance of great importance to the well-being of the body; but what it is, and how it affects the organism, are still involved in difficulties. However, as they are all closely associated with the blood system, they may well be called vascular glands.

GLANDERS (from *gland*, from Lat. *glans*, acorn). A virulent contagious disease due to the action of a specific microbe, the *Bacillus mallei*. The microbe was discovered in 1882 by Loeffler and Schütz. It is a short, rather stubby rod, with rounded ends. It stains irregularly, occurs singly, in pairs, or in long strings, and grows readily in the ordinary culture media. As a result of natural contagion, glanders is almost entirely confined to the horse, ass, and mule. Cattle enjoy an immunity from it, and sheep and pigs are highly resistant to natural contagion. Dogs, cats, and wild carnivora may become infected by eating the meat of glanderous horses. Glanders has been known since the time of the classic Latin and Greek writers as one of the most dreaded horse diseases. Its distribution is practically universal, though it is said not to occur in Australia.

Glanders appears under several forms with different symptoms. The acute and chronic forms of glanders are universally recognized. The acute form begins with a high fever. The coat is staring, and there are frequent chills. The mucous surfaces are reddened or sometimes yellowish, purulent ulcers appearing on those of the nose. These ulcers rapidly increase in size and depth. Painful swellings occur on various parts of the body, especially in the

neighborhood of the lymphatics. In many cases the joints of the legs are affected by acute inflammation. Death generally occurs in from 8 to 30 days. Chronic glanders occurs in the skin form known as farcy, and as true glanders affecting the lungs and other internal organs. In farcy the symptoms begins by the formation of nodules under the skin, known as farcy buttons. The surrounding tissues are broken down, and running ulcers are thus formed. After a variable period these ulcers heal. The disease breaks out again, however, in the same or other locations. The farcy buttons occur most frequently on the neck, shoulders, and inside the thighs.

During the progress of ordinary chronic glanders the lungs are affected by glanderous pneumonia. A lobular V-shaped pneumonia, occurring at the various foci of infection, is characteristic of glanders. Tubercles of sizes varying from that of a millet seed to that of an egg are formed in the lungs, liver, spleen, and occasionally in the kidneys. The tissue of these tubercles breaks down, leaving cavities filled with pus, some of which, in long-standing cases, may ultimately heal.

The symptoms of chronic glanders which are most relied upon by practicing veterinarians for diagnostic purposes are nodular swelling of the submaxillary glands, a dry cough after exercise, farcy buttons on the skin, and a persistent purulent discharge from the nose.

The spread of the disease is due chiefly to the discharges from the nose and from farcy sores. The virus from these sources may contaminate harness, vehicles, fences, stables, water supply, etc., through which other animals are readily infected.

Nearly all the tonics and curative agents known to veterinary medicine have been used in the treatment of glanders, but without result. Medical treatment is of no avail. Spontaneous recovery takes place in rare instances. When the chief symptoms are those of farcy, apparent recovery takes place at intervals, followed by renewed outbreaks of the disease. The nasal symptoms may also cease and later recur. In chronic cases the disease may persist for several years before death occurs.

Glandered animals should be shot and buried or burned. Such procedure is required by law in nearly all countries. Stables and all articles with which glandered horses have come in contact should be disinfected.

For the detection of cases of glanders the symptoms already mentioned are not always sufficient. In latent cases recourse is had to several other means, including injections of mallein. This substance is prepared from the glanders bacillus and contains the glanders toxin, but not the living bacilli. An injection of this substance into healthy horses causes no reaction. In glanderous horses it produces an elevation of temperature, swelling of the submaxillary glands, and trembling, which subsides after a few hours. A rise in body temperature of 2° F. after a mallein injection is considered good evidence of the presence of glanders. Some investigators have reported quite striking curative effects from the continued use of large doses of mallein. Several reliable methods of serum diagnosis are now available for use, including the serum agglutination and precipitation reactions and the complement fixation test. The complement fixation test is considered to be the

most satisfactory single method of diagnosing glanders.

Glanders in Man, otherwise called EQUINIA. Man may acquire the disease by accidental inoculation from the horse, though several cases have been recorded in which glanders has been transmitted from one human being to another. The symptoms of acute glanders in man are: weakness, chills, muscular and articular pains, the appearance of nodules with swelling and redness, rise of temperature, and suppuration. A single ulcer may cause great swelling of the whole hand and arm, with œdema, enlarged glands in armpits, and subsequent ulcers and pustules upon the swollen surface. A discharge from the nasal cavities appears, watery and viscid at first, afterward purulent and very offensive. The nose becomes swollen and painful, and perforations of the cartilage occur. The mouth becomes dry, dark red, and thickly coated; constipation is followed by diarrhœa; intense nervousness or delirium may follow; albumin appears in the urine. Emaciation and prostration are followed by death in the fourth week, in fatal cases. Besides the acute form just described, there is also a chronic form of glanders in man, but this occurs very rarely. Consult: J. Law, *Text-Book of Veterinary Medicine*, vol. iv (Ithaca, 1905-11); Hutyra and Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals*, vol. i (New York, 1913); E. W. Hoare, *A System of Veterinary Medicine*, vol. i (ib., 1913); Mohler and Eichhorn, "The Diagnosis of Glanders by Complement Fixation," *United States Department of Agriculture, Bureau of Animal Industry Bulletin 136* (1911); id., "Various Methods for the Diagnosis of Glanders," *United States Department of Agriculture, Bureau of Animal Industry Circular 191* (1912).

GLANDINA (Neo-Lat., from Lat. *glans*, acorn). A genus of large pulmonate mollusks, or land shells, of the shell-bearing slug family Testacellidæ. It includes about 125 species, whose shells are somewhat fusiform in shape, smooth, polished, and beautifully colored and marked. They creep about among the herbage and on bushes and are voracious feeders upon other smaller snails and all sorts of animal matter. Most of them belong to the American tropics, but one, at least, is European. Several species enter the southern border of the United States, of which the best known is the rose-tinted extremely variable *Glandina truncata*, which is illustrated on the Colored Plate of NORTH AMERICAN SNAILS, accompanying the article SNAIL.

GLANDS, DISEASES OF THE. The lymphatic glands are subject to enlargement from acute inflammation and abscess, usually in consequence of irritation of the part from which their lymphatics spring, as in the case of scarlet fever and diphtheria (q.v.), in which the glands of the throat are affected; or in the case of gonorrhœa (q.v.), in which the glands of the groins are affected; in bubonic plague, in which the glands of the groins, armpits, or neck, etc., may be involved. The treatment of such abscesses is purely surgical. A much more troublesome affection of the glands is the slow, comparatively painless, at first dense, solid swelling which they undergo in scrofula (q.v.), which tends very slowly, if at all, to suppuration and sometimes remains for years. In syphilis (q.v.) and cancer there are also en-

largements of the lymphatic glands. Scrofulous or tubercular diseases of the mesenteric glands in children constitute *tabes mesenterica*. (See MESPENTER.) The larger glands, as the liver, kidney, pancreas, spleen, thyroid, thymus, testicle, and even the pituitary gland (qq.v.) have all their special diseases.

Glandular fever is a disease of childhood, probably of infectious origin, and characterized by a sudden onset, moderate fever, and swelling of the glands of the neck, and sometimes those of the axilla and groin. The disease is not dangerous, but complications, the most serious of which is nephritis, may lend gravity to the case. Isolation, mild purgation, rest, and symptomatic remedies are indicated in the treatment.

GLAND TREATMENT. See SECRETIONS, INTERNAL.

GLANEUSES, glá'néz', LES (Fr., The Gleaners). A celebrated painting by Jean François Millet (1857) in the Louvre, representing a field in which three women are picking up the forgotten stalks, while the laborers are seen with loaded wagons in the background. The picture is remarkable for its effects of light and is considered one of Millet's best works. For illustration, see MILLET, JEAN FRANÇOIS.

GLANVILL. The putative author of the first classical textbook of the English common law. This work, *A Treatise on the Laws and Customs of England (Tractatus de Legibus et Consuetudinibus Angliæ)*, appears from internal evidence to have been composed towards the close of the twelfth century and in the last years of the reign of Henry II. The Glanvill whose name it bears is doubtless the celebrated Ranulph de Glanvill, Chief Justiciar and Prime Minister of Henry, one of the conspicuous figures of that stormy period of English history. He came of a Suffolk family of position, was sheriff of Yorkshire from 1163 to 1170, and in 1174, when sheriff of Lancashire, led the forces of the King against the invading Scots and won a great victory. Thereafter his place was at the right hand of the King as trusted adviser, ambassador, prime minister, and justiciar. He died at Acre in 1200, to which place he had gone with Richard I on his crusade to the Holy Land.

But there is no trustworthy evidence that Ranulph de Glanvill wrote the law book attributed to him. It is more likely to have been the work of some learned clerk at his court, perhaps of his secretary and kinsman, Hubert Walter, and that the title of the work is a dedication rather than an attribution. But there can be no doubt that it represents the law of Glanvill's time and is a correct picture of the legal system which he was engaged in shaping. Though the writer must have had some knowledge of the canon law, his work is English both in matter and arrangement. That is to say, it is not "institutional" and scientific in form, but empirical and practical. It sets forth the procedure of the King's Court, the *Curia Regis*, the various pleas which it will entertain, the several classes of wrongs which it will remedy, and the plea appropriate to each, and so considers the substantive law, both civil and criminal, after the usual common-law method, from the standpoint of procedure. It immediately took high rank as a legal authority and retained its unquestioned supremacy until superseded, 60 or 70 years later, by Bracton's great work. In the meantime many editions, as we should call them, by various annotators, ap-

peared, and many of these manuscripts are still in existence. A Scottish version, known as the *Regiam Majestatem*, long passed as an original treatise.

Glanvill was first printed in the year 1554 at the instance of Sir W. Stanford, a judge of the Court of Common Pleas. It was early translated into French, and an English version by Beames appeared in 1812. A new edition of Beames's translation has recently appeared under the careful editorship of Prof. Joseph H. Beale, Jr. (Washington, 1900).

GLANVILL, JOSEPH (1636-80). An English divine, born at Plymouth. He graduated at Exeter College, Oxford, in 1655, took the degree of M.A. at Lincoln College in 1658, and became chaplain to Francis Rous, provost of Eton. After the Restoration he conformed, and in 1660 became rector at Wimbold, Essex, by appointment of his brother, a prominent London merchant. He became a friend of Henry More, but was not himself a Platonist, and was one of the early fellows of the Royal Society. His first and best-known work, *The Vanity of Dogmatizing* (1661), an attack on the scholasticism of the Oxford school, anticipates Hume's theory of causation and foreshadows the electric telegraph in the words: "to confer at the distance of the Indies by sympathetic contrivances may be as natural to future times as to us is a literary correspondence." It contains the story of the "Scholar Gypsy" from which Matthew Arnold obtained the basis for his poem. Glanvill was appointed rector of the Abbey Church at Bath in 1666, and chaplain in ordinary to Charles II in 1672. During the "Popish Plot" excitement he wrote a spirited attack on the nonconformist sects, *The Zealous and Impartial Protestant* (published in 1681). Among his voluminous works, written in a rather rhetorical style, are: *Lux Orientalis* (1662), a defense of More's doctrine of the preexistence of souls; *Scriptis Scientifica: or Confess Ignorance the Way to Science* (1665; reprinted 1885), a revision of his first work, in which, as in *Philosophical Considerations Touching Witches and Witchcraft* (1666) and *Madducismism Triumphatus* (1681), he collected evidence on superstitions and conducted psychical research; *Plus Ultra, or the Progress and Advancement of Knowledge Since the Days of Aristotle* (1668), a defense of the Royal Society; *The Ways of Happiness* (1670); *An Earnest Invitation to the Lord's Supper* (1673); *Essays on Several Important Subjects* (1676), containing his remarkable "Anti-Fanatick Theologie and Free Philosophy," in continuation of Bacon's *Nov Atlantis*; *An Essay Concerning Preaching* (1678).

GLANVILLE, BARTHOLOMEW DE. See BARTHOLOMEUS ANGLICUS.

GLAPTHORNE, HENRY. An English dramatist, of whose life nothing is known except that he was a friend of Cotton and Lovelace and an adherent of the court, and wrote most between the years 1639 and 1643. His works consist of: *Albertus Wallenstein* (1639), an historical drama; *Argalus and Parthonia* (1639), a dramatization in verse of a part of Sidney's *Arcadia*; *The Hollander* (1640); *Wit in a Constable* (1640); and *The Ladies' Privilege* (1640). Other plays have been credited to him; Bullen and Fleay both reprint *The Lady Mother* as his work, and Schelling attributes it to him. He wrote a volume of *Poems* (1639) and a poem called

Whitehall (1643). His works may be characterized as indifferent and feeble, with occasional bursts of beauty. Consult the memoir in the collected edition of his *Plays and Poems* (London, 1874); an essay in *Retrospective Review*, vol. x (ib., 1824); and Ward, *English Dramatic Literature*, vol. iii (ib., 1899).

GLAREANUS, glä'rä-ä'nus, HENRICUS (1488-1563). A Swiss humanist and musical theorist, whose name was Heinrich Loriti. He was born at Mollis, Canton of Glarus (whence his name). He studied music under Cochlihus at Cologne, where he also gave considerable attention to philosophy and theology. At the age of 24 he became poet laureate to Emperor Maximilian I. He taught mathematics at Basel from 1515 to 1517, when his friend Erasmus is said to have secured for him an appointment to the chair of philosophy at Paris. At first a defender of Reuchlin and a follower of the Reformation, he is believed subsequently to have changed his views and to have removed to Basel, accepting a professorship at the university in that city about 1520, whence he afterward removed to Freiburg. Biographical details concerning him are somewhat meagre and unreliable; more is known of his work. One of his principal publications is entitled *Isagoge in Musicen Henrici Glareani, etc.* (1516), the first work published by him, and treating of solmization, the intervals, tones, and modes. His *Dodekachordon* (1547) is still of great value to the historian and student of music, inasmuch as here for the first time the theory is enunciated that there should be 12, instead of 8, church modes, corresponding to those of ancient Greece. The work is divided into three parts and is furnished with numerous examples from the works of Oekenheim, Josquin de Près, and other famous composers of the fifteenth and sixteenth centuries. Consult O. F. Fritzsche, *Henricus Glareanus* (Frauenfeld, 1890).

GLARUS, glä'rūs. A canton of Switzerland, bounded by the Canton of St. Gall on the north and east, Grisons on the south, and Uri and Schwyz on the west (Map: Switzerland, D 1). Area, 267 square miles. The centre is taken up by a valley open on the north and inclosed on the east, south, and west by snow-capped mountains, most of them exceeding 10,000 feet in height. The chief river is the Linth, flowing into the Wallensee. Agriculture is of secondary importance, domestic products not sufficing to meet the home demand. The chief manufactured products are cotton, woolen, and silk goods, and beer. The canton is well provided with transportation facilities and carries on a considerable trade in textiles.

The form of government is thoroughly democratic. The people exercise their legislative power directly, assembling for that purpose once a year in the Landesgemeinde. The executive power is vested in a council of seven members elected by the Landesgemeinde for three years. The rural communities are administered by communal councils. Pop., 1900, 32,349; 1910, 33,316. The inhabitants are mostly Protestant and speak German. Capital, Glarus (q.v.).

GLARUS. The capital of the Swiss canton of the same name, situated on the Linth, 43 miles by rail from Zurich (Map: Switzerland, D 1). The chief buildings are the Gothic church, used in common by Roman Catholics and Protestants, and the government buildings, containing a natural history museum and an art

collection. The town is lighted by gas and electricity, and has water works. There are cotton-printing mills, bleacheries, cigar factories, and breweries. The commerce is of considerable importance. Pop., including the suburbs, 1900, 4940; 1910, 4877, mostly German-speaking Protestants.

GLAS, JOHN (1695-1773). Founder of the Glassites, or Sandemanians. He was born at Auchtermuchty, Fifeshire, Scotland. He studied at St. Andrews and Edinburgh, entered the ministry, and became a popular preacher. In his *Testimony of the King of Martyrs* (1727) he maintained that all national establishments of religion and all interference of the civil authority in religious affairs are inconsistent with the true nature of the Church of Christ and was thus probably the first to assert the voluntary principle in Scotland. For advocating such views he was first suspended and later deposed from the ministry (1730). He then formed an independent congregation in Dundee and in 1733 removed to Perth, where he built his first church. He was here joined by Robert Sandeman, who married his daughter and became the better-known leader of his followers in England and America. He died at Perth, Nov. 2, 1773. Notwithstanding some intellectual eccentricities, Glas was a man of strong character and sound scholarship. His works were published at Edinburgh in 1761 and at Perth in 1782-83. The thirteenth edition of his *Christian Songs* appeared at Perth in 1847. See SANDEMAN, ROBERT; SANDEMANIANS.

GLASENAPP, glä'zo-näp, KARL FRIEDRICH (1847-1915). A German philologist and writer on music. He was born at Riga, studied comparative philology at Dorpat, and in 1875 became professor of German literature at Riga. His principal work, *Richard Wagners Leben und Wirken*, is the most comprehensive biography of the master. The first volume appeared in 1876, the last (sixth) not until 1913. Two other important works are *Wagner-Lexicon* (1883) and *Wagner-Encyclopädie* (1891). Beginning with their foundation he was a frequent contributor to the *Bayreuther Blätter*. He also published some of Wagner's correspondence and wrote a life of Siegfried Wagner (1906).

GLASER, glä'zër, ADOLF (1820-). A German author, born at Wiesbaden. For more than 22 years (1856-78) he continuously conducted *Westermann's Illustrierte Monatshefte* and he again was associated with that publication after 1882. His first success was the novel *Schlitzwang* (2d ed., 1879), which was followed by a series of historical novels, such as *Savonarola* (1883) and *Wulfhilde* (1885). His principal dramas are also chiefly historic: as *Galileo Galilei* (1861). He is favorably known as a translator of Dutch novels. His collected works were published in 12 volumes, 1889-92.

GLASER, EDUARD (1855-1908). An Austrian explorer, born at Deutsch-Rust, Bohemia. He studied physics, geology, and astronomy at Vienna and Prague, and afterward devoted himself to the study of Oriental languages, visiting Egypt and Tunis. In 1882 he observed a total eclipse of the sun at Sohag, Upper Egypt, and subsequently he made a trip to southern Arabia (Yemen, especially Jauf and Märib). In 1885 and thereafter he again made several tours through Arabia, and collected nearly 2000 manuscripts and numerous archaeological specimens, relics chiefly of the city of Märib, the capital

of the ancient Sabæan kingdom; most of these are in the Imperial Library, Vienna. Glaser's researches on the topography of Arabia, and on the epigraphy and dialects of the southern portion of the peninsula, are highly important. Besides contributions to scientific periodicals he wrote: *Mitteilungen über einige aus meiner Sammlung stammende sabäische Inschriften* (1886); *Skizze der Geschichte und Geographie Arabiens von den ältesten Zeiten bis zum Propheten Muhammad* (1889 et seq.); *Die Abessinier in Arabien und Afrika* (1895).

GLASER, glä'zér, JULIUS ANTON (originally JOSUA) (1831-85). An Austrian jurist and statesman. He was born at Postelberg, Bohemia, of Jewish parents, and was educated at Vienna and Zurich. In 1856 he was appointed professor in the University of Vienna. In 1871 he was elected to the Diet of Lower Austria, and from 1873 to 1879 he was a member of the Austrian Reichsrat. In 1871-79 he was Minister of Justice in the Auerperg cabinet, and subsequently was procurator general at the Court of Cassation, Vienna. He was one of the foremost jurists of his day, and aided greatly in the reformation of criminal jurisprudence in Austria. His principal publications are: *Das englische-schottische Strafverfahren* (1850); *Die Fragestellung im Schwurgerichtsverfahren* (1863); *Zur Juryfrage* (1864; republished with the preceding work in 1879, under the title *Schwurgerichtliche Erörterungen*); *Anklage, Wahrspruch und Rechtsmittel in englischen Schwurgerichtsverfahren* (1866); *Gesammelte kleinere Schriften über Strafrecht, Civil- und Strafprozess* (2d ed., 1883); *Sammlung strafrechtlicher Entscheidungen des k. k. Obersten Gerichtshofs* (3 vols., 1872). Consult the sketch by Unger (Vienna, 1888).

GLASER, OTTO C(HARLES) (1880-). An American zoölogist. He was born at Wiesbaden, Germany, and graduated in 1900 from Johns Hopkins University, where he received his doctorate in philosophy in 1904. He was an assistant in the United States Bureau of Fisheries and the North Carolina Geological Survey (1901-02), marine biologist of the Gulf Biological station (1903), demonstrator at the College of Physicians and Surgeons, Baltimore (1901-03), and taught biology at Woods Hole, Mass., in 1905-07, and at the University of Michigan after 1905, becoming assistant professor in 1908. His researches comprise investigations on the behavior of the white rat, behavior of the *Ophiura*, oyster culture, origin and physiology of nematocysts, cytology and embryology of *Fasciolaria*, and developmental energetics.

GLASGOW, gläs'gò or gläs'kò. A royal and parliamentary burgh, the industrial and maritime metropolis and the largest city of Scotland; after London and Birmingham, the largest city in the United Kingdom (Map: Scotland D 4). It is situated on the river Clyde, in the lower ward of Lanarkshire, and occupies chiefly the north side of the river, but has large and populous suburbs on the south side. The river is crossed by several bridges. Two of granite and one of iron are much admired for their light and graceful architecture. Two are suspension bridges and three are railway bridges. Below the bridges, ferryboats ply at all hours.

Glasgow is built for the most part on level ground, but in the north and northwest districts there are considerable elevations. Owing to the great number of factories and mills of all kinds,

the city has a somewhat dingy and smoky aspect; in other respects it has many attractions. The houses facing the river stand well back, leaving spacious thoroughfares on each side which afford full and noble views of the bridges, of several handsome street ranges and public buildings, and of the harbor with its funnels and forests of masts. Most of the leading streets run from east to west, parallel with the river, and almost all the streets, except in the oldest parts of the city, are laid in straight lines. The houses are generally lofty, and built of freestone, the floors of each tenement being usually occupied by separate families, entering by a common stair. In the fashionable quarters elegant residences prevail. The city may be divided into the eastern and western sections, separated by Buchanan Street; the former contains all that there is of antiquarian interest and many of the modern public buildings, while the latter is the more modern and fashionable quarter. The principal business streets are Argyll, running parallel to the river; Buchanan, running at right angles; and Sauchiehall, the main thoroughfare to the west-end residential section. George Square, the centre of the city, is adorned with an 80-foot fluted column surmounted by a statue of Sir Walter Scott, equestrian statues of Queen Victoria and the Prince Consort, and statues of Sir John Moore, James Watt, Sir Robert Peel, William Pitt, Thomas Campbell, Robert Burns, David Livingstone, Lord Clyde (Sir Colin Campbell), and Gladstone. About this square are clustered some of the most notable buildings in the city, such as the municipal buildings (in Venetian Renaissance style, opened in 1889), Merchants' House, Bank of Scotland, and the General Post Office. Among other public buildings are the Royal Exchange in Queen Street, in the Corinthian style, in front of which stands a colossal equestrian statue of the Duke of Wellington; the magnificent buildings of the university, erected in Early English style on Gilmore Hill and opened in 1870; the Institute of Fine Arts and the Corporation Art Gallery, both in Sauchiehall Street (the art gallery and museum are now housed in Kelvingrove Park). The cathedral, dedicated in 1197 and completed about the middle of the fifteenth century, was designed in the form of a cross, but the transepts were never completed. It is Early English in style, and is particularly noted for its beautifully proportioned and elaborately decorated crypt. The principal cemetery is the Necropolis, on a hill in the northern part of the city; here is a conspicuous Doric column erected (1824) in memory of John Knox.

Glasgow owes its industrial and commercial importance to its advantageous situation in the midst of a district abounding in coal and iron. Much of its prosperity is due also to its position near the mouth of the Clyde and the possession of a splendid harbor (206 acres). Over \$40,000,000 has been expended in the widening and deepening of the river, which is now navigable by vessels drawing 26 feet of water. In 1912 the total net tonnage entered and cleared, excluding coastwise vessels, was 5,226,000. In 1900 imports and exports of merchandise were valued at \$68,309,527 and \$90,006,810 respectively; in 1910, \$70,777,317 and \$143,961,057; in 1912, \$82,506,000 and \$182,817,725. The chief articles of export are woolen, cotton, and linen goods, machinery, millwork, and metal manu-

factures, coal, paper, chemicals, and whisky. The imports include largely raw products, such as wheat, corn, flour, sugar, wool, metal (especially iron) ores, timber, tobacco, and petroleum. The city is the chief centre of the shipbuilding industry of the world; the building of all kinds of machinery is next in importance, followed by cotton spinning and weaving. Calico printing, dyeing, and distilling and brewing should be mentioned. The famous St. Rollox Chemical Works, one of the largest of its kind in the world, has a chimney stack 435 feet high, a conspicuous landmark of the city. Loch Katrine, 42 miles distant and 364 feet above sea level, furnishes the water supply of Glasgow.

The government of the city is administered by a corporation consisting of 77 members, including the lord provost and 14 bailies. See paragraph on *Local Government* under GREAT BRITAIN.

Glasgow has led in the work of municipal reform in Great Britain. Its various improvements and great undertakings have been carried out by the corporation, which, under an act of Parliament, constituted itself in each case as a "trust," such as the Improvement Trust, the Police Trust, the Market Trust, the Navigation Trust, etc. For the purposes of practical work, the various trusts, i.e., the corporation in its several capacities, elect subcommittees, which have immediate supervision of the respective departments of city administration. Thus, the Sanitary Department, or Board of Health, is under the supervision of a corporation committee with subcommittees on cleansing and hospitals. It is administered by a chief inspector, assisted by some 150 inspectors, the work of each being highly specialized. The thorough organization of the Board of Health and the numerous other improvements of the city were necessitated by the extreme density of the population, and the consequent high rate of mortality among the working people. In 1865, the year marking the beginnings of the various public undertakings, the density of the population was very great—1000 per acre in certain districts. The average mortality in 1864 was 32.8 per thousand, and as high as 38.64 for a series of preceding years. The Improvement Trust, in cutting wide streets as well as in laying out new ones, in demolishing old buildings and creating vacant space, and in a good many other ways, helped to disperse the population over a wider area. In 1891 the boundaries of the city were extended; before extension, the average density was 92.5 to the acre, and after extension 55.5; in 1901, about 60 to the acre; in 1911, 62. Still, at the present day, a vast number of families occupy single-room dwellings (in 1911 there were 32,606 one-room dwellings and 75,536 two-room, out of a total of 163,057). The death rate has fallen to about 20. The birth rate averages about 33.

In addition to its work of prevention of disease, the Sanitary Department pays due attention to combating prevailing disease. Its two great municipal hospitals not only are models in appointment, but are built in a very attractive manner. Special buildings are provided for infectious diseases. The sanitary washhouses are used for disinfecting the belongings of families whose members are afflicted with contagious diseases, the families themselves being entertained at the cost of the city in its "house of reception" while their homes go through the

process of disinfection and whitewashing. The Cleansing Department probably contributes as much to the health of Glasgow as the Sanitary Department. In addition to the usual sweeping and sprinkling of public streets, this department attends to the cleansing of private courtyards and passageways, the owners being assessed a slight tax to cover the expense. The street sweeping is done by machines at night. The litter swept up by men and boys during the day is deposited in covered iron bins, located under the surface of the streets at short intervals. There are three principal "dispatch stations," together with a number of minor ones, at which the city garbage undergoes a treatment which converts the greater part of it into manure. The city owns a number of farms for the utilization of that part of the refuse which cannot be marketed. To avoid contamination of the waters of the Clyde, the city's sewage is treated chemically in a special sewage plant, where it is made to precipitate all its solid ingredients, which are then made into "cakes" by powerful presses, and passed automatically into freight cars standing on the tracks below. Most of the cakes are utilized at the city's farm for raising fodder for the horses employed in the Cleansing and Street Railway departments. The water remaining after the precipitation of the solid ingredients is filtered, and passed entirely pure into the Clyde. All of these improvements, though originally involving a considerable outlay of capital, have more than paid for themselves.

The Glasgow police consists mostly of Highlanders, who are universally praised for their intelligence and efficiency. The police courts constitute a part of the police department. Justice is administered by the Lord Provost and the bailies. Half of the expense of the department is met by the general government.

The city possesses considerable and profitable real estate. There are some two dozen municipal tenements, which, though superior to the private houses of the same class, are built largely in undesirable localities, and thus utilize land which could not be disposed of otherwise.

The Glasgow municipal lodging houses are models in their line, and a boon to the poor. Although the charge is only seven to nine cents per night, they yield a revenue above all expenses, including interest. In 1896 the municipal family home was opened to accommodate families of widows or widowers who are obliged to be away from their children during the day. It contains all the necessary accommodations, including playrooms, playgrounds, and a nursery. There are nurses to take care of the children while their parents are at work. The charges are: for mother with one child, 76 cents per week; mother with two children, 92 cents. Board: breakfast, five cents; dinner, eight cents; tea, six cents. The public baths comprise five large establishments containing swimming pools, and accommodating on the average 1500 people per day. The public washhouses are fitted out with steam boiling apparatus, centrifugal machine driers, hot-air apartments, steam-operated roller mangles, etc. The charge for their use is four cents per hour.

The public lighting is done by the city. After having taken over the gas plant, the city went on improving it, at the same time reducing the cost of gas to consumers. Between 1869 and 1901 the population increased less than 30 per

cent, and the consumption of gas increased 170 per cent. From \$1.14 per 1000 feet in 1869, the price has gradually been reduced to 60 cents, without diminishing the net profits. In 1893 the city opened a large electric plant which has proved a great success, and lights not only streets and public buildings, but also private courts and stairways.

The water supply is under the management of the Board of Water Commissioners. In 1860 a new supply of water was introduced from Loch Katrine by means of a large reservoir covering an area of 86¼ acres, at a distance of 7 miles from the city and 300 feet above its general level. Subsequently the water supply was greatly augmented in part by raising the level of Loch Katrine 5 feet. With a steadily diminishing water rate the city has been able to meet not only all the expenses, including interest, but also to accumulate a sinking fund.

In 1894 the city took over the street-car system; by the terms of the original contract it did not have to pay for the plant, but received from the company a total sum of \$225,000 in rental money, and exacted another sum known as the renewal fund to keep the system in repair. Since then a new set of commodious cars has been introduced, certain extensions have been made, and the horse-car service has been replaced by a modern electric-traction system, all completed by the summer of 1901. After carrying out all of the improvements and charging the low rate of one cent for short rides and two cents for long ones, and after having reduced the hours of its employees from 14 (under the rule of the company) to 10, and advanced their wages, the city not only has managed to pay all expenses, including depreciation and interest on capital, but lays aside annually about \$300,000 in the sinking and general reserve fund.

Glasgow possesses a system of municipal markets, used, however, for wholesale transactions only. All slaughtering is done in the municipal abattoirs, yielding an income to the city. Under the name of the Clyde Navigation Trust, the city operates the harbor ferries, and holds a monopoly of all harbor services. The Mitchell Library, with 175,000 volumes, though founded by private persons, serves the purposes of a public library, and receives a grant from the city. In addition, the city has several minor libraries.

The schools are managed very successfully by the Glasgow School Board, as may be seen from the increasing attendance in public schools and the diminishing numbers in private ones. A system of fees divides the schools into three distinct classes, each aiming to furnish the same kind of education, but serving to separate the children of the rich from those of the poor. There are a number of technical schools, governed by a board of trustees, on which the Glasgow University is also represented. In addition to the University (see GLASGOW UNIVERSITY), there are the Glasgow and West of Scotland Technical College, St. Mungo's College, Anderson College, St. Margaret's College for Women, and the United Free Church College. The secondary schools include the High School, Glasgow and Kelvinside academies, and the Hutcheson Trust schools. There are numerous hospitals and dispensaries, and three large, excellently appointed general infirmaries. Glasgow has a number of theatres and large concert halls. The

Royal Botanic Gardens near the Western Infirmary, with their large conservatories and fine collections of exotic and other plants, form a favorite resort for the citizens. Other large parks include the Glasgow Green (140 acres) on the Clyde, Kelvingrove Park, in the west end, Queen's Park (130 acres) on the south side, and Alexandra Park (120 acres). Glasgow is the seat of a United States consul.

The population of Glasgow in 1801 was 77,385; in 1821, 147,043; in 1861, 395,503; in 1881, 511,415; 1891, 565,839. The city limits were extended in 1891, the population becoming 658,198. In 1901 Glasgow had 761,742 inhabitants, and the area of the city was 12,561 acres; in 1911, 784,496 inhabitants, the area being 12,669 acres. The 1901 population of the 1911 area was 775,594, so that in the decade the increase on the same area was 8902; the natural increase is calculated at 91,540, showing a loss by migration of 82,638. Of Glasgow's area, 12,400 acres are reckoned as of Lanarkshire and 179 acres Renfrewshire. There are important suburbs, including the conterminous burghs of Govan (1303 acres, pop., 89,605) and Partick (956 acres, pop., 66,849), and, in Dumbartonshire, the burgh of Clydebank (1330 acres, pop., 37,548).

Glasgow traces its beginnings in tradition to the little wooden church which St. Kentigorn, apostle to the Scots, built on the banks of the Molendinar about 560 A.D. Nothing is known of the town for more than five hundred years, till David, Prince of Cumbria, the future King David I, in 1116, reestablished the see of Glasgow and rebuilt its church. Between 1175 and 1178 Glasgow was made a burgh, subject to its bishop, whose bailie and provosts administered its affairs. In 1300 Wallace defeated the English there, and five years later he was also betrayed to the English there. In 1450 it was made a regality; in 1611 it gained by charter the right of electing its magistrates, and in 1636 became a free royal burgh. Its university, modeled on that of Bologna, was founded by a papal bull in 1451. In the seventeenth century the town was a stronghold of Whiggism and the Reformed religion. The great commercial growth of Glasgow dates from the union with England in 1707. Enjoying equal freedom of trade with English ports, it quickly obtained a large share of the American trade, for which its position on the west coast fitted it especially. Glasgow became the chief emporium of the tobacco trade, and its Virginian merchants formed a local aristocracy remarkable for wealth and distinction. This trade was at length paralyzed by the American war; but sugar cultivation in the West Indies and the introduction of cotton manufacture opened up new paths to wealth. It was here that Watt invented his steam engine. To-day it is the centre of huge shipbuilding yards and numerous branches of the iron industry.

GLASGOW. A city and the county seat of Barren Co., Ky., about 100 miles (direct) south of Louisville, on the Louisville and Nashville Railroad (Map: Kentucky, E 6). It has the Liberty Female College. The city is in the oil region of the State; carries on a considerable trade in lumber, cattle, mules, and livestock; and its industrial establishments include lumber mills, large tobacco warehouses, handle factories, furniture and tobacco factories, etc. Pop., 1900, 2019; 1910, 2316.

GLASGOW, ELLEN ANDERSON GHOLSON (1874-). An American novelist, especially interesting in her studies of Southern scenes and people, and not least in her pictures of the change in the South from the old order to the new. She was born at Richmond, Va., and was educated privately. Her works include: *The Descendant* (1897); *Phases of an Inferior Planet* (1898); *The Voice of the People* (1900-02); *The Freeman and Other Poems* (1902); *The Battle-Ground* (1902); *The Deliverance* (1904); *The Wheel of Life* (1906); *Ancient Larc* (1908); *The Romance of a Plain Man* (1909); *The Miller of Old Church* (1911); *Virginia* (1913).

GLASGOW UNIVERSITY. One of the great seats of learning in Scotland. It was founded in 1451 by Bishop Turnbull, its foundation being ratified by a papal bull of Nicholas V. In 1460 James, first Lord Hamilton, bequeathed a tenement and four acres of ground to the Regents of the "Pædagogium," or college of arts, and the university was further endowed by Queen Mary, as well as by her son, James VI of Scotland, better known as James I of England, who issued a new charter to the institution. The chief prosperity of the university, however, dates from the middle of the nineteenth century. In 1864 the university buildings and adjacent lands were sold, and splendid new buildings were erected on a site overlooking the Kelvin River, at a cost of about £470,000. These were opened in 1870 and have been extensively added to since 1892. By acts of Parliament, in 1858 and 1889, the university has been entirely reorganized and is now a corporation consisting of a chancellor, rector, dean of faculties, principal, professors, and students. The university court consists of the rector, the principal, the Lord Provost of Glasgow, and various *assessors*, representing both city and university. The body administers the property of the institution, appoints and regulates professors, and acts as court of appeal from the senate, which consists of the principal and professors, and regulates teaching and discipline. The general council, consisting of various *ex officio* members and all masters and doctors, meets twice a year to revise the business of the university. It elects the chancellor, four assessors to the court, and, with the general council of Aberdeen University, returns one member to Parliament. The chancellor in 1914 was the Earl of Rosebery. There is also a students' representative council. The chancellor holds office for life; the rector, generally some man distinguished in politics or letters, is chosen triennially by the students. The duties of the latter are wholly honorary. The students retain many of the customs and rights of medieval universities; of which the election of the

rector is one. They are still divided into four "nations"—Gloetiana (Lanarkshire), Transforthana (Scotland north of the Forth), Rothsciana (Bute, Renfrew; and Ayr), and Londonian (all others). In 1913 the number of students was 2770, including some 700 women. Women were first admitted in 1893 and Queen Margaret College was then handed over to the university by its trustees for their use. In 1913 the instructors numbered 164. In 1914 the rector was the Right Hon. A. Birrell, M.P. President Poincaré was chosen rector for 1915 by the student body.

The university grants degrees in arts, science, medicine and surgery, divinity, and law. It has a library of 210,000 volumes, an observatory, a botanical garden, besides many special collections of books, apparatus, and the great Hunterian collection of coins, medals, and anatomical preparations. An important feature of the university is the number of scholarships, exhibitions, and fellowships in its gift, among which the Snell exhibitions are the oldest and richest.

The University of Glasgow is rich in the number of distinguished graduates and teachers. Among them may be mentioned Bishop William Elphinstone, John Major, John Spottiswoode, Andrew Melville, James Melville, Robert Boyd, of Trochrigg, John Cameron, Zachary Boyd, Robert Baillie, James Dalrymple, first Viscount Stair, Gilbert Burnet (Bishop of Salisbury), John Douglas (Bishop of Salisbury), Dr. Robert Simson, Francis Hutcheson, Dr. William Hunter, Dr. James Moor, Adam Smith, Dr. Thomas Reid, Dr. William Cullen, Dr. Joseph Black, Dr. Matthew Baillie, Prof. John Miller, Thomas Thomson, Francis Jeffrey, J. G. Lockhart, Sir William Hamilton, Archbishop Tait, Prof. R. C. Jebb, Lord Kelvin, and Sir Joseph Lister. The four hundred and fiftieth anniversary of the foundation of Glasgow University was celebrated in 1901, and in the various publications of that celebration is to be found much valuable information regarding the institution. Consult also: Stewart, *The University of Glasgow* (Glasgow, 1891); Coutts, *A History of the University of Glasgow from its Foundation in 1451 to 1909* (ib., 1909); and the *Glasgow University Calendar*.

GLASH'AN, JOHN CADENHEAD (1844-). A Canadian educator and mathematician. He was born at Ellon, Aberdeenshire, Scotland, and was brought by his parents to Upper Canada (Ontario) when nine years old. He was educated at the public schools, at the provincial normal school, and at Toronto University. In 1864 he became a teacher in the Provincial Model School, Toronto, and in 1871 and 1876 respectively was appointed inspector of schools for Middlesex County and for the city of Ottawa, continuing in the latter office until 1910. In 1895 he was made a member of the board of civil-service examiners. In 1902 he was elected a fellow of the Royal Society of Canada. He contributed articles on mathematical subjects to various journals and devoted special attention to the history of mathematics. He is the author of an arithmetic for public schools, an advanced arithmetic for high schools, and also, with G. A. Wentworth and J. A. McLellan, of *Algebraic Analysis* (1889).

GLASPELL, SUSAN (Mrs. GEORGE 'RAM COOK) (1882-). An American author, born at Davenport, Iowa. She graduated from Drake University and also studied at the University

of Chicago. For a time she was State House and legislative reporter for the *News* and the *Capital*, daily newspapers of Des Moines, Iowa. She married George Cram Cook in 1913. Besides her contributions to magazines, she is author of *The Glory of the Conquered* (1909), *The Visioning* (1911), and *Lifted Masks* (1912)—novels that are intensely emotional and distinguished by their vivid realism and imaginative power.

GLASS (from AS. *glas*, Icel. OHG. *glas*, Ger. *Glas*; connected with Icel. *gler*, AS. *glær*, amber, and ultimately with Eng. *glare*). The use of glass came to the West from the East, and for that reason there is a diversity of names among the Indo-European nations. In Greek the usual word is *βάλος*, *hyalos*, of which the etymology is uncertain. In Latin the word is *vitrum*, which also means *violet*, used for its blue dye—a fact which suggests that the earliest glass known to the Romans was in the form of blue beads. Among the northern peoples the original name of the amber (OHG. *glas*) was transferred to the new material and has given rise to the English *glass*. The French (*verre*) and most of the other Romance languages have kept the Latin name.

The manufacture of glass was known to the Egyptians at a very early date. Tombs of the fourth and fifth dynasties (c.4000 B.C.) show glass blowers at work, and glazed pottery in the form of beads occurs in prehistoric times, though true glass first appears later in the form of opaque "paste" and finally as transparent glass. The oldest example of dark-blue glass is a pendant found at Naqada, which seems to date from the seventh dynasty, though no other specimens of this manufacture are known before the eighteenth dynasty. A wall painting of the eleventh dynasty, at Beni Hassan, is commonly interpreted as representing accurately the processes of glass blowing, but Dr. Flinders Petrie believes that some metallurgical process is depicted in which reeds tipped with lumps of clay were used. The fullest information about the processes and materials used by the Egyptians is furnished by the discovery of the glassworks at Tell el-Amarna, belonging to the eighteenth dynasty. Here were found fritting pans in which the first melting of the substances took place and also many imperfectly fused frits. The ingredients used were silica, lime, alkalies, and copper carbonate; but the exact proportions needed to secure a given color do not seem to have been known, and the exact tint produced must have been largely a matter of chance. They did know, however, that river sand, from the presence of iron, gave a green tinge, and to avoid this used crushed quartz pebbles. After the mixture had been fused until the colors began to appear, it was formed into cakes of paste, and these were again heated until the proper tint was reached. These cakes were fused in crucibles and allowed to cool in them, so that the impurities rose to the surface or settled at the bottom. The crucibles were then broken away, and the impure glass at the top and bottom chipped off, leaving a lump of glass, which was then broken up and softened so that it could be rolled into thick rods. These rods were then drawn out into slender rods or hollow tubes or rolled into flat strips, and these rods or ribbons were used by the glassmaker to produce beads, vases, or inlaid work. It is noticeable that, in the view of Dr. Petrie, the vases

from this site were not blown, but were formed by coating a core of sand with melted glass, and pressing out the foot and lip by hand, while the decoration was produced by rolling in threads of colored glass. (Consult Petrie, *Tell el-Amarna*, London, 1894.) Vigorous exception, however, has been taken to this view by other scholars, who hold that the facts on which Dr. Petrie based his view are entirely compatible with the belief that the vases were blown. In general, glass was used for the manufacture of small objects, and especially for the imitation of precious stones, in which the later workmen attained extraordinary skill. Cutting and engraving were also early practiced. Apart from these independent uses of glass, it was very largely employed for inlaying, while an enamel or glaze on clay, stone, or wood was a favorite form of decoration from early times. A very large proportion of the scarabaei, amulets, and small ornaments found in Egypt or exported to foreign parts are of various earths covered with a vitreous glaze, producing the ware incorrectly termed "Egyptian porcelain." However empirical the methods of the Egyptians, there can be no doubt of the technical skill attained by them, and even in Roman times the Alexandrian glassworkers maintained their preeminence. It was not till the Hellenistic period that value seems to have been set on clear glass, for, though clear glass was known earlier, it is certain that Egyptian taste valued only the highly colored varieties.

Phœnicia. Tyre and Sidon were celebrated for their glass, and Pliny (*Hist. Nat.*, 36, 190) locates the invention of glass at the mouth of the river Belus in Syria. His story is that the crew of a ship laden with nitre landed at this point, and when preparing to cook their food found no stones on which to rest the kettle. They therefore used lumps of nitre from the ship, and as these were fused with the fine sand a stream of liquid glass flowed out. Glass was certainly known long before the Phœnicians manufactured it, and the heat of an ordinary fire would be quite insufficient to fuse glass; but the fact remains that the river Belus was always an inexhaustible mine for ancient glassworkers, and modern travelers still describe the white sands heaped on each side of the stream. The glass factories of Tyre and Sidon were among the most noted of ancient times and remained conspicuous under the Roman emperors. Sidon is credited with the invention of mirrors. She certainly produced the best in the world in her time and knew the value of manganese in making glass clear. The artisans of this city used the blowpipe, the lathe, the graver, and the casting plate with splendid results. In the view of some scholars, the Phœnicians did little more than carry on the processes learned by them from the Egyptians; they were not great artists, but skillful fabricators and traders, and, as a result, their glass is found throughout the Mediterranean. Other scholars, however, attaching great weight to Pliny's account, regard Syria as the birthplace of glassmaking and think that the Egyptians derived their knowledge of it from Syria; they believe that thus we can adequately explain the fact that the glass industry, when first it meets us in Egypt, is fully developed. The date of any single piece is usually hard to determine, nor is it of great importance, as there are but slight variations in style at different periods and little advance

in technical skill. Indeed, it is often impossible to say whether a specimen is of Phœnician or Egyptian manufacture.

Assyria and Babylonia. Though glass is scarcely found in the Mesopotamian ruins, glazed or enameled bricks, statuettes, and small objects are numerous. Transparent glass was also known, and a fine example is the bowl of transparent green, now in the British Museum, bearing the name of King Sargon (722 B.C.). This bowl is not blown, but turned and cut from a lump of cool glass. It seems probable that this and other objects of transparent glass are importations from Phœnicia.

Persia. The use of enameled bricks for wall decorations was continued by the Persian kings, and the Louvre contains parts of the friezes representing lions and the royal guard which adorned the palace of Xerxes at Persepolis. The beautiful enamels of Persia are famous, and her delicate, lacelike porcelain, filled with transparent glass, is celebrated as Gambroon ware. In the Paris Bibliothèque is the famous cup of Khosru I, King of Persia (532 A.D.), a shallow bowl of crystal with the monarch's figure in relief in the central medallion, encircled with disks of red and white alternating with green, the whole glass ornamented in relief and bound with gold.

China and India. The Chinese claim that glass and even lenses were known and manufactured by them as far back as 2000 B.C., but the claim is most improbable, and it is not likely that the art was introduced before the Christian era. Modern Chinese glassworks imitate agate and other stones beautifully. All their glass is made from pulverized quartz, as in Japan and India. The Hindus, Siamese, and Chinese have from time immemorial placed lumps of glass on the high parts of their buildings to avert lightning. Indian enamelers have been celebrated from ancient times, but they work with simplest processes. The mosaic industry of Agra originated in the Taj Mahal, for which Italian artists were imported. Glass has never been used for windows in the Far East, except rarely in palaces, and to the present day oiled paper is the usual glazing throughout China, the palace windows being generally filled with mother-of-pearl or tortoise shell.

Greece. Homer does not mention glass (unless the word *κυανος*, *kyanos*, denotes a blue-glass paste, such as decorated the alabaster frieze found at Tiryns), but excavations have shown that beads and such small objects were known in Greece during the Mycenaean period, though no fragments of glass vessels have been discovered. It seems probable that these objects were imported, as there is no trace of the manufacture of glass on Greek soil, even in much later times. The excellence of the Greek ceramic ware made glass of less importance. Even the word *υαλος* is not used in the sense of glass before Aristophanes (425 B.C.), and then it refers to vessels used at the Persian court. In later time undoubtedly Greek artistic training exercised a powerful influence upon the glassmakers, some of whom bore Greek names, but the industry never became Hellenic, and Egypt, especially Alexandria, and Syria remained until Roman times the chief sources for fine glass.

Rome. In Italy glass first appears at the very beginning of the iron age, in the cemeteries of the Villanova (q.v.) type, naturally in the

form of beads and other paste ornaments. Glass bowls and bottles, however, are found in Etruscan tombs, and with the extension of the Roman power the use of glass increased enormously. Not only was glass imported from the old seats of this industry, but the manufacture was introduced into Italy, and thence into the provinces of Gaul, Spain, and Germany. Here, as in Italy, glass and iron had been introduced together, but only ornaments, beads, amulets, etc., were purchased from traders. Under the favorable conditions the industry flourished greatly, and glass became so cheap that ordinary cups or platters were sold in Strabo's time for a farthing. On the other hand, the expensive and beautiful vessels, according to Pliny, had almost driven out the use of gold and silver. The absence of fine porcelain led to a much more extensive use of glass than in modern times; and by Christian times glass was used even for windowpanes. It was used, too, in pavements and in thin plates as a coating for walls. Glass was used in many colors, and the skill of the ancient artists produced works not surpassed or even equaled in later times. In variety of shapes and in some points of technique the Venetians surpassed the ancient Romans; the special merit of the ancient workmen is in the beauty of the coloring and the skill with which the various threads or layers are combined, producing the effect of onyx and agate. The glass was *blown, cast, pressed, ground, and cut*. It was used for drinking cups, flasks, bowls, and other vessels, for mosaics, small ornaments of various kinds, and especially for imitations of precious stones, which in many cases were finely engraved as intaglios or cameos. Two methods of decorating are of special beauty. In one the workman blew the glass in two layers—the inner of a dark color, usually blue, and the outer of white. The outer layer was then cut away on the wheel, leaving the design in white relief on the dark background, as in a cameo (q.v.). The most famous example of this technique is the Portland Vase (q.v.) in the British Museum, though another fine specimen is in Naples, and fragments are very common. The second method is represented by but few specimens, all apparently egg-shaped cups without a foot. The vessel is inclosed in a network of rings of glass which are attached only by slender filaments to the surface of the cup. They seem to have been produced by cutting away the outer surface of the original vessel—an exceedingly delicate and tedious process, though some authorities hold that the outer network has been applied while soft and worked out with the forceps. Consult especially Fröhner, *La verrerie antique* (Le Pecq, 1879), an account of the Chareot collection, with a full historical introduction and numerous fine colored plates. More popular is Wallace-Dunlop, *History of Glass in the Old World* (London, 1883). A very elaborate work is Kisa, *Das Glas im Alterthum* (3 vols., Leipzig, 1912), dealing with the origin of glass-making, glass in Egypt, Phœnicia, Syria, Greece, Rome, and its provinces, etc.

Byzantium. Constantine, on transplanting his capital to Byzantium (330 A.D.), selected the best artisans in glass and not only gave them studios in a quarter of the city called "glass-making quarter," but caused them to be exempt from the tax levied by previous emperors. Accordingly glassmakers flocked from fallen Rome, carrying the fame and the skill of the Imperial

city to the East, and Byzantium supplied all Europe with *verre de luxe* until the rise of Venice. Factories were reestablished in Greece, Macedonia, Phœnicia, and Alexandria, and after the Arab conquest they continued to be the sole sources of artistic glass through the Middle Ages. The early Byzantines followed classic models, often badly, but later a Byzantine school arose which prevailed throughout Europe until the thirteenth century. Mosaic art, under the impetus of Christianity, was developed to its greatest glory for mural decoration, as the Byzantines believed and demonstrated that "mosaic is the only painting for eternity." Their world-renowned specimens at Ravenna (440 A.D.) are superior to those of the Romans. In the famous St. Sophia are mosaics made in the sixth century. On the lower walls these mosaics are of marble, and of glass cubes or tesserae on the upper walls and ceiling. These and its colored windows caused Justinian, its builder, to say, "I have surpassed thee, O Solomon." The church of the Transfiguration, Mount Sinai, is adorned with precious Byzantine mosaics of the seventh and eighth centuries. The Byzantine churches were usually lighted by a series of small windows around the base of the dome. Some of the original plates of cast glass still remain at St. Sophia. Colored window glass is not mentioned till towards the end of the eighth century. A common method of inserting it, which is still practiced in the East, was to perforate slabs of marble, or even the plaster, in patterned openings and place the glass in these.

One of the terms of peace at the beginning of the eighth century between Caliph Walid and Justinian II was that the latter should furnish a quantity of mosaic for his mosque at Damascus. A series of Byzantine mosaics extends from Constantine to Charlemagne. So late as the eleventh century, Pope Victor III sent to Constantinople for workers in mosaic. Imitation stones were also made wonderfully well there. The blue cup at Monza (600 A.D.), 3 inches in diameter, said to be made of a single sapphire; the celebrated emerald table captured at Toledo in the fourteenth century, long believed to be cut from a single emerald, inlaid with gold and precious stones, and valued at 100,000 dinars; and the famous Sauro Catino of Genoa, a shallow dish which passed as one of the most sacred relics of Christendom, the veritable "Sangraal," the ransom of a captive king, and supposed to be cut from an emerald until pronounced green glass, in 1761, by a French chemist—were all from Byzantine factories. The precious sacrament cups of glass, used in the church service, were theirs. They made the glass medallions circulated as test weights for money throughout the large estates of the Fatimite princes, which have been mistaken for coins. These were abolished in 888, but Venice continued to make glass weights in 1279, as the old Greeks had done. From Byzantine centres the Crusaders brought back into Europe the manufacture of glass, and it is probably from this source that Venice received its early impulse and first lessons in glassmaking.

Venice. Refugees in Venice made glass as early as the fifth century, the abundance of excellent sand and alkaline sea plants facilitating the industry. St. Mark's, built in 1150, gave an impetus to mosaic work on the spot, and the taking of Constantinople (1204) drove many Greek workmen to the asylum of Venice with

Byzantine secrets. The interior walls of this church are entirely covered with glass mosaics, representing the principal events of biblical history. The work on these mosaics extended over a period of 250 years. The wonderful color effect and beauty of these mosaics have been eloquently described by Ruskin. With the rise of the Italian painters, mural painting took the place of mosaics for wall decoration, and no mosaics of importance were made after the fifteenth century. But in the meantime the Venetians had turned their attention to the production of ornamental glass and guarded the secrets of its production with the most jealous care. In 1275 the Council of Venice prohibited the exportation of glass materials. The fear of fire abolished the furnaces, in 1291, from Venice proper to the outlying island of Murano, where the artists formed a small republic and have flourished ever since. The fame of Venetian glassmakers led other countries to tempt them away, but the Council of Ten jealously guarded the secrets of Venetian wealth. No stranger could learn the art. Any workman carrying his skill to another country was followed and ordered back. If he refused to come, his relatives were imprisoned. If he persisted, an emissary was dispatched to kill him. A wandering glassmaker called Paoli was tracked to Normandy, where he was stabbed with a dagger on which was written "Traitor." But the Venetian police had no power in Murano, and that island had its own codes and magistrates. Nobles gave their daughters in marriage to glassworkers, and the children were counted of the nobility. The shops of Murano formed, in 1495, a magnificent street a mile long, where every conceivable object was fashioned. The furnaces were small, a few workmen about each, which explains the diversity of design and the scarcity of pure glass, such as only long fusion in large furnaces can produce; but nowhere in the world could the precious products of Murano be matched. The vases and cups were royal presents to every sovereign. Their dishes displaced gold. Many of their wares were in patterns like madrepore coral. Their *mille fiore* was a starry mosaic of white threads combined in a blue ground. A favorite style imitated the pulp of an orange. *Vetro de trina* ware was made of twisted rods of opaque white in clear glass, and most delicate of all was their *lattice*, a lacelike network in exquisite designs. They also secured wonderful effects in mosaic, imitation gems, and cameos. All of these were simply repetitions or extensions of wonders done ages before by the Romans, Greeks, and Egyptians, which had since become lost arts, and all the lightness and wealth of color of ancient glass were exquisitely copied in an endless variety of fantastic forms. Fishes, lions, dragons, etc., were made to assume grotesque effects with the colors of different wines. They blended two sheets of color into one. They invented aventurine and far surpassed their masters in reticulated glass. About 1300, Murano artists conceived of covering plates of glass with an amalgam of tin and mercury, and their mirrors became proverbially fine. Marco Polo prompted them to manufacture beads for African trade. These beads became very popular, and enormous numbers of them were made, so that now, wherever the trade of the Middle Ages penetrated, they may still be found. These beautiful beads contrast strangely with the vulgar and glittering productions that

are now made for the similar purpose of trade with African and Indian tribes. In the early fifteenth century Panfilo Castaldi, a Venetian engrosser of deeds, made movable glass types and printed from them, and tradition says that John Faust, his friend, visited his scriptorium. Modern spectacles were invented by Salvino d'Armati, of Florence, according to the statement on his tombstone (1317). At the beginning of the seventeenth century there were 300 glasshouses in Murano, but at the commencement of the nineteenth century all were gone except a small mosaic factory. The art, however, was not allowed to die out entirely, but was cherished by a few workmen, one of whom, Radi, undertook the work of restoring some of the mosaics at St. Mark's. Salviati, an Italian lawyer, assisted in the Radi enterprise, and with the aid of English capital two sets of workshops have been established where ancient methods and objects such as mosaics are skillfully copied, and new and beautiful work is also done. The Venetians excel in glass novelties, such as mirrors, beads, tableware, bric-a-brac, and aventurine. Their glass is very soft so that it can be spun, woven, or otherwise fashioned into the daintiest designs. In the production of a single piece, it is said, the glass may be reheated 50 times.

France. The factories of Poitiers were active during the Roman and Frankish periods, survived the Norman invasion, and were left as a legacy to the gentlemen workers of the Middle Ages. Ruins of glass vases abound in the Poitiers territory, and such town names as Vieille, Verrières, Voirie, Verrines, come from their glassworks. The ancient cemeteries of Poitiers and La Vendée yield a rich harvest of glass, and fully 20,000 vases have been found at Terre-Noire, Bordeaux. The Imperial factory of Frontenennes, at Forêt-Eu, cradle of all the later Norman glassworks, is supposed to have been founded in the second century and is surely the oldest in the world. The beautiful Roman glass seen in the museums of France is thought to be of native manufacture. The Merovingian ornaments have a peculiar dynastic mark in the thin gold-threads dividing differently colored layers. In 677 many Greek workmen were called to France. Normandy was the first country to give privileges to glassworkers. In the tenth and eleventh centuries four noble families received the special prerogatives of glassworkers, and these were confirmed by successive kings until the eighteenth century. Factories in other parts of France were established by gentlemen from Normandy, and the Crusaders brought back many improvements in glassworking. Charles V gave all glassmakers exemption from taxes, and later kings extended this privilege as well as permitting noblemen alone to labor at this art. In 1388 Humbert, Dauphin of Viennois, granted a portion of the forest of Chamborant to a glassmaker to establish factories there, provided he should furnish him 3000 pieces annually. M. Jaquin, in 1656, invented the imitation pearls which are made by lining the beads with fish scales, instead of the old quicksilver lining, copying the uneven shapes of pearls in perfect mimicry, of all shades. Glass painting was first developed, if not invented, by the French, the earlier artisans being content with mosaic. Painted glass windows are said to have originated in the school of Limoges, about 800, where a Venetian colony was planted. In all the old

French churches the glassmaker's art was conspicuous. The windows of Saint-Denis (rebuilt for the sixth time in 1108) are pronounced the oldest mosaic pictures in France. In 1665 Colbert tempted away 18 Venetian workmen, with their secrets, and founded a mirror factory in Paris, which in 1693 was enlarged and transferred to Saint-Gobain, where the manufacture still continues on a grand scale. About this time Thévenot rediscovered the *casting* of plate glass, making plates 84 by 50 inches. All previous plate glass had been produced by *blowing* and was therefore limited in size. For over 100 years cast plate glass was to be obtained only from these makers. In 1740 a factory for French cylindrical window glass was established, with German workmen, at Saint-Quirin, which became the parent of the modern French, Belgian, and English plate-glass works. In 1823 D'Arques established the world-renowned "crystal-lerie de Baccarat."

Germany. Roman glass has been found in abundance along the Rhine, a fact which indicates the early date of local manufactures. The Frankish jewels were of Teutonic origin. In the ninth century, probably, the Germans taught glassmaking to the northern nations. The bishops of early Germany specially encouraged glassmaking to dispel pagan idleness with Christian industry. The inhabitants of Tegernsee, Bavaria, have lately held a festival in honor of the invention of glass painting, which, they claim, dates from the windows of the abbey in that town, made in 900. For a long time painted glass and frescoes were the only library of the people. Lehmann, of Prague, reinvented the casting of glass in molds in the seventeenth century. In 1609 cut glass was first made by him, and it soon outrivalled Italian glass. Cut glass had been made by the ancients, but the art had probably been lost. Bnati, a glassmaker of Murano, worked three years in a Bohemian glasshouse, as a porter, to learn its secret, and returned in 1739 to obtain a patent for Bohemian cut glass. Henry Schwanhard, in 1670, invented the etching of glass with hydrofluoric acid. The Electoral glassworks, near Potsdam, established in the eighteenth century, became famous for their gold ruby, invented by Kunckel (1679). Mirror making was introduced from France in the eighteenth century.

England. Great difference of opinion prevails regarding the origin of glassmaking in Great Britain, some claiming that it was established before the Roman Conquest, and others as late as the sixteenth century. French workmen, in 699, were brought over to glaze St. Peter's, York. Benedict established French glassmakers at Wearmouth, 675, for the building of his church; but for centuries glassmaking languished in Britain. Henry III had but one glass drinking cup, which he specially prized. France taught England the secrets of glassmaking. The oldest painted windows in England are those of 1174 in the choir of Canterbury Cathedral, which are as French as those in Saint-Denis. As late as the sixteenth century oiled linen was the usual window material, and a century later the royal palaces of Scotland had only the upper rooms glazed. In 1677 the Duke of Buckingham brought glassmakers from Murano to Lambeth to manufacture crystal vases, looking-glasses, and coach windows. The revocation of the Edict of Nantes (1685) sent many glassmakers to England, and the manufacture

speedily improved. Early in the seventeenth century the greatest of modern glass inventions was achieved in England, the making of lead flint, producing brilliant glass, which was impossible for earlier makers. The famous plate-glass works of Ravenhead were established in 1771. Towards the close of the nineteenth century the art of making glass mosaics was revived in England, largely through the efforts of Sir W. B. Richmond.

United States. Prior to the European colonists the only glass known in America was the "obsidian" volcanic glass. In 1608 some glass-makers were among the artisans brought to Jamestown, Va., but the craze for tobacco interfered with their industry. In 1621 several Italian glassworkers were imported to manufacture beads for the Indians. In 1639 a glass-house was erected at Salem, Mass., and William Penn alludes to a Quaker glasshouse in 1683. A glassmaker, Jan Smeedes, received an allotment of land on Manhattan Island, and the business which he carried on gave the name "Glassmakers' Street" to the present South William Street of New York. In 1754 a Dutch gentleman, Bamber, built glassworks in Brooklyn, N. Y., and the first bottle blown by him, bearing the name and date, is in the collection of the Long Island Historical Society, Brooklyn. Glassboro, N. J., was founded by a colony of German glassmakers, who moved there in 1775. In 1787 the Massachusetts Legislature gave to a Boston glass company the exclusive right to make glass in the State for 15 years. This is said to have been the first successful glass factory in the United States. Pittsburgh, Pa., first made glass in 1706, and is still a most important glassmaking centre. At the very beginning coal was used instead of the traditional wood fuel. This, with the abundance of excellent sand in the adjoining rivers, gave the industry a phenomenal development there, which has been increased by the substitution of gas and oil fuel. In 1827 pressed glass was invented by a carpenter of Sandwich, Mass. With the discovery of a cheaper and better fuel, in the form of natural gas, the centre of glassmaking moved west of the Alleghenies, where it still remains. As natural gas failed, petroleum was substituted and proved an excellent fuel. By the close of 1880 the census shows that the glass industry of the United States had been brought to a

very extensive and prosperous condition. There were then 211 factories, employing 24,177 men, sending out an annual product worth \$21,154,571. In 1890 the number of factories had increased to 294, and the product to \$41,051,004, and in 1909 there were 363 establishments and the product was \$92,095,203. Within recent years artistic glassware of great beauty has been produced in the United States, notable examples of which are the stained-glass windows and mosaics of leading makers and such as La Farge and Tiffany and the famous "Favrille" glass of the Tiffany Company of New York. The United States still imports more glass than she exports, the exports being largely that peculiar product of Yankee ingenuity, pressed glass.

VALUE OF GLASS AND GLASSWARE IMPORTED INTO AND EXPORTED FROM THE UNITED STATES

FISCAL YEAR	IMPORTS Total value	EXPORTS Total value
1914	\$8,191,133	\$3,729,623
1913	6,537,293	4,103,642
1912	6,210,625	3,494,153
1911	6,881,891	3,246,391
1910	6,553,764	2,805,401
1900	5,037,931	1,936,119
1890	7,411,343	882,677
1880	5,221,511	749,866
1870	4,157,643	530,654

Chemical and Physical Properties. Chemically any vitreous compound is called glass, but commercially glass is a fused mixture of two or more metallic silicates, and is often named from the predominant base, as "soda glass," "potash glass," "lime glass," and "lead glass." The essential ingredients are silica and alkali. *Flint glass* is a mixture of the silicates of lead and potassium; *Bohemian glass*, of the silicates of potassium and calcium; *plate or sheet glass*, of the silicates of calcium and sodium; *bottle glass* is a mixture of the silicates of sodium, aluminium, and calcium; *Venetian glass*, of sodium, potassium, and calcium. Sodium, potassium, calcium, and lead are the bases that form almost all glasses. To obtain the silica, sand is now generally used—river or sea sand sufficing for cheap grades in spite of the impurities, but for fine qualities the sand is quarried. American sand is pronounced by experts superior to English and French. The principal deposits

GLASS INDUSTRY OF THE UNITED STATES, 1869 TO 1909

In 1861 the first regenerative glass furnace was introduced into Germany by its inventor, Siemens, and this type of furnace is in wide use in Europe and America. In these furnaces

REGENERATIVE OPEN-POT FURNACE.

the gas is generally produced from coal outside of the furnace, mixed with the air, on the principle of the Bunsen burner. In the United States natural gas, and later on petroleum, have been largely used as a fuel. Instead of melting pots there is a tank, constructed from pot clay, covering the whole area of the furnace, and divided by floating partitions into compartments. The melting compartment at the rear receives the raw material through the doors. As this melts, it flows into the refining compartment, where a higher temperature purifies it till it flows under the second partition into the gathering compartment, and there a lower temperature thickens it for the blower. A recent improvement dispenses with the floating partitions by the use of floating vessels, which gather the molten glass at the lowest depths in the tank and raise it to the surface to be completely refined in a special compartment, whence, as it sinks in perfect fusion (the best glass being the heaviest), it can only flow into the working-out compartment. The depth of the floaters is usually one-fourth the depth of the tank. These tank furnaces may be worked continuously, with no change in temperature and no discoloration from smoke and on a colossal scale.

Improvements in the methods of glass manufacture have all been in the direction of substituting gaseous for solid fuel. Even in pot furnaces gas is preferred, and for a tank furnace it is indispensable. Natural gas is the ideal fuel, but is very limited in its occurrence, and when it cannot be obtained gas is manufactured from other fuel. Its advantages are its freedom from ashes and other dirt, and the ease with which the flame may be applied and controlled.

A commercial classification of glass and of the principal types of furnaces producing it may be given as follows: 1. *Polished plate* embraces all glass cast upon a smooth table, rolled to the required thickness with a roller, annealed, and then ground and polished. Under this head comes *thin plate*, a recently developed process. 2. *Rough plate* includes all glass cast as above, but not ground and polished. The principal varieties are *ribbed plate*, *colored cathedral*, *rough plate*, *wire glass*, *heavy rough plate*, for

skylights. 3. *Window glass* embraces all glass blown in cylinders and afterward cut and flattened out and polished while hot. Chiefly used for pictures and mirrors. 4. *Crown glass* is glass blown in spherical form and flattened to a disk shape by centrifugal motion of blowpipe. A little is now made for decorative purposes. 5. *Green glass*. All the common kinds of glass, and not necessarily green in color. Used in manufacture of bottles, fruit jars, etc. 6. *Lime flint* includes the finer kinds of bottle glass, certain lines of pressed tableware, and many novelties. 7. *Lead flint* embraces all the finest products of glassmaking, such as cut glass, fine tableware, artificial gems, and optical glass.

The principal furnaces are: (1) open-pot furnaces for bottles and window glass; (2) open-pot furnaces for plate glass; (3) covered-pot furnaces for flint glass; (4) day tanks, which are practically open-pot furnaces, gas-fired, and with a single tank or pot; (5) regenerative continuous tank furnaces for window glass; (6) regenerative continuous tank furnaces for bottles; (7) recuperative continuous tank furnaces for bottles.

Manipulation. The curious viscosity assumed by molten glass has already been referred to. While in this condition it may be gathered up in a soft mass on the end of a stick, and, if the stick be a tube, the lump may be distended, by blowing through the tube, into a hollow sphere. The form of this sphere or bulb may be modified by manipulating the pipe, and if a second iron be attached by a seal of glass to the other side of the bulb, it may be drawn out into a tube. If the bulb be opened by removing it from the blowing iron, and then, after attaching it at its opposite side to another iron, be trundled rapidly like a mop, the opening will expand, by centrifugal force, into a disk. These are the processes which, infinitely diversified and complicated by the skill of the workmen and the nature of the product, constitute the art of the glass blower. Every melting furnace has several working furnaces called "glory holes," where the glassworker reheats his work. These are small blast furnaces, each affording several openings into the flames.

There are three general methods of shaping glass—by blowing, pressing, and casting.

Window-Glass making in recent years has been revolutionized by the use of machinery. Formerly window glass required the most muscular and skillful workmen, but this has been changed somewhat by modern methods. The older method, however, is fundamental and presents many points of interest. Here the "monkey pots" are filled with the mixed "batch," and when this is melted a second charge is shoveled in, followed, as soon as it flows, by a third and a small amount of "cullet" (broken glass), which fills the pots. Sixteen hours are consumed in the entire melting, and the master melter carefully watches his "monkeys," forcing the furnaces to their highest heat. As soon as the signs appear indicating that the molten glass or "metal" is ready to work, the heat is lowered to thicken the glass for the blowers. Each man is trained to one small part of the whole process and does nothing else. The gatherer holds a mask before his face, by a plug grasped between his teeth, to screen him from the glare of the furnace, and starts the "journey" of the glass by dipping the blowpipe into the pot several times, dexterously forming on its end an

oval mass of the white, hot, gummy "metal," which weighs from 20 to 40 pounds, according to the thickness and size of the sheet to be made. Revolving the ball in the glaring pot, he completes its symmetry and consistency and then turns it in an iron mold till it takes a perfect pear shape. This finishes the gatherer's work, and he hands the fiery sphere to the blower, who is the master workman of the establishment. He takes the pipe from the gatherer's hand and blows a huge bubble of air into it, then another and another, swelling the solid sphere into a great decanter, with its thinnest part hardening next the pipe, as one end of the cylinder which is to be evolved from the soft thick mass attached to it. Now he takes his stand on the long narrow platform which leads to his furnace door over a deep pit, swinging the glowing bulb like a giant pendulum into the depths below, persuading it to elongate with frequent puffs at the most effective moments. Now and then, as it cools into hardness, he rests his pipe on a prop and softens the end in the furnace, or he may toss the cylinder above him until it settles into a workable condition. Thus he blows and swings, and, heating from time to time the molten mass, he works it till it grows as long as himself and becomes a round-topped cylinder. When this has cooled considerably, he holds the end in the furnace, blows strongly into it, and, covering the mouthpiece with his thumb, an explosive report is heard. The imprisoned air, heated expansively, has burst an opening through the soft extremity. Revolving the end rapidly in the furnace, the blower enlarges the hole by centrifugal force, till it is as large as the diameter of the cylinder. Then he cools it in a pit to a cherry red, and his part is done. An assistant carries it off and detaches it from the blowpipe by encircling the neck with a thread of hot glass and then touching the line with a cold iron. The cylinder is then cracked lengthwise by a diamond or by passing a red-hot iron inside it. Next the flattener takes it. First he warms the split cylinder, then places it on the stone before him, a fire-clay table, which revolves within an oven. The curved sheet opens in the heat like an uneven sheet of paper, and he smooths it by a wooden block. The stone carries it then to the cooling oven, whence it is lifted on an immense fork into a car at the mouth of the "leer," or annealing tunnel, and there it is tempered for service. To-day these huge cylinders are made by a drawing machine, by means of which cylinders of large size are formed by drawing the material from the bath. There are numerous variations of this process and special machines for which many patents have been secured since the beginning of the present century.

Crown Glass, once the favorite for window-panes, has now shrunk into small importance and is made for ornamental work only. Though much more brilliant, the plates are small and of tapering thickness. The same molten material as that used for sheet glass is gathered in a smaller globe on the end of a blowpipe and rolled into a cone on a stone table, or "marver." The workman blows it then into a sphere and flattens the underside of it, keeping in the centre the "bullion point," or thick apex of the original cone. While he rests the pipe on a horizontal support, another workman with a "punky," or solid iron rod, attaches a small cup of warm glass to the bullion point, and the blower de-

taches his pipe by touching the neck of the flattened globe with a cold iron and quickly striking it. The punky man carries it off with a small hole where it left the blowpipe, and, heating it in the furnace and revolving it, the opening enlarges wider and wider until it becomes the "crown," which named it, and at last whirls out into a flat disk, or "table." This is kept incessantly turning till it cools enough to be laid on a support, where it is clipped by shears from the rod and sent to the annealing oven. The diameter of such a plate varies from a few inches, like those made in colored glass for fancy windows, to 6 feet. But the square panes cut from it are always small, as the round lump in the centre, the "bullion point," or "bull's-eye," must be omitted, though these are sometimes used for decorative purposes.

Plate Glass has the same composition as sheet and crown glass, but is melted in vast open vessels (sometimes holding $2\frac{1}{2}$ tons) resting upon frames behind fire-clay doors. After the long fusion is perfect, the door is thrown open, and the tank is seized by an immense fork mounted on a truck, and carried bodily to the casting table, where it is hoisted by a crane and poured over the metal bed, which has a very smooth, highly polished surface. A heavy roller passes over it, spreading the glass out in a uniform thickness determined by the height of the strips on either side of the table. Instantly it is rolled into the annealing oven for a tempering of several days. It comes out in the form of rough plate. To be polished it is fastened by plaster of Paris to a large rotary platform which revolves so that the entire surface is covered at each rotation by the disks of grinding machines which rub it with sand, then with emery, and last with rouge, first on one side, then on the other, till 40 per cent of its thickness is removed, and it remains a shining sheet from $\frac{1}{4}$ to $\frac{3}{8}$ of an inch thick. "Rolled plate" is cast upon an engraved table, which gives the impressions of fluted lines or fancy patterns in a translucent body of glass adapted to panels and partitions.

Green Glass, or Bottle Glass, is the coarsest form, made from roughest materials, and is the simplest branch of glasswork. From the time of the early Phœnicians until 1880 the process of manufacturing glass articles had been practically the same. The operative would dip the glass out by a rod or a blowpipe or by a ladle. The article, in the case of a bottle, was then blown by hand, the pipe was broken off from the bottle, and the neck was finished by hand. The glass articles in the Museum of Art in New York taken from the Egyptian tombs were all made in this way, and, though a great number of people had tried to introduce machinery, no improvement had been successful up to about 1880. Before the days of bottle machines the bottle blower would gather the molten glass on his blowpipe, in the quantity desired for his bottle, or jar, or demijohn, pull a bubble into it, drop the inflated lump into an iron mold, which was closed together over it by a small boy, and blow the glass into its permanent shape with the lettering or trade-mark which was cut in the mold. The jagged mouth was then rounded in the "glory hole," and the bottle went to the "leer." Bottle molds are made of brass or iron and must be maintained at nearly a red heat while being used. The simplest form is of two sides hinged together at the base, and the famil-

lar ridges running up each side of a glass bottle are formed where the two sides of the mold shut together. Sometimes the mold is in three pieces, one for the body and two for the neck, in which case the ridges are only on the neck; this is usually the case with wine bottles.

Formerly the blowing of bottles was done wholly by the breath; but recently blowing machines have been successfully operated and have revolutionized the industry. The manufacture of glass articles roughly may be divided into two classes—wide-mouth articles such as fruit jars or milk jars, and narrow-mouth bottles such as beer bottles, champagne bottles, or druggist bottles. The first attempt at an automatic bottle machine was made by an Englishman named Ashleigh. Ashleigh invented a machine to make a narrow-mouth bottle, for which he obtained several patents and was all but successful in practice. He, however, failed because he could get only one bottle out of about 50 that was marketable, owing to the imperfection of the necks. Following along the lines of progress towards the realization of a practical machine, the next invention that was of any great importance was made by John I. Arbogast. Arbogast conceived the idea of pressing a blank of molten or plastic glass, forming the neck in the pressing operation, then placing the blank in a secondary mold which had the required shape, and turning on a jet of compressed air which blew the bottle to the proper shape. This was only applicable to wide-mouth ware and of course was only semiautomatic. A man gathered the glass in the same manner as has been done for 3000 years and dropped it into the mold. It was then pressed down and blown as described above. To-day practically every wide-mouth bottle is made in this manner, except those that are made on the automatic machine, which will be described later.

The next important step in the progress of the glass industry was made by Michael J. Owens, financed by the Libby Glass Company, of Toledo, Ohio. The Libby Glass Company spent, it is reported, \$500,000 before they made a bottle commercially. After Owens had made use of the vacuum for forming his blanks, he discovered that the only way to make perfect bottles was always to have a fresh surface of glass that was at a white heat. To accomplish this result it was necessary to have the melting part of the furnace revolving. The glass is melted in the usual way in a Siemen's furnace and then run into a revolving pot, which is about 20 feet in diameter and has a portion about 3 feet wide always projecting out from under the cap or covering of the revolving pot opposite to where the glass enters from the furnace. With this revolving mechanism the result desired was accomplished, and there is always a fresh surface of hot glass into which the gathering mold can be dipped. The capital required to build the automatic machine is very large. Two Owens machines are run in a battery on one furnace, and the outlay for a furnace and two machines has been estimated at not far from \$100,000.

The Owens method consists in forming the blank by having the blank mold suspended over the surface of the glass and lowered until it projects into the glass for about an inch. The vacuum is then turned on, and the hollow receptacle is filled with glass by the aid of the vacuum, and the ring is formed. The arm is

then raised, and a knife cuts off the glass from the glass in the tank, thus forming a perfect blank. The machine, which revolves, is a succession of molds, 12 to 16 being on each machine. After the blank is formed as described above, the machine revolves one round; the two parts of the blank mold are opened, the neck part still being closed. The finishing mold is then closed up on the suspended blank, compressed air is turned on, and the finished bottle is blown, and after the machine revolves to the point of delivery, both the next mold and the finishing mold are opened in one movement, and the finished bottle drops out. It then slides down a chute and is pushed into the leer by an automatic arrangement. The leers are made automatic, so that the only hand operation that is necessary on the machine is the oiling and care of the machine and the sorting and packing of the glass articles. The great advantage of this invention is that either narrow-mouth or wide-mouth bottles can be made, and one bottle is made absolutely the same size as the other, as the gathering device always gathers the same amount of glass, which is absolutely impossible in the hand operation.

The saving on this Owens automatic machine is enormous. In the old method of working three men and three boys work together to make 15 gross of beer bottles or 10 or 12 gross of fruit jars, while the machine will turn out, in the case of the former, 110 gross a day, in the case of the latter about 90 gross a day. It is easy to see that there is a saving of about 50 hands. This means, in dollars and cents, a saving of \$125 to \$150 a day. There were in use in 1914 in the United States 60 or 70 of these machines, and it was probable that within five years there would be very few blown-glass articles made in the United States.

Flint Glass broadly includes all the myriad forms of glass except windowpanes and dark bottles. The lead, which the true flint glass alone contains, gives it a characteristic brilliancy and weight. Flint glass is the choicest material for table and cut ware, for optical glass, and for the best blown and pressed ware that fills the household. An extra proportion of lead makes it "strass," from which artificial gems are made. The "lime flint" has a lighter weight and a lustre approaching "lead flint," but it does not equal its royal superior. From this the ordinary utensils are made.

A flint-glass establishment is the most fascinating of glasshouses, as it generally includes blowing, molding, and pressing. A wineglass is made from a glowing bulb as large as a peach. A breath swells it into a hollow sphere the size of the bowl. The gatherer attaches a small knob of soft glass and draws it out into the stem and on the end of this presses a bell-shaped base, previously hardened, which is flattened out into a stable foundation. Shears cut free the top of the bowl, and the furnace rounds the edge, this operation now being done either by a special blowpipe flame or by an electrically heated wire. In fact, machinery may be employed to cut off, round, and polish the edges automatically. So, from three pieces, the ordinary wineglasses and similar-shaped vessels are made.

The costlier kind of table glass has the stem drawn out of the original sphere, and the base, blown separately like a tiny disk of crown glass, is united by its heat to the upper part. All the best "hollow ware" is blown either in the

weave into cloth or to fashion into fancy plumage. It has been found possible to weave glass into fabrics, sometimes with a warp of silk, and to shape it into collars, neckties, brushes, lamp wicks, etc. M. Dubus Bonnet, of Lille, France, invented a process of spinning and weaving glass into cloth. The warp is composed of silk, forming the groundwork, on which the pattern in glass appears, as effected by the weft. The requisite flexibility of glass thread for manufacturing purposes is due to its extreme fineness, as not less than from 50 to 60 of the original strands form one thread. This fashion had but a short vogue, and the fine particles likely to be separated from the fibres were likely to have an unwholesome effect on those inhaling them. *Mineral wool* is made from the slag-glass refuse of iron smelting, being blown into fine shreds by a blast, to fill walls and floors with a fireproof and rat-proof padding, and for other unique services, as well as in chemical laboratories. *Réaumur's porcelain* is an opaque and porcelain-like glass, which has been "devitrified" by great heat and gradual cooling, becoming marvelously tough. *Soluble glass* is a highly alkaline solution of minerals composing glass, which is applied to textures in theatres and elsewhere to render them fireproof. Fire touching them melts the invisible minerals into a glaze which excludes air and prevents combustion. M. de la Bastie introduced into Europe transmuted glass, which had not been annealed, but which, by retaining some of the internal conditions of strain, was tougher than cast iron. The process, however, did not secure commercial success. *Malleable glass* is one of the legends descending from the ancients which may be some day verified. See ENAMEL.

Bibliography. Among the authorities on glass are: for the history of the art, Gaudy, *Romance of Glass Making* (London, 1898); for the scientific side, Powell, Chance, and Harris, *The Principles of Glass Making* (ib., 1883); Hovestadt, *Jena Glass and its Scientific Industrial Appliances* (New York, 1902); and Rosenhain, *Glass Manufacture* (ib., 1912); Austin, report on glass in *Ticelfth Census of the United States* (Washington, 1902); and volumes on manufactures in later issues of United States census. Consult also: Dillon, *Glass* (London, 1907); Duthio, *Decorative Glass Processes* (New York, 1908); Bate, *English Table Glass* (ib., 1913); Nelson, *Ancient Painted Glass in Europe* (ib., 1913); Saint and Arnold, *Stained Glass of the Middle Ages in England and France* (London, 1913); Bushnell, *Stained Windows* (New York, 1914).

GLASS, CARTER (1858-). An American legislator, born at Lynchburg, Va. He was educated in public and private schools of his native town, learned the printing trade, and worked eight years in the mechanical department of a printing office. He became proprietor of the *Daily News* and the *Daily Advance*, morning and evening papers of Lynchburg. From 1899 to 1903 he was a member of the Virginia Senate and in 1901 a member of the State Constitutional Convention. Beginning in 1902, he served in the United States House of Representatives. He was sponsor in the House for the banking bill (see BANK, BANKING), known popularly as the Owen-Glass Bill, enacted into law in 1912.

GLASS, MONTAGUE (MARSDEN) (1877-). An American story-writer. He was born at Manchester, England, was educated at the Col-

lege of the City of New York and at New York University, and entered the practice of law. After 1900 he became known as contributor to *Munsey's*, *McClure's*, *Harper's Weekly*, the *Saturday Evening Post*, and other magazines. He is known principally as author of *Potash and Perlmutter* (1910), a collection of unusually diverting stories of the Jewish wholesale clothing trade in New York City. As dramatized, it had a long run (1913-14). Other books by this author are *Abe and Mauruss* (1911); *Elkan Lubliner, American* (1912); *Object: Matrimony* (1912).

GLASS, SOLUBLE. See WATER GLASS.

GLASSBRENNER, gläs'brën'ër, ADOLF (1810-76). A German humorous and satirical writer, born in Berlin. From 1831 to 1833 he was editor of the Berlin periodical *Don Quixote*, which in the latter year was suppressed by the ministry. He first became known through his series, *Berlin wie es ist und—trinkt* (33 parts, 1832-50), which originated the Berlin local type of popular humor, much imitated by others. His best work is the comic epic *Neuer Reinicke Fuchs* (1846; often reprinted). From 1858 until his death he edited the *Berliner Montagspost*.

GLASSCHORD, gläs'körd'. A musical instrument, with keys like a pianoforte, but with bars of glass instead of strings of wire. It was invented in Paris in 1785 by a German called Beyer. The name "glasschord" was given to the instrument by Franklin. When the glasschord was completed it was exhibited publicly in Paris and performed on by the inventor; but it never was received with favor by the instrument makers, so that no more were ever made. See HARMONICA. Consult K. F. Pohl, *Zur Geschichte der Glasharmonika* (Vienna, 1862).

GLASS CLOTH. See GLASS PAPER.

GLASS CRAB. A larval form of certain macrurous decapoda (q.v.). They were formerly ranked as a separate group of crustaceans. They are remarkable for the transparency of their bodies, whence their name. They have little resemblance to crabs. The head is represented by a large oval plate, bearing eyes mounted on very long stalks; a second plate, the breadth of which much exceeds its length, represents the thorax and bears the feet, most of which are long, and some of them, as in other crustaceans, bifid, with one branch much longer than the other. The abdomen is small. These creatures have no special organs of respiration, but the blood is aerated through the general surface of the body. They are found in tropical and subtropical seas; and so transparent are they that when floating on the surface of the water they would not be perceived but for the beautiful blue of their eyes.

GLASSE, gläs, HANNAL. The author of *The Art of Cookery* (1747). "Mrs. Glasse, Cary Street," is mentioned among the subscribers to the first edition, which was published anonymously, and in the fourth edition (1770) is an advertisement of "Hannal Glasse, Habit Maker to H. R. H. the Princess of Wales, in Tavistock Street, Covent Garden." Practically nothing else is known of her. *The Art of Cookery Made Plain and Easy* is ascribed to Dr. John Hill in Boswell's *Johnson*, but this is improbable. Mrs. Glasse wrote *The Compleat Confectioner* (c.1770) and *The Servants' Directory, or House-keeper's Companion* (1770). The famous direction, "First catch your hare," although often referred to *The Art of Cookery*, is not to be

found there. She says, "Take your hare when it is cased."

GLASS EYE. The wall-eyed pike (*Stizostedion vitreum*). See PIKE PERCH.

GLASSITES, gläs'īts. See SANDEMANIANS.

GLASSON, glä'sôn', ERNEST DESIRÉ (1839-1907). A French jurist, born at Noyon. He was educated at Strassburg, was admitted to the bar in 1860, and, after teaching a year at Strassburg, went to Nancy in 1865 as a member of the new legal faculty. In 1867 he became an instructor in the University of Paris and in 1899 dean of the faculty of law. He did much to popularize the study of comparative legislation. His works include: *Du consentement des époux au mariage* (1866); *Éléments du droit français dans ses rapports avec le droit naturel et l'économie politique* (2d ed., 1884); *Le mariage civil et le divorce* (1879); *Histoire du droit et des institutions de l'Angleterre* (1881-83), which received a prize from the Institute; *Le code civil et la question ouvrière* (1886); *Histoire du droit et des institutions de la France* (1887-96). Glasson was legal editor of *La Grande Encyclopédie* and was elected to the Académie des Sciences Morales et Politiques in 1882. Consult Gironon's sketch in *La Grande Encyclopédie* (Paris, 1885-1903).

GLASS PAPER, or CLOTH. An abrasive surface made by powdering glass more or less finely and sprinkling it over paper or calico still wet with a coat of thin glue; the powdered glass adheres as it dries. Glass paper is very extensively employed as a means for polishing metal and woodwork and is sold in sheets.

GLASSPORT. A borough in Allegheny Co., Pa., 10 miles south of Pittsburgh, on the Pittsburgh and Lake Erie Railroad, and on the Monongahela River (Map: Pennsylvania, B 7). The surrounding region abounds in coal, and there are manufactories of axes and tools, steel hoops, foundry products, spikes and rivets, glass, etc. Pop., 1910, 5540.

GLASS SAND. A sand used in the manufacture of glass. It is obtained from quartzites and sandstones by crushing them to the desired fineness, or from deposits of sand. If the latter is employed, it is sometimes put through a washing process to remove impurities, such as clay, mica, or iron grains. Silica is the chief constituent of glass sand, and impurities such as iron oxide, alumina, titanium oxide, lime, and magnesia should be present in but small amounts, as shown by the analyses given here-with. Some persons believe the injurious effects of alumina and magnesia are overestimated.

CONSTITUENTS	I	II	III	IV
SiO ₂	99.95	97.50	99.46	97.705
Al ₂ O ₃30	1.50	.48	.755
Fe ₂ O ₃13	.50	..06	.15
CaO.....	tr.	..50955
MgO.....				.442

I, sand, Ottawa, Ill.; II, crushed sandstone, Massillon, Ohio; III, crushed Cambrian quartzite, Cheshire, Mass.; IV, Tertiary sand, Hanover, N. J.

The grains of glass sand may be either rounded or angular, but approximate uniformity of grain is desirable and should range between 30 and 120 mesh. If larger than 30 mesh, the sand is difficult to fuse; if finer than 120 mesh, it is said to "burn out" in the batch. Following are sieve tests of several:

LOCALITY	Sample	Passes 20 mesh	Passes 40 mesh	Passes 60 mesh	Passes 100 mesh
Ottawa, Ill.	Finest grain	100%	100%	92%	25%
"	Coarsest grain	99%	6%	1%	0%
Gray's Summit, Mo.	Crude	100%	88%	55%	1%
	Finished	100%	92%	25%	2%

Glass sand is obtained from a number of different geological formations, ranging from Cambrian to Pleistocene. The Pleistocene and most of the Cretaceous and Tertiary deposits are sand, but the Cambrian to Carboniferous ones are sandstone or quartzite and have to be crushed before use. Pennsylvania and Illinois are the most important producing States. The glass sand produced in the United States in 1912 amounted to 1,465,386 short tons, valued at \$1,430,471. Consult: Ries, *Economic Geology* (3d ed., New York, 1910)—contains also many references; Merrill, *Non-Metallic Minerals* (ib., 1910); *United States Geological Survey, Mineral Resources for 1909*—many analyses.

GLASS SNAIL. A very small, almost transparent snail of the genus *Vitrina*, species of which are common in the northerly United States. These glassy snails are remarkably hardy in reference to cold and consequently are found higher up on mountains than most snails are able to live.

GLASS SNAKE. See BLINDWORM.

GLASTONBURY, gläs'n-bër-ī or gläs'tün-bër-ī. A market town and municipal borough in Somersetshire, England, situated on a peninsula formed by a winding of the river Brue, 25 miles southwest of Bath (Map: England, D 5). It has some manufactures, an export trade, and in the vicinity are chalybeate springs which formerly attracted health seekers. Pop., 1891, 4119; 1901, 4016; 1911, 4250; the area of the municipal borough is 5019 acres. Its chief material interest lies in the ruins of its splendid abbey founded in the twelfth century. Of this magnificent pile, which covered 60 acres, the only remains are parts of the abbey church, with the roofless chapels of St. Joseph and of St. Mary, and the Abbot's Kitchen, a square, massive, and strongly buttressed structure, all especially important as specimens of early and transitional architecture, and the abbey barn and the porter's lodge. A causeway across Sedge-moor and many of the houses of the town are built from the materials of the abbey, which became a common and prolific quarry for the neighborhood. Other buildings and places of interest are the George Inn, a pilgrims' hostelry of the fifteenth century; the two parish churches, the Tribunal, Wearyall Hill, and the Tor, 500 feet high, from which a fine view is obtained. Two miles to the southwest lies Sharpham Park, where Fielding the novelist was born.

Glastonbury has prehistoric remains of a lake village of considerable extent. At Glastonbury is said to have been situated the first English Christian church, a little wattle building erected by Joseph of Arimathea, the leader of the 12 Apostles sent by St. Philip to Christianize Britain. Tradition states that Joseph established himself here, owing to his pilgrim's staff, which he planted on Wearyall Hill while he rested, taking root. From it sprang the celebrated "Glastonbury thorn," the *Crataegus pro-*

oak, which, according to popular superstition, blossomed every Christmas Day. It was fanatically destroyed by a Puritan during the Cromwellian period, but grafts exist which maintain the traditional blossoming. The traditional site of the original tree is marked by a stone, inscribed I. A. A. D. XXXI. Joseph was succeeded, a century later, by two missionaries who established a fraternity of anchorites, which the famous St. Patrick organized under monastic rule three centuries later. Although joined to the land by St. Michael's Tor, the peninsula was first known by the Celtic name *Ynys vitrin* (isle of the glassy water) and later as *Ynys yr Afalon* (isle of Avalon, or of Apples). It is the Avalonian burial place of King Arthur and Queen Guinevere. The modern name is a corruption of Glæstýngabyrig. A legend relates that in the long quest of a lost sow a Glæsting was led to an apple tree by the old church, where, pleased with the place, he and his family settled; hence Glæstýngabyrig (city of the Glæstings).

In the eighth century the Saxon King Ine built and endowed a monastery, which suffered during the Danish invasions, but was restored and added to by another famous prelate, St. Dunstan, a native of Glastonbury and a pupil of the institution, who became abbot in 946. During the tumultuous period of the Norman Conquest, Glastonbury remained unmolested. From 1120 to 1172 the old buildings were replaced by much finer ones, which were scarcely completed when they, with the wicker church, were destroyed by fire on May 25, 1184. Henry II immediately ordered a larger abbey and church of superb proportions and architecture to be built, which were finished about a century after his death. The length of the church was 528 feet. During the foundation excavations the supposed grave of King Arthur was discovered. In 1539, on the refusal of Abbot Whiting to surrender Glastonbury and its treasures, Henry VIII suppressed and dismantled the abbey and hanged the abbot on the Tor. His body was quartered, and his head fixed on the abbey gate. He was canonized by the Roman Catholic church in 1806. The famous old abbey clock is preserved in Wells Cathedral. In 1909 the site of the abbey and the remaining buildings were transferred to the Church of England. Consult: Hearn, *History and Antiquities of Glastonbury* (Oxford, 1722); Wakefield, *The Avalonian Guide* (Glastonbury, 1839); Willis, *Architectural History of Glastonbury Abbey* (London, 1806); Gasquet, *The Last Abbot of Glastonbury* (ib., 1908); Henry VIII and the English Monasteries (ib., 1906); Holmes, *Wells and Glastonbury* (New York, 1909); Greswell, *The Early History of Glastonbury Abbey* (Taunton, England, 1909).

GLASTONBURY. A town in Hartford Co., Conn., 7 miles southeast of Hartford, with which it has steamboat connection, on the Connecticut River (Map: Connecticut, E 3). It is an agricultural region, producing tobacco and fruit, and has manufactories of soap, woolen goods, paper, and silverware. Pop., 1900, 4260; 1910, 4796.

GLASTONBURY THORN. See GLASTONBURY, ENGLAND.

GLATIGNY, glát'nyé', ALFRED, or ALBERT (1839-73). A French poet, born at Lillebonne (Seine-Inférieure), son of a carpenter. While still very young, he wrote his first play, and at 17 joined a troupe of strolling actors and wandered with them over northern France and into

Belgium. He wrote constantly, with all the faults and failings of an improvisator. He was one of the "Parnassiens" (q.v.). His works include: *Les vignes folles* (1857); *Les flèches d'or* (1864); *Gilles et pasquins* (1872); *Le testament de l'illustre Brizacier* (1873). He was made the subject of a tragedy (1906) by Catulle Mendès. Consult Mendès, *Légende du Parnasse Contemporain* (Brussels, 1884).

GLATZ, gläts (Bohemian *Kladsko*). The capital of a circle and a fortified town in the Prussian Province of Silesia, situated on the Neisse, among the Sudetic Mountains, 58 miles southwest of Breslau (Map: Germany, G 3). It is commanded by an old citadel, and the right bank of the stream is protected by a strong fort, the Schifferberg, both fortifications dating from 1745. The old ramparts have been demolished, and fine promenades and streets laid out on their sites. Glatz has an old parish church, with the graves of seven Silesian counts, a new Rathaus, a municipal theatre, and a Gymnasium, originally a Jesuit college founded in 1597. The manufactures consist principally of iron products, machinery, furniture, spirits, cigars, shoes, pottery, brushes, lumber, and bricks. (Glatz is believed to have been founded by the Bohemians in the tenth century. Pop., 1900, 14,926; 1910, 17,095.)

GLAUBER, glou'bër, JAN, called POLYDOR (1646-1726). A Dutch landscape painter and etcher. He was born at Utrecht and was a pupil of Berchem and Vlemberg at Haarlem, then of Picard in Paris (1671), and for two years of A. van der Kabel at Lyons. Having gone to Rome, he was much influenced there by Gaspard Poussin, worked afterward in Padua and Venice, and in 1680 went to Hamburg, residing there and in Copenhagen until 1685, when he came to The Hague and settled in Amsterdam, living in the house of Gerard de Lairesse, who often painted the figures in his landscapes. These are kindred in conception and coloring to those of G. Poussin, and are to be found in the Louvre, Munich Pinakothek, and most of the principal galleries of Europe. Of his etchings, the best are a series of 12 plates, two after Poussin, and six others published under the title "La grande Chartreuse."

GLAUBER, JOHANN RUDOLF (1604-68). A German chemist and physician, born at Karlstadt in Franconia. No details regarding his life are known except that he resided for a long time at Salzburg, then at Kitzingen, then at Frankfurt-on-the-Main, then at Cologne, whence he removed to Amsterdam in 1648. A complete edition of his works, in seven volumes, appeared at Amsterdam in 1661. An English translation by Parke, in one large folio volume, was published in London in 1680. Glauber improved many industrial processes and discovered the medicinal properties of numerous substances. His name at the present day is chiefly known for his discovery of hydrated sodium sulphate, which he termed *sal mirabile* and regarded as a universal medicine and a cure for all diseases. See CHEMISTRY; GLAUBER'S SALT.

GLAUBER'S SALT. Sodium sulphate, $\text{Na}_2\text{SO}_4 + 10\text{H}_2\text{O}$. It is found native as *mirabilite* or *sal mirabile* at various places in Austria, Italy, and Spain, and in the United States in large quantities at Great Salt Lake, Utah. It is also a constituent of mineral waters and exists in small quantities in the blood and other animal fluids. It was originally prepared by

J. R. Glauber in 1658, by treating sodium chloride (common salt) with sulphuric acid. Anhydrous sodium sulphate ("salt cake") is obtained as an intermediate product in the manufacture of soda ash. Glauber's salt is a white crystalline compound, with a bitter saline taste. When exposed to the air, its crystals effloresce, losing most of their water in crystallization and turning into a white powder. Its chief use is as a purgative in medicine, and as such it is largely used in veterinary practice; but it is also largely employed in the production of certain kinds of glass and in fixing lead mordants in dyeing and printing. See SODA.

GLAUCHAU, glou'kou. A manufacturing town in Saxony, Germany, situated on the Mulde, 8 miles north-northeast of Zwickau (Map: Germany, E 3). It contains two old churches, dating from the twelfth and the sixteenth century respectively; two castles of the counts of Schönberg; and a new Rathaus. Among its numerous educational institutions the most prominent is the school of weaving, with a good collection of old textiles; also a technical college. Glauchau is one of the centres of the German textile industry, producing principally woolen and half-woolen goods. It has 24 dye establishments; there are also manufactured machinery, vehicles, paper, timber, and brick. Glauchau is the birthplace of the famous mineralogist Georg Agricola. It is the seat of an American consul. Pop., 1900, 25,677; 1910, 25,155.

GLAUCOMA (Lat., from Gk. γλαύκωμα, opacity of the crystalline lens, from γλαυκός, *glaukos*, bluish green; so called from the appearance of the eye in this disease). A disease of the eye, characterized by increased intraocular tension. In addition to primary and secondary glaucoma, a congenital glaucoma is described. According to the rapidity of onset and the severity of the disease, primary glaucoma is divided into inflammatory or congestive, and noninflammatory or simple. The inflammatory type may be acute or chronic. The cause of glaucoma is unknown. The disease has been observed chiefly in old persons, particularly in women, and usually involves the eyes successively. Jews seem predisposed to it. Heredity, gouty and rheumatic diatheses, cardiac and arterial disease, and chronic constipation seem to exert an influence. Persons with hyperopia (see SIGHT, DEFECTS OF) are often afflicted with glaucoma; those with myopic eyes, very rarely. Various forms of excitement, eye strain, improper use of atropine, and other causes of venous congestion of the eyes are mentioned as exciting factors. The essential feature of the disease is the increase of pressure within the eye, the present view being that there is undue retention of fluids within the eye. Acute inflammatory glaucoma may begin with a prodromal stage, in which sight is somewhat obscured by edema of the cornea, with some dilatation of the pupil and increased tension in the eyeball. A number of these attacks, each followed by increased presbyopia (see SIGHT, DEFECTS OF), are succeeded by the stage of active glaucoma. This is marked by sudden failure of vision, with great pain in the eye, and headache. There are marked increase of tension, cloudiness and insensibility of the cornea; the pupil is oval, fixedly dilated, and often greenish; the iris is dull and changed in color. The conjunctiva is congested, including the space around the cornea. The interior of the eye is cloudy.

Recovery takes place with practically a persistence of all these appearances in a slight degree, and from time to time other attacks occur, the eye being left in worse condition after each. Finally the stage of absolute glaucoma is reached—blindness, increase of the changes in appearance noted in the early attacks, increased tension, and in some cases pain at intervals. Degeneration of the eyeball may follow. Cases of unusual severity, resulting in blindness within a few hours, are known as *glaucoma fulminans*. Chronic inflammatory glaucoma differs from the acute only in the mildness of its initial symptoms and the slowness of its course, the final result being the same. *Simple glaucoma* is a very slowly progressing type, with no active symptoms of inflammation, simply the increased tension and gradual failure of vision. *Secondary glaucoma* is an increase of tension, with other symptoms of glaucoma, secondary to other disease of the eye or to injury. *Congenital glaucoma* usually affects both eyes, leading to blindness. In the treatment of glaucoma atropine must never be employed. Eserine and pilocarpine, locally, may give some relief. Iridectomy, an excision of part of the iris, is the most effectual treatment. Sclerotomy, an incision through the sclera or white of the eye, is sometimes employed in its place, but this procedure has been superseded by trephining, which operation consists in removing a small section of the eyeball at the junction of the cornea and sclera and excising a portion of the iris. Consult T. Henderson, *Glaucoma* (New York, 1910), and R. H. Elliot, *Trephining in the Treatment of Glaucoma* (ib., 1913).

GLAUCONITE, glā'kō-nīt (from Gk. γλαυκός, *glaukos*, bluish green), or GREEN EARTH. An iron potassium hydrous silicate. It is found either amorphous in cavities of rocks or in a loosely granular condition. In color it is of various shades of green and is found in Russia, in Belgium, and in various localities in New Jersey and Mississippi in the United States.

GLAUCOPHANE, glā'kō-phān (from Gk. γλαυκός, *glaukos*, bluish green + φαίνειν, *phainein*, to appear). A mineral belonging to the amphibole group and crystallizing in the monoclinic system. It is a silicate of sodium, aluminium, iron, and magnesium. The mineral has a vitreous to pearly lustre and is found in various shades of blue. It is a constituent of various crystalline schists, gneisses, and other rocks. It occurs associated with diallage, epidote, mica, garnet, etc., at various points along the Alps in Switzerland, and in Italy; while in the United States it is found on the coast ranges of California. According to Dana, it has been noted as a secondary product due to the alteration of diallage by a process of "glaucophanization."

GLAUCUS (Lat., from Gk. Γλαῦκος, *Glaucos*). A Lycian prince, who, along with Sarpedon, assisted Priam in the Trojan War. He was the son of Hippolochus and grandson of Bellerophon and was mythical progenitor of the kings of Lycia. When Glaucus and Diomedes met in battle, they discovered that their houses were joined in hereditary friendship, whereupon they exchanged weapons, Glaucus giving his golden armor for the bronze of Diomedes (*Iliad*, vi). The incident became proverbial for an unequal exchange. Later writers say that Glaucus was afterward slain by Ajax; but his body was carried back to Lycia, as that of his brother had been.

GLAUCUS. An artist of Chios, said to have invented the art of soldering iron. His most famous work was a silver vase resting on an iron base, curiously decorated and wrought in his new technique; the vase was dedicated about 605 B.C. by Alyattes II of Lydia to Apollo at Delphi. Consult the article "Glaucus, 46," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. vii (Stuttgart, 1912).

GLAUCUS. Son of Minos, King of Crete, and Pasiphaë. On one occasion when a child, while playing at ball or, according to another account, chasing a mouse, he fell into a pot of honey and was smothered. His father, after a long and vain search, consulted the oracle and was told that the person who could suggest the aptest comparison for one of his own cows, which had the power of assuming every day three colors, would restore his son alive. Polyidus, the seer of Argos, who likened the animal to the mulberry and the bramble, was ordered by Minos to find the child and restore it to life. Polyidus found the body of the child, but the latter injunction he was unable to perform, and he was therefore sentenced to be entombed alive with the corpse. Seeing in the tomb a serpent bring back to life its dead companion by laying upon it the leaves of a certain herb, Polyidus conceived the idea of treating the dead boy in the same way. The process proved successful. Then Minos ordered the seer to teach the child the art of prophecy. This also Polyidus did, but immediately deprived him again of all remembrance of his instruction. Consult: Hück, *Kreta* (Göttingen, 1829); Roscher, *Nektar und Ambrosia* (Leipzig, 1883); Güdechens, in Roscher's *Lexikon*, vol. i (Leipzig, 1884 et seq.).

GLAUCUS. The hero of Bulwer's novel *The Last Days of Pompeii*.

GLAUCUS PONTIUS. According to the legend, a fisherman of Anthedon. Through the influence of a magic herb he was changed into a sea god and gifted with unerring prophecy. He is found especially in connection with Nereus and his train and was worshiped not only at Anthedon but on many islands and coasts, as at Delos, Naxos, Corinth. He was especially honored by sailors and fishermen and is often represented in art as wearing a fish basket on his head. In the legends he appears as prophesying to the Argonauts, or as builder and pilot of the *Argo* (consult Ovid, *Met.*, xiii, 904), and his unrequited loves for Scylla and Ariadne were frequent themes among the later poets (e.g., of a satyric play by Æschylus, q.v.). Consult Güdechens, *Glaukos der Meergott* (Göttingen, 1860), and his article on "Glaukos," in Roscher's *Lexikon*, vol. i (Leipzig, 1884 et seq.).

GLAUCUS POTNIEUS. A son of Sisyphus (q.v.) by Merope, and the father of Bellerophon (q.v.). According to the legend he was destroyed by his own mares, the most common form of the story being that he was torn to pieces by them (Vergil, *Georgics*, iii, 267). Accounts differ about the place of his violent death and also concerning the immediate occasion of it. Sometimes it is represented as having happened at Iolcus, at the funeral games of Pelias, but usually the scene is laid at Potnia, near Thebes. He is most frequently represented as having offended Aphrodite by having kept his mares from breeding; but other versions of the myth are that he had fed them on human flesh to make them more spirited, or that they had been

suffered to drink at a sacred well in Boeotia, or that they had eaten the herb hippocrepis. He was the subject of a lost tragedy of Æschylus (q.v.). In Corinth this legend is confused with that of Glaucus Pontius (see above), and the same stories are told of both. In fact, it is very probable that the Corinthian Glaucus is only a local variation of the commonly worshiped divinity. Some mythologists (comparing the Greek phrase γλαυκή θαλάσση, 'the flashing sea') see in Glaucus Potnieus the quiet gleaming sea, whose calm surface is destroyed by the violent risings of the waves, the wild horses of Glaucus Pontius.

GLAZE. See POTTERY.

GLAZE/BROOK, RICHARD TETLEY (1854-). An English physicist. He was born at West Derby, Liverpool, Sept. 18, 1854, and was educated at Liverpool College and Trinity College, Cambridge, where he graduated with honors in 1876 and was made a fellow in the following year and in 1895 senior bursar. In 1880 he was appointed demonstrator in physics at the Cavendish Laboratory and 10 years later was made assistant director. He was also university lecturer in mathematics at Cambridge and in 1898 and 1899 was principal of University College, Liverpool. In the latter year he was made director of the National Physical Laboratory, a position he has since held. In 1906 he was elected president of the Institute of Electrical Engineers. Dr. Glazebrook received the degree of D.Sc. from Victoria College and Heidelberg and was elected a fellow of the Royal Society. In 1910 he was made Companion of the Bath. Among his more important researches are those dealing with the absolute resistance of the British Association unit and the specific resistance of mercury, a dynamical treatment of the theory of double refraction, a verification of Fresnel's theory of double refraction in a biaxial crystal, and other investigations dealing mainly with optics and electricity. He is the author, with W. N. Shaw, of an excellent *Text-Book of Practical Physics* (1884) and of a *Text-Book of Physical Optics* (1882); *Laws and Properties of Matter* (1893); *Clerk-Maxwell and Modern Physics* (1896); *Electricity and Magnetism* (1903); *Heat and Light* (2 vols., 1910); *Heat: An Elementary Textbook* (1911).

GLAZIER, glá'zhēr, WILLARD (WORCESTER) (1841-1905). An American soldier, author, and explorer. He was born at Fowler, N. Y., was educated at Gouverneur Seminary and at the Albany Normal School. In 1861 he enlisted in the Second New York Cavalry. In 1863 he was taken prisoner by the Confederates in Virginia and confined in Libby Prison, Richmond, and at Columbia, S. C. His escape to the Union lines was the subject of his first book, *Capture, Prison-Pen and Escape* (1865), of which more than 400,000 copies were sold. He also wrote: *Three Years in the Federal Cavalry* (1870); *Heroes of Three Years* (1878); *Peculiarities of American Cities* (1873); *Down the Great River* (1887); *Headhunters of the Mississippi* (1892); *Ocean to Ocean on Horseback* (1896). The belief that he discovered the source of the Mississippi is without foundation; the body of water (above Lake Itaska) which he called the source has been named Lake Glazier. Consult his life by Owens, *Sword and Pen* (Philadelphia, 1880), and Harrower, *Captain Glazier and his Lake* (New York, 1886).

GLAZUNOV, glá'zūn-ŏf', ALEXANDER (1865-

). A Russian composer. He was born at St. Petersburg and studied first at the Polytechnic Institute. Conscious of his gift for music, and with the advice of many musical friends and teachers in sympathy with his aims, he determined to devote himself entirely to music. His most important teacher was Rimsky-Korsakoff, who was friend as well as teacher. His first symphony was produced when he was but 16 years of age, and the second three years later, under the auspices of Liszt at Weimar. Paris accorded him a most enthusiastic reception when in 1889 he visited there and conducted in person his second symphony and many minor compositions. He visited London afterward and conducted his fourth symphony at a concert of the London Philharmonic Society. In 1896-97, together with Liadoff and Rimsky-Korsakoff, he conducted the national Russian symphony concerts at St. Petersburg. In 1899 he became professor of instrumentation at the St. Petersburg Conservatory and was its director in 1909-12. He belongs to the school of Tchaikowsky in the national sense and, like him, is occasionally prodigal in brilliant orchestral effects. Not only is he perhaps the most prolific, but also one of the most talented, of modern Russian masters. Together with Rimsky-Korsakoff he completed and orchestrated Borodin's opera *Prince Igor*. His principal works are seven symphonies (in E, F#m, D, Eb, Bb, Cm, F); five suites; four concert overtures; two serenades; two symphonic poems; a violin concerto in Am; numerous smaller works for orchestra (rhapsodies, fantasies, dances); four cantatas for soli, chorus, and orchestra; several ballets; and much chamber music of unusual merit. Consult A. W. Ossowski, *Alexander Glazunoff: His Life and Works* (St. Petersburg, 1907, in Russian).

GLEANERS, THE. See GLANEUSES.

GLEASON, FREDERICK GRANT (1848-1903). An American composer, born at Middleton, Conn. He was a pupil of Dudley Buck and in 1869 went to Germany, where he studied in the Leipzig Conservatory and later in Berlin and London. In 1875 he returned to the United States, becoming church organist in Hartford and New Britain, Conn., and, in 1877, teacher in the Hershey School of Music, Chicago. Mr. Gleason was elected a fellow of the American College of Musicians, president of the Chicago Musical Society, and president general of the American Patriotic Musical League. He composed two grand operas, *Otho Visconti* and *Montezuma*; a symphonic poem *Edris*; several cantatas; some chamber music; and numerous songs and instrumental pieces.

GLEBA (Lat., *clod*). Among the Gasteromycetes (q.v.) the fructification, as, e.g., the puffballs, is differentiated into an outer zone, called the peridium, and an inner mass of tissue, called the gleba. It is the gleba which incloses the spore-bearing cells. The variations in the development of peridium and gleba distinguish the five orders of Gasteromycetes. See BASIDIOMYCETES.

GLEBE (Lat. *gleba*, *clod*). The land possessed as part of an ecclesiastical benefice or from which the revenues of the benefice arise. The assignment of glebe lands was formerly held to be of such absolute necessity that without them no church could be regularly consecrated. The fee simple of the glebe is held by the law of England to be in *abeyance*; i.e., it is only "in

the remembrance, expectation, and intendment of the law"; but after induction, the freehold of the glebe is in the parson, and he possesses most of the powers of a proprietor, with the exception of the power of alienation. Previous to the Reformation the clergy possessed certain powers of alienation at common law; and if a bishop, with the assent of his chapter, or an abbot, with the assent of his convent, or the like, alienated glebe lands, the deed would not have been void, because the fee simple was in the holder of the benefice for the time being; but by 1 Eliz., c. 19, and 13 Eliz., c. 10, it was provided that all gifts, grants, feoffments, conveyances, or other estates made of glebe lands should be utterly void and of none effect. Neither could the incumbent exchange the lands or any portion of them without the authority of an act of Parliament. This restriction was done away by 55 Geo. III, c. 147, for enabling spiritual persons to exchange parsonage or glebe houses or glebe lands for others of greater value or more conveniently situated for their residence and occupation. By 5 and 6 Vict., c. 54, it is now provided that the commissioners appointed to carry into effect the commutation of tithes shall have power to ascertain and define the boundaries of the glebe lands of any benefice, and also power, with consent of the ordinary and patron, to exchange the glebe lands for other lands within the same or any adjoining parish, or otherwise conveniently situated.

In Scotland, as in England, a glebe forms, as a general rule, a portion of every ecclesiastical benefice of the Established church and is thus an addition to the stipend and sometimes a very important one. As in England, the alienation of glebe lands by the incumbent of the parish has from a very early period been forbidden. (Stat. 1572, c. 48.) Consult Phillimore, *Ecclesiastical Lairs of the Church of England* (2d ed., London, 1895).

GLEBE LAND. See CHURCH RATES.

GLEDE. A bird. See KITE.

GLEDITSCH, glä'dich, JOHANN GOTTLIEB (1714-86). A German botanist and writer on forestry, born and educated at Leipzig. After lecturing on botany and materia medica at Frankfurt on the Oder for four years, he was appointed professor of botany at Berlin and director of the Botanical Garden in that city. It was, however, in his capacity as professor of forestry at the Berlin academy devoted to that science that he exercised that permanent influence which induced Linnæus to name the genus *Gleditsia*, the honey locust, after him. His chief publication is *Systematische Einleitung in die neuere aus ihren eigenthümlichen physikalisch-ökonomischen Gründen hergeleitete Forstwissenschaft* (2 vols., 1774-75).

GLEDITSIA. See HONEY LOCUST.

GLEE (AS. *gligg*, music, Icel. *glý*, merri-ment). The English name of a vocal composition for three or more voices, without instrumental accompaniment, and in one or more movements. The style of music of the glee is peculiar to England and quite different from the part songs of Germany or the older madrigal (q.v.), being more extended and laying emphasis on variety rather than unity. The first glees were written by Arne and Boyce about the middle of the eighteenth century. The great composer of glees was S. Webbe, who died in London in 1816. This form flourished particularly in the period from 1750 to 1825. In

1787 the "Glee Club" was founded in London, which cultivated glees with great zeal until it was dissolved in 1857.

GLEET. See GONORRHŒA.

GLEICHENBERG, glîk'en-bêrk. A watering place of Styria, Austria, 1020 feet above sea level, in a charming, picturesque valley surrounded on three sides by mountains, about 40 miles southeast of Graz, near the Hungarian frontier (Map: Austria, E 3). It is well known for its nonchalybeate saline alkali springs, which are much frequented by sufferers from pulmonary complaints. Large quantities of the water are exported. There are several beautiful châteaux and many villas of the Austrian nobility in the vicinity. Resident population, about 1500.

GLEICHEN-RUSSWURM, glîk'en-rus'vûrm, LUDWIG, BARON VON (1836-1901). A German landscape painter and etcher. He was born at Castle Greifenstein in Bavaria, and studied under Max Schmidt and Hagen at the School of Art in Weimar. Given to realistic treatment from the first, with broad, decided brushwork and excellent handling of light, his style of painting afterward approached closely that of the Impressionists, as may be seen respectively from "An Idyl" (1885), in the National Gallery, Berlin, and an "Evening Landscape" (1892), in the Weimar Museum. Both these galleries have also collections of his water colors. His etchings are among the best produced in Germany during the later nineteenth century. He was a grandson of Schiller. Consult the monograph by Freuzel and Lehr (Vienna, 1902).

GLEIG, glêg, GEORGE (1753-1840). A Scottish divine, Bishop of Brechin, and primus of the Episcopal church of Scotland. He was born on a farm at Boghall, Kincardineshire, was educated at King's College, Aberdeen, was ordained in the Scottish Episcopal church in 1773, and took charge of a congregation at Pittenweem, Fifeshire, removing thence to Stirling in 1787. He contributed to the *Monthly Review*, the *Gentleman's Magazine*, and other publications, and wrote for the third edition of the *Encyclopædia Britannica*, of which, after the death of Colin Macfarquhar, proprietor and editor, in 1793, he edited the last six volumes, and in 1801 a supplement. He was twice elected Bishop of Dunkeld, but Bishop Skinner, the primus of the Scottish church, whom Gleig had criticized in the *Gentleman's Magazine*, prevented his taking office. In 1808, having acceded to the tests imposed by Bishop Skinner, he was chosen successor to Bishop Strohan, of Brechin. His efforts towards securing a strict adherence to the English liturgy, with the single exception of the communion, were eminently successful. In 1816, when elected primus of the Church of Scotland, he tried to extend the reforms begun in his own episcopate and to cement the alliance with the English church. He was not altogether successful, for his persistent interference in diocesan elections alienated some of his strongest supporters. He resigned the primacy in 1837. He published several volumes of sermons, *The Life and Writings of William Robertson* (1812), and *Directions for the Study of Theology* (1837); and edited Stackhouse's *History of the Bible* (1817). Consult Walker, *Life of the Right Reverend John Gleig, Bishop of Brechin* (Edinburgh, 1878).

GLEIG, GEORGE ROBERT (1796-1888). A Scottish writer, born at Stirling, son of the

preceding. In 1812, while a student at Oxford, he joined a regiment on its way to London and served in the Peninsular campaign. During the American War of 1812-14 he participated in the movement against the city of Washington and was severely wounded in the battle of Bladensburg. In 1821 he published an account of the *Campaigns of the British Army at Washington and New Orleans*. After the war he returned to Oxford, entered holy orders, and was presented to the living of Ivy Church, Kent. In 1825 he published *The Subaltern*, an entertaining and well-written novel founded on his experience in the Peninsular War. In 1834 he became chaplain of Chelsea Hospital and in 1844 chaplain general of the forces. Having devised a scheme for the education of soldiers, in 1846 he was appointed inspector general of military schools. Gleig contributed to *Fraser's*, *Blackwood's*, the *Edinburgh*, and the *Quarterly*; and wrote a great variety of biographical, historical, and religious books. The most interesting is his *Life of the Duke of Wellington* (1862). His *Life of Warren Hastings* (1841) was the text for Macaulay's *Essay on Warren Hastings*.

GLEIM, glîm, JOHANN WILHELM LUDWIG (1710-1803). A German poet whom the glories of Frederick II's struggle in the Seven Years' War inspired to write the 16 vigorous and thrilling *Lieder eines preussischen Grenadiers* (1758). He was called "Father Gleim" because he assisted many of the younger poets. Gleim was born at Ermsleben, near Halberstadt, and was the most prominent of the early political song writers of Germany. His other songs, fables, romances, classical and mediæval imitations, are, with few exceptions, as unimportant as his didactic epic *Udalladit* in Oriental garb (1774), being at their best feebly pretty and at their worst very dull. He died at Halberstadt. Gleim's *Works* are in seven volumes (1811-13). For his life, consult Körte (*Halberstadt*, 1811).

GLEIWITZ, glîvîts. A town in the southeastern part of the Prussian Province of Silesia, situated on the Klodnitz and the Klodnitz Canal, 100 miles by rail southeast of Breslau (Map: Germany, H 3). It has an old Catholic church. A Gynnasium, a mechanical school, an ironworking school, and a museum are among its institutions. It has a royal foundry and hearths; manufactures machinery, boilers, wire, agricultural machinery, paper, glass, oil, lumber, chemicals, cabinetwork, and piping. Gleiwitz dates from the twelfth century. Pop., 1900, 52,362; 1910, 66,910, mostly Roman Catholics.

GLENARVON. Lady Caroline Lamb's first novel, published anonymously in London in 1816. Its caricature of Byron, with whom the author had had a short love affair and a quarrel, soon made the book famous. It was reprinted in 1865.

GLENCOE, glên-kô'. A deep, precipitous valley, in northern Argyllshire, Scotland. It extends southward from Loch Leven, is about 8 miles in length, and is divided into an upper and a lower valley. It is famous for the wildness and sublimity of its scenery and for the massacre of Glencoe. The Highlanders, faithful to the Stuart dynasty, were promised full pardon if on or before Dec. 31, 1691, they submitted to the rule of William III and Mary. The surrender of Mac Ian, chief of the Mac-

donalds of Glencoe, was delayed by bad weather until January 7. The sheriff at Inveraray, yielding to his entreaties, accepted his oath on that day, but at Edinburgh the clerks refused to receive it. With these circumstances unknown to the King, Mac Ian's enemies, headed by Sir John Dalrymple, Master of Stair, obtained a royal warrant for their extirpation. Under the guise of friends, 120 men, mostly Campbells and hereditary foemen, led by Captain Campbell of Glenlyon, accepted the hospitality of the Macdonalds for 12 days, then treacherously attacked them at five o'clock in the morning of Feb. 13, 1692. Thirty-eight persons, including children and women, were slain. About 300 men and women escaped in a violent storm, but many perished from cold and hunger in the snow of the mountain gorges. Consult: Macaulay, *History of England* (3 vols., New York, 1908); Charles Leslie, *The Massacre of Glencoe, Being a Reprint of a Contemporary Account*, ed. by E. Goldsmid (Edinburgh, 1885); George Gilfillan, *The Massacre of Glencoe and the Campbells of Glenlyon* (Stirling, 1913).

GLENCOE. A city and the county seat of McLeod Co., Minn., 51 miles west-southwest of Minneapolis, on the Chicago, Milwaukee, and St. Paul Railroad, and on Buffalo Creek (Map: Minnesota, C 6). It is surrounded by a farming and dairying region, and has grain elevators, flour mills, a foundry, machine shops, a creamery, etc. Stevens Seminary is located here. The water works are owned by the city. Pop., 1900, 1780; 1910, 1728.

GLENCOE, OR THE FALL OF THE McDONALDS. A drama by Sir Thomas Talfourd, produced in 1840 by Macready.

GLEN'CORSE, LORD. See INGLIS, JOHN, LORD GLENCORSE.

GLEN COVE. An unincorporated village in Nassau Co., N. Y., 28 miles northeast of Brooklyn, on the Long Island Railroad and on an inlet of Long Island Sound (Map: New York, B 3). It is the seat of a Friends' Academy and has three fine public school buildings and a public library. It has manufactories of leather belting, but is essentially a residential place. It was settled in 1668. Pop., 1914 (local est.), 7500.

GLENDALE. A city in Los Angeles Co., Cal., 7 miles north of Los Angeles, on the Pacific Electric and the San Pedro, Los Angeles, and Salt Lake railroads. It contains a branch of the Battle Creek Sanitarium, a Carnegie library, and a fine high-school building. The city is situated in a rich fruit-growing country, producing chiefly oranges and olives. The electric-light plant is owned by the municipality. Pop., 1910, 2746; 1920, 13,536.

GLENDALE, BATTLE OF. See FRAZIER'S FARM, BATTLE OF.

GLENDIVE. A city and the county seat of Dawson Co., Mont., 78 miles by rail northeast of Miles City, on the Yellowstone River, and on the Northern Pacific Railroad (Map: Montana, M 2). The city contains three hospitals and a poor farm. It has railroad repair shops, and carries on an important trade in live stock and wool. Extensive deposits of lignite are found in the adjacent region. The water works and electric-light plant are owned by the city. Pop., 1910, 2428.

GLENDOWER, glen-doo' or dou'er, OWEN (?1359-?1416). A Welsh chief, claiming descent from Llewellyn and prominent as an opponent

of the English during the reign of Henry IV. He was the last to claim the title of independent Prince of Wales. At first he was a follower of Henry of Lancaster, who succeeded Richard II in 1399, but local troubles forced him into opposition. The Welsh were strongly attached to Richard II and, moved by rumors that Richard was still alive, rose in revolt against Henry (1400). Glendower led this movement and was at first very successful. The King ordered his subjugation and granted his estates to the Earl of Somerset. Though Glendower's forces were inferior in number to those of his adversaries, he was sometimes victorious, chiefly through surprise, ambushes, and the like. Often, however, he was defeated and forced to retire to the hills. In 1402 he drew Lord Grey into an ambush and took him prisoner. A few weeks later Sir Edmund Mortimer, the uncle of the Earl of March, was captured by Glendower, after a battle won by the latter. Treason seems to have been falsely imputed to Mortimer as the cause of his defeat; but Henry IV's suspicions and Glendower's kindness soon made the treason sufficiently real, for Mortimer married one of Glendower's daughters and conspired with him against the English King. At this time Glendower styled himself openly Prince of Wales. In July, 1404, Glendower entered into a treaty with Charles VI of France against the English. Little came of it, for in the following year Glendower sustained severe reverses. For two or three years more his fortunes were somewhat in the ascendant, and then they sank to the ordinary level of the petty warfare of a barbarous mountain chief. On Feb. 24, 1416, Glendower was still alive, but nothing is known about him after that date. His successes show that he had about the highest talents of his class, and he had their faults also. The popular idea of him is to be found in Shakespeare's *King Henry IV*. From the first he has been a kind of mythical hero, and the lapse of centuries does not clear up the exact facts of his history. He was the last champion of Welsh independence which the English kings had been steadily stamping out for nearly a century and a half. Consult: Pennant, *Tour in Wales* (London, 1778); Pauli's *Geschichte von England* (Hamburg, 1854-58); Wylie, *History of Henry IV, 1394-1404* (London, 1880-98); Bradley, *Owen Glyndwr: The Last Struggle for Welsh Independence* (New York, 1901).

GLENELG. A shallow river, 200 miles long, rising in the southwestern part of Victoria (Map: Victoria, A 5). It crosses the boundary into South Australia and enters Discovery Bay, a bight of the Indian Ocean, between Cape Northumberland on the west and Cape Bridgewater on the east. In the rainy season it is subject to heavy floods.

GLENELG, LORD. See GRANT, CHARLES.

GLENGARRY. A beautiful valley or glen in West Inverness-shire, Scotland, about 8 miles southwest of Fort Augustus (Map: Scotland, D 3). It takes its name from the Garry River, which takes a winding course through it for some 19 miles. This valley was the home of the Macdonnells from the beginning of the sixteenth century until the death of the last of the acknowledged chief's family in the early part of the nineteenth century. Scott is said to have taken the last chief of this family, Col. Alexander Ranaldson Macdonell, as his model for Fergus MacIvor in *Waverley*. The Glengarry cap was named from this valley.

GLENN, JOHN MARK (1858-). An American sociologist. He was born at Baltimore, Md., and was educated at Washington and Lee University (M.A., 1879), Johns Hopkins University, and the University of Maryland (LL.B., 1882). From 1898 to 1907 he was a member (president, 1904-07) of the supervisors of city charities of Baltimore. In 1907 he became director of the Russell Sage Foundation of \$10,000,000 to be used to improve social and living conditions. He was a vice president of the American Statistical Association in 1909-10.

GLEN'NON, JOHN JOSEPH (1862-). An American Roman Catholic prelate, born at Kinnegad, County Westmeath, Ireland. He studied at St. Mary's College, Mullingar, graduated from All Hallows College, Dublin, in 1883, and was ordained a priest in 1884. He served as an assistant pastor of St. Patrick's Church at Kansas City in 1884-87 and as pastor of the cathedral of that city under Bishop Hogan; was vicar-general of the diocese in 1892-94 and administrator of the diocese in 1894-95; became Coadjutor Bishop of Kansas City and Bishop of Pinara in 1896; and Coadjutor Archbishop of St. Louis in 1903, and later in the same year Archbishop. In 1914 the city of Drogheda, Ireland, presented Archbishop Glennon with the freedom of the city.

GLEN RIDGE. A borough in Essex Co., N. J., 4 miles from Newark, on the Delaware, Lackawanna, and Western and the Erie railroads (Map: New York City (Greater New York), A 4). It is a purely residential community and contains the Mountainside Hospital and a public library. The water works are owned by the borough. Pop., 1900, 1960; 1910, 3260.

GLENROY'. A narrow, rocky glen of Inverness-shire, Scotland, through which flows the Roy. After a course of about 15 miles this stream joins the Spean at Keppoch. The glen is remarkable for three terraces running round it, everywhere horizontal and parallel to each other, and known as the "parallel roads of Glenroy." The highest is about 1150 feet above sea level. The second is 80 feet lower; the third lies about 855 feet above sea level and may be traced round the mountain of the glen into the valley of the Spean. The subject of much scientific study and discussion, they are now conceded to be ancient shore lines of a glacial lake, which halted for a while at the three levels in the process of the return to a normal drainage.

GLENS FALLS. A city in Warren Co., N. Y., 40 miles (direct) north of Troy, on the Hudson River, the Champlain Canal, and on the Delaware and Hudson Railroad (Map: New York, G 4). It derives its name from the falls in the Hudson, which supply exceptional power for manufacturing; and the island below the falls is associated with Cooper's *Last of the Mohicans*. The region abounds in points of interest connected with the French and Indian and the Revolutionary wars. There are large quarries of limestone, extensive lime works, Portland-cement works, a number of saw and planing mills, brickworks, and manufactories of paper, shirts, collars, shirt waists, etc. The city has the Crandall Free Library, St. Mary's and Glens Falls academies, a home for aged women, the Parks and Glens Falls hospitals, Crandall Park, and a great iron bridge over the falls. The city owns and operates its water works. Glens Falls was settled in 1763, incor-

porated as a village in 1837, and reincorporated as a city in 1908. In 1864 it was almost completely destroyed by fire and again in 1884 was visited with a similar disaster, which necessitated the rebuilding of the southern part of the city. Pop., 1900, 12,613; 1910, 15,243; 1914 (U. S. est.), 16,362; 1920, 16,638.

GLEN'WOOD. A city and the county seat of Mills Co., Iowa, 20 miles south by east of Council Bluffs, on the Chicago, Burlington, and Quincy Railroad (Map: Iowa, B 3). It is the seat of the State Institution for Feeble-Minded Children and contains a public library and fine city park. The city, besides being the centre of important corn and live-stock interests, is in a highly productive fruit-growing country and has a large canning factory and granite works. The water works are owned by the municipality. Pop., 1900, 3040; 1910, 4052.

GLENWOOD SPRINGS. A city and the county seat of Garfield Co., Colo., 126 miles (direct) southwest of Denver, on the Colorado Midland, and the Denver and Rio Grande railroads and on the Grand River (Map: Colorado, B 2). It is in a cattle-raising, coal-mining, fruit-growing, and a general farming region and is widely known as a health resort. Among its attractions are numerous hot springs, vapor caves, an open-air swimming pool which affords bathing in winter and in summer, and superb mountain scenery. Pop., 1900, 1350; 1910, 2010.

GLEVUM. See GLOUCESTER, ENGLAND.

GLEYLE, glâr, CHARLES (1806-74). A French historical painter. He was born at Chevilly, Canton Vaud, Switzerland, was brought up at Lyons, and studied four years with Hersent in Paris. Later he studied the old masters in Italy and traveled extensively in the Orient, sketching land and people after nature. His first work at the Salon appeared in 1840, but he did not obtain marked success until in 1843 he exhibited "Evening," also called "Lost Illusions," now in the Louvre. Among his other works are the "Departure of the Apostles" (1845), in the church at Montargis; "Pentecost," in Ste. Marguerite, Paris; the "Execution of Major Dave" and the "Romans Passing under the Yoke of the Helvetians," in the Lausanne Museum; "Pentheus Pursued by Menads" and the "Charmer," in the Basel Museum. Gleyre's genius was refined and sensitive, and his works were executed with conscientiousness and sincerity; but they are not exempt from the dryness and coldness of the academic style. He opened an important studio in Paris, and among his pupils were many men afterward well known in the world of art. Gleyre died suddenly, May 5, 1874, while visiting the Alsace-Lorraine Exhibition at the Palais Bourbon. For his biography, consult: Clement (Paris, 1878); Berthoud (Lausanne, 1880); Mantz, in *Gazette des Beaux-Arts* (Paris, 1875); Cook, *Art and Artists of our Time*, vol. i (New York, 1888).

GLICHEZARE, HEINRICH DER. See HEINRICH DER GLICHEZARE.

GLID'DON, GEORGE ROBINS (1809-57). An English archaeologist, Egyptologist, and ethnologist, born in Devonshire. When very young, he was taken to Egypt by his father, who was a merchant residing at Alexandria and also United States Consul. During Gliddon's long residence in Egypt, in the course of which he served for some time as United States Vice Consul, he devoted much time to the study of Egypt.

tian antiquities. Later he came to America and lectured on this subject in Boston, New York, and Philadelphia. His lectures did much to attract popular interest to Egyptology and its results. At the time of his death in Panama he was agent for the Honduras Inter-oceanic Railway. He wrote: *A Memoir on the Cotton of Egypt* (1841); *An Appeal to the Antiquaries of Europe on the Destruction of the Monuments of Egypt* (1841); *Discourses on Egyptian Archaeology* (1841); *Ancient Egypt* (1850; new ed., 1853); *Types of Mankind*, written in conjunction with Dr. J. C. Nott and containing contributions from Agassiz, Dr. Samuel G. Morton, and others (1854); *Indigenous Races of the Earth*, also written in conjunction with Dr. Nott and containing contributions from Alfred Maury, librarian of the French Institute; Francis Pulszky, the Hungarian ethnologist; and Professor Meigs, of Philadelphia (1857).

GLIERE, glé-är', REINHOLD MORITZOVITCH (1875-). A Russian composer, born at Kieff. He studied at the Conservatory of Moscow under Tancieff and Ippolitoff-Ivanoff from 1894 to 1900. His striking inventive power and conciseness of expression soon gained him general recognition both in Europe and in America. With marked predilection he cultivates the purely instrumental forms. His compositions include two symphonies, in E flat and C minor; three string sextets; and two string quartets.

GLINKA, glén'ká, FEODOR NIKOLÁEVITCH (1786-1880). A Russian soldier and man of letters. He was born at Smolensk and was educated for the army. In 1803 he became an officer and in 1805 fought at Austerlitz. At the close of the campaign he left the service and devoted himself to study and travel about Russia. Upon the invasion of the French in 1812 he reentered the Russian army and remained in active service until the end of the campaign in 1814. When Count Milarodovitch became military governor of St. Petersburg, Glinka was appointed colonel under his command. In 1826, on account of his alleged connection with a political conspiracy, he was banished to Petrozavodsk. After some time he was pardoned, again took up his residence at St. Petersburg, and became Councilor of State. He wrote: *Letters of a Russian Officer in the Campaigns of 1805-06* (1815-16; 2d ed., 1870); a poetical translation of the Psalms, of the Prophets, and of the Book of Job; *Reminiscences of the Year 1812*; a poem, "Kareliya"; and several other things full of mysticism, which possessed his mind after 1853.

GLINKA, MIKHAIL IVANOVITCH (1804-57). A celebrated Russian composer of the early modern school. He was born at Novospaskoi, near Smolensk, of aristocratic parents, and consequently received the education of a young noble of the period. His earlier musical teachers were Böhm (violin), Carl Mayer (theory and piano-forte), and later Field; subsequently he spent four years in Italy, ostensibly for his health, but practically completing his musical education. After studying for a little while with Dehn, of Berlin (1834), he was led to attempt composition, the result being the first Russian national opera, *A Life for the Czar* (1836), which received its first performance at St. Petersburg. While the musical treatment of the opera on the whole is Italian to a degree, it is occasionally very Russian in its coloring, which, together with its purely Russian plot and the employment of Russian folk songs, has earned

for its composer the reputation of being the pioneer of the modern Russian school and the forerunner of the famous national composer Tchaikowsky. His success gained for him the appointment of Imperial chapelmaster and conductor of the opera at St. Petersburg. The second opera, first presented at St. Petersburg in 1842, was arranged from a poem of the Russian poet Pushkin and was entitled *Russian and Ludmilla*. In character it is very similar to the first one and was almost as great a popular success. In 1844 he visited Paris and gave a series of orchestral concerts. From 1845 to 1847 he lived in Spain and wrote two overtures on Spanish national themes, *Jota Aragonesa* and *Noche en Madrid*. His other works include compositions for the piano-forte, on which instrument he was a brilliant performer, symphonies, orchestral suites, and numerous songs and romances, the latter clearly indicating the influence of Field. He died at Berlin, while on a visit to his old teacher, Dehn. Consult: Cui, *La musique en Russie* (Paris, 1880); N. Findeisen, *M. I. Glinka* (St. Petersburg, 1898, in Russian); A. Pongin, *Essai historique sur la musique en Russie* (Paris, 1904).

GLINKA, SERGEEVITCH NIKOLAI (1775-1847). A Russian author, brother of Feodor Glinka. He was born in the Government of Smolensk and lived principally at Moscow, where he devoted himself to literary work and founded the anti-French periodical *Russky Vestnik* (the Russian Courier). His contributions to juvenile literature include *Russian History for Young People* (3d ed., 1824) and *Reading for Children* (1821). Glinka was a very prolific author; he is said to have written more than 50 works. During the last 20 years of his life he was a censor at Moscow. Owing chiefly to his exaggerated chauvinism, Glinka is now entirely neglected. His *Notes on 1812*, however, still retains some historical interest.

GLIOMA, glí-ó'má (Neo-Lat., from Gk. γλία, glia, glue). A tumor arising from the delicate connective tissue which holds together the nerve substance, either of the brain or of other parts, and which has a gummy or glutinous consistency. Its usual seat is the brain, spinal cord, or orbit. See TUMOR.

GLISSAN, RODNEY (1827-1890). An American physician. He was born at Linganore, Md., and graduated at the University of Maryland in 1849. After practicing a few months in Baltimore, he was appointed an assistant surgeon in the United States army and served in that capacity from 1850 to 1861. In the latter year he entered practice in San Francisco and ultimately settled at Portland, Oreg. His publications include the following: *Journal of Army Life* (1874); *Text-Book of Modern Midwifery* (1881); *Two Years in Europe* (1887).

GLISSON, glis'son, FRANCIS (1597-1677). An English physiologist, born at Rampisham, Dorsetshire, and educated at Cambridge and Oxford. He became professor of physics at the former university in 1636 and retained that position until his death. In 1639 he also received an appointment as lecturer on anatomy at the College of Physicians, London, of which he was president from 1667 to 1669. He was one of the founders of the Royal Society. His investigations on the morbid anatomy of rickets, as treated in his famous work entitled *De Rachitide, sive morbo puerili qui vulgo The*

Rickets dicitur, Tractatus (1650), is especially notable. His work on the liver and its diseases, entitled *Anatomia Hepatis* (1654), is also important, the term "Glisson's capsule," now a part of medical phraseology, perpetuating the name of its author.

GLISSON, OLIVER S. (1809-90). An American naval officer, born in Ohio. He entered the navy as a midshipman in 1826, commanded the schooner *Reef* during the Mexican War, and accompanied Commodore Perry to Japan in 1853-55. In the Civil War he commanded successively the *Mount Vernon* and the *Mohican*, and in the attacks of December, 1864, and January, 1865, on Fort Fisher (q.v.), commanded the third division of the fleet. He was promoted commodore in July, 1866, and rear admiral in June, 1870, and on Jan. 18, 1871, was retired from the service.

GLOAG, glög, PATON JAMES (1823-1906). A Scottish clergyman. He was born at Perth and was educated at the academy in that city and at the universities of Edinburgh and St. Andrews. In 1848 he was appointed minister at Dunning and remained there until 1860, when he accepted a call to the ministry of Blantyre. He was minister of Galashiels from 1871 to 1892, when he removed to Edinburgh. He was moderator of the General Assembly in 1889. Besides several translations from the German of works on the New Testament by Lechler, Huther, Lüdemann, and Meyer, he published the following works: *Assurance of Salvation* (1853; 2d ed., 1869); *Exegetical Studies* (1884); *Introduction to the Johannine Writings* (1891); *Subjects and Modes of Baptism* (1891); *The Life of Saint John* (1892). Consult the biography by his wife (London, 1908).

GLOBE. A city and the county seat of Gila Co., Ariz., 82 miles (direct) north of Tucson, on the Arizona Eastern Railroad (Map: Arizona, E 4). Noteworthy features are the Roosevelt Reservoir, costing more than \$8,000,000, and the Old Dominion Library. The mining and smelting of copper is the chief industry, and there are also silver and gold mines. Globe owns its water-works system. It was first settled in 1873. Pop., 1900, 1495; 1910, 7083.

GLOBE (from Lat. *globus*, ball). A term used to denote any round or spherical body (see SPHERE) and often used to signify the earth. "Globes," or "the globes," generally means a pair of artificial globes used as a part of schoolroom apparatus. These are usually hollow spheres of cardboard, coated with a composition of whiting, glue, and oil, upon which paper bearing certain delineations is laid. Globes are either celestial or terrestrial. On the *celestial* globe the stars are represented in positions corresponding to their actual situation in the sky. If the celestial globe is *oriented* (i.e., set in position) correctly, a line drawn from its centre to any star marked on its surface will, if produced to the sky, pass through the actual star. On the *terrestrial* globe the distribution of land and water and their subdivisions, together with important places, are laid down in positions corresponding to those which they actually occupy on the surface of the earth. Terrestrial globes came into wide use as soon as the idea of the sphericity of the earth became prevalent. They afford a generalized representation of the earth which is very convenient, although the equatorial diameter exceeds the polar by $\frac{1}{111}$ of its length and

the difference is not appreciable to the eye in the sizes of globes usually constructed. The usual mode of making globes is as follows: A ball of wood or iron is used as a matrix, and a layer of damped paper is carefully and closely placed upon this, without paste, and other layers are successively pasted over the first one. Ordinary cardboard is thus produced, but instead of being flat, as usual, it forms a spherical shell. When sufficiently thick, this is cut into two hemispheres, the section being made in the line of the intended equator. The hemispheres are then taken off the matrix and again glued together on an axis, and the whiting composition laid on, the outside of which is smoothed and finished to shape in a lathe. The workman has to lay on this composition evenly enough to balance the globe, in order that it may rest at whatever point it is turned. The smooth surface is now marked with the lines of latitude and longitude and is covered with the paper on which the required geographical or astronomical delineations are engraved. In order to adapt the plane surface of the paper to the curvature of the sphere, it is printed in pieces, small circles for the Arctic and Antarctic regions, and the rest in lens-shaped gores, usually six in number. Great care is required in laying on these curved pieces, so that their edges shall meet exactly without overlapping. The surface is then colored and strongly varnished, and the globe mounted in its frame and stand. It was formerly impossible to represent the relief of the earth on globes, because elevations on the surface of the earth are insignificant when compared to the terrestrial diameter. In recent years, however, patches of color, technically known as layers, and contour lines have been adopted to show altitudes.

Globes of India rubber and gutta-percha have also been made, others of thin paper, to be inflated and suspended in a schoolroom. Embossed globes show, in exaggerated relief, the elevations and depressions of the earth's surface. Compound globes, including the celestial and terrestrial, have been made with an outer glass sphere for the celestial, and an orrery (q.v.) mechanism to show the varying relative positions of the sun and moon, etc. As schoolroom apparatus, globes are used for illustrating the form and motion of the earth, the position and apparent motion of the fixed stars, and for the mechanical solution of a number of problems in geography and practical astronomy. For this purpose each globe is suspended in a brass ring of somewhat greater diameter, by means of two pins exactly opposite to each other, these pins forming the extremities of the axis round which it revolves, or the north and south poles. This brass circle is then let into a horizontal ring of wood, supported on a stand. The globes in common use in schools are from 1 to 4 feet in diameter. The oldest terrestrial globe of any importance (though probably not the first) is that of Behaim. It was constructed in Nuremberg and bears the date of 1492. One of the earliest globes constructed after the discovery of America is that in the New York Public Library (1506-07). Consult V. Fiorini's "Le sfere cosmografiche e specialmente la sfera terrestre," in *Bollettino della Società Geografica Italiana*, vols. xxx-xxxi (Rome, 1893-04).

GLOBE, THE. A famous Elizabethan theatre, where most of the plays of Shakespeare, Jonson, Beaumont, Fletcher, Chapman, Massinger,

and Ford were first produced. It was erected in Bankside, by the Burbage brothers, in 1599, and was built chiefly from the material of their earlier theatre in Shoreditch. Its hexagonal outer wall inclosed a circular pit, flanked by three galleries, the pit being open to the sky, while the galleries were roofed with thatch, which caught fire in 1613, during a representation of *Henry VIII*, and caused the destruction of the building. It was soon rebuilt, but was destroyed in 1644 by the Puritans, and a brewery now occupies its site. Consult C. W. Wallace, *Three London Theatres of Shakespeare's Time* (Lincoln, Neb., 1909).

GLOBE AMARANTH. See AMARANTH.

GLOBE/FISH. A marine fish of the family Tetraodontidae and order Plectognathi (q.v.), remarkable for its power of inflation. These fishes possess a large, ventral, bladder-like expansion of the œsophagus, which may be filled with water or air so suddenly that the body assumes at once a spherical form. The skin is stretched to its utmost extent and becomes firm. The scales are mostly reduced to spines embedded in the skin, and these spines now stand upright and form an important protective covering. This power of swelling suddenly must be regarded as an adaptation for defense, since the distended fish can hardly be grasped with impunity by the mouth of any predacious animal. The fishes of this group are chiefly tropical, and some species are as large as a football, or larger, and used as food. Two or three species occur along the eastern coast of the United States, of which one (*Spheroides turgidus*) is very abundant, especially along the rocky shores of southern New England and Long Island, where it is known as swelldoodle, puffer, egg fish, and bellows fish. It is often caught with a hook, and hundreds, usually small, are taken with every haul of a seine. When lifted from the water, it immediately inflates its body by means of short, jerking inspirations of air, and if dropped on the ground will bound about like a rubber ball; or if thrown in the water will bob about for some time at the surface, with little control over its movements and relieving itself with difficulty of its inflation. It forms a very amusing tenant of a salt-water aquarium. A well-known globe-fish of the Nile is the fahaka (*Tetrodon fahaka*). A large edible West Indian species (*Laogcephalus lamigatus*) is better known as rabbit fish. See Plate of PLECTOGNATHI FISHES.

GLOBEFLOWER (*Trollius*). A genus of plants of the family Ranunculaceæ, with a calyx of yellow sepals and a corolla of small and linear petals. There are several species, natives of the colder parts of the Northern Hemisphere. The common globeflower, the lucken gowan of the Scotch (*Trollius europæus*), a native of Great Britain, is sometimes cultivated in flower gardens. The globelike appearance of the flower suggests the name. The spreading globeflower, *Trollius laxus*, occurs in deep swamps from Connecticut to Michigan and also in the Rocky Mountains.

GLOBIGERINA, glô-bij'ér-ī-nā (Neo-Lat., from Lat. *globus*, ball + *gerere*, to carry). A genus of multilocular perforate foraminifera, with minute shells of glassy, calcareous texture and globular form. They are exceedingly abundant in many portions of the ocean bottom, where they form the greater proportion of the "globigerina ooze." Specimens referred to the

genus *Globigerina* have been found in the Lower Cambrian rocks of the Province of New Brunswick, Canada. Their next appearance is in Triassic rocks. But they do not attain prominence till Tertiary time, when they became quite as abundant as they are at present. See FORAMINIFERA: OOZE; OCEAN DEPOSITS.

GLO'BIN. See GLOBULINS.

GLO'BROID (from Lat. *globus*, ball + Gk. εἶδος, *eidos*, form). A spheroidal mass of a double phosphate of calcium and magnesium found in aleurone grains. It is supposed to be a by-product of the formation of the crystalloid in those bodies. See ALEURONE.

GLOB'ULINS (from *globule*, from Lat. *globulus*, dim. of *globus*, ball). Natural proteins, which with albumins constitute the principal nitrogenous component of animal and plant tissues. Globulins of different origin possess some individual differences in physical and chemical properties, but also some points of similarity which permit the grouping of them into one class. The principal points of similarity are the following: they all possess the properties of very weak acids; as such, in a free state, they are insoluble in water. They enter into loose combination with neutral salts, and in that form they are soluble in water. However, the addition to a solution of globulin of an excess of the salt again causes its precipitation. Heating of an aqueous solution of every animal globulin, and some vegetable globulins, causes their coagulation. Globulins differ from albumins, not only by differences in solubility and in precipitability, but also by their chemical composition. On decomposition of globulins among other amino acids was found glycocoll. This amino acid is not obtained on decomposition of albumins.

Preparation of Globulins. They are prepared from natural sources by extraction with salt solutions. As a rule, the solution contains also albumins and other proteins. The globulins are obtained from this solution in solid state by means of precipitating agents. These may be either very weak acids or neutral salts. They may also be precipitated by dialysing the solution and completely removing the neutral salts. A process analogous to this consists in diluting a salt solution of globulin with a large volume of water. Some of the principal animal globulins are:

1. *Serum globulin*, which occurs in the blood plasma, serum, lymph, transudates, and exudates, and in the white and red cells.

2. *Fibrinogen* is also found in the blood plasma and plays an important part in the clotting of blood. In this process it is converted by the action of fibrin ferment or thrombin into fibrin.

3. *Myosin* constitutes the principal mass of the soluble proteins of the dead muscle. In the live muscle it is present as myosinogen, which is converted by the action of a specific enzyme, the myosin ferment, into myosin.

4. *Crystallin* is the globulin which is found in the lens of the eye.

5. *Lactoglobulin*, together with casein and lactalbumin, occurs in milk plasma.

The vegetable globulins differ from those of animal origin by their solubilities and by their behavior towards neutral salts. For instance, magnesium sulphate is a general precipitant for animal, but not for plant, globulins. Half saturation with ammonium sulphate precipitates nearly all animal, but does not precipitate

a large number of vegetable, globulins. Further, vegetable globulins differ from animal in the behavior of their aqueous solutions towards heat; whereas the former are only imperfectly coagulated by heat, the latter coagulate completely. A particularly interesting property of the vegetable globulin is its capacity to form crystalline compounds. Finally animal and vegetable globulins differ in the proportion of their individual components. When decomposed by heating with strong mineral acids, the vegetable globulins yield a higher proportion of aspartic and particularly of glutaminic acids.

The following are the principal vegetable globulins:

GLOBULINS:	OBTAINED FROM SEEDS OF:
Legumin.....	Pea, <i>Pisum sativum</i> . Horse bean, <i>Vicia faba</i> . Vetch, <i>Vicia sativa</i> . Lentil, <i>Ervum lens</i> .
Vignin.....	Cow pea, <i>Vigna sinensis</i> .
Glycinin.....	Soy bean, <i>Glycine hispida</i> .
Phaseolin, crystalline.....	Kidney bean, <i>Phaseolus vulgaris</i> . Adzuki bean, <i>Phaseolus radiatus</i> .
Conglutin.....	Lima bean, <i>Phaseolus lunatus</i> . Lupines, <i>Lupinus</i> .
Vicilin.....	Horse bean, <i>Vicia faba</i> . Pea, <i>Pisum sativum</i> . Lentil, <i>Ervum lens</i> .
Corylin.....	Hazelnut, <i>Corylus avellana</i> .
Amandin.....	Almond, <i>Prunus amygdalus</i> . Peach, <i>Prunus persica</i> . Plum, <i>Prunus domestica</i> . Apricot, <i>Prunus armeniaca</i> .
Juglansin.....	European walnut, <i>Juglans regia</i> . American black walnut, <i>Juglans nigra</i> . American butternut, <i>Juglans cinerea</i> .
Excelsin, crystalline	Brazil nut, <i>Bertholletia excelsa</i> .
Edestin.....	Hempseed, <i>Cannabis sativa</i> .
Aviculin.....	Oat, <i>Avena sativa</i> .
Castanin.....	European chestnut, <i>Castanea vulgaris</i> .
Maysin.....	Maise, <i>Zea mays</i> .
Tuberin, found in the tubers of.....	Potato, <i>Solanum tuberosum</i> .

GLOBUS HYSTERICUS (Lat., hysterical ball), or BALL IN THE TUBOAT. See HYSTERIA.

GLOCKENSPIEL, glók'en-spöl (Ger., bell play). A musical instrument originally consisting

EARLY FORM OF GLOCKENSPIEL.

ing of bells fastened to an iron rod and rising above one another in the form of a pyramid. The bells were struck by means of a hammer with a metal head. Later the glockenspiel was constructed in the shape of a lyre, within which metal bars, instead of bells, were fastened. The bars yield a fuller tone than the bells. The instrument is now also constructed so that metal bars are arranged within a box. In this form the glockenspiel is used in the modern opera orchestra and has a range from b^1 to d^3 . The music is written an octave lower than its sounds. Wagner employs the glockenspiel in the magic fire scene in *Die Walküre*.

GLOCKNER, glók'nér, or **GROSSGLOCKNER**, grös-glók'nér. One of the highest peaks of the Austrian Alps, commanding a famous view, situated on the boundary between Tirol, Carinthia, and Upper Austria (Map: Austria, C 3). Its altitude is 12,344 feet.

GLOGAU, gló'gou, or **GROSSGLOGAU**. The capital of a district and a second-class fortress in the Prussian Province of Silesia, situated on the left bank of the Oder, 60 miles

northwest of Breslau (Map: Germany, F 3). The town is fortified on three sides and connected by a wooden bridge with a fortified island in the Oder. The more prominent buildings of Glogau are the old castle, the Gothic cathedral on an island in the Oder, the Rathaus, with a high tower, and the post office. Glogau has a prominent geographical institute, a municipal theatre, two Gymnasias, a war college, and is an infantry, artillery, and cavalry station. Castings, machinery, boilers, sugar, starch, dextrin, furniture, and hats are manufactured. It is an important wool market. The railway shops are extensive, and there is some trade in wine. Pop., 1900, 22,147; 1910, 24,524. Glogau was an important fortified place as early as the beginning of the eleventh century and became in the thirteenth century the capital of the Principality of Glogau. At the end of the fifteenth century the town, together with the principality, fell into the hands of Bohemia. During the Thirty Years' War, Glogau was captured repeatedly by the Swedes and the Imperial troops, and in 1741 it was taken by storm by the Prussians and strongly fortified.

GLOGAU, GUSTAV (1844-95). A German philosopher, born at Laukschken, East Prussia, and educated at Berlin. In 1882 he was appointed professor at the Polytechnical Institute at Zürich, in 1883 professor extraordinary at Halle, and in 1884 professor of philosophy at Kiel. In 1895 he entered upon a tour through Greece, where he met his death in an accident. Glogau regards philosophy as a science embodying the results of all achievements and thus represents it as a natural growth, inseparable from evolution in its widest sense. Besides his principal work, *Abriß der philosophischen Grundwissenschaften* (1880-88), he published: *Ziel und Wesen der humanistischen Bildung* (1881); *Grundriß der Psychologie* (1884); *Die Ideale der Sozialdemokratie und die Aufgabe des Zeitalters* (1892); *Die Hauptlehren der Logik und Wissenschaftslehre* (1894); and *Das Vorstadium und die Anfänge der Philosophie*, ed. by Siebeck (1896).

GLOGGNITZ, glóg'nits. A small market town of Lower Austria, situated on the Schwarza, at the northern base of the Semmering Alps, 45 miles south-southwest of Vienna (Map: Austria, D 3). The building of the railway from here to Mürzzuschlag, a distance of 35 miles, was an extraordinary feat of mountain engineering. The line was constructed in 1848-54 at a cost of about \$10,000,000. Gloggnitz has a picturesque castle situated on a hill. Until 1803 it was a Benedictine abbey, but afterward became a private residence. To the southwest lies the interesting castle of Wartenstein. The town has cotton and woolen mills, cabinet-works, stone quarries, and magnesia factories. In the Schwarza valley near by is the large paper factory of Schlögnathl. Pop. (commune), 5296.

GLOMERULE, glóm'er-ül (from Lat. *glomus*, ball of yarn). A flower cluster (inflorescence) which is merely a cyme (q.v.), in which the flowers are crowded so close together as to form a sort of head, as seen in some species of dogwood. See INFLORESCENCE.

GLOMMEN. The largest river of Norway, issuing from Lake Annsundsjø, at the town of Røraas, at an altitude of about 2300 feet (Map: Norway, D 6). It flows in a general southerly direction past the fortress of Kongsvinger, emp-

tying into the Skager Rack at Fredrikstad, after a course of 350 miles. Its most important affluent is the Vormen. The Glommen forms a number of lakes and several waterfalls, which greatly detract from its usefulness as a navigable waterway. Boats ascend to the last waterfall, about 10 miles from the mouth of the river, and above this fall the river is navigable for about 20 miles.

GLONAIN, glôn'ô-in. See NITROGLYCERIN.

GLO'RIA IN EXCELSIS (Lat., Glory be to God on high). The first words and the title of one of the oldest Christian doxologies, Eastern in origin and in use for more than 1500 years. In the English church and American churches it forms part of the communion office and is a substitute for the Gloria Patri after the Psalter. See DOXOLOGY.

GLO'RIA'NA. The "Faerie Queene" in Spenser's famous poem of that name, for whose honor the various combats against vice are undertaken, and who is Prince Arthur's fated bride. She shadows forth Queen Elizabeth in her capacity of sovereign.

GLO'RIA PA'TRI (Lat., Glory be to the Father). The minor doxology in the Christian Church. It is used after the selections from the Psalter and at the end of the anthems.

GLORIETTA, BATTLE OF. One of the most important battles fought in the West during the American Civil War. The Union forces, composed of the First Colorado Volunteers and some New Mexico Regulars, under Colonel Slough, met the Confederates under Major Pyron at Apache Cañon, near Santa Fe, on March 22, 1862. The battle was indecisive, both sides withdrawing from the field. On March 28, however, the two forces met again at the same place. The Federal command, by previously destroying the ammunition, baggage, and provisions of the Confederates, completely routed them, and they were compelled to fall back on their base at Santa Fe. The North lost 71 killed and wounded and the South 96. In Southern reports this battle is called Glorietta, in Northern reports Apache Cañon. It practically put an end to the only serious attempt the Confederates made to invade the West. Consult *Battles and Leaders of the Civil War*, ed. by Johnson and Buel (New York, 1887-88).

GLORIOUS VIRGIN, or SAINT MARY THE GLORIOUS. An order of knighthood, founded early in the thirteenth century, and approved by Pope Urban IV in 1262. This institution was ecclesiastical as well as military, and its objects were the protection of widows and orphans and the furtherance of the peace of Italy by the suppression of the strife between Guelphs and Ghibellines. The badge was a red cross surmounted by two stars, and the costume a white mantle. The members were not obliged to take the vow of celibacy or live in monasteries; consequently they were called *Gaudenti* (or Joyful) and this is the name by which they are best known. The order was suppressed towards the end of the sixteenth century. The Order of St. Mary the Glorious, at Rome, was sanctioned by Paul V in 1618. Its object was to suppress the Barbary corsairs who infested the Mediterranean. To make the order effective, the Pope gave the knights command of his galleys and set apart the town and harbor of Civitavecchia for their use. Consult Ashmole, *History of the Most Noble Order of the Garter* (London, 1718).

GLORY, IN METEOROLOGY. See HALO.

GLOSS (from Lat. *glossa*, gloss, Gk. γλῶσσα, *glōssa*, tongue). A brief note or explanation written upon the margin or between the lines of a manuscript by some reader. In subsequent copyings such glosses often became incorporated as a part of the text. The object was generally to explain some verbal difficulty. From an early period these difficulties were the object of attention, and the writers who devoted themselves to their elucidation were called *glossatores*, and their works *glossaria*. The principal Greek glossatores are Hesychius of Alexandria (fourth century), Photius (q.v.), Zonaras (twelfth century), Suidas (q.v.), and Favorinus, a Benedictine (died 1537). Their works are lexicons of difficult words. Most of the rabbinical writers did the same work for the Hebrew text of the Old Testament. The chief glossatores of the Latin Vulgate are the celebrated Walafrid Strabo (q.v.), in the ninth century, author of the *Glossa Ordinaria*, and Anselm of Laon, author of the *Glossa Interlinearis*, who continued Walafrid's work in the twelfth century. Their work was the great storehouse of mediæval exegesis. It was printed with the Latin text in an edition of the Vulgate in 1480. In Roman and canon law the practice of introducing glosses was of early origin and probably was in imitation of the biblical glosses. Among jurists the gloss was not purely verbal, but had to do with the true interpretation of the law, and in some cases it was held to be of equal authority with the text itself. From the position which it occupied in the manuscript, being generally written between the lines of the text, it was called *glossa interlinearis*. The gloss of the Roman law is written in very pure Latin, that of the canon law in the Latinity of the mediæval schools. The first collection of glosses to the canon law was made by Johannes Semeca (Teutonicus) in 1212. It accompanied the *Decretum Gratiani* and was printed in connection with it (Lyons, 1584). Other divisions for the *Corpus Juris Canonici* also had glosses, and they are given in the edition mentioned above. The term is also used in textual criticism of the Bible for brief readings suspected to be added to the original text for explanatory purposes, written first on the margin and later incorporated into the text.

GLOSSARY. See DICTIONARY.

GLOSSITIS (Neo-Lat., from Gk. γλῶσσα, *glōssa*, tongue). A term used in designating inflammatory diseases of the tongue. (*Glossitis superficialis simplex* occurs with great frequency in febrile and digestive disorders accompanied by "coated tongue" or "strawberry tongue.") Chronic superficial glossitis occurs often in hypochondriacs, especially in women; the tongue burns, is painful, especially during eating or speaking, and is dotted with red spots and white nodules. It may last for years, with intermissions of weeks or months. Treatment with nitrate of silver or lactic acid is palliative. A similar condition (*Leucoplakia buccalis*), also known as psoriasis or ichthyosis of the tongue, or smoker's patches, may result from syphilis, the irritation of roughened teeth, excessive smoking, and indigestion. The disease tends to become malignant. Hairy tongue is a rare glossitis in which, surrounding a smooth, yellow, brown, or black area, the papillæ are smaller and resemble bristles. The treatment consists in scraping and the application of antiseptics.

In "geographical tongue" bright red plaques appear, slightly elevated and circumscribed by a gray marginal zone. The forms of the maps change frequently. The trouble generally disappears without treatment. Acute papular glossitis is extremely rare. In acute diffuse glossitis, or abscess of the tongue, the latter becomes enormously swollen, and the chief dangers of the attack are suffocation from swelling of the parts about the hyoid bone, closure thereby of the glottis (see LARYNX), and general infection. The only effective treatment is to make deep incisions into the inflamed part. With a straight bistoury several incisions are made lengthwise sufficiently deep to evacuate the pus. A good deal of blood will usually follow, but if care has been taken not to injure the lingual artery or its branches (see TONGUE), there is no real danger from this cause. Glossitis is also caused by mercury during mercurial stomatitis, by syphilis, tuberculosis, and actinomycosis.

GLOS/SOP. A market town and municipal borough in Derbyshire, England, 13 miles east-southeast of Manchester (Map: England, E 3). The town consists of Old Town (Glossop proper), Howard Town (Glossop Dale), and Mill Town. It is situated on rising ground above the deep Dinting valley, where a 2000-foot railway bridge spans it. It is the chief seat of the cotton manufacture of Derbyshire, and has woollen, cotton, and paper mills, dye works, print fields, and iron foundries. The parish church of All Saints, Victoria Hall with a public library, the grammar school, mechanics' institute, and the town hall and market house are the principal buildings. The town maintains a public park, a hospital, and public baths. Melandra Castle, the site of a Roman camp, is near. Pop. (borough), 1901, 21,526; 1911, 21,688.

GLOSSOPTERIS (Neo-Lat., from Gk. γλῶσσα, *glōssa*, tongue + πτερίς, *ptēris*, fern). A fossil fern of the family Tæniopteridæ, which is an important index fossil of certain Permian-Triassic beds of India, Australia, South Africa, and South America, known as the Gondwana series. This fern has thick leaves of linguulate form, with entire margin, median rib, and anastomosing veins.

GLOSTER, or **GLOUCESTER**, glōs'tēr, EARL OF. The father of Edgar and of the bastard Edmund, in Shakespeare's *King Lear*. He is deceived and betrayed by his illegitimate son, blinded by Cornwall, and guided through the country and saved from springing over Dover Cliff by the heir, whom he had unjustly disowned. The story is taken from Sidney's *Arcadia*.

GLOTTIS. See LARYNX.

GLOUCESTER, glōs'tēr (AS. *Gleowceaster*, fair city, Lat. *Glevum*, *Claudia*). An inland port, city, and county borough, the county town of Gloucestershire, England, on the left bank of the Severn, 33 miles northeast of Bristol (Map: England, D 5). The city is built on a slight declivity, sloping to the Severn, and is sheltered by the surrounding Cotswolds and Malvern Hills. The modern portion is in the neighborhood of the public park and spa, which contains the chalybeate spring, discovered in 1814. The four main streets, named after their orientation, are wide, and built on the ancient Roman ground plan, meeting at right angles in the centre of the town, where the former town hall, the historic Tolsey, stands at the intersection, on the site of the old Roman Capitol.

Other buildings and objects of interest are the picturesque deanery, formerly the old priory lodge; the New Inn, a pilgrim's hostelry, built in 1540; the episcopal palace; the new guildhall; and many quaintly gabled timbered houses. A cross marks the spot where Bishop Hooper was burned. The principal building in Gloucester is the cathedral, the foundation of which dates from the eleventh century. Formerly a Benedictine abbey, skillful alterations and additions evolved from the Norman body a fine building in various styles of Gothic, which in 1541, after the suppression of monasteries, was converted into a cathedral by Henry VIII. The chief external ornament is the stately central tower, 225 feet high, with its beautiful tracery and pinnacles. It contains the "Great Peter" bell, weighing over three tons. The cathedral was restored between 1873 and 1890 and in 1897. Gloucester has three endowed ancient schools, in addition to several modern schools. It has an important municipal record; it received special charters from several monarchs, and in 1483 was incorporated by Richard III, who made it a county in itself. It is governed by a mayor, 10 aldermen, and 30 councilors. It owns its markets, water works, cemetery, public baths, technical schools, public library, electric-lighting supply, and dust-destructor works. It has manufactures of railway cars, engines, agricultural implements, and cutlery. There are boat and ship building yards, foundries, flour and saw mills, and chemical, rope, match, marble, and slate works. Bell founding and cloth and pin manufactures were once important industries which no longer exist. A ship canal, 17 miles long, communicating with the estuary of the Severn below Sharpness Point, gives access to the spacious docks. The famous bore or tidal wave of the Severn attains its greatest height just before reaching Gloucester. Considerable commerce is carried on with the Baltic and other foreign ports; corn, timber, wines, and spirits are imported; iron and coal, bricks, pottery, salt, malt, and agricultural products are exported. Gloucester is the seat of an American consul. Pop., 1891, 41,303; 1901, 47,955; 1911, 50,035; area, 2318 acres.

Gloucester was an important Saxon town, styled by Bede "one of the noblest cities in the land." It suffered greatly during the period of the Danish incursions. It was a favorite residence of the Norman kings and was the seat of eight parliaments. Gloucester afforded a refuge and support to Queen Matilda in her contest with Stephen, and Henry III, who "loved Gloucester better than London," was crowned in the abbey. In 1643 Gloucester successfully resisted the royal army under Charles I until relieved by Essex, and at the Restoration its fortifications were dismantled for this "malignity." Robert of Gloucester, the metrical historian, Whitefield, and Wheatstone are among Gloucester's celebrities. Consult: Fossbrooke, *Original History of the City of Gloucester* (London, 1819); Masse, *The Cathedral Church of Gloucester* (ib., 1898); *Victoria History of the Counties of England*, vol. ii (ib., 1907).

GLOUCESTER. A city in Essex Co., Mass., including the villages of Annisquam, Bay View, East Gloucester, Freshwater Cove, Lanewville, Magnolia, Riverdale, and West Gloucester, 32 miles northeast of Boston, on Massachusetts Bay, on Cape Ann, and on the Boston and Maine Railroad (Map: Massachusetts, F 2). It is a

GLOUCESTER CATHEDRAL

popular resort for summer residents, artists, and tourists, and has the Gilbert Hospital, Home for Aged Fishermen, Huntress Home, Magnolia, public, and Sawyer free libraries, and Stage Fort, Marine, and other parks. The city is the seat of the largest fishery interests in the United States, over 5000 men being engaged in the cod and mackerel fisheries. There is a large, accessible, and safe harbor, and salt, coal, and lumber are extensively imported. Besides the fisheries and the quarrying of granite, the principal industries are shipbuilding, drop forging, brass founding, and the manufacture of fish glue, anchors, machinery, oil clothing, dresses, hardware, hosiery, shoes, nets and twine, sails, and cigars. In 1623 a company from Dorchester, England, settled at Gloucester, but three years later a portion of the settlers removed to Naumkeag (Salem). The permanent settlement dates from about 1633, and a town charter was granted in 1642. It was not until the beginning of the eighteenth century that Gloucester became especially prominent for its fisheries and its shipbuilding industries. Many privateers were sent out during the Revolution and the War of 1812, and the town was unsuccessfully attacked by the English in 1775. Near by is the large sunken rock called Norman's Woe, rendered famous by Longfellow's "The Wreck of the Hesperus." Gloucester was incorporated as a city in 1873 and adopted the commission form of government in 1908. The city owns and operates its water works. Pop., 1900, 26,121; 1910, 24,398; 1920, 22,947. Consult J. J. Babson, *History of Gloucester* (Gloucester, 1800, supp. 1876), and J. R. Pringle, *History of the Town and City of Gloucester, 1623-1902* (ib., n. d.).

GLOUCESTER, DUKES AND EARLS OF.—**ROBERT**, first Earl of Gloucester (?-1147), was a natural son of King Henry I and the husband of Mabel of Gloucester. As the champion of the cause of his sister Matilda, he won the famous battle of Lincoln (1141) over Stephen of Blois.—**RICHARD DE CLARE** (1222-62), seventh Earl, was active on the side of the barons under Henry III, quarreled with Simon de Montfort in 1239, but had made up with him in 1261.—**GILBERT**, eighth Earl, surnamed the "Red" (1243-95), was one of the principal leaders of the barons in their conflict with Henry III, but afterward joined the royal cause, and was Regent during the absence of Edward I.—**GILBERT**, ninth Earl (?-1314), a son of the preceding and of the daughter of Edward I, was leader of the advance guard at the battle of Bannockburn, in which he fell. The line soon afterward became extinct, but was renewed in **THOMAS OF WOODSTOCK**, Earl of Buckingham (1355-97), the youngest son of Edward III, who was made Duke of Gloucester by his uncle, Richard II, in 1385, and who later acquired an extraordinary political influence and dominated the affairs of England.—Among the later conspicuous representatives of the title were **HUMPHREY**, Duke of Gloucester, the youngest son of Henry IV (1391-1447), who was Protector during the minority of Henry VI; **RICHARD**, brother of King Edward IV, and King of England as Richard III; **WILLIAM HENRY** (1734-1805), a brother of George III; and **WILLIAM FREDERICK** (1776-1854), a son of the preceding. Consult Vickers, *Humphrey, Duke of Gloucester* (London, 1907).

GLOUCESTER CITY. A city in Camden Co., N. J., 1 mile south of Camden, on the Dela-

ware River, opposite Philadelphia, with which it is connected by ferry, and on the Atlantic City and the Pennsylvania railroads (Map: New Jersey, B 4). It has manufactures of incandescent gas burners, Smyrna rugs, woolen yarns, boats, drills, paper, etc. Settled in 1677, Gloucester City was incorporated in 1868 and is governed under the charter of that date, which provides for a mayor, elected every two years, and a unicameral council. The city owns and operates its water works. Pop., 1900, 6840; 1910, 9462; 1914 (U. S. est.), 10,577; 1920, 12,162.

GLOUCESTERSHIRE, glōs'tēr-shēr. A southwest county of England, bounded by Worcester and Warwickshire on the north, Oxford on the east, Wiltshire and Somerset on the south, and Monmouth and Hereford on the west (Map: England, D 5). Area, 1259 square miles. Gloucestershire is famous as a dairy county and raises large numbers of cattle; its cider is also noted. The Forest of Dean has some iron deposits. The manufactures are numerous, cloth and textiles being important. The county contains the parliamentary boroughs of Cheltenham and Gloucester and part of the parliamentary borough of Bristol. Capital, Gloucester. Pop., 1901, 708,439; 1911, 736,125. Consult *Victoria History of the Counties of England*, vol. ii (London, 1907), and P. H. Ditchfield, *Memorials of Old Gloucestershire* (ib., 1911).

GLOUSTER, glōs'tēr. A village in Athens Co., Ohio, 15 miles north of Athens, on the Kanawha and Michigan, the Toledo and Ohio Central, and the Zanesville and Western railroads (Map: Ohio, G 6). The chief industries are coal mining and brickmaking. The water works and electric-light plant are owned by the village. Pop., 1900, 2155; 1910, 2527.

GLOUVET, glōv'vā, JULES DE. See QUESNAY DE BEAUREPAIRE, JULES.

GLOVAT'SKI, ALEXANDER. See GLOWACKI, ALEXANDER.

GLOVE (A.S. *glōf*; perhaps connected with Goth. *lōfa*, Icel. *lōfi*, Eng. *loof*, palm of the hand). A covering for the hand having a separate sheath for each finger, as distinguished from a mitten, in which there is a separate compartment for the thumb only. The glove is a very ancient article of dress. It has been found in the relics of the cave dwellers, made of leather and sewn with leather thread. Gloves were worn by the ancient Greeks, but chiefly as a protection for the hands in doing heavy work, rather than as an ornamental part of the dress. By the Romans they were worn as ornaments and were considered a sign of rank. While something in the form of a protection for the hands from cold must always have been needed by northern nations, gloves did not become an important article of dress until after the Norman Conquest. It is thought that the custom of carrying a pet falcon upon the wrist led to their general use. During the eighth and ninth centuries they were worn chiefly by persons of noble birth. Hence they were considered a sign of rank and were taken off, as a token of respect, before a superior or in churches. They were worn in the hat as favors and cast down as a challenge. By the sixteenth century gloves were worn by all classes, and then, as now, were made of silk, worsted, and leather. Those worn by the wealthy were most elaborately ornamented with embroidery and lace. As early as 1190 a guild of glove

makers was formed in France, which took upon itself the task of maintaining honest workmanship among glove makers and in introducing constant improvements in methods of manufacture. In Scotland the glovers of Perth were incorporated in 1165. Nearly five centuries later a company of glovers was organized in London, and that city has been an important centre of glove manufacture ever since. At one time glove making was an important industry in Ireland, and the famous "Limerick" glove was widely esteemed for its exquisite texture and workmanship. For many centuries France has excelled in the number and quality of gloves manufactured in some of her cities.

Glove Manufacturing in the United States. The manufacture of leather gloves in the United States is said to date back to the days of Sir William Johnson in New York State. In 1760 he induced several families of glove makers from Scotland to settle on his grants, who brought over with them their glove patterns, and the necessary needles and thread for glove making. Gloves continued to be made in this locality, and gradually the demand for them spread until by 1825 they had found a market in Albany and Boston. These early gloves, as compared with modern productions, were crude and clumsy. They were cut with shears from pasteboard patterns, the cutting being usually done by men and the sewing by women. Later, dies were introduced for cutting and were a great improvement. The invention of the sewing machine in 1852 marked the beginning of a new era in glove manufacture, and soon all hand work was superseded. Steam power for running the sewing machines was introduced in 1875. From the start glove making has been to a large extent a household industry, and it still gives employment to a large number of home workers. The cutting and the stitching on the backs are done at the factories before the gloves are sent out.

Glove-Making Processes. The term "kid" is a mere technicality, as the quantity of leather bearing this name yearly consumed is largely in excess of what could be supplied from the skins of all the young goats that are annually slaughtered. Gloves are largely made from lambskin. The finest gloves, however, are made from real kid, derived chiefly from Germany, Austria, Sweden, Brazil, Madagascar, France, and Bavaria. The younger the kid, the thinner, finer, and softer the glove. Lambskin is tougher and harder to work than kidskin, but it is said that none but an expert can tell the difference in their appearance. The so-called dogskin, buckskin, and doeskin gloves are made chiefly from sheepskin; some of the thickest kinds of leather gloves are made from calfskin. *Suedo* gloves are those in which the inside of the skin is used as the outside of the glove, the name being derived from the Swedish manner of making up gloves. *Glacé* gloves are made with the outside of the leather retained as the outside of the glove.

The leather in all cases undergoes a much lighter dressing than when used for boots and shoes. The skin having been freed from hair and cleaned, it is prepared for use by one of the three processes of dressing—tanning, tawing, or shamoying—described under LEATHER. For light dress gloves the skins are usually tawed. The leather is next broken or "staked" to render it pliable and even in texture. It is then colored, by painting lightly on the outside, two

or three coats, with a brush, so that the inside will not be affected by the coloring. White gloves are simply undyed gloves. When the dye is thoroughly dried, the superfluous color is removed and the surface rubbed with a size. The gloves are now "doled" on a marble slab, to remove the dirt and irregularities. After the leather has been properly prepared the gloves are cut out by means of dies. The die cuts out all the parts, including the gussets. A single glove consists of from 16 to 19 pieces. The large skins are used for ladies' evening gloves, but one pair of which can be made from a single skin, though ordinarily two pairs of ordinary gloves can be made from one skin. The scraps that are left, unless the skin was tanned, are used for glue. The first and fourth fingers are completed by gussets or strips sewed only on the inner side, but the second and third fingers require gussets on both sides to complete the finger. Besides these, small pieces of a diamond shape are sewed in at the base of the fingers, toward the palm of the hand. The stitching of the parts together, and also the ornamental stitching on the back of the hand, as required by fashion, is done by specially made sewing machines. The putting on of the thumb piece requires special skill and management, and badly made gloves commonly give way at this point.

In the American glove factories there are two classes of cutters, the block and the table cutters, the former of whom are engaged chiefly on the cheaper grades of gloves. The block cutter simply cuts out the glove with a die and hammer, from a skin which is laid on a block of wood. The table cutter first dampens his skin, stretches it to the fullest possible extent, and cuts off the length of a glove. He then stretches it again and cuts it to width, after which fingers are cut to shape with a die. A table-cut glove is more elastic and hence fits better than one cut on the block. The table cutters employed in America are mostly foreigners from the glove-manufacturing centres of Europe, and many of them come from families which for centuries have been engaged in the glove-making industry. To be a good cutter requires not only great experience, but natural dexterity and rare judgment in selecting leather so as to cut out the greatest possible number of gloves and yet avoid flaws.

Gloves not Made from Leather. The manufacture of woven and knit gloves is an entirely separate branch of the trade. Sometimes the material is first woven and then cut and made up similarly to the leather gloves, or they may be knit into shape by special knitting machines.

Statistics. The centre of the glove industry in the United States is still in Fulton Co., N. Y., in the vicinity where Sir William Johnson planted his first colony of glove makers. Of the 377 glove factories in the United States, in 1909, as reported in the *Thirteenth Census, Manufactures* (1913), 225 were in the State of New York, 156 being in Fulton County, which supplied 54.7 per cent of the total product. Its two principal cities, Gloversville and Johnstown, reported 87 and 54 establishments respectively. The remaining establishments are scattered over the entire country. These 377 establishments represented a combined capital of \$10,908,071, and they turn out an annual product valued at \$23,030,398. This business has shown a steady growth since 1850, when the first census report

of the industry was published. At that time there were already 110 glove factories in the country, with a capital of \$181,200 and an annual product of \$708,184. Of the 3,368,655 dozen pairs manufactured in 1909, all but 782,678 dozen pairs were men's gloves, as the finer grades of women's gloves are still chiefly produced in Europe. In 1913 the imports of gloves into the United States were valued at \$7,691,927.

Consult: Beck, *Gloves: Their Annals and Associations* (London, 1883); Frothingham, *History of Fulton County, N. Y.* (Syracuse, 1892); Côte, *L'Industrie gantière à Grenoble* (Paris, 1903); Pflüger, *Die Lederhandschuindustrie Deutschlands* (Heidelberg, 1908); Redmond, *The Leather Glove Industry in the United States* (New York, 1913); "Leather Glove and Mitten Industry," vol. x, *Manufactures: Thirteenth United States Census* (Washington, 1913).

GLOVE, THE. A story originally told (about 1550) by Pierre Ronsard, and later variously adapted by Schiller, Leigh Hunt, and Browning. It tells of a lady who tosses her glove into a lion's den and commands her lover to fetch it back. He springs down and, returning unharmed, hurls it in her face in scorn at her capricious cruelty.

GLOVER, JOHN (1732-97). An American soldier, prominent in the Revolutionary War, born in Salem, Mass. He removed to Marblehead when very young, was a shoemaker for a time, and then engaged in the fishing business. In February, 1773, he was chosen colonel of a militia regiment which upon the outbreak of the Revolution became a part of the continental army, as the Fourteenth Regiment, better known as the "Marine Regiment." On Oct. 4, 1775, he was placed in charge, with Stephen Moylan, of the equipment and manning of armed vessels and cruisers designed for service against the British, and until July, 1776, was stationed at Beverly, Mass. He then was ordered to New York, and on the night of August 28-29, after the battle of Long Island, conducted the transfer of the American army from Long Island to New York. He was placed in command of General Clinton's brigade on September 4, took part in the battle of White Plains, and on December 25 manned the boats in which Washington and his army effected the passage of the Delaware before the attack upon Trenton. On Feb. 21, 1777, he was appointed brigadier general by the Continental Congress and afterward took an active part in the campaign against Burgoyne; was placed in charge of the British prisoners on their march from Saratoga to Cambridge; took part in General Sullivan's Rhode Island expedition in July and August, 1778; was a member of the court which tried Major André and was officer of the day when André was executed; and in July, 1782, was retired on half pay. He returned to Marblehead and seems for a time to have worked as a cobbler again. In 1788 he was a member of the Massachusetts Convention which ratified the Federal Constitution. His orderly books and a letter book containing his Revolutionary correspondence are in the possession of the Essex Institute at Salem, Mass. Consult Upham, *A Memoir of General John Glover of Marblehead* (Salem, 1863), and Sanborn, *Gen. Glover and his Marblehead Regiment* (Marblehead, 1903).

GLOVER, JOHN (1787-1849). An English landscape painter, born in Leicestershire. He was self-taught in art, having been master of

the Appleby Free School from 1786 to 1794. He went to London in 1805 and joined the Water-Color Society, of which he became president in 1815. He received a gold medal at the Paris Exhibition in 1814, and in 1823 he took a prominent part in the foundation of the Society of British Artists. He went to Australia in 1831 and sent to England his sketches of native scenery, until his death in Tasmania. Glover was one of the earliest founders of the modern landscape school and of the English water-color school. He was an artist of some skill and originality, especially skillful in aerial perspective, but his work became mannered. He also painted in oils, but not with equal success. Among his water colors are views of "Tivoli," "Windsor Castle," and a "River Scene," in the South Kensington Museum. One of his best oil paintings is a "Landscape with Cattle," in the British Museum.

GLOVER, MRS. JULIA BETTERTON (1770-1850). An English actress, born at Newry. The daughter of an actor, she began to play juvenile parts about 1789. In 1795 she made her formal début as Marianne, in Reynolds's *Dramatist*. Her repertoire included Lydia Languish, Widow Green in *The Love Chase*, and the Queen in *Richard III*. Her last appearance on the stage was as Mrs. Malaprop, at Drury Lane only a few days before her death, July 16, 1850. Remarkable for her memory, she was during her middle life considered the best comic actress of the time and in later years was styled the "Mother of the Stage." Consult the memoir by Mrs. Wilson in *Our Actresses*, vol. ii (London, 1844), and Cook, *Hours with the Players* (ib., 1881).

GLOVER, RICHARD (1712-85). An English poet. He was the son of a London merchant, and after attending school at Cheam, in Surrey, he entered his father's business. In 1762-68 he sat in Parliament for Weymouth. Though he never attended either university, he acquired, it is said, a good knowledge of Greek. Be that as it may, most of his poems are founded on Greek subjects. In 1737 appeared his *Leonidas*, an epic in blank verse running through nine books, subsequently (1770) extended to 12 books. Once popular, the poem is no longer read. Its sequel, the *Athenaid* (30 books, 1787), it is hard to believe any one ever read. He wrote several heavy tragedies: *Boadicea* (1753), *Medea* (1761), and *Jason* (1769). His fame now rests upon the spirited "Ballad of Admiral Hosier's Ghost," founded on Hosier's disastrous expedition to Porto Bello (1726). For his poems consult Chalmers, *Works of the English Poets*, vol. xvii (London, 1810).

GLOVERSVILLE. A city in Fulton Co., N. Y., 54 miles northwest of Albany, on the Fonda, Johnstown, and Gloversville Railroad, and on the Erie Canal (Map: New York, F 4). It has a Carnegie library, Federal building, and the Nathan Littauer Hospital. Gloversville is the principal seat of the manufacture of gloves in the United States, its factories with those of the neighboring city of Johnstown controlling a large proportion of the entire production of the country. Besides gloves and mittens, there are extensive manufactures of glove and shoe leather, pocketbooks, and leather novelties. Settled during or just before the Revolution, Gloversville was known as Stump City from 1816 to 1832, when it received its present name. It was incorporated as a village in 1851 and

was chartered as a city in 1890. The government, under the revised charter of 1890, is administered by a mayor, elected biennially, and a council which confirms the executive's appointments to the Board of Health and elects all other officers, except standing committees, boards of civil service and plumbing, which are appointed by the mayor. The boards of education and water commissioners are chosen by the people. The city owns and operates its water works and sewage system. Pop., 1900, 18,349; 1910, 20,642; 1914 (U. S. est.), 21,618; 1920, 22,075.

GLOVE SPONGE, or **FINGER SPONGE** (so called from the branching shape). An inferior sort of commercial sponge (*Spongia officinalis*) which takes a bushy form, sometimes 2 feet high. It grows on hard bottoms all along the coast of Florida and Bermuda and is regarded as the poorest kind gathered, although closely related to the finest sort of sponge. See **SPONGE**.

GLOWACKI, gló-wits'kē, ALEKSANDER (1847-1912). A famous Polish writer, best known by his pseudonym "Boleslav Prus," under which he contributed popular feuilletons to the *Warsaw Courier* and the *Illustrated Weekly*. Collections of his works appeared under the titles *Tales* (1881), *Sketches and Portraits* (1885-86), *Early Tales* (1890), and in a complete edition in 1897. In his tales the humorous and lifelike portraits of children, peasants, and animals are peculiarly excellent. The best-known series of tales is *Placówka* (The Sentry), which deals with the national and economic conflict between the enterprising German colonists and the stubborn Polish peasant Slinak (Snail). *The Doll* (1891) is perhaps the most important of his novels, while *The Emancipated Women* is somewhat marred by mysticism. Among his last works was a novel entitled *The Children* (1900). His *Pharaoh* was translated into English as *The Pharaoh and the Priest* (Boston, 1902). His humor conceals a deep sympathy for the unfortunate, to which is added a masterful power of character analysis. Consult Konstanty Wojciechowski, *Boleslav Prus* (Cracow, 1913).

GLOWWORM. See **FIREFLY**.

GLUCASE (from Gk. γλυκύς, *glykys*, sweet). An enzyme also known as maltase, found in various species of yeasts, in some molds, and probably also in the seeds of germinating barley and other cereals. It is also found in various parts of animal bodies. The glucase prepared from cereals differs somewhat in its action from that obtained from fungi; the latter acts best at a temperature of 40° C., and the former is most active at 57-60° C. Glucase acts upon maltose, hydrolyzing it into two molecules of glucose. It has also been found to decompose certain glucosides. See **DIGESTION IN PLANTS**.

GLUCINUM (Neo-Lat., from Gk. γλυκύς, *glykys*, sweet), or **BERYLLIUM**. A metallic chemical element discovered by Wöhler in 1828. It is not found native, but occurs as a constituent of various minerals, such as beryl, chrysoberyl, and phenacite. Its existence as an oxide was recognized in beryl in 1798 by Vauquelin, but it was not until Wöhler obtained the impure metal by the action of potassium on fused glucinum chloride that the element itself may be said to have been isolated.

Glucinum (symbol, Gl or Be; atomic weight, 9.1) is a steel-colored, malleable metal that has a specific gravity of 1.93, and its melting point is about 1400° C. (about 2550° F.). It is

divalent and combines with oxygen, forming *glucinum oxide*, or *glucina*, GlO, a white infusible powder with a sweetish taste. However, on the basis of the composition of its organic compounds, Tanatar considers glucinum as a quadrivalent element. With copper and certain other metals glucinum forms alloys that have valuable properties; thus, a small percentage of glucinum renders copper sonorous; an alloy of 95 per cent copper and 5 per cent glucinum is malleable, takes a polish, and is not affected by the air.

GLUCK, glūk, ALMA (1886-). An American dramatic soprano, born at Bucharest, May 11, 1886. Her parents brought her as a child of five to New York. A gentleman who heard her sing was so much struck with the quality of her voice that he advised her to have it cultivated. Without any thought of a professional career she studied with Duzzi-Peccia in New York from 1906 to 1909. In the latter year her teacher induced her to sing for Mr. Gatti-Casazza, the director of the Metropolitan Opera House, who immediately offered her an engagement. She accepted, and made her debut as Sophie in Massenet's *Werther* in November, 1909. During that first season she sang 11 different rôles and instantly became a prime favorite with the public. At the same time she also appeared frequently in recitals with such success that she practically withdrew from the stage. In 1912 she went to Berlin and studied for one year under Madame Semblich (q.v.). In 1914 she married the violinist Efreim Zimbalist (q.v.).

GLÜCK, glūk, CHRISTIAN FRIEDRICH VON (1755-1831). A German jurist, born and educated at Halle. In 1784 he became professor of law in the University of Erlangen, Bavaria. His principal works are *Ausführliche Erläuterung der Pandekten* (34 vols., 1790-1830; continued by other scholars, 1832-93), which was begun to supplement Heffeld's *Elementa juris civilis* (1728), and *Handbuch zum systematischen Studium des neuesten römischen Privatrechts* (1812).

GLUCK, CHRISTOPH WILLIBALD (1714-87). A famous German composer and operatic reformer. He was born July 2, 1714, at Weidenwang, in the Upper Palatinate, where his father was forester to Prince Eugene of Savoy, and later to Prince Lobkowitz at Eisenberg. From 1726 to 1732 the boy attended a Jesuit seminary at Komotau, where he was taught singing, violin, cello, and organ. In the latter year he went to Prague to continue his musical studies and was compelled to eke out a livelihood by playing in the neighboring villages. While there, he heard and stored away in his memory many rustic tunes which later did service in his operas. Czernohorsky, noting his aptitude, took him as a pupil. In 1736 he went to Vienna, where, through the good offices of the Lobkowitz family, he met Prince Melzi. The latter became deeply interested in the young musician and took him to Milan, where Gluck continued his technical studies with Sammartini.

Gluck was 27 years old when his first opera, *Artaserse*, was produced at La Scala. *Artaserse* led to commissions for other works, and within five years Gluck produced eight operas. His fame having reached England, he went to London in 1745 at the invitation of Lord Middlesex and produced *La caduta de' giganti* in honor of the Duke of Cumberland's victories. The time, however, was inauspicious, and *The Fall*

of the *Giants* was withdrawn after only five performances. The performances of an earlier opera, *Artamene*, were more successful, while a *pasticcio*, *Piramo e Tisbe*, an opera loosely strung together from the best arias of his earlier works, met with a complete fiasco.

In 1748, Gluck's father having died and left him a small inheritance, he settled in Vienna, which remained his principal place of residence for the rest of his life. On May 14, 1748, in celebration of the Empress's birthday, he produced in the recently completed opera house *La Semiramide riconosciuta*, which achieved great success. The spring of 1749 found the composer in Copenhagen, where he was received with distinction and lodged in the royal palace, and where he produced a two-act serenade, *Tetide*, in honor of the recent birth of a Crown Prince (afterward Christian VII). In April of the same year he traveled in the guise of a Capuchin (for no other reason, it is believed, than to avoid trouble regarding passports) to Rome. There and in Naples he brought out a new two-act opera, *Telemacco, ossia l'isola di Circe*, which was attended with his usual success.

Shortly afterward Gluck returned to Vienna, where, in September, 1750, he married Marianne Pergin. They soon left Vienna for Naples, where he achieved great success with his opera *La clemenza di Tito*. In 1754, having produced, and again successfully, two operas, *Il Trionfo di Camillo* and *Antigone*, in Rome, the Pope created him Chevalier of the Golden Spur, and thereafter the composer, who set great store by this title, was always careful to call himself Ritter von Gluck. Previous to this visit to Rome he had been appointed by Count Durazzo conductor of the Opera at Vienna. His productivity in this office was great, including the composition of light operas whose librettos Durazzo secured from Paris, where they were brought out with music usually by Duni and Monsigny, while the Viennese heard the same librettos with music by Gluck. Meanwhile Gluck was growing steadily in intellectual breadth. He became more and more dissatisfied with the flippant conventionalities of the Italian opera of the day, though he himself had composed an appalling number of works in that style. About 1760 he met Raniero di Calzabigi, a real poet, who held very decided views as to the possibilities of music when wedded to a real drama. It was he who furnished Gluck with the libretto to *Orfeo ed Euridice*, the first of the "reform" operas, produced in Vienna, Oct. 5, 1762. This, his first great opera, is still a famous work. Though not immediately successful, *Orfeo* soon established itself in popular favor, not only in Vienna, but also in Italy, where, at Parma, Tronchetti was unable to obtain a hearing for his *Armida* because every one wanted to hear *Orfeo*. Gluck's other operas in his great style are *Alceste* (1767), *Paride ed Elena* (1769) (both on texts by Calzabigi), *Iphigénie en Aulide* (Paris, 1774), *Armide* (1777), and *Iphigénie en Tauride* (1779).

The production of *Iphigénie en Aulide* in Paris was an important event in Gluck's life. It led to the hotly waged and now historic contest between the operatic reformers headed by Gluck and those who championed the existing style of opera. The latter put forward Piccini to oppose Gluck, but Gluck was overwhelmingly victorious. In 1780 he returned to Vienna, but ill health prevented him from accomplishing

anything of importance, and he died in that city, Nov. 15, 1787. Gluck's reform of the opera was his greatest service to music. He found it marred by senseless embellishments, and a mere vehicle for the display of singers' voices; he left operatic music restored to its original purpose of expressing musically the meaning of the words to which it was composed and of emphasizing the dramatic situation, and in this reform the share of Calzabigi is scarcely less important than that of Gluck himself. In two prefaces, printed in the scores of *Alceste* and *Paride ed Elena*, the master explains his views in detail. Consult: A. B. Marx, *Gluck und die Oper* (Berlin, 1863); E. Newman, *Gluck and the Opera* (London, 1895); A. Reissman, *Christoph Willibald von Gluck* (Berlin, 1882); J. d'Udine, *Gluck, biographie critique* (Paris, 1906); J. Tiersot, *Gluck* (ib., 1910).

GLÜCKSBERG, DUKE OF. See DECAZES, L.

GLÜCKSTADT, glük'shtät. A town in the Prussian Province of Schleswig-Holstein, on the Elbe, 32 miles below Hamburg (Map: Germany, C 2). It is intersected by canals; has a Gymnasium, railway repair shops, shipyards, fruit and vegetable canneries, manufactures of furniture, wagons, mirrors, soaps, shoes, saddlery, bricks, cigars, etc. The fisheries are important. When the Elbe is icebound the harbor, which is large and deep, receives much of the Hamburg shipping. Glückstadt was founded in 1617 by Christian IV of Denmark, fortified, and endowed with various commercial privileges. During the Thirty Years' War it successfully withstood three sieges; its fortifications were demolished by the allies in 1815. Pop., 1900, 6586; 1910, 6555.

GLUCOSE (from Gk. γλυκός, *glykys*, sweet). Glucose is a carbohydrate, and it is customary to speak of this simple sugar also as dextrose and grape sugar. The latter name is given to it on account of its occurrence in the juice of the grape and of other ripening fruits and also to distinguish it from cane or beet sugar. It is also contained in honey. In the vegetable kingdom it is widely distributed, where it plays an important rôle in the economy of plant life. It is also found in the animal body, and the human blood may have as much as 0.1 per cent under healthy conditions.

The molecular formula of glucose is $C_6H_{12}O_6$, and it is called a carbohydrate because the molecule contains carbon, hydrogen, and oxygen, the H and O being present in the same proportion as in water (H_2O).

Glucose can be readily prepared from starch by hydrolyzing with dilute sulphuric or hydrochloric acid. It may also be prepared from cellulose and cane (sucrose), beet (sucrose), milk (lactose), or malt (maltose) sugar, but in most of these cases other sugars are split off with the dextrose. Thus cane or beet sugar when treated with an acid or the ferment invertase (present in yeast) yields equal parts of glucose and levulose. The name "invert sugar" is given to the products of hydrolyzation of cane or beet sugar. Levulose accompanies dextrose in the juice of fruits.

In appearance chemically pure glucose is white, and it is less sweet in taste than cane sugar. Unlike cane sugar, it never separates in well-defined, clear crystals from either water or alcohol. It is usually met with as a crystalline, crusty powder. It is very soluble in water and less so in ethyl and methyl alcohol.

Either glucose anhydride or hydrate crystallizes from strong concentrated aqueous or strong alcoholic solutions at temperatures of 30° to 40° C. and as hydrate from water at room temperature. The needle-like crystals of the anhydride melt at 140° C. and the hydrate at 80 to 100° C. (176° to 200° F.).

Glucose deflects the ray of polarized light to the right (dextrorotatory) and when first polarized shows a variable rotation (mutarotation), which rises or sinks to a constant level after a number of hours. Glucose reduces cupric hydroxide (mixed Fehling's solution) to copper oxide. This fact and the degree of polarization are utilized when determining glucose in foods, etc. Heating glucose with a decinormal sodium hydroxide solution for a number of hours at 37° C. destroys it. Cane sugar when present in the same solution is not decomposed, and this constitutes a method for separating cane sugar from glucose. By heating glucose at a temperature of 170° C. or over, it becomes brownish and loses much of its sweetness and is converted into glucosan ($C_6H_{10}O_5$). When heated between 200 and 220° C., it is converted into caramel, a brown coloring matter principally employed for coloring artificial vanilla extract, beers, whiskies, confectionery, etc.

On oxidation glucose yields three acids, viz., gluconic, glucuronic, and saccharic. Physiologically considered, glucuronic acid is the most interesting because it is frequently found in the urine combined with a variety of substances and in the sugar beet combined with a resin acid.

Under normal conditions glucose is rapidly oxidized in the animal body, to which it furnishes heat and energy.

Glucose is fermentable by the zymase contained in yeast and also by the ferments of some molds and bacteria. Before starch, malt, or cane sugar can be fermented, it is necessary to convert the first two into glucose, and cane sugar into glucose and levulose. Upon the fermentability of glucose by yeast the manufacture of alcohol, wine, beer, distilled liquors, cider, and bread depends. (See BEER.) Alcohol is not always the final product resulting from the fermentation of glucose, and in many cases lactic acid, acetic acid (see VINEGAR), and butyric acid are formed.

Commercial Glucose. The first person to prepare sugar from grapes was Proust (1800-01); but, according to Wichelhaus, Kirchhoff must be regarded as the real discoverer of the conversion of starch into glucose. According to Gaissicourt, however, Fourcroy and Parmentier in 1781 produced sugar from starch, but the value of the reaction was not appreciated at that time.

In the United States the term "glucose" to the brewer, candy maker, leather manufacturer, etc., has come to mean an almost transparent, sirupy liquid composed of dextrorotatory glucose, maltose, dextrin, and water prepared from cornstarch by heating with dilute acids. In Europe, especially in Germany, the product is usually prepared from potato starch and takes the name of starch sirup. Quite often cornstarch is prepared in the same establishment where glucose is manufactured, and here the two processes make up a large industry.

For the manufacture of glucose from corn, the grain is first softened by treatment, for two or three days, with water containing a small per-

centage of sulphurous acid, then coarsely ground, and then treated with "starch milk" (a mixture of starch and water) of such a density that the lighter embryos, or "germs," float on the surface, whence they are removed, while the heavier parts of the kernels sink to the bottom of the liquid. The "germs" are dried and sold for stock feed after the extraction by hydraulic pressure of the oil they contain. This oil is found in commerce under the name of corn oil, or maize oil. The parts of the kernel that sink are finely ground. The starch is thus set free, so that it can be separated from the ground grain by washing on sieves. It is afterward purified by successive mixing with water and sedimentation, or by deposition on "starch tables," over which the washings from the sieves are allowed to flow. The starch, which is much heavier than water and the impurities from which it is to be freed, collects at the bottom of the settling vats in a hard white layer which, when drained, is called "green starch" and is ready for conversion into glucose. The residue retained by the sieves and the nitrogenous matter, as well as the small amount of starch left in the wash waters, are collected, pressed, dried, and sold for stock feed. See GLUTEN MEAL AND GLUTEN FEED.

For converting the starch into glucose (hydrolysis), sulphuric acid is now very generally used. For certain products sulphuric acid in mixture with a minute quantity of nitric acid is employed. Hydrochloric and oxalic acids are also used for this purpose. The operation is conducted in steam-heated, closed copper "converters," under a pressure of two or three atmospheres (30 to 45 pounds per square inch). This high pressure greatly lessens the quantity of acid and time necessary for conversion. In the case of sulphuric acid from one to three pounds are used per 100 pounds of dry starch; in the case of hydrochloric acid only one-half to three-quarters of a pound of the concentrated acid is necessary. The starch is mixed with a considerable quantity of water before the acid is added; the time required for the conversion varies from 10 to 30 minutes, according to the character of the required product. By the action of the acid the starch is first converted into dextrin and maltose; by continued treatment these bodies are changed to dextrorotatory glucose. As the liquor comes from the "converter," the acid is neutralized with chalk or marble dust, if sulphuric acid is used, or with soda if hydrochloric acid is used. In the former case the gypsum, or sulphate of lime, formed crystallizes out and is separated by filtration; in the case of hydrochloric acid the neutralization product is sodium chloride (common salt). This product cannot be used for all purposes on account of its salty taste. The neutralized liquid is decolorized by filtration through boneblack and concentrated in vacuum evaporators to form a sirup.

Other products manufactured in glucose factories from starch are solid substances rich in dextrose (glucose) and containing a minimal amount of dextrin and maltose. These are the so-called grape sugars of commerce. In manufacturing these products the time required for heating with dilute acid is longer than for making glucose sirup. The products occur in the hydrous and anhydrous forms.

The following analyses of starch sugar products are taken from *Bulletin 66* of the Bureau of

Chemistry, United States Department of Agriculture:

COMPOSITION OF COMMERCIAL GLUCOSE AND STARCH SUGAR

DESCRIPTION	Water	Ash	Dextrose	Maltose	Dextrin
	Per ct.	Per ct.	Per ct.	Per ct.	Per ct.
Neutral glucose sirup . . .	18.00	.259	14.00	33.40	30.99
XXX glucose	18.31	.459	14.53	33.24	26.53
70 per cent sugar	18.56	.837	68.71	1.79	2.89
80 per cent sugar	10.34	.796	79.28	.90	3.68
Anhydrous grape sugar	6.18	.351	86.43	2.02	.88

According to the thirteenth census the amount of glucose manufactured during 1909 was 769,060,210 pounds, and its value was \$17,922,514. The grape sugar manufactured during the same year amounted to 159,060,478 pounds and had a value of \$3,620,816. In 1904 the money value for each of these commodities was \$12,352,616 (glucose) and \$2,254,745 (grape sugar).

Among the products of glucose factories those of greatest commercial importance are "mixing glucose," used by sirup and molasses manipulators; "jelly glucose," used in making jellies from evaporated apple juice and other materials; "confectioners' glucose"; "brewers' glucose," used as a substitute for malt in brewing; and "anhydrous grape sugar." Well-made glucoses must be regarded as a perfectly wholesome product, as they are composed of substances of frequent and abundant occurrence in foods that have been in use from time immemorial, and which are similar to the products into which starch is normally transformed by the processes of digestion. The objection to their use in the preparation of foods lies mainly in the fact that the consumer is frequently misled in regard to the value of the commodities containing them, and that they are frequently used in the fabrication of inferior, artificial or highly diluted, or otherwise adulterated goods.

Consult: Wagner, *A Practical Treatise on the Manufacture of Starch, Glucose, Starch-Sugar, and Dextrin*, translated by Frankel and Hutton (Philadelphia, 1881); Iiallock, *Bibliography of Starch-Sugar* (Washington, 1884); O. Hammarsten, *A Text-Book of Physiological Chemistry*, trans. by J. A. Mandel (New York, 1909); *Thirteenth Census of the United States Taken in the Year 1910: vol. a, Manufactures, 1909, Reports for Principal Industries*; E. F. Armstrong, *The Simple Carbohydrates and the Glucosides* (New York, 1912); H. Wichelhaus, *Der Stärkezucker* (Leipzig, 1913); B. Tollens, *Kurzes Handbuch der Kohlenhydrate* (ib., 1914).

GLUCOSIDE, glŭ'kō-sīd. A name given to a number of complex organic substances which occur principally in the plant kingdom. As a class, they are generally colorless, crystalline, bitter substances and can be obtained by extracting the plant with water or alcohol. They have the common property of yielding a sugar—usually glucose—when decomposed with either an acid or appropriate ferment, and one or more organic substances classed with the alcohols, aldehydes, phenols, etc. Thus, amygdalin found in bitter almond, the kernels of the peach, apricot, plum, and other stone fruits belonging to the Rosaceæ, when treated with the ferment emulsin, is decomposed into glucose, benzaldehyde, and hydrocyanic acid. In most cases the ferment which

hydrolyzes the glucoside is present in the same plant or seed, but in different cells. Glucosides which give off hydrocyanic acid, a strong poison, are termed cyanogenetic, and their detection is a matter of the utmost importance when they occur in beans used as a food for man and in animal fodders.

Digitonin, a glucoside contained in *Digitalis purpurea* (foxglove), a heart stimulant, on decomposition yields when decomposed (hydrolyzed) both glucose and galactose, while hesperidin, found in the unripe orange, and quercitrin, in the black oak (*Quercus tinctoria*), yield a pentose sugar called rhamnose.

Again salicin, a glucoside, the active principle of willow bark and used as a remedy against fever and rheumatism, is hydrolyzed by emulsin to glucose and saligen, and gaultherin, contained in *Gaultheria procumbens*, yields methyl salicylate, which is essentially oil of wintergreen. Sinagrin and sinalbin, found in black and white mustard respectively, when hydrolyzed by myrosin, yield mustard oils, glucose, etc.

The real biological function of glucosides in the economy of the plant is not known, but is suggested as protective. Many of the glucosides have been produced artificially. Consult Haas and Hill, *An Introduction to the Chemistry of Plant Products* (New York, 1913), and E. F. Armstrong, *The Simple Carbohydrates and the Glucosides: Monographs on Biochemistry* (ib., 1912).

GLUE (from OF. *glu*, bird lime, from Lat. *glus*, glue; connected with Gk. γλοιός, *gloios*, glue, Eng. *clay*). An inferior grade of gelatin, prepared on account of its adhesive qualities, for use in the arts and industries and particularly in the various branches of woodworking. A preparation of glue or other gelatinous material for glazing the surface of a textile fabric, paper, or other material is known as "size." With the development of the textile, paper, and allied industries, the use of glue as sizing has enormously increased the demand for this article and its consequent commercial importance. The best glue-making material is the corium, or true skin of the animal, that portion lying beneath the epidermis and inner layer of fat, which is also used for the manufacture of leather. The glue extracted from the bones of animals is inferior in adhesive qualities unless prepared by the acid process, which is expensive. The softer bones of an animal yield the better glue. Fish glue is made from the skin, scales, and muscular tissue of some of the larger fish, especially cod, and is, of course, a very different product from true isinglass (q.v.). In its adhesive powers it resembles hide glue, but it retains an offensive odor. The raw material of most glue factories is chiefly composed of the waste from slaughter-houses and from leather manufactories—the trimmings of hides and bones, and scraps of leather or pieces of old leather which was cured by some other process than tanning. Glue, however, cannot be made from material in which the slightest trace of tannic acid remains.

The method of glue manufacture varies with the character of the material employed. In making glue from hide the scraps are first limed, to facilitate the removal of adhering hair, flesh, and fat, as in the manufacture of leather (q.v.). This process requires from 10 to 40 days, after which the skins are washed and dried. Instead of lime, caustic soda or sulphurous acid is sometimes used for cleansing the glue stock. The

prepared stock is converted into glue by the application of heat, and the solution, separated from the impurities and foreign matter, is filtered off and concentrated, after which it is cooled in thin layers on flat surfaces. By an older method the pieces are placed in flat-bottomed copper boilers, which have perforated false bottoms placed a little above the true ones, to prevent the burning of the materials. The whole is kept at a gentle boiling heat until the gelatinous part has boiled out, and the mass of the material has sunk down into the fluid. The boiler is at first filled with soft water for two-thirds of its depth. The boiling is sustained until, by repeated trials of small quantities, the operator knows the fluid to be of the right consistency, when it is drawn off to the congealing boxes; a fresh lot of material is often added to the residue left in the boiler, and the process is repeated. Recently the use of steam, either indirectly in closed pipes or directly in perforated pipes, or else blown under high pressure directly into the closed vessel containing the mixture, has been found to expedite the process and improve the quality of the glue. After boiling, the glue is allowed to settle, or is strained through linen bags to free it from impurities. The waste thus recovered, consisting of fat, hair, and other matter, is utilized in the manufacture of fertilizers, while the glue itself is subjected to a process of drying. Drying is likely to prove a troublesome process, requiring great care, as the glue readily spoils at this stage. Once drying was accomplished in the open air, but recent practice is to place the glue in specially prepared drying rooms, where the temperature and humidity can be carefully regulated. The glue is dried in shallow wooden molds, or "coolers," and the tablets are laid in wire netting. Thence it is removed to a smooth-topped table, whose surface has been moistened to prevent sticking, and here it is cut, by means of wires, into pieces of the desired shape and size. Fish glue is made by a similar process of treating with hydrochloric acid, washing, liming, and boiling with water.

Bone glue is extracted by boiling the bones, which have been previously treated with a solution of hydrochloric acid, to remove the calcium phosphate. The powdered bones are kept in a solution of dilute hydrochloric acid for several days. They are then allowed to stand in lime water for a few hours, after which the gelatin is extracted by means of boiling water or steam, as in the preparation of hide glue. The calcium phosphate recovered from the bones is used as fertilizing material, and the fat is also utilized.

Liquid glue is prepared from a solution of dried glue by the action of nitric or acetic acid, which checks its tendency to gelatinize without diminishing its adhesive qualities. An excellent liquid glue may be made by mixing four parts of transparent gelatin, four parts of strong vinegar, one part of alcohol, and a small amount of alum. Consult Taggart, *The Glue Book* (Toledo, O., 1913).

The glue industry in the United States dates from 1837, when Peter Cooper produced the first American-made glue. Since that time it has developed steadily, and the thirteenth United States census of manufactures (1913) reported that in the year 1909 the glue industry embraced 65 establishments, employing an average number of 3265 wage earners, with an annual product valued at \$13,717,820—an in-

crease in the value of product from 1899 of 154.6 per cent. Illinois ranked first, in 1909, in the value of its product, supplying 27.5 per cent of the total, being followed by New York and Pennsylvania with 21.8 per cent and 14.0 per cent respectively. The 65 establishments had an aggregate capital of \$14,288,674, with aggregate expenses for the year of \$11,759,336.

A series of tests of ordinary glue were reported before the 1914 meeting of the American Society for Testing Materials by O. Linder and E. C. Frost. In making the tests they considered the principal qualities to be covered were: viscosity of the melted solution, strength of the cold jelly (judged by the fingers), odor, reaction, grease content, liability to foaming, ash, moisture, appearance. The method of testing was to glue a $2 \times 1 \times 1$ inch block between two $2 \times 1 \times 1\frac{1}{2}$ inch pieces, pressing together under 100 pounds' pressure for 12 hours, and after another 12 hours pushing the middle block from between the others on a testing machine. It was found that in the 25 samples tested the strength developed varied from 1100 to 1950 pounds per square inch for one part dry glue to three parts of water, and 60 to 70 per cent of this amount for a one to five glue. It was further found that prolonged heating of glue lowered its strength, and, if kept heated to 150° F. for 20 hours, a loss of from 20 to 45 per cent in strength was shown in testing. Consult: Davidowsky, *Glue, Gelatine, Cements, and Pastes* (Philadelphia, 1905); Lambert, *Glue, Gelatine, and their Allied Products* (London, 1905); Fernback, *Glues and Gelatine* (ib., 1907); Standage, *Agglutinants of All Kinds* (ib., 1907).

GLUE, MARINE. A waterproof cement made by dissolving one part of finely divided pure gum rubber in 12 parts of naphtha or benzine, adding 20 parts of powdered shellac, and digesting at a gentle heat until the shellac is dissolved. The hot fused mass is poured on plates of metal or stone, and allowed to cool in thin sheets. For use, it is melted and applied with a brush. Owing to its property of resisting moisture, it is much used in shipbuilding, to unite surfaces exposed to water, and is also valuable as a cement for glass, metal, and stone.

GLUGÆA BOMBYCIS, glō-jē'a bōm-bī'sis. A parasite of the silkworm, which formerly did immense injury to the silk industry of France.

GLUKHOV, glō'kōv. The capital of a district of the same name in the Russian Government of Tchernigov, situated on the Yemana, 180 miles south-southeast of Tchernigov (Map: Russia, D 4). The chief occupation is agriculture; the trade is insignificant. The town existed as early as the twelfth century and passed to Lithuania in the fourteenth century and later to Poland. It was the seat of the hetmans of Little Russia. Pop., 1897, 14,850.

GLUME, glōm (Lat. *gluma*, husk, from *glubere*, to peel, Gk. γλύφειν, *glyphein*, to carve). The characteristic bract which distinguishes the inflorescence of grasses, which on this account are often spoken of as "glumaceous plants." See GRAMINEÆ.

GLÜMER, glū'mēr, ADOLF VON (1814-96). A German soldier. He was born at Longfeld and, entering the Prussian army in 1831, won rapid promotion, participated in the Austro-Prussian War of 1866, and then was commander of the Thirty-second Infantry Brigade. In the Franco-German War he especially distinguished

himself, serving as a division commander at Spichern, Forbach, Gravelotte, and Metz, and taking a prominent part in the battle around Belfort. In 1873 he was Governor of Metz and retired from active service. In 1878 the German Emperor intrusted him with the task—which he had to give up in 1880—of unifying the Imperial army.

GLÜMER, CLAIRE VON (1825-1906). A German author, born at Blankenburg in the Harz Mountains and educated chiefly in France. Her translations include works of Swift, Daudet, George Sand, Turgenev, Tolstoy, and others. Among her novels and romances are: *Düstere Mächte* (1870); *Vom Weibstuhle der Zeit* (1882); *Junge Herren* (1890); *Es giebt ein Glück* (1897). The story of her childhood is told in *Aus einem Flüchtlingsleben* (1904).

GLUTEN (Lat., glue). One of the most important constituents of the varieties of grain used as food. It is obtained by mixing flour with water and thus forming a paste or dough. This paste is placed in a bag of fine linen and kneaded in water, which must be repeatedly changed, till it ceases to assume a milky appearance. A gray, tenacious, viscous, tasteless substance, having the appearance of birdlime, is left in the bag. This substance consists mainly of gluten, mixed with traces of bran starch and of oily matter. The gluten thus obtained from wheat and from rye is far more tenacious than that which is obtained from the other cereals, and it is the great tenacity of this constituent that especially fits these flours for conversion into bread. It is found, by analysis, that the proportion of gluten contained in wheat grown in hot countries is considerably higher than in wheat grown in colder countries; and the hard, thin-skinned wheats contain more of this ingredient than the softer varieties of the grain. The quantity of gluten usually found in flour varies from 8 to 15 per cent. Gluten in a moist state rapidly putrefies, the mass acquiring the smell of decaying cheese; but when dry, it forms a hard, brownish, horny-looking mass, that does not very readily decompose. Gluten is composed mainly of two protein substances, *gliadin* and *glutenin*, which are present in approximately equal quantities. The action of gluten in the manufacture of bread is probably a double one; it induces, by constant action, an alteration of the starch, and subsequent fermentation, while by its tenacity it prevents the escape of carbonic-acid gas.

The large quantities of gluten obtained as a by-product in the manufacture of starch are at present utilized for the manufacture of certain articles of food. The cohesive properties of gluten are destroyed, or rather suspended, by the action of dilute acids or alkalis, but are restored again by the addition of salts. Wet gluten, when first extracted, contains two parts by weight of water for every one part of true gluten.

GLUTEN MEAL AND GLUTEN FEED. By-products resulting in the manufacture of starch or glucose from the starch of the corn kernel. Their principal use is as a feeding stuff for farm animals. The products differ greatly in composition according to the process of manufacture which is followed. Gluten feed is the entire residue of the kernel, including the germs and hulls. Gluten meal, cream gluten, and similar materials sold under a variety of trade names, do not contain the corn hulls. Some fac-

tories extract a part of the fat from the gluten meal; others mix the gluten meal with the hulls and germs without extracting the fat and sell it as gluten feed. The dried products from the same factory vary considerably in composition from time to time, so that although a very large number of samples of gluten meal and feed have been analyzed by the experiment stations, no very constant figures can be given for percentage composition. In general, the gluten meals are richer than the gluten feeds. These meals contain from 20 to 40 per cent of protein, the average being about 30 per cent, and from 6 to 20 per cent of fat, with an average of nearly 12 per cent. The carbohydrates constitute about 45 per cent, and the fibre varies with the completeness of the separation of the hulls, rarely amounting to over 3 or 4 per cent. The gluten feeds usually contain about 24 or 25 per cent of protein, although the product from some factories has been below 20 per cent and of others over 30 per cent. The fat varies less than in gluten meal, averaging about 10 per cent; and the carbohydrates are higher, averaging over 50 per cent. Like other corn products, none of these materials contain much ash—less than 1 per cent usually.

Gluten meal and feed are both quite digestible, from 85 to 90 per cent of the protein, 90 to 95 per cent of the carbohydrates, and 85 to 95 per cent of the fat being digested by ruminants. They are highly prized as feeding stuffs, especially for dairy cows, and are now very extensively used over the northeastern part of the United States. Gluten meals, when fed to cows in considerable quantity, cause a slight softening of the butter, but give a product of good quality. Gluten meal is also a satisfactory feed for fattening steers and for pigs.

GLUT HERBING. A "river herring" (*Clupea estivalis*), closely related and similar to the alewife and often confused with it in the market, although considered inferior. It is more commonly known on the New England coast as "blueback."

GLUTIN. See GELATIN.

GLUTTON. The English name for the European representatives of the circumpolar carnivore known in North America as the wolverine (*Gulo luscus*). The fables to which it owes its name, and the equivalents in all European languages, are sketched and considered by Dr. Elliott Coues in his *Fur-Bearing Animals* (Washington, 1877). In the early books about animals this denizen of forests, popularly supposed to be more or less filled with hobgoblins anyhow, was represented as a ravenous monster of insatiate voracity, matchless strength, and supernatural cunning. For the real character of the animal whose name perpetuates these foolish calumnies, the reader is referred to the article WOLVERINE, and the Plate of FUR-BEARING ANIMALS.

GLYCE'RIA. See MANNA GRASS.

GLYCERIN, glis'er-in, **GLYCEROL**, glis'er-ol (from Gk. γλυκερός, *glykeros*, sweet, from γλυκός, *glykys*, sweet), or PROPENYL ALCOHOL, C₃H₅(OH)₃. An organic chemical compound, used for a variety of purposes in the arts and in medicine. Perfectly pure glycerin is a crystalline solid substance melting at 17° C. (62.6° F.); but the merest traces of impurities prevent it from crystallizing, and it is therefore usually obtained in the form of a thick sirupy liquid that boils at 290° C. (554° F.). Small

quantities of salts cause it to decompose to some extent when distilled. Glycerin mixes in all proportions with water and alcohol and readily absorbs moisture if exposed to the air, but, owing to the three hydroxyl groups contained in its molecule, it does not mix with ether, chloroform, carbon disulphide, benzene, and many other organic liquids. On the other hand, it forms an excellent solvent for a variety of substances, both inorganic and organic. It is colorless and odorless, but has a distinctly sweet taste. Its specific gravity at 15° C. (59° F.) is 1.265. Glycerin is obtained in large quantities in the manufacture of soap and of candles. It is well known that natural fats are largely used in the manufacture of these products, and as fats consist mainly of glycerides, i.e., compounds of glycerin with fatty acids, glycerin is set free when the fats are decomposed, or "saponified." It is thus obtained, in more or less dilute aqueous solution, through the saponification of fats with lime or with superheated steam. To separate the glycerin from the dilute solution, the latter is somewhat concentrated by evaporation, filtered through boneblack, and then further evaporated *in vacuo*. To render it fit for use in medicine and in the manufacture of nitroglycerin, the product thus obtained is further purified by distillation with superheated steam before it is brought into the market. Finally, to eliminate, for scientific purposes, the last traces of impurities in the commercial product, the latter may be again mixed with water, filtered through carefully purified boneblack, and evaporated *in vacuo*. In medicine glycerin is used chiefly as a vehicle for applying externally many substances, such as the alkalies, neutral salts, bromine, iodine, alkaloids, tannic acid, etc., the glycerin solutions of which are readily absorbed by the skin. If injected into the rectum, glycerin relieves constipation, its action being speedy, painless, and followed by no constitutional disturbance. Very large doses of glycerin taken internally are liable to cause loss of muscular strength, lethargy, and even death. In the arts glycerin is employed mainly in the manufacture of nitroglycerin, from which many valuable modern explosives are made; nitroglycerin is the trinitrate of glycerin, $C_3H_5(NO_3)_3$, obtained by the action of a mixture of nitric and sulphuric acids on glycerin. Glycerin is further used as a preservative fluid for small and delicate anatomical preparations and has been applied to the preservation of meat and other foods; it has been added to the water in gas meters, with the view of preventing it from freezing in winter and from evaporating too rapidly in summer. It is also used in the manufacture of toilet soap, of parchment paper, and of printers' rollers, in the textile industry, etc.

Chemically glycerin is a triatomic alcohol, its constitutional formula being $CH_2(OH).CH(OH).CH_2(OH)$. When the hydrogen of its hydroxyl groups is replaced by metals or by organic acid radicals, alcoholates or esters respectively are obtained. Fats are mixtures containing, in various proportions, mainly the esters which glycerin forms with oleic, palmitic, and stearic acids. The hydroxyl groups of glycerin may be readily replaced by chlorine or bromine, one or two atoms of chlorine being thus substituted by the direct action of hydrochloric acid, while the third hydroxyl group may be replaced by chlorine by the action of

phosphorus pentachloride. Besides the method described above, by which glycerin is made on an industrial scale, it may be prepared by the action of potassium permanganate on allyl alcohol, and it is produced in small quantities during the alcoholic fermentation of sugars. By the action of acid potassium sulphate or other dehydrating agents on glycerin, or simply by distilling impure glycerin under ordinary atmospheric pressure, acrolein is produced according to the following chemical equation:

Glycerin Acrolein Water

When carefully oxidized with dilute nitric acid, glycerin is transformed into glyceric acid, $CH_2(OH).CH(OH).COOH$. Usually, however, the products of oxidation of glycerin are oxalic, carbonic, and glycollic acids.

Glycerin was discovered by Scheele in 1779; Chevreul demonstrated its existence, in the form of glycerides, in the fats; its composition was determined by Pelouze, and its chemical constitution by Berthelot and Wurtz. Finally, Charles Friedel, in collaboration with Silva, succeeded in effecting the complete synthesis of glycerin from its chemical elements; their method, however, is too complicated to be described here.

Imports of glycerin into the United States are about 35,000,000 pounds annually, valued at about 12 cents per pound. In 1913 imports were 34,414,000 pounds, chiefly from France and England.

GLYCERRHIZA, glis'ēr-rī'zā. See LICORICE.

GLYCINE (from Gk. γλυκός, *glykys*, sweet), GLYCOCINE, GLYCOCOL, SUGAR OF GELATIN, or AMINO-ACETIC ACID, $CH_2(NH_2)COOH$. An organic chemical compound of carbon, hydrogen, oxygen, and nitrogen, discovered by Braconnot in 1820. It forms colorless, transparent, rhombic prisms, which have a sweet taste and are devoid of odor. It is very soluble in water, but is insoluble in alcohol and in ether. Glycine combines both with acids (as hydrochloric, nitric, sulphuric, and oxalic acid) and with metallic oxides, and the compounds in both cases are soluble and crystallizable; they are, however, of no great importance. Glycine is usually prepared by subjecting hippuric acid to prolonged boiling with hydrochloric acid, benzoic acid being produced at the same time. It is also sometimes prepared synthetically, by the action of ammonia, or ammonium carbonate, upon monochloroacetic acid, according to the following chemical equation:

Monochloro-
acetic acid

Ammonia

Glycine

Ammonium
chloride

Glycine exists in the animal body only in combination; it is one of the chemical components of hippuric acid and glycollic acid, two substances of considerable physiological importance. It is, further, one of the products obtained by boiling gelatin with acids or with alkalies and is produced also when uric acid is subjected to the action of hydriodic acid.

GLYCOCINE. See GLYCINE.

GLYCOCOL. See GLYCINE.

GLYCOGEN (from Gk. γλυκός, *glykys*, sweet + γένεσις, *-genesis*, producing, from γίγνεσθαι, *gignesthai*, to be born), or ANIMAL STARCH.

An organic substance found in small amounts in all tissues of the body, lymphoid, blood, and pus cells. In larger quantities it is found in the liver of mammals, particularly after the ingestion of large quantities of carbohydrate food. It is also found in large amounts in the muscles of mollusks, oysters, clams, and scallops.

Glycogen is a carbohydrate closely related to the starches or dextrins, with the general formula $(C_6H_{10}O_5)_n$. It forms an amorphous, white, tasteless, and inodorous powder. With water it gives an opalescent solution which is dextrorotatory, the specific rotation being $[\alpha]_D = +196.57^\circ$. The solution is colored wine red by the addition of iodine. Glycogen is separated out of its solutions by various reagents, such as, barium hydrate, acetic acid, tannic acid, and phosphotungstic acid. It may be salted out of its solutions by means of either magnesium sulphate or ammonium sulphate. Boiling with dilute mineral acids converts glycogen, like starch, gradually into dextrose. This is also accomplished by diastatic enzymes present in various plant and animal tissues and animal secretion. Yeast does not ferment glycogen into alcohol. This is, however, accomplished by yeast press juice which contains diastatic enzymes which first convert glycogen into dextrose. The conversion of glycogen into dextrose may also be accomplished by photocatalysis and by electrolysis. The heat of combustion of glycogen has been determined for 1 gram = 4190 cal., and for 1 gram molecule = 678.9 cal. It may be prepared by plunging into boiling water, immediately after death, the liver of an animal (rabbit) which has been fed on large amounts of carbohydrates. The organ is then macerated and boiled several times with fresh water. The combined filtered extracts are concentrated and allowed to cool. The proteids are removed from it by alternate precipitation with potassium mercuric iodide and hydrochloric acid. From this solution the glycogen is precipitated by the addition of large volumes of alcohol. The uses of glycogen in the animal economy are noticed in the article LIVER (q.v.).

GLYCOL (from *glyco*-er in + *alcohol*), or more properly, **ETHYLENE GLYCOL**, $C_2H_4(OH)_2$. A thick liquid, having a sweet taste and boiling at 197.5° C. (387.5° F.). It cannot be mixed with ether, owing to the two hydroxyl groups (OH) contained in its molecule; but mixes in all proportions with water and ordinary alcohol. It may be prepared by heating ethylene dibromide with an aqueous solution of potassium carbonate, evaporating the resulting solution at a gentle heat, extracting the semisolid residue with a mixture of alcohol and ether, and subjecting the solution thus obtained to fractional distillation. Ethylene glycol is the simplest substance of the group of glycols, or diatomic alcohols, a general description of which may be found under ALCOHOLS. A detailed account of the glycols was given by their discoverer, Adolphe Wurtz, in a lecture delivered before the Chemical Society of Paris. Consult Pasteur, Cahours, Wurtz, etc., *Leçons de chimie professées en 1860* (Paris, 1861).

GLYCOLIC ACID, or **HYDROXYACETIC ACID**, $CH_2(OH).COOH$. A compound of carbon, hydrogen, and oxygen, which is at once an acid and a primary alcohol. It may be prepared from monochloroacetic acid by boiling a concentrated solution of its potassium salt in water for a number of hours, then distilling off

most of the liquid under reduced pressure, and diluting the residue with acetone: at first potassium chloride separates out, but after that the filtered mother liquor deposits a mass of crystals of glycolic acid. Pure glycolic acid melts at 78.9° C. (174° F.). Glycolic acid is contained in beet juice and is the principal acid constituent of sugar-cane juice.

GLYCON (Lat., from Gk. Γλυκων, *Glykōn*). An Athenian sculptor, who lived probably in the first century A.D. He executed the celebrated colossal marble statue of the Farnese Hercules, discovered in the baths of Caracalla in 1540. After adorning the Farnese Palace for some time, it was removed to the Royal Museum at Naples. It represents the hero resting on his club after one of his labors and is supposed to have been copied from the Heracles of Lysippus (q.v.). No ancient writer mentions Glycon, but ΓΑΥΚΩΝ ΑΘΗΝΑΙΟΣ ΕΠΙΘΙΕΙ (Glycon, the Athenian, made it) is engraved on the rock which supported the statue. Consult Brunn, *Geschichte der griechischen Künstler* (Brunswick, 1853), and E. A. Gardner, *A Handbook of Greek Sculpture* (London, 1911).

GLY'COSURIA (Neo-Lat., from Gk. γλυκός, *glykys*, sweet + *ούρον*, *ouron*, urine). A symptom of diabetes mellitus. See DIABETES.

GLYKAS, MICHAEL. A Byzantine historian. Little is known of his life. His *History of the World*, from the earliest times to 1118, is a valuable work of reference and contains many interesting references to theological and other matters. The best edition of the work was published by Bekker (Bonn collection, 1836). Glykas is said to have been imprisoned and blinded about the middle of the twelfth century. A poem, containing nearly 600 verses, addressed to the Emperor Manuel Comnenus, is valuable as one of the earliest examples of vulgar Greek.

GLYN, ELINOR (?-). An English novelist, daughter of Douglas Sutherland, of Toronto, Ontario. In 1892 she married Clayton Glyn, of Harlow, Essex. She made Paris her residence. Among her published books are: *The Visits of Elizabeth* (1900); *The Reflections of Ambrosine* (1902); *The Damsel and the Suge* (1903); *Vicissitudes of Evangeline* (1905); *Beyond the Rocks* (1906); *Three Weeks* (1907); a great success because of its almost scandalous audacity; *The Sayings of Grandmama* (1908); *Elizabeth Visits America* (1909), with the author's impressions of the United States; *His Hour* (1910); *The Point of View* (1913; called *The Contrast* in England); *The Sequence* (1913); *Your Affectionate Godmother* (1914).

GLYNN, JOHN (1722-79). An English politician and lawyer. He studied at Exeter College, Oxford, but got no degree. Called to the bar in 1748, he soon became famous for his wide knowledge of law and for his radical position in politics. He was the valuable friend and adviser of John Wilkes, and acted for him in many cases. Wilkes said of Glynn, "He was a Wilkite, which I never was." In 1772 he was counsel for an alderman named Townsend in a suit against a land tax, in which he urged the nullity of Parliament on the ground of irregular elections. In 1768 he was elected to Parliament after an exciting campaign, marked by much violence and corruption; in the next year he presented the Middlesex petition, and in 1770 urged a committee to inquire into cases in regard to the press.

GLYNN, MARTIN H. (1871-1924). An American public official, born at Kinderhook, N. Y. He graduated from St. John's College, Fordham, in 1894, and in the following year became managing editor of the *Albany Times-Union*. He served in the 56th Congress (1899-1901), and was comptroller of New York State (1906-08). He was elected Lieutenant Governor in 1912, and on Aug. 14, 1913, became acting Governor, although William Sulzer (q.v.) still continued in the duties of that office; but after Sulzer was removed by the Court of Impeachment Glynn assumed full control, Oct. 18, 1913. He received the degree of LL.D. from Syracuse University in 1914. After he became Governor, Glynn frequently reiterated his early statement that he was independent of Tammany Hall, and he claimed to have effected great economies in the State government. In 1914 he was successful in the direct primaries, winning the Democratic gubernatorial nomination in a contest with John A. Hennessy (q.v.). Though supported by both Tammany and the Wilson administration, Glynn was defeated, in a Republican landslide, by Charles S. Whitman.

GLYNNE, SIR JOHN (1603-66). An English jurist and Parliamentarian. He was born at Glynllifon, Carnarvonshire, and was educated at Westminster School and Oxford. Called to the bar in 1628, by 1639 he was a leading member of the famous Long Parliament and shared in the impeachment of Strafford. He was recorder of the city of London for six years (1643-49) and retired on an annual pension of £300. Though a stout adherent of Cromwell and a most able prosecutor of his would-be assassins, Glynne was no Republican and urged the Protector to call himself King. After the Restoration he devoted his great abilities as judge and advocate to the service of Charles II, bringing to trial some of his former associates. But he was no ordinary turncoat, though he so figures in Pepys's *Diary* and in *Hudibras*, and he remained true throughout to the Presbyterian party.

GLYOXYLIC ACID, $\text{CHO} \cdot \text{COOH}$. A compound of carbon, hydrogen, and oxygen, found in various fruits, including unripe apples, currants, grapes, and gooseberries. Chemically it is closely related to glycollic acid (q.v.) and is at once an aldehyde and an acid. In its salts, however, its aldehyde group is changed by hydration to the usually unstable group $\text{CH}(\text{OH})$. Crystalline glycollic acid, too, has been shown to have the formula $\text{CH}(\text{OH})\text{COOH}$.

GLYPTICS. The art of engraving, particularly as applied to the carving of precious stones. It is now generally performed by means of diamond dust and diamond-pointed instruments. In addition to gems the engraving of various substances, such as coral and ivory, and unusually hard woods, such as box and ebony, is included under this head. See **ENGRAVING**; **GEMS**; **INTAGLIO**.

GLYPTODON (Neo-Lat., from Gk. *γλυπτός*, *glyptos*, carved + *ὀδός*, *odous*, tooth, in allusion to the sculptured grinding surface of the teeth). A gigantic extinct edentate mammal allied to the armadillo, and of which fossil remains are found in the Pleistocene deposits of South America and less commonly in Mexico, Texas, and Florida. The animal had a solid carapace made up of mostly hexagonal plates arranged in transverse rows, like those of the armadillo, but solidly united, so that the creature was

unable to curl up. These bony plates were often ornamented by grooves or tubercles and were covered by horny epidermal scales. The tail also was incased in a sheath of strongly nodular bony plates. The head likewise had, in some species, a coat of mail of small plates. The skull is high, narrow, and short, with a peculiar long process descending from the zygomatic arch. Both the jaws have eight molar teeth on each side, each of which is divided into three vertical prisms by two deep lateral grooves, and the form of the crown sculpturing is very peculiar. The legs are heavily built, the feet large, and the fingers are short and armed with thick hooflike claws. The latter character shows that the animal could not have been a burrower like the armadillo. The best-known species is *Glyptodon clavipes* of the Pleistocene beds of Argentina, which attained a length over all of about 17 feet. An allied genus is *Dadiacurus*, of even larger size than *Glyptodon*, with a smooth carapace pierced by many cavities, and a longer tail formed of five or perhaps six movable rings, terminated by a club-shaped tube, which seems to have borne movable spines or bosses at its extremity.

Consult: Huxley, "On the Osteology of the Genus *Glyptodon*," *Collected Memoirs*, iii (London, 1898); Lydekker, "The Extinct Edentates of Argentina," in *Anales de Museo de la Plata, Paleontologia Argentina*, vol. iii, part ii (La Plata, 1894); Scott, *A History of Land Mammals in the Western Hemisphere* (New York, 1913). See **EDENTATA**.

GLYP'TOTHE'CA, or **GLYPTOTHEK'** (Ger., from Gk. *γλυπτός*, *glyptos*, carved + *θήκη*, *thékē*, chest). A building or room for the preservation of sculpture. Such buildings were common in ancient times. Cicero gives a minute description of one. The most famous modern gallery of sculpture called by this name is the Glyptothek in Munich (q.v.); another is the Ny-Karlsberg Glyptothek in Copenhagen.

GMELIN, GMA'ËN, CHRISTIAN GOTTLIEB (1792-1860). A German chemist, born in Tübingen, and for many years professor of chemistry and pharmacy in the university of his native city. His discovery of the artificial preparation of ultramarine was highly important in its bearing on manufacturing industry. His principal work is entitled *Hinleitung in die Chemie* (1833-37).

GMELIN, JOHANN GEORG (1709-55). A German botanist. He was born in Tübingen, was educated in the university there, and in 1731 became professor of chemistry and natural history at St. Petersburg. In 1733, by order of the Empress Anne, he joined Deslisle, (I. F. Müller, and Bering in an expedition for the exploration of Siberia, which country they penetrated as far as the Lena. He returned to St. Petersburg in 1743. In 1749 he was chosen professor of botany and chemistry at Tübingen. He published *Flora Sibirica* (1747-69) and *Reise durch Sibirien* (1751-52). Linnaeus named a genus of plants (*Gmelina*) in his honor.

GMELIN, LEOPOLD (1788-1853). A German chemist. For several generations members of the Gmelin family have distinguished themselves in science. Leopold's father, Johann Friedrich, held professorships of natural history and medicine at Tübingen and Göttingen. Leopold was professor of medicine and chemistry at Heidelberg from 1817 to 1851. In 1820 he undertook, in conjunction with Tiedemann,

a series of experiments on digestion, and in 1826 they published their celebrated work on the subject, in two volumes, under the title *Die Verdauung*. Gmelin is famous chiefly, however, for his admirable and elaborate *Handbook of Chemistry* (1817-19), which was subsequently revised and enlarged by Kraut; Gmelin-Kraut's *Handbuch* is well known to every student of chemistry. An English translation of the work (under the auspices of the Cavendish Society), with important additions by Watts, the translator, was published in the course of 1848-59. Consult obituary in the *Journal of the Chemical Society* (London, 1855).

GMELIN, SAMUEL GOTTLIEB (1743-74). A German botanist and traveler, nephew of J. G. Gmelin. He was born in Tübingen, graduated there in 1763, went to St. Petersburg in 1767, and in 1768, with Gölldenstadt and Lapuchin, entered on a journey for the scientific exploration of the southeastern possessions of Russia. When on his way back to St. Petersburg, he was seized as a hostage by Usmei Khan, of the Kaitak tribe, and died from the results of his ill treatment. He published: *Historia Fucorum* (1768); *Reisen durch Russland* (1771-84); and other works.

GMELINA, mēl'ī-nā or mē-lī'na (Neo-Lat., named in honor of the German traveler J. G. Gmelin, 1709-55). A genus of trees of the family Verbenaceæ, with heart-shaped leaves and panicles of flowers consisting of a small four or five toothed calyx and a large obliquely bell-shaped corolla. *Gmelina arborea*, called goombar or koombar in Hindustan and the Eastern Peninsula, where it is widely distributed and attains a great size, is valuable for its timber, which resembles teak, but is closer in grain and lighter. It is used for many purposes, such as foundations for buildings, decks of boats, Venetian blinds, picture frames, etc. It bears exposure to water better than do most kinds of timber. This tree has been successfully grown in the south of Florida and in California. In Australia there are two species that yield important timber—*Gmelina macrophylla* and *Gmelina leichhardtii*. The latter attains a height of 120 feet, with a diameter of 4 feet, and is one of the most valuable timbers of the country, where it is known as beech or white beech, although it is in no way related to the white beeches of Europe and America. The sapwood of the former species is mottled, heavy, close-grained, and valuable.

GMÜND, gmünt. A town of the German Kingdom of Württemberg, situated in the beautiful valley of the Rems, about 32 miles southeast of Stuttgart (Map: Germany, C 4). It was formerly an Imperial city, and its walls and towers still remain. The most noteworthy churches are the Romanesque church of St. John and the fourteenth-century church of the Holy Cross, with a sculptured portal and a carved altar. The thirteenth-century Dominican monastery of Gotteszell is now used as a prison, and the church of St. Salvator, hewn in a cliff outside the town, is visited by many pilgrims. Gmünd has a Gymnasium, a trade school in working the precious metals, and a Catholic teachers' seminary. The manufactures are wooden and iron articles, bronzes, cigars, chronometers, wax goods, flour; but the chief industry is making jewelry and other gold and silver goods. Gmünd, first mentioned in the

eleventh century, became an Imperial free city in the thirteenth century and retained its independence until 1803. It is the birthplace of Heinrich von Gmünd, one of the architects of the Milan Cathedral. Pop., 1900, 18,699; 1910, 21,270.

GMÜND, VON. A German family of stone cutters. For the more important members, see **PARLER, PETER**.

GMUNDEN, gmün'den. A favorite summer resort and watering place of Upper Austria, charmingly situated at the north end of Lake Traun, 1395 feet above sea level, about 50 miles northeast of Salzburg (Map: Austria, C 3). It has a seventeenth-century Catholic church with a fine carved wood altar; a new sanatorium, a Gymnasium, and a brewery. It is well built and lighted by electricity, and has beautiful promenades and many handsome villas in the environs, which offer many chances for excursions. Pop., 1900, 7126; 1910, 6699.

GNAT, nāt (AS. *gnæt*). A name applied to several kinds of small flies and in England to mosquitoes. Having been replaced by "mosquito," the word is becoming obsolete in North America. The commonest form to which it is still applied are the fungus gnats (Mycetophilidæ) and the gall gnats of the family Cecidomyiidae. The fungus gnats are mosquito-like, but are easily recognized by the great length of the coxal (or uppermost) joint of the leg. They are found in great numbers on fungi and around decaying vegetable matter found in damp places. They can leap actively as well as fly. The gregarious larvæ live in such vegetable matter. In some species the larvæ before pupating will form a marching army in which the individuals are four to six deep. The gnats of the dipterous genus *Sciara* frequently swarm in houses during summer evenings. The gall gnats have the body and wings covered with long hairs, that are easily lost. The larvæ are small maggots, often bright-colored, and live in plants, in which they form galls. The Hessian fly that infests wheat belongs here, and also the resin gnat that infests pine. See **FUNGUS GNAT**; **GALL GNAT**; **MOSQUITO**; **BLACK FLY**.

GNAT CATCHER. A small insectivorous bird, related to the Old World warblers, and peculiar to America, especially to Central and South America. About 15 species are known, of which three reach the United States. The coloration is bluish ash, paler below; tail black and white. They are said to be good singers. The commonest species is the blue-gray gnat catcher (*Poliophtila ocerulea ocerulea*), which is found in the southeastern United States, in summer breeding as far north as southern Pennsylvania and New Jersey, from the Atlantic to the Pacific. It breeds throughout its range, making a singularly beautiful nest in the form of a tiny cup, set upon the upper side of a lofty tree limb, and coated with lichens until it simulates a mossy excrescence. A western subspecies occurs on the Pacific coast and two other species are found in the southwestern United States, near the Mexican border.

GNATHO, nā'thō. A sycophant in Terence's *Eunuchus*, and in later comedy the typical name for a parasite.

GNATHOBDELLIDA, nūth'ōb-dēl'lī-dū (Neo-Lat. nom. pl., from Gk. γνάθος, *gnathos*, jaw + βδέλλα, *bdella*, leech). The order of worms of the class Hirudinea which includes those leeches

that have no proboscis, as the common parasite leech, the horseleech, the land leech, and related forms. See LEECH.

GNATIA, nā'shī-ā, or **EGNATIA**, ēg-nā'shī-ā. An ancient town in southern Italy, on the Adriatic Sea, 38 miles southeast of Barium (see BARI), mentioned by Horace, *Satires*, i, v, 97, in his account of his journey from Rome to Brundisium, as lacking in good water, and as the seat of a supposed fire miracle (consult Pliny, *Historia Naturalis*, ii, 107, 240). In Roman times the town had a lively trade because of its position on the sea and at the junction of important roads. The ancient city, which some locate near Monopoli, others at Torre d' Anazzo, near Fasano, has disappeared, but important finds have been made in its tombs; these are to be seen in the museum at Bari. Consult the article "Gnathia," in Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

GNATSNAPPER. A name given to certain Old World birds that seize insects on the wing, often with an audible snap of the beak, such as the bee eater (q.v.).

GNAUTH, gnout, ADOLF (1840-84). A German architect, born in Stuttgart, where he was educated at the Polytechnic Institute. In 1861-63 he studied in Italy, whither, after a stay in Vienna, he went again, in 1864, to collaborate with Emil von Förster in making the designs for Raschdorf's *Palastarchitektur von Oberitalien und Toscana* (Berlin, 1883). He was once more in Italy during the summer months of 1867-69, painting large-sized water colors of the monuments of the Renaissance for the Arundel Society in London. Appointed professor at the Polytechnicum in Stuttgart in 1870, he resigned in 1872, in order to execute orders for the erection of a number of private buildings. He visited Greece and Egypt in 1875, Spain and southern France in 1882, and became director of the Industrial Art School at Nuremberg in 1877. An adherent of the late Renaissance style, he adapted in an original manner the palatial architecture of Italian cities to his structures.

GNEDITCH, gnā'dīch, NICOLAI IVANOVITCH (1784-1833). A Russian poet. He was born at Poltava and was educated at the University of Moscow. He went to St. Petersburg at the age of 19 and was employed there in the Ministry of Education and in the Imperial Public Library. He devoted especial attention to translation of the classical poets of Europe, his best work in that field being the Russian version of the *Iliad* (latest ed., 1880). The work was begun in 1809 and completed in 1829 and is a masterpiece of versification. He wrote several original poems of high merit and translated into Russian some works of Shakespeare, Voltaire, Schiller, and other European poets.

GNEISENAU, gnī'ze-nou, AUGUST WILHELM ANTON, COUNT NEITHARDT VON (1760-1831). A Prussian field marshal and one of the most prominent figures in the War of Liberation. He was born at Schildau in Prussian Saxony, Oct. 27, 1760. In 1777 he entered the University of Erfurt and two years later joined an Austrian regiment. In the following year he entered the service of the Margrave of Ansbach-Bayreuth and in 1782 went to America as an officer in the mercenary force raised by Great Britain in Germany. He returned, however, in the following year without having seen any actual fighting. In 1786 he entered the Prussian service as lieutenant of infantry. The next 20 years, with

the exception of a year's active service in Poland in 1793-94, were spent in the quiet of garrison life. During this time, however, Gneisenau became a profound student of military and political history. In 1806 he took the field against Napoleon and fought at Saalfeld and Jena. He was raised to the rank of major and was intrusted, in April, 1807, with the defense of Kolberg, which was invested by a large French army. With the aid of Schill and Nettelbeck he carried on a heroic resistance against the greatly superior forces of the French until hostilities were concluded by the Peace of Tilsit. For his services he was raised to the post of chief of engineers, received the Prussian order "pour le mérite," and was made a member of the council to which was intrusted the task of reorganizing the Prussian state, which had exhausted its forces in the disastrous war against Napoleon and had been dismembered by the Peace of Tilsit. In this work of national revival he cooperated heartily with Stein and Scharnhorst, and though primarily devoted to the problem of military reorganization, exercised considerable influence on the general policy of the ministry. After Stein's dismissal he resigned (1809), owing to the hostility of Napoleon, and from 1811 to 1813 was intrusted with secret missions to Austria, Sweden, Russia, and England. Upon the outbreak of the War of Liberation in 1813, he became a general in the corps of Blücher and subsequently chief of staff to the army of Silesia. In this position Gneisenau displayed remarkable strategic talents, a relentless energy, and a daring which contributed in no small degree to the success of the Prussian arms. He became lieutenant general after the battle of Leipzig and upon the return of Napoleon from Elba was made once more chief of staff under his old commander, Blücher. After the repulse of the Prussians at Ligny, June 16, 1815, he executed a skillful retreat, and to him was due, in large measure, the opportune arrival of the Prussians on the battlefield of Waterloo (June 18). After the decision of the battle he led the pursuit, turning the French retreat into a complete rout. He was made Governor of Berlin in 1818 and field marshal in 1825. Soon after the outbreak of the Polish insurrection of 1830 he was assigned to the command of the Prussian corps on the Polish frontier, but he died at Posen, Aug. 24, 1831. Gneisenau has assumed in Prussian history the dimensions almost of a national hero. He was with Stein, Scharnhorst, and York, one of the small band of patriots who in the hour of Prussia's deepest degradation never despaired of their country, and later, when an opportunity offered for overthrowing Napoleon, devoted themselves to the destruction of the hateful French domination. In Gneisenau, moreover, ardent patriotism was combined with a most lovable nature, marked by natural gentleness and refined by years of study and by travel. There is a monumental life of Gneisenau, *Das Leben des Feldmarschalls Grafen Neithardt von Gneisenau*, in five volumes, by Pertz and Delbrück (Berlin, 1864-80); a shorter biography, *Das Leben des Feldmarschalls Grafen Neithardt von Gneisenau*, was published by Delbrück in two volumes (2d ed., ib., 1907). Consult also Neff, *Die Heldenlaufbahn des Generals der Infanterie August von Gneisenau* (ib., 1889), and Pick, *Aus der Zeit der Not, 1806 bis 1815* (ib., 1900).

GNEISS, nis (Ger., probably connected with OHG. *gneista*, Icel. *gneisti*, AS. *gnást*, Eng. *gnast*, spark). A family of rocks belonging to the metamorphic series and resembling granite in composition. Gneisses are granular aggregates of feldspar and quartz, with mica, hornblende, or pyroxene, and some of the rarer metals. Their structure is characterized by a parallel arrangement of the constituents; the light and dark minerals alternate in bands or layers, which are sometimes so regular and distinct as to give the appearance of stratification. Owing to this peculiarity, many geologists hold that they are metamorphosed sediments. There is conclusive evidence, however, that the parallel arrangement may be brought about in rocks of truly igneous origin, either as a result of movements of the constituents while the magma is in process of solidification, or by compression and shearing strains after the rock mass has solidified. Some gneisses, doubtless, have resulted from the metamorphism of sediments; but in such cases the proof is not based primarily upon the gneissoid character. Neither the igneous nor the sedimentary theory of origin is to be accepted for gneisses as a class, and each occurrence must be studied by itself. For this reason geologists have come to use the term "gneiss" in its structural sense, without implying anything further as to origin or constituent minerals. When it is desired to define the composition of a particular type, other rock names are united with the term; e.g., granite gneiss, syenite gneiss, gabbro gneiss, or granitic gneiss, syenitic gneiss, gabbroic gneiss. Gneisses are the most widely distributed of metamorphic rocks (q.v.) and are found underlying the earliest sediments in almost all parts of the world. They are important quarry materials, and many of the so-called granites that are employed for structural stones are really gneisses, as indicated by their foliated textures. Consult Kemp, *Handbook of Rocks* (New York, 1900), and Pirsson, *Rocks and Rock Minerals* (ib., 1911). See *GEOLOGY*.

GNEIST, gníst, **RUDOLF VON** (1816-95). A German jurist and statesman, born in Berlin, Aug. 13, 1816. He was graduated from the University of Berlin and while occupying the post of lecturer in the university practiced the profession of law. From 1841 to 1844 he traveled through Italy, France, and England, making a comparative study of the law system of these countries. In 1844 he became professor extraordinary of jurisprudence, and in 1850 he resigned his position as assistant judge of the Superior Court to devote himself more exclusively to teaching and especially to further the interests of the National Liberal party. In 1858 he became a member of the Lower Prussian House, where he served till 1893. He was prominent as a Liberal in that body and in the Reichstag, of which he was a member from 1867 to 1884. Gneist was an active member of the Liberal opposition, and subsequently of the National Liberal party, among whom his profound scholarship made him an intellectual leader. Several of his ablest works relate to the English constitution, which he greatly admired, and which he studied and cited as a model in the discussion of German affairs. In 1888 Frederick III raised him to the nobility. His first notable work was *Geschichte und heutige Gestalt der Aemter in England* (1857). Other important works of special interest to English students and

appearing in English translations are *Englische Verfassungsgeschichte* (1882), which is perhaps his greatest single piece of work, and *Das Englische Parlament* (1886). He also wrote *Der Rechtsstaat* (1872) and numerous other works on the history of jurisprudence and legislation. Consult Gierke, *Rudolf von Gneist* (Berlin, 1895).

GNESEN, gnä'zen (Pol. *Gniezno*). A town in the Province of Posen, Prussia, capital of a district of the same name, situated between hills and lakes, 31 miles east-northeast of Posen (Map: Germany, G 2). Its old and noteworthy cathedral, begun in the tenth century, is adorned with fine paintings, bronze doors, and chapels, and contains the tomb of St. Adalbert, who was Bishop here, and first preacher of the gospel in Prussia. There are also an archiepiscopal palace, a theological seminary, a college, a gymnasium, and a monument to Emperor Frederick III. The manufactures include machinery, lumber, leather, dairy products, sugar, and flour. It has a large trade in cattle, horses, and grain. Tradition fixes the year 550 as the date of the foundation of Gnesen, one of the oldest towns in Poland. It became an archiepiscopal seat in 1000 and during the Middle Ages was for a time the residence of the Polish kings, who were crowned here until 1320. The archbishops of Gnesen were primates of the realm and acted as vicars during the frequent interregnums. Pop., 1900, 21,603; 1910, 25,339, including many Poles.

GNETALES, nê-tă'lez (Neo-Lat. nom. pl., from *Gnetum*, from Malay *gnemon*, the native name). One of the great groups of gymnosperms, which comprises at present three genera, that differ remarkably in habit and habitat. The genera are *Ephedra*, with about 30 species, from the arid regions of both hemispheres; the very peculiar *Welwitschia*, from certain extremely arid regions of western South Africa; and *Gnetum*, with about 15 species, from the tropics of both hemispheres. The species of *Ephedra* are low, straggling shrubs, with long-jointed and fluted green stems, and opposite, scalelike leaves connate into a two-toothed sheath. The body of *Welwitschia* has the shape of a gigantic radish, which rises little above the surface of the ground, and whose crown is sometimes 12 to 15 feet in circumference. From the edge of the crown two enormously long, parallel-veined leaves arise, which extend upon the ground sometimes for 10 to 15 feet, and become split into numerous ribbons. This single pair of opposite leaves, the only pair produced, grows continually at the base and lasts through the lifetime of the plant, which is said to reach more than 100 years. The species of *Gnetum* are either small trees or woody climbers and are among the prominent lianas of tropical forests. The foliage is leathery in texture and suggests dicotyledons, as the well-developed opposite leaves are lanceolate to ovate in outline and pinnately net-veined. See Plate of *GYMNOSPERMS*.

The group is of special interest to the botanist on account of the display of certain angiospermous characters that have suggested that Gnetales may have given rise to the angiosperms. The characters that distinguish the group from other gymnosperms are the occurrence of true vessels in the secondary wood and the presence of a so-called perianth. In addition to these two distinguishing characters, the group has the following four characters in common, but not peculiar to it: (1) opposite leaves, (2) dicoty-

ledonous embryos, (3) cauline ovules, and (4) no resin ducts. Some fossil forms have been found in the later deposits that suggest Gnetales in appearance, especially *Ephedra*, but such evidence is not trustworthy. At present Gnetales are unknown as fossils, but they give evidence of an extended history. Their great dissimilarity in habit, structure, and habitat, associated with their widely scattered distribution, indicate a relatively large group of ancestors of somewhat general distribution.

GNOLI, *nyôlé*, DOMENICO (1839-). An Italian author, born in Rome. He attracted public attention by his volume of poems published under the pseudonym of "Dario Gaddi," and a collection of critical essays, *Odi tiberine*, classic in style. He was professor of Italian literature at Turin and in 1893 was made prefect of the Library Vittorio Emanuele at Rome. He collaborated on the *Nuova Antologia* and founded and was a director of the *Archivio Storico dell'Arte*. Besides translations of the *Römische Elegien* of Goethe and various other German classics, he published several volumes of verse under the name "Giulio Orsini." Many of his original essays were published in the *Nuova Antologia*. His other writings are: *Il morto il re* (1882); *Canto dei pellegrini alla tomba del gran re* (1883); *Le opere di Donatello in Roma*; *Il banco d'Agostino Chigi*; *Jacovello*, poems (1905), showing an entirely new manner of exquisite sentimentality as opposed to the sculptural intellectuality of his earlier work. His critical studies, especially of the *Risorgimento*, are admirable. He became famous as a lecturer.

GNOME, *nôm* (Fr. *gnome*, apparently from Gk. *γνῶμη*, *gnômê*, knowledge, or from *γνώμων*, *gnômôn*, one who knows, from *γινῶσκειν*, *gignôskein*, to know). A name given in the cabalistic and mediæval mythology to one of the classes of beings which are supposed to be the presiding spirits in the operations of nature in the mineral and vegetable world. They have their dwelling within the earth, where they preside specially over its treasures, and are of both sexes, male and female. (See INCUBUS; KOBOLD.) The males are often represented in the form of misshapen dwarfs. They are supposed to be the special guardians of mines and miners. In later times the word has been loosely used as the equivalent of "elf" or "fairy."

GNOME (Gk. *γνῶμη*, knowledge, judgment, maxim). A short and pithy proverbial saying, often embodying a moral precept. Such sayings have been common among nearly all nations at some period of their development; examples are plentiful in the Bible. In Greece the period when men began to express in a proverbial form general maxims of conduct was the age of the Seven Wise Men. The gnomic form of expression became also a characteristic of much of the lyric poetry of the period, and such poetry as had this characteristic was called at a later time *gnômio* (*γνῶμικός*). Lyric poets in whose verse this gnomic character prevailed or was prominent are Solon, Theognis, Phocylides, Simonides of Amorgus, and Xenophanes; of these Theognis is the most important, since his gnomic writings are well preserved. In gnomic poetry the source of moral philosophy has been found. The Romans had a great fondness for short and pithy sayings, which they called *sententiæ*. Such *sententiæ* characterize all Latin writing, but especially the writers of the late Augustan age

and of the first century A.D., e.g., Publilius Syrus, Lucan, and Juvenal. There are editions of the gnomic poets by Brunck (Strassburg, 1817), Schäfer (Leipzig, 1817), and Bergk, *Poeta Lyrici Graeci*, vol. ii (4th ed., ib., 1882). Consult also: Opsimathes, *Γνώμαι: sive Thesaurus Sententiarum et Apophthegmatum* (ib., 1884); Haskins and Heitland, ed. of Lucan, pp. lxx-lxix (London, 1887); Wright, *A Short History of Greek Literature*, 81 ff. (New York, 1907); Murray, *A History of Ancient Greek Literature*, 84 ff. (ib., 1897).

GNOME OWL. A name given both to the burrowing owl (q.v.) and to the pygmy owl (q.v.) of the western United States.

GNOMON, *nômôn* (Gk. *γνῶμων*, one who knows). The name given to odd numbers by Pythagoras. An odd number of the form $2n + 1$ was known to be the difference of two square numbers $(n + 1)^2$ and n^2 . This doubtless arose from the geometric conception of a gnomon as the difference between two

squares or rectangles; e.g., take a square of side 3 (see figure) and extend its length and breadth one unit. The resulting figure is a square of area 16. The difference of these squares, $16 - 9$, or 7, represents an odd number, or gnomon. The term "gnomon" was also applied to a kind of sundial (consisting of a staff through the centre of three concentric circles), used not only for measuring time during the day, but also for ascertaining the periods between the solstices and for finding altitudes of the sun and stars. As a scientific instrument, it is said to have been introduced into Greece by Anaximander (610-546 B.C.).

GNOSTICISM, *nôs'ti-siz'm* (from *gnostic*, from Lat. *gnosticus*, Gk. *γνῶστικός*, *gnôstikos*, relating to knowledge, from *γινῶσκω*, *gnôskō*, knowing, knowable, from *γινῶσκειν*, *gignôskein*, to know). The name given to related systems representing a wide movement which flourished in the Church of the second century. Like much of the philosophy of that time, the Gnostic systems were syncretistic, drawing their materials from Jewish, Christian, and pagan (Oriental) sources. They were cosmological rather than theological in character, their aim being to describe how the cosmic order was originally projected, then lost, and finally restored.

Gnosticism arose outside the Church, but soon entered it. Even before the close of the New Testament we find warnings against a "false" knowledge (1 Tim. vi. 20), which doubtless refers to some kind of Gnostic speculation already judged to be dangerous to the faith. The letter to the Colossians combats ideas which show elements of Gnosticism. Nevertheless, Gnostic ideas were long current within the Church, and often during the early period they were maintained without offense. Ignatius of Antioch, at the beginning of the second century, uses Gnostic language in speaking of Christ as the Logos of God, "who proceeded from silence." (*Ep. to Magnesians*, 8.) And in 2 Clement, 14, we meet again with Gnostic terms, where the preacher says: "I do not suppose ye are ignorant that the living Church is the body of Christ, for the Scripture saith God made man male and female. The male is Christ, and the female is the Church." In other words, the Christian

Gnostics were Christian theologians, though the system had already developed from Oriental mythologies before it came into contact with Christianity. Their leaders were persistent in maintaining that they drew their inspiration and authority from apostolic sources. So Valentinus traced his connection with Paul through one Theudas; Basilides with St. Peter through Glaukias. (Clement of Alexandria, *Stromata*, vii, 17.) We learn from Epiphanius that Ptolemy declared he had the authority of "apostolic tradition" for what he taught. In this respect the Gnostics pursued the same course as the ancient Catholic church. But when Irenæus wrote his great work, *Against Heresies* (180-190 A.D.), the Church had already begun to distinguish between "ordinary" (i.e., orthodox) Christians and Gnostics, whom Irenæus calls "heretics." We may therefore infer that about this time the exclusion of Gnostics from Church fellowship was beginning. After the close of the second century, whenever the claims of "knowledge" are freely advanced and maintained by prominent writers (as, e.g., by Clement of Alexandria and Origen), it is a permissible Christian Gnosticism which they are describing and defending, not the Gnostic heresy which the Church had by that time rejected. To Clement the Christian is the only true Gnostic. (*Stromata*, vii, passim.)

Most of the Gnostic literature has perished, though several extensive treatises from Coptic represent a late form of the movement, and we are forced to rely upon its orthodox opponents for most of our information concerning the heresy. Our most important witnesses are Irenæus, Tertullian, Hippolytus, and Epiphanius; but light is also cast upon its early forms by Ignatius and Justin Martyr. Gnostics were numerous after the end of the first century and found in widely separated localities. (For the names of the leaders and sects, see Gnosticos.) Their teachers differed from one another in details and in some important doctrines; nevertheless, a remark made by Hippolytus in his account of the serpent worshippers (*Refutatio*, v, 1) might be applied to all Gnostics alike: "Their detached heresies are essentially one." The sects were all religions of redemption. All held some sort of dualistic theory of the world—that spirit and matter, good and evil, are essentially opposed to each other. Whatever comes in contact with matter shares in its contamination; therefore the supreme God cannot be the Creator of the world. Of the supreme God indeed hardly anything can be predicated. He (It) is wholly transcendent, utterly remote from all that we know as existing. We might even call Him (It) the "Nonexistent," as does Hippolytus. From information given mainly by Irenæus in his work *Against Heresies* we are able to construct an outline of the teaching of Valentinus, from which the place occupied by the Creating God will appear in due course. At the two extremities of thought are transcendent Deity and the Void, or Emptiness (*κένωμα*). Between them there is no connection or communication. No world exists, nor is there any creative agency to produce a world. There is a series of divine beings, or powers, called *Æons* (*αἰῶνες*), which emanate in pairs from the First Cause, with diminishing dignity as they proceed. These *Æons* together constitute the Pleroma (*πλήρωμα*), or Fullness of divine existence, as over against the Kenoma, or great Void. They are sym-

bolized as male and female; e.g., Nous (*νοῦς*, mind) and Aletheia (*ἀλήθεια*, truth); Logos (*λόγος*, word or reason) and Zoe (*ζωή*, life). The total number is 30, corresponding to the unknown and mysterious years of Christ's life, before He began His public ministry. They are arranged in groups of an Ogdoad, a Decad, and a Duodecad. One of the lowest and feeblest *Æons*, Sophia (*σοφία*, wisdom), rashly attempts to mount up to a union with the great First Cause, or Father of All, and thereby interrupts the order or equilibrium of the whole system, which is the Gnostic "fall." Part of Sophia sinks to the great Void and produces a son, the Creator, or Demiurge (*δημιουργός*, which suggests Plato's creating god), who proceeds to form the visible world, including man. He is the Jehovah of the Old Testament, the only God known to the Jews. He, ignorant of the Pleroma, supposes Himself to be the Supreme Being. The material creation, being more or less directly the consequence of an interrupted order, is itself by nature evil. And this evil quality, from which nothing material escapes, includes the human race. See DEMIURGE.

The problem of redemption for the Gnostics was to restore the lost cosmic order, to remedy the evil caused by the weak and erring Sophia, to liberate those sparks of Deity which had become entangled in the meshes of evil matter and in man. Christ is an instrument in the accomplishment of this task—Himself an *Æon* indeed, who was joined with the human Jesus of Nazareth from the time of his birth, or of his baptism to his crucifixion. This union was *docetic*, i.e., only a seeming. The heavenly Christ did not in fact suffer or die, but left the man Jesus before his death on the cross. (See Docetæ.) Christ's office, so far as men are concerned, was to teach the true "knowledge," to make Gnostics, to impart the secrets of that system to which He Himself belonged. The redeemed are those who can receive this esoteric teaching and become free from the flesh. Their salvation is only an incident in the vast process of restoring the lost harmony of the Pleroma. This salvation is from ignorance—a very different matter from the Christian idea of being saved from sin.

According to the ethical system of the Gnostics, all men are divided into three classes, according as they have, or have not, elements of Deity within them; spiritual or pneumatic men (*πνευματικοί*); animal or psychic men (*ψυχικοί*); and carnal or physical men (*σαρκικοί*, *σωματικοί*). The Gnostics themselves constitute the members of the first group; they will be saved through their knowledge of the esoteric system and through their ascetic life. The third group are wholly material and cannot be saved, for their nature is evil; they have no single spark of the divine within them. In the intermediate class ordinary Christians are found, persons who have not the higher knowledge, yet who may possibly—at least some of them—be saved through faith (*πίστις*), which is vastly inferior to "knowledge." In the practical relations of life the Gnostics applied their principles in one of two ways. Although these seem diametrically opposed to each other, yet each was supported by an appeal to the logic of their principle that matter is essentially evil. Some said: The body, being composed of evil matter, should be denied in its every tendency and impulse—whence resulted asceticism. Others said: It may be indulged in

every physical gratification and even abused through overuse—whence resulted libertinism and sensuality. All the nobler Gnostics adopted the ascetic life, and some of them pushed it to an extreme (as, e.g., the Encratites). The opposite theory of self-indulgence was advocated and practiced by such sects as the Carpocratians, the Nicolaitans, and the Cainites.

The traces of Christian teaching in this system are manifest. But not less evident is the influence of Hellenic and Oriental speculation. Harnack has coined a phrase which is already proverbial (the “acute Hellenizing of Christianity”), to describe the progress of Gnosticism. The attempt to Hellenize Christianity and explain away its doctrines in the light of the “higher knowledge” was parallel to the line which heathen philosophers had taken with popular theology, which they admitted contained some manner of truth accommodated to the ignorance of the multitude. So Gnosticism would admit the necessity of faith for the vulgar multitude, but reserved the “higher knowledge” for the few who were fitted to receive it. This knowledge was superior to and independent of the faith. The central idea of Gnosticism made it welcome to many who were half converted from heathenism. The æsthetic instinct, which was the soul of Greek and Roman culture, revolted at the authority of the Church, which imposed the same belief on all, and exacted the same submission from philosopher and slave alike. In a system of compromise like Gnosticism, it escaped this ignominy.

In the course of the Gnostic controversy the Church defined her theory of the ancient Catholic standards, as the tests of orthodoxy, viz., the rule of faith, the canon of Scripture, and the episcopate, each of these being regarded as of apostolic origin and authority. Upon them she relied not only for vindicating the truth of her doctrine and the sole validity of her practice, but also for proving the falsity of her opponents’ position. With these standards once generally recognized, the Gnostics, who were in the minority, could be, and were, shut out from Christian fellowship. This development was under way long before the close of the second century and was practically complete in the age of Cyprian (c.250 A.D.), when Gnosticism had already become a negligible factor. In fact, after Marcion, in the middle of the second century, Gnosticism is of little practical importance, though its tendencies reappear in the Manichees and Manichean sects of the Middle Ages.

Gnostic Writings. Basilides’ 24 books on the Gospel, entitled *Evangelica*, have for the most part perished, along with other early heretical works, but we have some quotations from them in the early Christian literature. There is at present no way of verifying Origen’s statement that Basilides wrote a gospel of his own, nor have we the *Gospel of Truth*, which Irenæus attributes to the Valentinians. The *Letters*, *Homilies*, and *Psalms* of Valentinus have likewise perished. Fragments have come down to us from the works of Bardesanes, a Christian poet of Syria (died after 220 A.D.), who is sometimes classed among the Gnostics. In the *Pistis Sophia* we possess an Egyptian Gnostic writing of the third century, preserved in Coptic, relating the history of Wisdom in the form of a dialogue between the risen Christ and His disciples. Here asceticism is put forward as a

Christian duty, and we find something closely akin to the sacramental theory of penance. Other valuable Coptic versions of Gnostic works have recently been discovered by Carl Schmidt, including the *Books of Jen*, the *Gospel of Mary*, and the *Sophia Jesu Christi*. Eripiplanus preserves for us a letter from the Valentinian Ptolemy to Flora, and there is also a Naassene hymn. There are several books of Gnostic Acts, bearing the names of Peter, John, Thomas, and Andrew, which appear to have been circulated in a collection which passed under the name of one Leucius.

Bibliography. On the literature of Gnosticism, consult: Harnack-Preuschen, *Geschichte der altchristlichen Litteratur* (Leipzig, 1893); Mead, *Pistis Sophia*, translation (London, 1896); King, *The Gnostics and their Remains* (2d ed., ib., 1887); Mansel, *The Gnostic Heresies of the First and Second Centuries* (ib., 1875); Hilgenfeldt, *Ketzergeschichte des Urchristenthums* (Leipzig, 1884); Mead, *Fragments of a Faith Forgotten* (London, 1900); Swiney, *Esoteric Teachings of the Gnostics* (ib., 1909); Bousset, *Hauptprobleme der Gnosis* (Göttingen, 1911); Faye, *Gnostiques et gnosticisme* (Paris, 1913); and especially C. Schmidt, *Coptic-gnosticische Schriften* (Leipzig, 1905). The most important attacks upon the Gnostics may be read, in English, in the *Ante-Nicene Fathers*, ed. by Coxe (10 vols., New York, 1885-96). In general, consult: Harnack, *History of Dogma*, vol. i (London, 1894); Rainy, *The Ancient Catholic Church* (New York, 1902); W. Schultz, *Dokumente der Gnosis* (Jena, 1910). See BASILIDES; CARPOCRATES; CERDONTIANS; CERINTHIUS; DOCTES; ENCRATITES; HERACLEON; MARCION; NICOLAITANS; OPHITES; SETIITES; VALENTINIANS.

GNOSTICS, nō's'tiks. Those who adhered to the system known as Gnosticism. From the end of the first century onward for two generations Gnostic heretics were many and widely scattered. “A multitude of Gnostics have sprung up and have shown themselves like mushrooms growing out of the ground,” says Irenæus. It was formerly customary to distinguish two main types, a Jewish and a Greek, but it is hardly possible to classify them with any exactness. Carpocrates, Saturnilus, Cerdo, Basilides, Valentinus, Isidore, Heracleon, Ptolemy, and Julius Cassianus are among the best-known Gnostic leaders. Saturnilus (or Saturninus, as he is sometimes called) represents the Syrian school, to which Tatian and the ascetic sect of the Encratites are in a measure related. Basilides and Valentinus are the masters of the Alexandrian Gnostics, the school which was by far the most important and about which we have the fullest information. Basilides taught in the time of Hadrian. Valentinus went from Alexandria to Rome, where he labored (c.140-160 A.D.) and founded a church. Marcion of Pontus (q.v.) is sometimes reckoned as a Gnostic and certainly had many points in common with them. See GNOSTICISM, and the articles on the Gnostic teachers and sects.

GNOSUS. See CNOSUS.

GNU, nū (from Hottentot, *gnu, nyu*), or WILDEBEEST. A member of a remarkable genus (*Connochetes*) of African antelopes, of which the best-known species has been formerly described as made up of parts of an antelope, a buffalo, and a horse. The grotesque appearance of some species suggests this composite. (See Plate of

ANTELOPES.) The gnus form a genus of large, ungainly animals, having horns in both sexes and the withers higher than the haunches. The body and legs are antelope-like, but the head is so massive and broad as to resemble that of an ox. The muzzle is naked, the eyes are small, with a gland beneath each, whence sprout long

HORNS OF GNU.

Showing development from the yearling (1) through youth (2) to maturity (3) in the white-tailed gnu.

stiff hairs, and the horns, which in old age form a helmet over the forehead, are broad, black, and shaped like an African buffalo's, to which must be added the bovine-like circumstance, not present elsewhere among antelopes, that the horn cores are honeycombed with cavities. Long hairs bristle about the chin and throat, and a stiff mane is borne upon the arched crest of the neck; while the tail is profusely hairy, like that of a horse, and sweeps the ground.

There are two species. The once "common" gnu, or white-tailed wildebeest (*Connochetes gnu*), formerly roamed all over South Africa, but by the end of the nineteenth century had become so scarce as to be extinct except in the remoter districts; its dependence upon water denied it the desert, which has been the means of preserving some of its former associates. In this species long hair fringes the chest, and the color is uniformly deep brown, with the tail white. In the other species, the brindled gnu or blue wildebeest (*Connochetes taurinus*), whose habitat was north of the Zambezi, wherever plains extended, the chest has no long hair, the tail is black, and the general color duller, and marked with dark vertical stripes upon the shoulders and neck. The former stands about 4½ feet high; the latter is somewhat larger. The females of both are lighter in hue than the males.

Gnus went about in bands of 30 or 40 and were fond of associating with quaggas and zebras, whose actions their own resembled. The old bulls were extremely watchful and usually the first to discover danger and give the alarm. Consult Lydekker, *Game Animals of Africa* (London, 1908). See ANTELOPE, and Plate of ANTELOPES.

GNU GOAT. See TAKIN.

GOA, gô'â. A Portuguese colony on the Malabar coast, India, extending from lat. 14° 53' to 15° 48' N. and from long. 73° 45' to 74° 24' E. (Map: India, B 6). It is 60 miles long by 30 miles broad and contains an area of 1301 square miles. It has been a Portuguese possession since its conquest by Albuquerque in 1510. Pop., 1900, 475,513. Capital, Panjim, or New Goa. (See following article.)

GOA. A city on the Malabar coast, India, in lat. 15° 30' N. and long. 73° 57' E., the former capital of the Portuguese dominions in India (Map: India, B 6). It was once a city of great

magnificence, with 200,000 inhabitants, and important chiefly on account of its harbor, one of the best on the west coast. Its decline was due to the ravages of cholera in the beginning of the eighteenth century, when most of the Portuguese left the former site and settled nearer the harbor of Panjim, or New Goa, which is the present seat of the colony. Pop., 1900 (old town), 2302; (new town), 9325. The old city is the see of an archbishop, the head of Roman Catholicism in India, and contains the imposing cathedral of St. Catharine, built in 1623, and the church of Boni Jesus, besides many interesting ruins. Panjim, on the Mandavi River and connected by the Portuguese West India Railway with British India, is a clean and picturesque town, with a good modern harbor, large barracks, viceregal palace, college, and public library. It has large salt works near by. Rice, coconuts, and spices constitute the chief products and exports. For a description of ancient Goa, consult: Marryat, *Phantom Ship* (London, 1839); B. H. Baden-Powell, *The Villages of Goa in the Early Sixteenth Century* (ib., 1900); Henry Bruce, *Letters from Malabar and on the Way* (New York, 1909).

GOA. A gazelle (*Gazella picticaudata*), inhabiting the highest pastures of the Tibetan plateau, and having a very heavy coat of hair in adaptation to its cold habitat.

GOA CEDAR. See CYPRESS.

GOAJIRA, gô'â-hê'râ. A peninsula of South America, lying west of the Gulf of Venezuela, forming the most northern part of the continent. Its area is estimated at over 5000 square miles (Map: Colombia, C 1). The coasts are mostly sandy and low, while the interior contains a number of mountains. It is sparsely watered, and the chief occupation of the inhabitants is cattle breeding. Its people are semi-independent Indians, known under the name of Goajiros, and variously estimated at from 30,000 to twice that number. The peninsula was formerly divided between Venezuela and Colombia, but by the decision of 1891 it was awarded to the latter.

GOAJIROS, gô'â-hê'rôs. An Arawakan tribe of the Goajira Peninsula, on the northwest of Lake Maracaibo, South America. This most interesting tribe build their houses in the Maracaibo and other lagoons of Venezuela, driving piles into the mud, and erecting on them oblong rectangular dwellings with high-pitched roofs. The structures are thatched and have on one or more sides platforms on which cooking and the family occupations are carried on in open air, and which also serve as landing places for canoes. The name "Venezuela," or "little Venice," originated from the prevalence of these structures over the water. The people subsist by fishing, agriculture, and on the natural fruits, nuts, and roots of this bountiful region. They are expert in weaving cotton and palm textiles and make beautiful featherwork. Consult I. F. Holton, *New Granada: Twenty Months in the Andes* (New York, 1857).

GOA POWDER, ARAROA, or CHRYSAROBIN. A drug imported in the form of a yellowish or chocolate-colored powder. The name "Goa powder" is derived from the Portuguese colony of Goa, where the drug appears to have been introduced about the year 1852. It was exported from Bahia to Portugal, whence it found its way to the Portuguese colonies in Africa and Asia. The tree which yields it (*Andira araroba*) is met with in great abundance in certain forests

in the Province of Bahia, Brazil, preferring low and humid spots. It is from 80 to 100 feet high and is furnished with imparipinnate leaves, the leaflets of which are oblong, about $1\frac{1}{2}$ inches long and $\frac{3}{4}$ of an inch broad, and somewhat truncate at the apex. The flowers are papilionaceous, of purple color, and arranged in panicles. The Goa powder, or araroba, is contained in the trunk, filling crevices in the heartwood. To obtain it the oldest trees are selected as containing the larger quantity, and after being cut down are sawed transversely into logs, which are split longitudinally, and the araroba chipped or scraped off with the axe. During this process the workmen feel a bitter taste in the mouth, and great care has to be taken to prevent injury from the irritating action of the powder on the eyes. In this state, i.e., mixed with fragments of wood, the Goa powder is exported. Somewhat purified, as chrysarobin, it is used in the form of an ointment made by rubbing together 40 grains of the powder, 10 drops of acetic acid, and an ounce of lard. It is used in several skin diseases, especially in ringworm and psoriasis; and it owes its efficiency to the chrysophanic acid it contains.

GOAR, gô'ar', SAINT (c.585-649). A mediæval missionary, born in Aquitaine. According to the legends concerning him, he went (c.618) to Oberwesel, Germany, where he erected a chapel at what is now St. Goar and made numerous converts. He was buried in the chapel, and the monastery subsequently erected there became a chapter house in 1127. In 1768 the celebrated church of St. Goar on the Rhine was dedicated to him. His fête is July 6.

GOAT (AS. *gāt*, Icel. *geit*, OHG. *geiz*, Ger. *Geiss*; ultimately connected with Lat. *hædus*, kid). A genus (*Capra*) of ruminant quadrupeds of the family Bovidae, so closely allied to the sheep that it is not easy exactly to define the distinction, although the common domestic goat and sheep are of widely different appearance. One of the most marked of the distinguishing characters is that the horns of goats, present in both sexes, but smaller in the females, are long and directed upward, backward, and outward, while those of the sheep are more or less spirally twisted. Other characteristics are the beard on the chin of the male goats, which is wanting in the sheep, and the straight line of the face in goats, as compared with the arched line in sheep. The tail of goats is also much shorter than that of sheep. A constant mark of distinction is the absence in goats of a small pit between the toes of the hind feet (in some cases of all four feet), producing a fatty secretion, which exists in sheep and is peculiar to them. And another constant mark which is absent in sheep is the strong smell of male goats, particularly during the rutting season. Equally constant are the differences of temper and manners, goats being in a high degree curious and confident.

WILD GOATS

True wild goats, of which some 10 species are recognized, belong to the Old World alone, where they are confined to the mountainous region which extends from the Atlas ranges of north-western Africa to Central Asia. Some other animals called goats are zoologically otherwise related. All are essentially mountain animals and exhibit a great aptitude for scrambling among rocks and bushes, are extremely sure-

footed, and display great strength and agility in leaping. They also prefer as food the leaves and small branches of shrubs, and the strongly aromatic herbs which abound in mountainous localities, to the herbage of the richest pastures, browsing rather than grazing, as do sheep. They live in small herds, but the old bucks are likely to live separately, and thus serve the purpose of scouts, though all are extremely wary and hence are among the most difficult of game for the sportsman. Two kids are usually produced at birth, in late spring, and very quickly become able to travel with the band.

The best-known as well as most characteristic species of wild goat is the bezoar goat, or pasang (*Capra aegagrus*), which was once common throughout the Grecian Archipelago, but now is known only in Crete and one or two other islands and thence eastward through the highlands of Asia Minor to Persia and thence to northeastern India. It inhabits all barren hills in the East, but in Persia rarely descends much below the timber line. This goat (see Plate of WILD GOATS, ETC.) stands about 36 inches high and in winter is brownish gray, changing in summer to a more reddish-yellow tint, with the buttocks and underparts nearly white; and the older bucks have the forehead, chin, beard, throat, front of the legs, a stripe along the spine, the tail, and a band of the flanks dark brown. The horns of the old bucks measure 40 to 50 inches along the curve, rise close together from the top of the skull, and sweep backward in an even curve, with the front edge forming a strong keel marked by irregular prominences; the horns of the female are much smaller and smoother. The old bucks maintain a most vigilant watch, one or more being constantly on the lookout and warning the herd of danger. This is the species from which domestic goats have been derived. An illustrated account of this species will be found in the *Proceedings of the Zoological Society of London for 1875*, by C. G. Danford.

Goats of the Caucasus, or Turs. Three kinds of wild goats, distinguished as species, but perhaps only varieties of a single race, inhabit the Caucasus Range, which in form and color much resemble the pasang, though somewhat paler as a rule, and with long reddish-brown beard and short scut. Their horns, however, are very different, being very massive, smooth, and black, with a squarish cross section at the base, and sweeping outward and then inward, with a tendency towards a spiral, best shown in the Western, or Severtzow's, tur (see Plate of WILD GOATS, ETC.), which more nearly approach the form of the ibex's. The eastern Caucasus is inhabited by Pallas's tur (*Capra cylindricornis*); the central parts of the range, between Mount Elburz and Daghestan, by the Caucasian tur (*Capra caucasica*); and the western part by the larger, more ibex-like Severtzow's tur (*Capra severtzovi*).

The Spanish Goat. Closely allied to the turs is the wild goat, or "cabramontes" (*Capra pyrenaica*), of the mountains of Spain and Portugal. It is a smaller animal than the others, bucks standing about 26 inches in height, with horns measuring 25 to 28 inches in length. Its horns are divergent, tend to be spiral, are somewhat triangular in section, with a strong keel on their posterior border, and knobs along the outside. These goats are so wary and resourceful that they remain numerous.

GOAT-ANTELOPES

1. EUROPEAN CHAMOIS (*Rupicapra rupicapra*).
2. JAPANESE SEROW (*Nemorhoedus crispus*).
3. WHITE GOAT of Rocky Mountains (*Oreamnus montanus*).

4. TAHR or HIMALAYAN GOAT (*Hemitragus jemlicus*).
5. HIMALAYAN SEROW (*Nemorhoedus bubalinus*).
6. HIMALAYAN GORAL (*Cemas goral*).

Ibex. All wild goats are frequently spoken of as ibexes, but the term should properly be restricted to four species of *Capra* dwelling upon the higher mountains of southeastern Europe, Syria, Arabia, Abyssinia, and in the Himalayan region. They have long, knobbed, scimitar-like horns. See IBEX.

The Markhor. This is a large wild goat (*Capra falconeri*) of the western Himalayas, distinguished by its high, upward-reaching, flattened and spirally twisted horns. (See Plate of WILD GOATS, ETC.) It is found from central Afghanistan to the sources of the Indus, and in this area exhibits several well-marked local races, in some of which the horns are much less twisted than in others, the longest measuring (along the curve) 50 inches. Its habitat ranges from barren foothills to the edge of the snow and includes much rocky forest land; the country, therefore, is always an exceedingly difficult one to hunt in, besides which the animals are wonderfully keen and watchful. Nevertheless, kids are captured from time to time and are found to thrive well in captivity and to interbreed with domestic goats. The markhor is larger than other goats and is distinguished by the great black beard of the old bucks, which covers the whole throat and breast with a mat of long hair, which also forms a heavy ruff around the shoulders. The remains of a goat closely resembling the markhor have been found in the Pliocene strata of India.

Tahrs and Goat Antelopes. There exist in southern Asia three species of goat which have no beards and small horns and are assigned to a separate genus, *Hemitragus*, the tahrs; one is known to Anglo-Indian sportsmen as "Nilgiri goat." For an account of this genus, see TAHR.

Intermediate between the goats and the antelopes stand several genera and species of mountain-loving animals, including the goral, cambingutan, serows, takin, chamois, and the American white goat. For these, see their names and GOAT ANTELOPE.

Consult also the writings of sportsmen in India and Central Asia.

DOMESTIC GOATS

It is probable that the native Asiatic goats were among the first animals brought under the subjection of man, and there is no doubt that the main stock of those now in domestication was derived from the Persian pasang (see above). They must have been of peculiar value to the early nomadic men of southeastern Asia, since they could pasture on the scanty herbage and bushes of the rocky mountains and plateaus and move anywhere their masters went with even greater facility—conditions which domestic sheep could not well endure.

The varieties of the domestic goat are too many for treatment here, where only the most important can be mentioned. Those of Europe present many diversities of coat and form of horns, and distinguishable breeds are found in Ireland, Wales, and Norway; but no kind has the pendulous ears frequently seen in Asia, except a

cream-colored breed peculiar to the island of Malta, whose ears hang below the jaw. This goat and some Spanish breeds are frequently hornless. More distinctive breeds exist south and east of the Mediterranean. Thus, the "guinea" goats, kept in enormous flocks by the natives of the Sudan and of the Niger valley, are rather small, short-legged, short-haired, and usually dark in color, black and red prevailing. The horns are only 3 or 4 inches long and curve forward at their tips; and the black beard is continued downward to spread over the shoulders and forelegs, suggesting some possible ancestral cross with the aoudad (q.v.). The Nile valley and Egypt have a different goat, in which the legs and horns are longer; the profile is very convex, the horns crumpled, and often absent, and there is no beard. The short coat is usually reddish or bluish gray, more or less spotted, and the pendent ears are about as long as the head, flat, and round at the ends. The goats of Syria, Turkey, and southwestern Asia, on the other hand, are large and tall, with the hair long, black, and silky, prominent curving horns, a small beard in both sexes, and the ears hanging for half their length below the jaw. These are sometimes called mamber, or Kurd, goats, and are the common stock of the country. In Asia Minor, however, there has existed, from immemorial times, a remarkable breed known as mohair, or Angora, goats, which merit particular description, since lately they have been sedulously cultivated in various other countries, including South Africa and the United States.

The Angora Goat. Various types of Angora goats have arisen in Asia Minor and Turkey during the last half century, owing to unwise crossing with the common Kurd stock. The pure-bred Angora was originally a small, exceedingly delicate animal, with small thin horns, suggesting by their spiral form descent from the wild markhor. It was clothed with "dazzling white, fine, soft, silky, very lustrous mohair, curling in ringlets from 10 to 18 inches long." The continual crossing and recrossing it has undergone has resulted in an animal much larger and more hardy. The type now approved in the United States (see Plate of WILD GOATS) is strongly built, with a straight horizontal back, short and strong legs, the head like that of a common goat, but less coarse, and the horns heavy, with an inward twist. "Except the face and legs, from the hocks and knees down, the entire animal should be covered with mohair. Both the belly and throat and even the lower part of the jaws should have a covering of fine, silky mohair in long, curly ringlets." These goats were introduced into the United States by a gift of nine from the Sultan of Turkey in 1849. Little increase followed, and all disappeared during the Civil War. Other importations were occasionally made until 1881, when the Sultan prohibited any exportation of the animals. Several were, nevertheless, obtained for California breeders in 1901. Angoras were scattered through the Southern States, but their raising and keeping did not become an industry until recently, when large flocks were produced on the Pacific coast, especially in Oregon, and they have been successfully introduced in Iowa and Missouri. So promising have been these experiments that an extensive culture of this breed all over the United States, as well as in southern South America, is expected; and two clubs for the encouragement of the industry

and the registry of blooded stock have been organized. It is claimed for the Angora goats that they are among the most useful of domestic animals in a variety of ways. "The fleece, called mohair (q.v.), furnishes some of the finest of fabrics among ladies' goods and is used in various other manufactures; their habit of browsing enables the farmer in a wooded locality to use them to help in subjugating the forest; their flesh is exceedingly delicate and nutritious; the milk, though not so abundant as with the milch breed of goats, is richer than cow's milk; their tanned skins, though inferior in quality to the skins of the common goat, are used for leather; their pelts make the neatest of rugs and robes; they are excellent pets for children; a few of them in a flock of sheep are a protection from wolves and dogs; their manure is noticeably helpful to the grass, which follows them after they have cleaned away the underbrush." A pamphlet was issued by the United States Department of Agriculture in 1901, containing an account, with illustrations, of the breed, and its qualities and products, and full directions as to feeding, care, shearing, etc. See *Bibliography*.

Goats otherwise have never taken a serious place in the farm property of the United States. The latest agricultural statistics enumerate only 45,500 in the whole country—a number exceeded by such small countries as Cape Verde Islands and Senegal. The great bulk of the goats in the world, estimated at 36,000,000 in 1893, and 32,000,000 in 1896, are to be found in the south of Europe, in Syria, and in northern Africa. All the rest of the world together possesses scarcely a fifth of the total, and goats are almost absent from English-speaking countries the world over. The ordinary domestic goat is highly prized in oriental and tropical countries for its milk and its flesh which differs but little from that of sheep. The skins form an important article of commerce, the value of the goat skins imported into the United States ranging from \$20,000,000 to \$25,000,000 per annum and coming from China, Southern Russia, South America, and Mexico.

The Cashmere or Shawl Goat. Nowhere have goats, other than Angoras, received more attention or been brought to a higher usefulness than in India, where a long list of varieties might be named and described, such as the streaked "naga" of Assam, the "bukee" of the Deccan, the "maycay" of Mysore, etc. None of these equal in importance, however, those of the western Himalayan region, which are cultivated for the sake of their wool, of which the genuine Cashmere shawls are made. Two principal varieties of these are distinguished—the lesser, or chappoo, and the more common *changra*, or "shawl goat." This variety is rather small, of various colors, but generally silvery white, with long, flattened, spiral horns, and pendent ears. These goats are valued, not for the long outer hair, but for the underwool, or *pashm*, which in summer is combed out and appears like grayish down. It is beautifully fine, soft, and silky, and from it are made the famous and often extremely costly shawls of Kashmir and its neighborhood. These goats were introduced into France and Germany during the last years of the nineteenth century and have thriven well. Their natural home extends through Tibet through the mountains southwestward to the country of the Kirghiz,

and enormous flocks are pastured by the natives in the high Himalayan valleys.

For the "Rocky Mountain goat," see **ROCKY MOUNTAIN WHITE GOAT**.

Bibliography. Pegler, *The Book of the Goat* (4th ed., London, 1909); Schreiner, *The Angora Goat* [in South Africa] (London, 1898); Thompson, "The Angora Goat," in *United States Department of Agriculture, Farmers' Bulletin No. 137* (Washington, 1901); Robertson Scott, *The Use for the Goat* (New York, 1908).

GOAT ANTELOPE. A term applied by zoölogists to a group of ruminants having characteristics that join them to the goats on one side and the antelopes on the other; most of them, individually described elsewhere, have a more or less goatlike build, goatlike teeth, short tails, relatively small cylindrical horns, and no beards. The group includes the genus *Camas* of the Himalayan region (see **GORAL**); the genus *Nemorhadus* of southeastern Asia, including the cambing-utan of Sumatra, etc. (see **SEROW**); the Tibetan genus *Budorcas* (see **TAKIN**); the genus *Rupicapra* of the European Alps (see **CHAMOIS**); and the genus *Oreammus*, or *Haploceros*, which contains the white, woolly goats of northwestern America (see **ROCKY MOUNTAIN WHITE GOAT**). See **PLATE OF GOAT ANTELOPES**.

GOATFISH, or **SALMONETE**. A marine fish of the genus *Upeneus*, closely related to the surmullets, many species of which exist in tropical American waters and are used as food as well as admired for their gaudy beauty. The red goatfish is *Upeneus maculatus*; the yellow is *Upeneus martinicus*. Both are common at Key West, Fla., and in the West Indies.

GOAT ISLAND. An islet roughly oblong in shape, a little more than $\frac{1}{2}$ a mile long and somewhat less than $\frac{1}{4}$ of a mile in average width, which divides the two great cataracts forming the Niagara Falls (q.v.). A bridge connects it with the American shore.

GOAT LOUSE. A biting louse of one or more species of the genus *Trichodectes*, parasitic in the hair of goats. Several species are known in various parts of the world, most widely *Trichodectes climax*. The species commonly troublesome on the Angora, or mohair, goats is regarded by some entomologists as peculiar to that animal and is named *Trichodectes limbatus*. Consult Osborn, "Insects Affecting Domestic Animals," in *United States Department of Agriculture, Division of Entomology, Bulletin 5* (Washington, 1897).

GOAT MOTH. One of the largest of European moths (*Cossus ligniperda*), measuring 3 to $3\frac{1}{2}$ inches across the expanded wings, and brown, with various streaks and mottlings. In Great Britain the long, flat, hairy, yellowish caterpillar is called the auger worm, and wanders about in search of some suitable tree into which to bore a tunnel. It feeds upon the excavated wood more than three years, then spins at the extremity of the tunnel a very tough cocoon formed of wood chips glued together by a gummy secretion, in which a small aperture is left for the admission of air. The adults have no proboscis, take no food, are very short-lived, and take their name from the goatlike odor they exhale. Congeneric species dwell in the United States.

GOATSBEARD. See **SALSIFY**; also **SPIRÆA**.

GOAT'S-RUE. See **REST-HARROW**.

GOAT'SUCKER. The common European nightjar (*Caprimulgus europæus*), known anciently as "caprimulgus" in Italy and "aigothe-

las" in Greece, representative of a large cosmopolitan family of wide-gaped, nocturnal, moth-catching birds, the Caprimulgidae. The name is due to an immemorial popular belief that this bird milks goats. The notion probably arose from the habit of these birds of seeking insects, usually at dusk and near the ground, in pastures with domestic animals. Their strange leaping motions and great mouths would easily lend themselves to the construction of such a tale among primitive folk. See NIGHTJAR.

GOBAT, gó'bá' (CHARLES), ALBERT (1843-1914). A Swiss Parliamentarian, born at Tramelan, Canton Bern. He practiced law at Delémont from 1868 to 1882, when he was elected as a radical to the Great Council of Bern. In 1884 he became a member of the Federal Council of States, and in 1890 of the National Council. He became noted as an advocate of international peace and in 1902 received the Nobel prize (with Ducommun). He wrote a popular history of Switzerland (1900) and *Croquis et impressions d'Amérique* (1904). In 1907 he became head of the International Bureau of Peace in Bern.

GOBAT, gó-bá', SAMUEL (1799-1879). An English missionary, born at Crénine in Switzerland. In 1826, after studying at the Mission House in Basel, and learning Arabic, Ethiopic, and Amharic, he started as a missionary of the English Church Missionary Society to Abyssinia. Until 1820 he and his companion, Christian Kugler, got no farther than Cairo. Then they went to Gondar and met with much success. But in 1832, after Kugler's death and the beginning of hostilities, Gobat left the country. In 1839 he went to Malta, worked on the Arabic Bible, had charge of the presses there, and in 1845 was director of the Protestant College. A year afterward he was appointed (joint Anglican and Lutheran) Bishop of Jerusalem. There he did a great work, especially in his orphan schools and in the hospitals. His experiences in Abyssinia are described in *A Journal of a Three Years' Residence in Abyssinia* (2d ed., 1847; in French in Paris, 1834). Consult Schoelby, *Samuel Gobat, evangelischer Bischof in Jerusalem* (Basel, 1900), and Madame Roerich's biography (Paris, 1880; in German, Basel, 1884; in English, with preface by Shaftesbury, London, 1884).

GOBBO, IL. See SOLARI, CRISTOFORO.

GOBBO, LAUNCELOT. A quaint, shrewd clown, in Shakespeare's *Merchant of Venice*, at first a servant to Shylock, whom he afterward deserts for Bassanio.

GOBELIN, góblán'. Any tapestry woven at the Gobelins, Faubourg Saint-Marcel, Paris, where the industry was established in 1601. (See TAPESTRY.) The origin of the name is shown by the inscription in French at the entrance gateway: "Jean and Philibert Gobelin, merchant dyers of scarlet, who left their name to this quarter of Paris and to the tapestry factory, had their works here at the end of the fifteenth century." The family prospered and from dyers finally became financiers, two of them at the end of the sixteenth century acting as first presidents of the Chamber of Accounts, and a third later acquiring the title of Marquis of Brinvilliers. Dyeing being beneath their dignity, they were glad to dispose of the property. The name, however, remained and became so closely identified with the tapestry industry established by Comans and Planche on the invitation of Henry IV, that in Germany gobelin

still is, and elsewhere for a time was, the name of any picture tapestry, even one woven long before 1440, when Jean Gobelin moved from Rheims to Paris. Consult: Guiffrey, *Les Gobelins et Beauvais* (Paris, 1906); Fenaille, *L'Etat général des tapisseries de la manufacture des Gobelins depuis son origine jusqu'à nos jours* (5 vols., ib., 1903-12); Hunter, *Tapestries* (New York, 1912). See EMBROIDERY.

GOBE-MOUCHE, gób-móush' (Fr., gaping mouth). Originally the name of a certain species of birds termed flycatchers. In its transferred use it refers to a silly or credulous person who has no opinion of his own or to one who is generally idle.

GOBI, gó'bé, or **SHAMO**, shá'mó'. A vast desert region of Central Asia, constituting the eastern extension of the arid belt that stretches across the whole breadth of the Asiatic continent into Africa (Map: Asia, L 4). As generally defined, it includes only the desert area of Mongolia from the confines of Sinkiang on the west to the Khingan Mountains on the east, although some geographers extend its western limits to Lob Nor, in about long. 90° E. East of the Khingan Range is a smaller arid region, commonly called the Eastern Gobi. The Gobi has the form of a great plateau, whose surface, lying 3000 feet or more above the sea, is divided into dreary wastes of sand, rocky table-lands, and mountains. The climate is severe, especially on the borders, and the rainfall scanty; the precipitation being generally sufficient, however, to furnish pasturage for flocks and herds during the summer months. Most of the nomadic tribes inhabiting the interior are Buddhists. The permanent settlements are confined to the northern part, which is traversed by spurs of the Tian-Shan, Altai, and Yablonoi mountains. A number of caravan routes lead across the desert from China proper to Siberia. Some allusions to the Gobi Desert are found in the writings of Marco Polo, but the first definite information we owe to the Jesuit Gerbillon, who made several journeys across the country in 1688-98. It was later visited by the Dutchman Ysbrand Ides, in 1692-94, and twice (1727-28 and 1736) by Lorenz Lange, who was sent by the Russian government to Peking. The most accurate and valuable information about the desert was obtained by explorers in the last 50 years, especially by Przhevalski and Sven Hedin (qq.v.).

GOBINEAU, gó'bé'nó', JOSEPH ARTHUR, COUNT OF (1816-82). A French Orientalist, born at Ville-d'Avray, near Paris. He held various diplomatic positions in Europe and represented France at Athens, at Rio de Janeiro (1868), and Stockholm (1872-77). His works include: *Trois ans en Asie* (1859); *Les religions et les philosophies de l'Asie centrale* (1865; 3d ed., Paris, 1900); *Traité des inscriptions cunéiformes* (2 vols., 1864); *Histoire des Peres* (2 vols., 1869); *Histoire d'Ottar Jarl, pirate norvégien* (1879); *Essai sur l'inégalité des races humaines* (4 vols., 1853-55), translated into English under the title *Moral and Intellectual Diversity of Races* (Philadelphia, 1856) and into German by Schemann (Stuttgart, 1898-1901); and *Pages choisies*, a volume of selections edited by Morland (Paris, 1905), in which can be found a brief biography (pp. 5-45). Consult: Kretzer, *Gobineau* (Leipzig, 1902); Seillière, *Le comte de Gobineau et l'aryanisme historique* (Paris, 1903); Kleinecke, *Gobineaus Rassenphilosophie* (Berlin, 1902).

GOBLET, RENÉ (1828-1905). A French statesman. He was born at Aire-sur-la-Lys, studied law, and practiced with great success at Amiens. Already distinguished for his democratic principles expressed in his paper, the *Progrès de la Somme*, at the fall of the Empire he became procureur général at the court of Amiens. In 1871 he was elected to the National Assembly, where he joined the Republican Left and was soon recognized as an orator of rare ability. In 1876 he failed of reelection to the Chamber, but was successful in 1877 and 1881. In 1879 he was appointed Undersecretary of State for Justice, and in 1882 was appointed Minister of the Interior in the Freycinet cabinet, but in the crisis brought about by the Egyptian question and because of the attacks made upon the ministry of Freycinet, he, with the other members, resigned. Goblet was appointed Minister of Education and Public Worship in the Brisson ministry (April, 1885) and energetically continued his reform policy. He retained his portfolio in the Freycinet cabinet, which went out of office in December, 1886, when he became Prime Minister. His ministry was overthrown in May, 1887, because of his unpopular efforts towards radical change in the municipal organization of Paris and because he was weak in the Schnaebele affair with Germany. He had been much embarrassed besides by his Minister of War, Boulanger. From April, 1888, to February, 1889, he held the portfolio of Foreign Affairs in the Floquet cabinet. He was elected senator in 1891, and as such warmly supported anticlerical measures and, together with Lockroy, Sarrien, and Peytral, drew up a political programme of action of which the *Petite République Française* is the organ. From 1893 to 1898 he was again a member of the Chamber of Deputies, where he voted with the Radicals. In 1902 he protested against Combes's action in closing schools conducted by the religious orders.

GOBLET D'ALVIELLA, gô'b'lâ' dâl-vyél'la, ALBERT JOSEPH, COUNT (1790-1873). A Belgian general, born at Tournai. He served in the French army in 1811-14 and then in the Dutch, and was Minister of War after the revolution of 1830, which post he exchanged in 1832 for the Ministry of Foreign Affairs. From 1837 to 1839 he was Ambassador to Portugal and was adviser to the young Queen, Maria da Gloria, from whom he received the title of Count d'Alviella. In 1839, returning to Brussels, he became Minister without portfolio, was again Minister of Foreign Affairs from 1843 to 1845, and exercised a considerable influence upon the public measures advocated in the Chamber. As a military engineer, he planned the defenses of northern Belgium and the extension of the fortifications of Antwerp. His principal publications are *Des cinq grandes puissances de l'Europe dans leurs rapports politiques et militaires avec la Belgique* (1863) and *Dix-huit mois de politique* (2 vols., 1865). Consult the biographical sketch by Juste in *Les fondateurs de la monarchie belge*, vol. viii (Brussels, 1870).

GOBLET D'ALVIELLA, EUGÈNE, COUNT (1846-). A Belgian historian of religion, grandson of Albert Joseph. He was a member of the Chamber of Deputies in 1874-78 and of the Senate in 1892-04 and after 1900. He became in 1894 professor of the history of religion at the University of Brussels. In 1875 he accompanied the Prince of Wales (later Edward

VII) on the latter's journey to India. He also became a collaborator on the *Revue de Belgique*. In addition to descriptions of travel, *Sahara et Laponie* (Eng. trans., "Sahara and Lapland," 1874), *Inde et Himalaya*, and several other works, he published notably: *L'Évolution religieuse contemporaine chez les Anglais, les Américains et les Hindous* (1884; Eng. trans. by Moden, "The Contemporary Evolution of Religious Thought in England, America, and India," 1885); *La migration des Symboles* (1891; Eng. trans., "The Migration of Symbols," by Sir George Birdwood, 1894), his most important volume, whose thesis is that "the religious symbols common to the different historical races of mankind have not originated independently among them, but have for the most part been carried from one to the other in the course of their migrations, conquests, and commerce"; the (Libbert) *Lectures on the Origin and Growth of the Conception of God as Illustrated by Anthropology and History* (1892); *Ce que l'Inde doit à la Grèce* (1897); *Croyances, rites, institutions* (3 vols., 1911). He made the study of symbols a recognizedly valuable branch of archaeology.

GOBLINS (OF. *gobelin*, from ML. *cobalus*, Gk. *kóbalos*, *kóbalos*, rascal). Spirits of popular superstition, grotesque in appearance, and generally malicious, who live in woods or caves and often lurk about houses. They are called hobgoblins, perhaps a corruption of hopgoblin. See DEMON.

GOBLINS, THE. A sparkling comedy, interspersed with songs and music, by Sir John Suckling, first acted at Blackfriars in 1638 and revived at the Theatre Royal, Jan. 24, 1667.

GOBONY. A term in heraldry. See COM-PONÉ.

GOB/SECK. A novel by Balzac (1830).

GOBY (from Lat. *gobio*, *gobius*, gudgeon, from Gk. *gobios*, *kóbios*, gudgeon). A spiny-rayed fish of the family Gobiidae, whose ventral fins are completely united into a disk more or less capable of being used as a sucker, enabling the fish to cling to rocks and so resist the power of waves and currents. They have no air bladder. The true gobies are generally small fishes, some of them inhabiting the shallow bays of the coast, and others deeper water; the species are very numerous and belong to both hemispheres. One species (of Russia) inhabits fresh water alone. The gobies are very interesting, on account of their habits, and are of the number of nest-building fishes, employing seaweeds and eel grass for this purpose in spring. When the female has deposited her eggs in the nest, the male watches over them till they are hatched. In Europe, consequently, these fishes are much in request for aquaria, of which they are among the most interesting occupants. A British species (*Gobius minutus*), which ascends rivers, chooses a cockleshell for its home in some tidal pool. "The shell being placed on the sand with its concave surface downward, the sand beneath it is hollowed out and cemented by a special mucilaginous secretion from the skin; a cylindrical tunnel gives access to the nest, and the whole structure is covered over with loose sand." The female having glued her eggs to the shell, the male guards them for six to nine days, until they hatch. Another European goby (*Latunculus pelucidus*), which is nearly transparent, is remarkable for being perhaps the most

short-lived of all vertebrates, being born in mid-summer, maturing during the following winter, and spawning and dying upon the approach of summer, so that none live more than a year. Small species of several genera inhabit the coast and estuaries of the southern United States and of California. See MUDFISH.

GOCH, gôc, JOHANNES VON (properly JOHANN PUPPER, or CAUPPER) (c.1400-75). A German Augustinian monk. He was born at Goch, Prussia, studied at Cologne and probably at Paris, and was the founder (1459) of an Order of Canonesses at Tabor, near Mechlin, Flanders, of which he subsequently became prior. A precursor of the Reformation, in his writings, *De Libertate Christiana*, *De Quatuor Erroribus circa Legem Evangelicam exortis*, and *Epistola Apologetica* (1521), he attacks the influence of Pelagianism in the Church, and advocates a return to the text of the Bible as the only true source of religious truth. He was considered a man of profound piety, and as a theologian was unexcelled in his day. Consult Clemen, *Johann Pupper von Goch* (Leipzig, 1896).

GÖCKINGK, gē'kīnk (also spelled GOEKINGK and GÖKINGK), LEOPOLD FRIEDRICH GÜNTHER VON (1748-1828). A German poet. He was born at Grünigen and was educated at Halle. After occupying various official positions under the government at Magdeburg, Wernigerode, and Berlin, and acting for several years as privy counselor to the Prince of Orange-Fulda, he in 1826 removed to Berlin and subsequently to Wartenberg, Silesia. His *Lieder zweier Liebenden* (3d ed., 1819) won for him great popularity in Germany towards the close of the eighteenth century. His *Gedichte* (rev. ed., 1821) contain the excellent *Episteln* and *Sinngedichte* (separately published, 2d ed., 1778). The latter are occasionally characterized by a vein of modern political satire. Consult Gückingk's correspondence with Bürger (q.v.) in Strodtmann, *Briefe von und an Bürger* (4 vols., Berlin, 1874), and Kasch, *Leopold von Goeckingk* (Marburg, 1909).

GOD (AS., OS., Dutch *god*, Goth. *gub*, OHG. *got*, *cot*, Ger. *Gott*, of doubtful etymology, perhaps connected with Skt. *hū*, to call, or with Skt. *hu*, Gk. *χεῖν*, *chein*, to pour; the word is evidently originally a passive participle; the frequent derivation of *god* from *good*, AS *gōð*, Goth. *gōðs*, OHG. *guot*, Ger. *gut*, is entirely erroneous). Two types of definition of God are possible. One is the maximum definition, which defines God in terms of the highest conceivable religious ideas. According to this, God is the eternal and infinite personal Spirit, the Creator and Governor of the universe, the loving Father of all men. The other is the minimum definition so framed as to include the god of any historic religion, however primitive. A wide variety of such definitions have been given, which may be summarized thus: an extrahuman power, treated as personal, and conceived of as exercising control over some sphere which affects human life. In primitive religion any spirit may, by gaining more power and so winning worshippers and a cult, become a god. Man needs help for various things, and those powers to which he feels that he can appeal in any personal way become for him gods.

The idea of gods once introduced, the tendency is towards a multiplication of gods, whence arises polytheism. A tendency soon becomes marked to ascribe to one god the control over

some restricted portion of country or over the affairs of one family. This produces a "henotheism" within a restricted group of persons, which may be perfectly consistent with polytheism and polytheistic worship apart from the restricted circle to which this one god belongs. But with the growth of the family into a tribe, and of the tribe into a nation, the sphere of the god is also enlarged, and victories over other nations, as well as the attempt to find a single cause behind all things, will produce ultimately the idea of one god, beside whom all other gods are only pretended gods, having no real existence. Thus monotheism must develop. The Hebrew conception of God grew from an early tribal god to a national deity, caring for the welfare of the Hebrew nation. Under the prophets the conception came to be strongly moral, and Jehovah, the national God, became a God of social righteousness: "What doth the Lord require of thee but to do justly and to love mercy and to walk humbly with thy God?" (Mic. vi. 8.) The contact with other nations led the prophets to see that their God must be conceived as controlling the nations if he was to guide the fortunes of Israel. In this way Hebrew thought developed an ethical monotheism. By the time of the beginning of the Christian era the Hebrew idea of God was that of a Being, the sole cause of all things, omniscient and omnipotent, benevolent, rewarding the good and punishing the evil, and guiding the world to the fulfillment of His own purpose. The idea, however, was still nationalistic. While Jehovah was the God of the whole world, Israel was His particular care. This conception of God Christianity took over, only emphasizing the idea of God as a loving Father, and, when the new religion passed from the Hebrews to the Greeks, putting the Christian Church for the Hebrew nation as the object of God's peculiar care. Every age has a different conception of God, and the Christian idea has developed as the conceptions of ethics and of the brotherhood of the world have advanced. Theology has brought forward various proofs of the existence of God. 1. The first proof is the so-called cosmological, from the mere existence of a dependent world, which does not bear in itself the marks of eternal and independent existence, to an independent something which shall be its cause. This leaves the doctrine in a very vague condition. 2. The teleological proof adds definiteness to it. In innumerable individual objects, like the plants, in the adaptations of the chemical elements to each other, the construction of the bodies of animals and of the mind of man, and in the whole universe as revealed more and more by modern study, we see evidences of plan. The Cause of the world is therefore capable of making a vast plan; He possesses intelligence and will, i.e., rational personality. 3. The moral proof argues from the nature of man himself, especially as a moral being, to the nature of God as also moral, or benevolent, which argument is supplemented by the Christian argument which draws the conclusion from the experience of regeneration that God positively seeks to promote the holiness of men. 4. These arguments are completed by the ontological argument, which in its best form ascribes to the highest conception which man is able to form of God (the Christian conception) objective validity, on the basis of the proposition that it is fundamentally inconceivable that the highest

conception at which the mind of man can arrive should be a mere subjective creation.

The modern objection to this line of proof began with Kant, who declared it to be an application of the principle of causality beyond the bounds set by nature as an intellectual principle given man for the knowledge of empirical objects. The Sensational school, which Kant was opposing, has also denied the application of causality to reach beyond experience on various grounds. Mill was chiefly influenced by the complexity of the investigation, and particularly by the difficulties created by the existence of pain and sin. Spencer, who has carried this school to its natural results and combined a developed theory of evolution with sensationalism, has based his objections upon the doctrine of the relativity of knowledge, which makes such a conception as that of a first cause essentially unintelligible. In a more popular form the objection is raised against the idea of God that it is incapable of proof, by which is meant such proof as is given to the propositions of natural science, experimental and tangible proof.

It has sometimes been claimed that the idea of God is innate in the soul. If by this is meant that every man has by nature the idea of one infinite person, the claim is manifestly false, for the existence of polytheism at once disproves it. But if it be meant that there are innate in the mind certain principles, such as that of causation, which impel the mind to look up from phenomena to their source, and that the examination of all the phenomena belonging to this sphere will finally give to man the knowledge of God, the proposition in this sense is true. The argument is thus mingled of *a priori* and *a posteriori* elements. The former are necessary as the rational foundation of the argument, the latter to give it contents and to lead it to the concrete result of the being of God. See THEISM.

Bibliography. Among the numerous excellent treatises of recent times upon theism may be mentioned as the best: Orr, *Christian View of God and the World* (London, 1897); Flint, *Theism* (ib., 1886); id., *Anti-Theistic Theories* (Edinburgh, 1884); Martineau, *A Study of Religion* (Oxford, 1888); id., *The Idea of God* (Boston, 1887); Fiske, *Through Nature to God* (ib., 1899); Clarke, *The Christian Doctrine of God* (New York, 1909); Adoney, *The Christian Conception of God* (ib., 1912). For a modern theory of the origin of the idea of God, consult King, *The Development of Religion* (ib., 1910).

GODARD, gô'dâr', BENJAMIN (1849-95). A French composer, born in Paris. He was a precocious child and, after studying the violin with Richard Hammer, entered the Paris Conservatory, where his teachers were Viextemps (violin) and Reber (composition). In 1865 a violin sonata was published, and shortly afterward Godard received a prize from the Institut de France. From this time on, his compositions followed each other rapidly. While not works of genius, they are characterized by felicity of expression and met with considerable popular favor. His most successful opera was *La vivandière*, produced at the Opéra Comique shortly after his death. He also wrote: *Pedro de Salamea* (1884); *Jocelyn* (1888); *Le Dante* (1890); *Jeanne d'Arc* (1891); and numerous symphonies, suites, concertos, and songs.

GODAVARI, gô-dâ'vâ-ré. One of the principal rivers of the peninsula of India, and the largest of the Deccan, rising within 50 miles of

the Arabian Sea in the Western Ghats, near Dindori (Map: India, C 5). It flows southeast for 900 miles across the peninsula into the Bay of Bengal. Dividing at Rajamandry, it enters the sea by two principal mouths—the northern at the French town of Yanam and the southern at Narsapur. About 23 miles above the head of the delta the Godavari emerges near Rampa from the Eastern Ghats. It is navigable for 300 miles. Its northern tributaries are the Purna, the Pranhita, the Indravati, and the Saveri; from the south it receives the Manjera and the Maner.

GOD'DARD, ARABELLA (MRS. J. W. DAVISON) (1836-1922). An English pianist. She was born, of English parentage, in Brittany, studied in Paris under Kalkbrenner and in London under Mrs. Anderson and Thalberg, and made her first public appearance in 1850 at the Grand National Concerts at Her Majesty's Theatre. She continued her studies under Davison, whom she married in 1860. Her most brilliant success was in her interpretation of the last compositions of Beethoven. In 1873-76 she made a successful tour of the world, including America, Australia, and India, and in 1880 retired from professional concert giving.

GOD'DESS OF REASON. The new divinity set up by the French Revolutionists in their attempted reconstruction of religion in 1793. On November 10, in the cathedral of Notre Dame, changed into a Temple of Reason, the goddess was installed with much ceremony. The part of the goddess was taken by an actress, dressed in white and wearing the Phrygian cap and the tricolor. The cathedral was restored to its proper functions by Napoleon in 1802.

GODEBSKI, gô-dêl'ské, CYPRIN (1835-1909). A Polish sculptor, a son of Xaver (Godebski). He was born at Méry-sur-Oder, France, and was educated at the Polish school, Batignolles, and in the studio of Joffroy. He spent many years in Galicia and at St. Petersburg. His principal works include: "The Awakening," a marble statue (1886); "Children," a bronze group for a Polish school (1880); "The Angel of the Fatherland Protecting Two Orphans"; "Brutal Force Suffocating Genius" (Toulon Museum); busts of Rossini, Viextemps, Zichy, Servais, Prince Gortchakov, Krawzewski, and others, and the statues of Generals Landon and Lassy, in the Vienna Arsenal. He also executed a fine monument of the composer Moniuszko, in Warsaw Cathedral; a monument to the heroes of the Crimean War, at Sebastopol; the tomb of the tenor Tamberlik, at Père Lachaise Cemetery, Paris; and various other monumental works. Many of his later statues are polychrome, e.g., "A Dream of Glory."

GODEBSKI, gô-dêl'ské, KAWERZ or XAVER (1801-66). A Polish author, born at Frankenthal, a son of Cyprien Godebski, poet and patriot (1775-1809). He was for many years professor in a Polish school at Paris. His literary work includes the edition of his father's more important writings, works on politics and history, especially a life of Plater (1848), and the studies on social reform in Poland in the eighteenth century (1866), and on the spirit of the times (1860). He also translated several French plays into Polish.

GODEFROY, gôd'frwâ' (Lat. Gothofradus). The name borne by a family of distinguished scholars and jurists of French origin.—DENIS GODEFROY (1549-1622) was born at Paris and,

after studying at Louvain under Ramus, completed his education at the universities of Cologne and Heidelberg. It was probably at this last place that he adopted Protestant tenets. In 1579 Godefroy quitted France and became a professor of law at Geneva. In 1589, having returned to France, he was made bailiff of the District of Gex; but, his house having been pillaged and his library burnt by the troops of the Duke of Savoy, he retired first to Basel and later to Strassburg, where in 1591 he was given the chair of Roman law and history. In 1605 the Elector Palatine of the Rhine called him to be head of the faculty of law at Heidelberg. In 1618 he was sent as envoy to Paris from Frederick V to Louis XIII. Though numerous offers were made to him, Godefroy preferred to remain at Heidelberg, but in 1621 the presence of the army of the Catholic League under Count Tilly forced him to seek refuge at Strassburg, where he died Sept. 7, 1622. His most important work was his edition of the *Corpus Juris Civilis* (Geneva, 1583), which was long the standard text. He was also the author of numerous works on jurisprudence and on the classics.—THÉODORE GODEFROY (1580-1649) was the eldest son of Denis Godefroy. In 1602, after being educated at Geneva and Strassburg, he settled in Paris and abjured Protestantism. Although an advocate before the Parliament of Paris, he devoted most of his time to the study of history and eventually became the historiographer royal of France. During the latter half of the Thirty Years' War he was employed as one of the French diplomats at Cologne and Münster and helped negotiate the Peace of Westphalia in 1648. He died at Münster, Oct. 5, 1649. He was the author of numerous works in French history and politics and made a large and important collection of documents for the history of France and of other countries. This was continued by his son DENIS (1615-81) and in 1749 found its way into the library of the Institut de France.—JACQUES GODEFROY (1587-1652), the younger brother of Théodore, passed his life as professor of law at Geneva and remained true to his Protestant convictions. He held many important public offices during his stay in Switzerland. He is known as the editor of the *Theodosian Code* (Lyons, 1665), upon which he worked for 20 years, and which is still used by jurists. Besides this, he published a multitude of works on law and jurisprudence, and he ranks higher as a scholar than even his learned father.—Others of the Godefroy family who were distinguished in their time are: JEAN GODEFROY, Sieur d'Aumont (1656-1732, the third son of the younger Denis, and an historian of note; DENIS CHARLES GODEFROY, MARQUIS DE MÈUILLOIRE (1795-1877), the family biographer and a scholar of ability. He published *Les savants Godefroy* and *Mémoires d'une famille pendant les XVIème, XVIIème, et XVIIIème siècles* (1873).

GODEFROY, gôd'frwä', FRÉDÉRIC (1826-97). A French literary historian. He was educated for the most part privately and early devoted his leisure to the study of French language and literature. His *Lequel comparé de la langue de Corneille* (1862) was crowned by the Academy. He also wrote a *Histoire de la littérature française depuis le XVIème siècle jusqu'à nos jours* (1859-78; 2d ed., 1878-81). With governmental support he prepared the voluminous and important *Dictionnaire de l'an-*

cienne langue française et tous ses dialectes du IXème au XVème siècle (10 vols., 1880-1903). This work, laboriously compiled from all authoritative printed and manuscript sources, remains, despite certain defects, a standard reference book.

GODERICH, göd'rich. See RIPON FREDERICK JOHN ROBINSON, EARL OF.

GODERICH. A popular summer resort and the county seat of Huron Co., Ontario, Canada; a port of entry on Lake Huron, at the entrance of Maitland River, and on the Grand Trunk and the Canadian Pacific railroads (Map: Ontario, C 6). It has a good harbor and steam communication with all lake ports. There are salt refineries, flour and lumber mills, an organ factory, iron foundries, tanneries, grain elevators, and manufactories of wheels, road machines, and knitting machines. The surrounding district supplies excellent limestone, sand, and clay for manufacturing purposes. Pop., 1901, 4158; 1911, 4522.

GODESBERG, gö'des-bërk. A watering place in the Prussian Rhine Province, situated near the left bank of the Rhine, 4 miles below Bonn. It has an alkaline chalybeate spring, believed to have been known to the Romans, a hydro-pathic establishment, and numerous fine villas with gardens. It has extensive industries in quilting and brickmaking. A short distance from the village lie the ruins of the castle of Godesberg, erected by Archbishop Dietrich of Cologne in the thirteenth century. Pop., 1900, 8927; 1910, 10,644. Consult Dennert, *Godesberg, eine Perle des Rheins* (Godesberg, 1900).

GODET, gö'dä', FRÉDÉRIC (1812-1900). A Swiss Protestant theologian. He was born at Neuchâtel and was educated in that city and at Bonn and Berlin. In 1850 he was appointed professor of theology at Neuchâtel and in the following year received a pastorate which he held until 1866. In 1873 he helped to found the Evangelical church of Neuchâtel, independent of the state, and was a professor in its faculty of theology. As a prominent representative of Reformed orthodoxy, Godet exercised a very wholesome influence on the development of religious thought in Switzerland, further stimulated by his published works, particularly by his commentaries, which are marked by great delicacy of exegesis. He wrote: *Histoire de la réformation et du refuge dans le pays de Neuchâtel* (1859); *Commentaire sur l'évangile de Saint-Jean* (1863-65; 3d ed., 1881-88), which has been translated into English (1886), German, Dutch, and Danish; *Commentaire sur l'évangile de Saint-Luc* (1871; 3d ed., 1889; Eng. trans., 1875); *Commentaire sur l'épître aux Romains* (1879-80; 2d ed., 1890; Eng. trans., 1881); *Études bibliques* (4th ed., 1889; Eng. trans., first part, *Old Testament Studies*, 3d ed., 1885, second part, *New Testament Studies*, 6th ed., 1885); *Lectures in Defense of the Christian Faith* (4th ed., 1900).

GO'DEX, LOUIS ANTOINE (1804-78). An American publisher, born and educated in New York City. From 1830 to 1877 he conducted at Philadelphia *Godey's Lady's Book*, the first woman's periodical in the United States. Among his other publications were *Jarvis's Musical Library* and the *Young People's Book*.

GODFATHER AND GODMOTHER. The sponsors of candidates for baptism, and, in the Roman Catholic church, of candidates for confirmation. See SPONSORS.

GODFREY, SIR EDMUND BERRY (1621-78). An English magistrate, born in Kent and educated at Christ Church, Oxford. He became a justice of the peace for Westminster, and in 1666 was knighted for his efficient work during the plague. In 1678 he received the depositions of Titus Oates (q.v.) concerning the "Popish Plot." Shortly afterward he was found dead near Hampstead. The public immediately accused the Roman Catholic priests of having murdered Godfrey, and subsequently a man named Miles Prance was induced to make a confession implicating the Catholics. As a result of this confession, three men were hanged for the crime; but Prance, when accused of perjury, finally (1686) admitted that he had concocted his evidence. Considerable controversy arose as to how Godfrey met his death—some claimed he had committed suicide—but though the evidence pointed to murder, the mystery was never solved. Consult John Pollock, *The Popish Plot* (London, 1903), and Alfred Marks, *Who Killed Sir E. B. Godfrey?* (ib., 1905).

GODFREY, THOMAS (1704-49). A self-taught American mathematician, who acquired some reputation from an improvement which he made in Davis's quadrant. (See **SEXTANT**.) He was a man of intemperate habits, a humble artisan in Philadelphia, but he was sufficiently interested in science to learn Latin that he might read the better class of mathematical literature of the time. The improvement in the quadrant seems to have been due to him, but there was a dispute between him and John Hadley of England as to the priority of the invention. The Royal Society considered the claims of both parties and rewarded each, sending to Godfrey gifts to the value of \$1000. The account in the *Philosophical Transactions* of the Royal Society of London (abridged ed., London, 1809, vol. vii, p. 667, for 1734) speaks of him as "having under the greatest disadvantages made himself master of the principles of astronomy and optics, as well as other parts of mathematical science," and as having made his invention in 1730, the first account of it appearing two years later.

GODFREY DE BOUILLON, de bō'yōn' (c.1058-1100). One of the leaders of the First Crusade and the first Latin ruler of Jerusalem. He was the son of Eustace of Boulogne and Ida, sister of Gozelo, or Godfrey, the Humpbacked, of Lower Lorraine. The year of his birth is uncertain, but it was about 1058. His family traced its descent from Charles the Great, and later legends made Lohengrin, "the Knight of the Swan," Godfrey's progenitor. In the strife over investiture (q.v.) he was on the side of the Emperor, and it was said that he was the first to scale the walls of Rome when it was attacked by Henry IV in 1084. The legends also recount how he was stricken with disease because of his sacrilege at Rome and then miraculously healed when he took the Crusader's vow. In 1099 he became Duke of Lower Lorraine. He was one of the leaders in the First Crusade (1096-99), but not commander in chief, and after the capture of Jerusalem was elected "Baron and Defender of the Holy Sepulchre." According to an untrustworthy legend, he was offered the title of King, but refused "to wear a crown of gold where the Savior had worn a crown of thorns." He held this dignity for about a year, and died July 17 or 18, 1100. Godfrey is described as a man of large stature

and great bodily strength. Many feats of bravery and strength are ascribed to him, such as his combat single-handed with a ferocious bear, or his cleaving asunder the body of a Moslem emir with a single blow of his sword. He made an excellent and energetic ruler of Jerusalem. Many legends clustered about his name, and many deeds were falsely imputed to him. Consult: Sybel, *Geschichte des ersten Kreuzzuges* (Leipzig, 1900); Froboese, *Gottfried von Bouillon* (Berlin, 1879); Rührich, *Die Deutschen im Heiligen Lande* (Innsbruck, 1894); Pigeonneau, *Le cycle de la croisade et de la famille de Bouillon* (Saint-Cloud, 1877). Hagenmeyer, *Testa Francorum* (Heidelberg, 1890), gives a bibliography of all the best works on Godfrey. See **ASSIZE OF JERUSALEM**; **CRUSADE**.

GODGIFU. See **GODIVA**.

GODHAVN, gōd'hā'v'n. A town of Greenland, on the south coast of Disco Island (Map: America, North, N 3). It is the residence of the Danish Inspector of the Northern Inspectorate, and has some fishing industries. Godhavn, also called Lively, is mainly known in America as the stopping place of many polar expeditions. Pop., 300, of whom five only are Danes.

GODIN, gō'dān', AMÉLIE. See **LINZ, AMÉLIE**.

GODIN, gō'dān', JEAN BAPTISTE ANDRÉ (1817-88). A French socialist, born at Esquéhéries, in the Department of Aisne. He came from an artisan family, and received the meagre education which was given to boys of his class at that time. When 17 years old he began a trip through France, in order to perfect his skill as an artisan. Three years afterward he was a workman in Esquéhéries. A small workshop which he established in 1840 prospered and in 1846 employed about 30 men. He removed to Guise, in order to find a better market for his wares. He found time to pick up a very fair education, and became deeply interested in the writings of certain socialists, especially Fourier. He contributed 100,000 francs to the unsuccessful project of Victor Considérant (q.v.) to found a Fourieristic colony in Texas. In 1859 he began the construction of the buildings for his co-operative association, or *famillière*, and before 1886 had fully established profit sharing. By his plan profits in excess of 5 per cent on capital were to be divided between labor and capital in the ratio of aggregate wages to aggregate minimum profits. Prior to this distribution, however, a sum was to be set aside for education, insurance against sickness and old age, etc. At his death he left almost his entire personal fortune (about 2,500,000 francs) to the association. Almost all the shares in the association are at present held by the workers, numbering some 1200.

Godin had some success in politics. He was elected president of the municipal commission of Guise in 1870, and member of the National Assembly in 1875. In 1882 he was made Knight of the Legion of Honor. He published several books, the chief of which are: *Solutions sociales* (1871); *La politique du travail et la politique des privilèges* (1875); *La souveraineté et les droits du peuple; le gouvernement et le vrai socialisme en action* (1883); *La république du travail et la réforme parlementaire* (1889). Consult Bornadot, *Le famillière de Guise et son fondateur* (Paris, 1889), and D'Isambert, *Les idées socialistes en France* (ib., 1905). See **FOURIERISM**.

GODIN, Louis (1704-60). A French astronomer, born in Paris. He studied at the Lycée Louis le Grand and under Delisle. On May 16, 1735, he started on an expedition to South America to measure a degree of the meridian by geodetic methods. He arrived at Quito, Peru, in February, 1736, established two astronomical stations in the Andes, and was subsequently appointed professor of mathematics at Lima, where, in 1746, he made important seismological studies during the famous earthquake. A year after his return to Europe, in 1752, he was appointed president of the naval academy at Cadiz, where he rendered valuable service during the earthquake of Lisbon. His principal works include: *Histoire de l'Académie des Sciences 1680 à '99* (1728); *El temblor de tierra de Lima, sus causas, efectos y consecuencias* (1748); *Observations astronomiques au Pérou* (1752); *Des tremblements de terre en général, de ceux de Lima et Lisbon en particulier* (1753); *Les possessions espagnoles de l'Amérique du Sud* (1755).

GODIN DES DONAIS, dâ zô'dô'nâ', **JEAN** (1712-92). A French naturalist, born at Saint-Amand, France. Early in his life he went to Peru, where he was appointed to the chair of natural science and astronomy at Quito (1739). Several years later he began a botanical exploration of northern Peru and Ecuador, and afterward removed to Cayenne, where from 1750 to 1765 he explored the neighboring country and Brazilian Guiana. From here he traveled along the Amazon, on the banks of which he made further botanical investigations during a period extending over eight years. On these journeys he prepared illustrations of hundreds of mammals and birds, many of them before unknown, and collected more than 10,000 species of plants. Returning to France in 1773, he gave his collections to the Museum of Natural History at Paris. His numerous publications, comprising works on the botany and languages of South America, include: *Flore raisonnée du Pérou* (1776), containing more than 4000 species, with two volumes of illustrations, in more than 700 plates; *Les plantes de la Guayane* (1777); *Faune du Pérou* (1778), with numerous illustrations; *Flore de la Guayane* (1779), with three volumes of illustrations; *Grammaire comparée des langues indiennes de l'Amérique du Sud* (1784).

GÖDING, gē'ding (Bohemian *Hodonin*). A town in Moravia, Austria, on the right bank of the navigable March, which here forms part of the Hungarian boundary, about 70 miles northwest of Vienna. It is in a good agricultural district. The principal attraction is the Imperial castle, with its immense park. It has German and Czech high schools, cavalry barracks, a state horse depot, a tobacco factory, sugar refineries, a spirit distillery, a brewery, and several saw mills. Pop., 1900, 10,231.

GODIVA, or **GODGIFU** (?-c.1080). According to legend, a Saxon lady of Coventry, in Warwickshire, who rode naked through the streets of the town out of devotion for her people. It is impossible to say whether the story is wholly fictitious or partly true. In its developed form the legend runs as follows: About the year 1040, Leofric, Earl of Mercia and Lord of Coventry, imposed certain onerous services and heavy exactions upon the inhabitants of the latter, of which they loudly complained. His wife, the Lady Godiva, having the welfare of the town at heart, besought her husband to give them re-

lief, and was so earnest in her entreaties that at length, to escape from her importunities, the Earl said he would grant her the favor, but only on condition that she would ride naked through the town, supposing, from the modesty of Lady Godiva, that he had imposed an impossible condition. He was surprised with her answer: "But will you give me leave to do so?" As he could not in justice refuse, she ordered that proclamation be made that on a certain day no one should be out of doors, or even look from their houses: and, clothed only in her long hair, she rode through the town. Her husband, in admiration of her intrepid devotion, performed his promise. This circumstance was commemorated by a stained-glass window, mentioned in 1690, in St. Michael's Church, Coventry; and the legend that an unfortunate tailor, the only man who looked out of a window, was struck blind, has also found commemoration in an ancient effigy of "Peeping Tom of Coventry," probably an image of St. George, still to be seen in a niche of one of the buildings. By a charter of Henry III (1218), a fair is held at Coventry, beginning on Friday of Trinity week, and lasting eight days. The fair was formerly opened with a grand civic procession, a part of which was, in 1678, the representation of the ride of Lady Godiva. These processions were continued at intervals of from three to seven years until 1826. Some beautiful woman, who represented Lady Godiva, was the principal figure; but many other historical and emblematic personages were introduced. In 1848 the procession was revived with great splendor, and attracted 15,000 strangers. The ceremony has, however, fallen into disrepute, the last procession occurring in 1887. For a full discussion of the legend, consult Freeman, *The Norman Conquest* (Oxford, 1870-79); consult also Poole, *Coventry, its History and Antiquities* (London, 1870), and Harris, *Story of Coventry* (ib., 1911).

GODKIN, EDWIN LAWRENCE (1831-1902). An American editor and publicist, born in Moyne, County Wicklow, Ireland, son of a Presbyterian minister who was also a journalist and a leader in the "Young Ireland" movement. The son graduated at Queen's College, Belfast, in 1851, and during the Crimean War (1854-56) was special correspondent of the *London Daily News*. In 1856 he came to the United States, and traveled in the South. In 1857 he settled in New York City, where he read law under David D. Field (q.v.), was admitted to the bar in 1858, and for several years practiced occasionally. From 1862 until 1865 he was a correspondent of the *Daily News* and an editorial writer for the *New York Times*. In 1865 he established and became editor of the *Nation*, a weekly fashioned after the *London Spectator*, whose proprietorship was assumed in 1866 by himself, J. M. McKim, and F. L. Olmsted (q.v.). In 1881 the *Nation* was merged with the *Evening Post*, of which it became the weekly edition, and Godkin was thereafter an editor (in 1883-99 editor in chief) and proprietor of the combined publications. As a journalist, he devoted little attention to the organization of newspaper service, but he was one of the foremost leader writers in the history of the American press. His editorials in the *Nation* influenced in manifold ways the best thought of the time, and from 1884, previous to which the paper had been avowedly Republican, he made the *Evening Post* the leading independent American daily. His

style was noteworthy for its directness, its pith, and (to quote Henry James) "admirably aggressive and ironic editorial humor, of a quality and authority new in the air of a journalism that had meant for the most part the heavy hand alone." Godkin's critical estimates were singularly acute and mainly just, but possibly too purely intellectual to be often sympathetic. He was a prominent figure in reforms affecting the causes of sound money, of reconstruction, and of the civil service. In him the idea of public office as a public trust had undoubtedly its chief exponent in the United States. He consistently and severely opposed the "spoils" or close party system in American politics, as well as "hoss" or "machine" rule in various forms. His fearlessness often exposed him to disapproval, and not seldom to abuse. In preparation for the New York City municipal campaign of 1890, he printed in the *Post*, with scathing editorial comment, a series of biographies of Tammany Hall leaders, which resulted in the issuance against him of several warrants of arrest on charges of criminal libel. The cases were dismissed for lack of prosecution. He received the degree of D.C.L. from Oxford University in 1897. A memorial Godkin lectureship at Harvard upon "The Essentials of Free Government and the Duties of the Citizen" was founded in 1903. He published a *History of Hungary, A.D. 300-1850* (1853; 2d ed., 1856); an excellent work on *Government* (1871), in the "American Science Series"; and *Reflections and Comments* (1895), *Problems of Modern Democracy* (1906), and *Unforeseen Tendencies of Democracy* (1908)—all valuable collections of papers respectively from the *Nation*, the *Atlantic*, and other sources. Consult Ogden, *Life and Letters of E. L. Godkin* (New York, 1907).

GODLEY, ALFRED DENIS (1856-1925). A British educator, born in County Leitrim, Ireland, and educated at Harrow and at Balliol College, Oxford. He was assistant master at Bradfield College in 1879-82 and fellow and tutor of Magdalen College in 1883-1912, and in 1910 became public orator of the university. A remarkably clever writer of light verse, he contributed some brilliant parodies to the *Oxford Magazine*; edited, with Prof. Robinson Ellis, the *Nova Anthologia Oxoniensis* (1899); published an edition of Tacitus' *Historiae* (1887 and 1890) and a translation of Horace's *Odes* (1898); and wrote *Verses to Order* (1892 and 1903), *Aspects of Modern Oxford* (1893), *Socrates and Athenian Society* (1895), *Lyra Fritulu* (1899), *Second Strings* (1902), *Oxford in the Eighteenth Century* (1908), *The Casual Ward* (1912); and "Senecan Tragedy," in *English Literature and the Classics* (Oxford, 1914).

GODMAN, JOHN D. (1794-1830). An American physician, born in Annapolis, Md. He graduated at the University of Maryland in 1818, was professor of anatomy in the Medical College of Ohio, was one of the editors of the *Philadelphia Journal of Medical Science*, and in 1820-27 was professor of anatomy and physiology in Rutgers Medical College in New York. He was the author of many articles in the *Encyclopædia Americana*, and in addition published: *American Natural History; Anatomical Investigation* (1824); and *Rambles of a Naturalist*.

GODDIN. A seventh-century epic by the Welsh bard Aneurin, who was the son of the chief of the Gododin tribe, founded on the week's battle of Cattraeth (603). It is about 900 lines

in length, and in 1852 was translated by Rev. John Williams, at Ithel. John Morley has also translated parts of it, and the poet Gray founded his "Death of Hoel" upon it. Consult Elton, *Origins of English History* (London, 1882).

GÖDÖLLÖ, gē'dēl-lē. A market town in Hungary, about 16 miles northeast of Budapest. It is chiefly noteworthy for its royal château of more than 100 rooms, with an extensive park, formerly the property of the Princes Grassalkovich, later of Baron Sina, but purchased in 1867 by the Hungarian nation and presented to the King at his coronation. It is now the royal summer residence; yearly the court holds a great hunt here. In the vicinity is Besnyő, a noteworthy pilgrims' resort. It has a school of hand weaving. Pop., 1900, 5893. At Gödöllő, April 6-7, 1849, the Hungarians under Görgey defeated the Austrians under Windischgrätz. The victory led to the proclamation of Hungarian independence, April 14, 1849. Consult Ripka, *Gödöllő* (Vienna, 1898).

GODOLPHIN, SIDNEY, first EARL OF (1645-1712). An English statesman. The third son of Sir Francis Godolphin, he was born at Helston, Cornwall, but of his youth little is known. In 1662 he was page of honor to Charles II, and in 1678 he became Master of the Robes. From 1668 to 1679 he was a member of Parliament for Helston, then two years for St. Mawes. In 1678 he was one of the commissioners sent to Holland to negotiate the Peace of Nimeguen. Next year the government appointed him Lord of the Treasury. In 1684 he was made First Commissioner of the Treasury and created a peer, with the title of Lord Godolphin of Rialton. Although his dislike of Roman Catholicism led him to vote for the exclusion of the Duke of York from the succession, on the Duke's accession as James II, Godolphin became chamberlain to the Queen; in 1686 he was again Commissioner of the Treasury; and afterward the King gave him a place on the commission sent to treat with William of Orange. In 1690 William appointed him First Lord of the Treasury, and five years afterward one of the seven lords justices for the administration of government during the King's absence. As Godolphin was guilty of secret correspondence with James II at Saint-Germain, he resigned his office in trepidation upon Sir John Fenwick's confession. When Fenwick was beheaded and his story discredited, however, Godolphin again became Lord of the Treasury (1700). Appointed Lord Treasurer on the accession of Anne (1702), he remained head of the home government during eight years, mainly through the influence of the Duke of Marlborough, whom Godolphin staunchly supported with funds for the prosecution of the Duke's wars. In 1706 Godolphin was created Earl of Godolphin and Viscount Rialton. His position as head of the Whig government came to an end in 1710, when he fell from power and was supplanted by Harley. He died at St. Albans, Sept. 15, 1712. A man of remarkable intelligence and of business-like habits, he was thorough in everything he did, and in an age of corruption he kept his hands pure. Consult: Elliot, *Life of Sidney, Earl of Godolphin* (London, 1888), very favorable; Collins, *Peerage* (9 vols., ib., 1812); Evelyn, *Diary* (4 vols., ib., 1879); Clarke, *Life of James II* (2 vols., ib., 1816); Macpherson, *Original Papers* (2 vols., ib., 1775); Burnet, *History of my Own Time*

(Oxford, 1833); and Walpole, *Essays Political and Biographical* (London, 1908).

GODOLPHIN BARB, THE. See BARB.

GODON, SYLVANUS WILLIAM (1809-79). An American naval officer. He was born in Philadelphia; entered the navy as a midshipman in 1819; served in the Mexican War; and, in command of the *Albatross*, took part in the attack on Port Royal in 1861. In 1863 he became commodore, and in the attacks on Fort Fisher (q.v.) commanded a division of Admiral Porter's fleet. He was made rear admiral at the close of the war; commanded the South Atlantic squadron in 1866-67; was commandant of the Brooklyn Navy Yard in 1868-70; and was retired in 1871.

GODOWN (Malay *godong*, *godong*, warehouse). A term applied in the East Indies and in most of the Orient to a storehouse or building located on or near a wharf and chiefly used for the storage of goods. The term is believed by some to be a modification of a Dutch word indicating storehouse; by others it is believed to have come into use from the circumstance that most of the storehouses in the East Indies were formerly below the surface of the ground.

GODOWSKI, gó-dów'ské, LEOPOLD (1870-). A Polish-American pianist. He was born at Vilna, in Russian Poland, and received his first instruction from local teachers. From 1881 to 1884 he was student at the High School of Music, Berlin, coming from there to America on an extended concert tour (1884-85). From 1886 to 1890 he studied with Saint-Saëns in Paris. During the next two years he made his second tour of America. From 1895 to 1900 he was director of the pianoforte department of the Chicago Conservatory. In 1900 he resumed playing again in Europe, meeting everywhere with extraordinary success. When he was appointed director of the *Klaviermeisterschule* at Vienna in 1909 he settled definitely in the Austrian capital, but continued at the same time his extended concert tours. During the seasons of 1912, 1913, and 1914 he visited the United States again. The most conspicuous quality in his playing is a dazzling, fabulous technique, while he is lacking in soulfulness and poetic conception. His numerous paraphrases of works by Chopin, Weber, Henselt, and J. Strauss make extraordinary demands upon the player's technical execution. His original compositions consist of a sonata in E minor, 24 pieces published under the title *Renaissance*, and 24 others entitled *Walzermasken*.

GODOY, gó-dó's, MANUEL DE, DUKE OF AL-CUDIA (1767-1851). A Spanish statesman. He was born at Badajoz, of a noble family in straitened circumstances. At the age of 17 he entered the King's bodyguard at Madrid, where his personal attractions gained him the favor of Charles IV, and of his Queen, Maria Luisa. Honors and titles were heaped upon him and he became, in 1791, lieutenant general and grandee of Spain, with the title of Duke of Al-cudia. The next year he was made Prime Minister, and, failing to save the life of Louis XV, he declared war against the French Republic, which resulted disastrously for Spain. To secure peace Godoy negotiated the Treaty of Basel, for which he was severely criticized, though the King rewarded him with the title of the Prince of the Peace. In 1797 he was removed from the office of Minister, retaining all his honors and emoluments and continuing to exercise a dominating power in Spanish politics.

Returning to power in 1801, he entered into an alliance with France against Portugal, and invaded the latter country in command of the allied forces. The brief "War of the Oranges" was ended by the Treaty of Badajoz, by which Portugal closed her ports to England and ceded Olivenza and its territory to Spain. As a reward for this exploit Godoy was made generalissimo of the Spanish forces on land and sea. The ill success of the war against England, culminating in the defeat of Trafalgar, stirred up great popular hatred for Godoy, while his sudden elevation incited the hostility of the envious nobles. The Crown Prince Ferdinand placed himself at the head of a court faction, and Godoy's attempt to stir up the King against the Prince only served to excite popular feeling. When Godoy, upon the invasion of Spain by the French troops in 1808, prepared to escape with the King and the Queen to Mexico, an insurrection broke out at Aranjuez. The King was forced to imprison the hated Minister to save his life from the mob. Napoleon, who wished to make use of Godoy in his raid on the Spanish crown, summoned him to Bayonne, where he signed Charles's act of abdication in favor of his son Ferdinand. (See CHARLES IV; FERDINAND VII.) The latter part of his life was spent at Rome and, after 1830, in Paris. Reduced to straitened circumstances for a long time, he received back part of his confiscated property in 1847, together with his titles. He died in Paris, Oct. 7, 1851. His *Memorias Criticas apologeticas para la historia del reinado del Señor don Carlos IV de Bourbon* were published in English (London, 1836) and in French by Esménard (Paris, 1836). Consult Ovila y Otera, *Vida política y militar de D. M. Godoy* (Madrid, 1844), and D'Auvergne, *Godoy, the Queen's Favorite* (Boston, 1913).

GOD SAVE THE KING (or QUEEN). The national anthem of Great Britain, of which the music by adoption is that of several of the German states. It is played and sung in every part of the British Empire alike on solemn and festive occasions. Its origin has long been a subject of controversy. The contentions that it is of French or Scottish origin have been disproved, and according to Chrystander (*Jahrbücher* I, 287-407) it is almost certain that Henry Carey (q.v.) is the author of the hymn as we know it to-day. He is credited with having composed both words and music about 1740, though he never claimed the song as his, and though none of his friends put forward such a claim until his son, some fifty years later, petitioned the government for a pension on the ground that his father had written the hymn. The evidence which he adduced in support of this was purely circumstantial, and the petition was refused. On the contrary, there are traces of the existence of the song, or a similar one, long before Carey's time. A Latin hymn, "O Deus Optime," which still exists, and whose words are a counterpart of the present hymn, was sung in 1740. As for the music, John Bull (c.1563-1628) wrote an "ayre," still existing, which is identical in rhythm and similar in melody to "God Save the King." The hypothesis, backed by considerable circumstantial evidence, is that the above Latin words, or their prototypes, were written in 1688, and set to Bull's "ayre" by their author. There is record of such a hymn having been sung in King James's Chapel. The song would naturally be preserved by the Stu-

arts, and the music, passing through various popular transformations, would ultimately reach its present form. It will be seen that this theory does not preclude Carey from having translated the words and given the final shape to the music.

The words and music were first published anonymously in the *Harmonia Anglicana* (1742), and appeared in the *Gentleman's Magazine* (1745). It has been chosen for a national air in Prussia, where it is sung to the words *Hail dir im Siegerkranz*, and it was sung in Russia until the new anthem was written in 1833. In the United States it has long been known as the air to which "My Country, 'Tis of Thee" is sung. Consult: Bateman, "The National Anthem," in the *Gentleman's Magazine*, vol. cclxxv (London, 1893), and Hadden, "The 'God Save the Queen' Myths," in *Argosy*, vol. lxxii (ib., 1900); Cummings, *God Save the King* (ib., 1902); also Chappell, *Collection of National Airs* (ib., 1838-40). See NATIONAL HYMNS.

GOD'S FOOL. A novel by Maarten Maartens (1892), considered by the author his masterpiece. The fool, Elias Lossel, by accident in childhood became blind, deaf, and obscured in mind. In spite of all he had a sweet and loving nature. Handsome and wealthy, he was at last the victim of his half brother's greed. The story gives a realistic picture of life in a small Dutch city.

GOD'S TRUCE. See TRUCE OF GOD.

GODTHAAB, góth'haab (Dan., good hope). A town and harbor of Greenland, on the west coast, the capital of the Danish Southern Inspectorate and the residence of the Danish Inspector (Map: America, North, N 3). It was founded by Hans Egede in 1721 and is the oldest colony in Greenland. Pop., of the district, about 1000, of whom less than 20 are Danes. Of these about 150 are at Godthaab and 110 at Ny (New) Hernnhut, near by, the former headquarters of the Moravian missionaries.

GOD TREE. See CEDAR.

GODUNOV, gó'du-nóf, BOBIS (c.1551-1605). A czar of Russia. He became to all intents Regent during the reign of Feodor I (1584-98). In 1591 he is said to have caused the murder of the Czarevitch Demetrius, and in 1598, upon Feodor's death, was elected to the throne. In 1595 he recovered the territory previously lost to Sweden. He had previously (1591) defeated the Khan of the Crimean Tatars. While Regent, he recolonized Siberia, placed the Muscovite church on an equal footing with the other Eastern churches, and forbade (by the famous *ukas* of 1587) the transfer of peasants from one landowner to another—an edict of far-reaching consequences. As Czar, he appears to have been in the main clement and progressive. But the favor shown by him to foreigners and numerous innovations introduced by him resulted in considerable popular discontent. Thus, southern Russia was prepared to revolt to the standard of the first false Demetrius in 1604. Godunov's history has been utilized by Pushkin in a drama of the name, for a German rendering of which consult Von Bodenstedt's translation of the complete works of that author (vol. iii, Berlin, 1855). It has also inspired a charming opera by the Russian composer, Moussorgsky (q.v.).

GODWIN, or **GODWINE** (?-1053). An earl of the West Saxons. Nothing is known definitely of him until 1018, when he is described as *dun*, or earl. About 1020 he was Canute's most powerful official. More than any

other person he contributed to the elevation of Edward the Confessor to the English throne, and from that time Godwin was the head of the national party, as opposed to the Norman court favorites. He was Earl of Wessex and enormously wealthy; his son Sweegen was Earl of Hereford, Gloucester, and Oxford; his son Harold was Earl of East Anglia; his wife's nephew, Beorn, was Earl of Hertfordshire and Buckinghamshire; and his daughter Edith was Edward's Queen. As the Norman party became powerful, Godwin's influence over the King declined. The crimes of his son Sweegen, who was outlawed for the seduction of an abbess and the murder of his cousin Beorn, weakened his position. Finally, in 1051, when Godwin refused to obey the orders of Edward, to punish the citizens of Dover on account of complaints of ill treatment made by the Normans, he lost the King's favor, was outlawed, and fled to Flanders. Godwin attempted to treat with the King, but, finding this of no avail, resorted to violence, encouraged in this by the promises of support extended him everywhere in England. In September, 1052, he sailed up the Thames with a strong fleet and was enthusiastically received by the people. The King yielded and on September 15 restored to him and his family all his property which had been confiscated. Soon after Godwin became ill, and died, April 14, 1053. Consult Freeman, *The Norman Conquest*, vols. i and ii (Oxford, 1870-79), for a favorable view of Godwin, and Green, *The Conquest of England* (London, 1883), for a rather unfavorable estimate. Consult also Hodgkin, *History of England from Earliest Time to Norman Conquest* (London, 1906), and Oman, *England before the Norman Conquest* (New York, 1910-).

GODWIN, FRANCIS (1562-1633). An English Bishop and author, born at Hannington, Northamptonshire. He studied at Christ Church, Oxford, graduating in 1580, took orders, and became rector of Sampford, and afterward vicar of Weston-in-Zoyland and subdean of Exeter (1596). His *Catalogue of the Bishops of England* (1601) attracted the attention of Queen Elizabeth, who made him Bishop of Llandaff. In 1617 he was transferred to the see of Hereford by James I. He revised his *Catalogue* several times (1615 and 1616) and also wrote *Rerum Anglicarum Annales* (1616; Eng. version by his son, 1630). The best known of his works is *The Man in the Moone, or a Discourse of a Voyage Thither by Domingo Gonsales, the Speedy Messenger* (1638). It is supposed to have influenced Cyrano de Bergerac's *Voyage to the Moon*, as it was translated into French by J. Baudoin (1648), and traces of it seem to appear in parts of *Gulliver's Travels*.

GODWIN, MARY WOLLSTONECRAFT (1759-97). An English miscellaneous writer. She was born at Hoxton, near London, April 27, 1759, and was of Irish descent. Her mother died in 1780, and, owing to the brutality of her father, Mary and her sisters were compelled to leave his house. Mary earned her living as school-teacher and governess until 1788, when she settled in London and was employed by Johnson the publisher as reader and translator. While at Paris in 1792 she met Gilbert Imlay, an American merchant and author. After bearing to him a daughter she was deserted. On March 29, 1797, she married William Godwin, and became the mother of Mary, the future Mrs. Shelley. She

died Sept. 10, 1797. The outline of her career contributed to the plot of Mrs. Amelia Opie's *Adeline Mowbray* (1804). Mrs. Godwin was one of the "advanced women" of her time. Her most notable work is *Vindication of the Rights of Women* (1792), a conspicuous landmark in the history of feminism, which has anticipated the claims for greater freedom, personal, social, and political, that are the marks of the woman's movement of a century later. In it she attacked Rousseau's ideal woman, the heroine of novels and boarding schools. She advocated the establishment of government day schools and maintained the right of women to enter the professions and politics. In short, her thesis was the equality of the sexes. Among her other works are: *Thoughts on the Education of Daughters* (1787); *Original Stories from Real Life* (1788); *Vindication of the Rights of Men*, a letter to Burke (1790); *Posthumous Works*, containing "Wrongs of Women," fragment of a novel, and "Letters and Miscellaneous Pieces" (4 vols., 1798). Consult: Godwin, *Memoirs of the Author of a Vindication of the Rights of Women* (London, 1798); Paul, *Mary Wollstonecraft: Letters to Inlay*, with memoir (ib., 1879; and a good later edition, New York, 1908); Pennell, *Life of Mary Wollstonecraft* (Boston, 1884); E. Rauschenbusch-Clough, *Study of Mary Wollstonecraft and the Rights of Woman* (New York, 1898); G. R. S. Taylor, *Mary Wollstonecraft* (ib., 1911); W. Godwin, *Elopement of Percy Bysshe Shelley and Mary Wollstonecraft Godwin* (privately printed, St. Louis, Mo., 1912), with commentary by H. B. Forman.

GODWIN, PARKE (1816-1904). An American journalist and author. He was born in Paterson, N. J., Feb. 25, 1816, and after graduating at Princeton, in 1834, practiced law for a short time in Kentucky, but after 1837 was for many years in the main connected with the New York *Evening Post*, of which the poet Bryant, his father-in-law, was for so long chief editor. Godwin conducted in 1842 a weekly, the *Pathfinder*, contributed much to the *Democratic Review*, was one of the editors of *Putnam's Magazine*, deputy collector in the New York Custom House under President Polk, and an early member of the Republican party, though a consistent advocate of free trade. Two volumes of essays from *Putnam's Magazine* are gathered in *Out of the Past* (1870). Among his numerous other publications may be mentioned: *A Popular View of the Doctrine of Fourier* (1844); *Democracy, Civic and Constructive* (1844); *Vala: A Mythological Tale* (1851); *Political Essays* (1856). Godwin compiled a *Handbook of Universal Biography* (1851) and *Cyclopædia of Biography* (1863). He edited the *Works of W. C. Bryant*, with a *Life* (4 vols., 1884), and made translations from the prose of Goethe, Fouqué, and Zschokke. He also wrote an ingenious but rather erratic *New Study of Shakespeare's Sonnets* (1900).

GODWIN, THOMAS (1587-1642). A Church of England scholar. He was born at Wookey, Somersetshire; educated at Oxford; was rector of Brightwell, Berkshire, and died there March 20, 1642. He is remembered for his English treatise on Roman antiquities, with the Latin title *Romanæ Historiæ Anthologia* (1614); and *Moses and Aaron, or Civil and Ecclesiastical Rites Used by the Ancient Hebrews* (1625).

GODWIN, WILLIAM (1756-1836). An Eng-

lish novelist and political writer. The son of a dissenting minister, he was born at Wisbeach, Cambridgeshire, March 3, 1756. After studying at the Hoxton Presbyterian College, he became minister at Ware in Hertfordshire and in 1780 minister at Stowmarket in Suffolk. Having been shaken in his religious belief, he gave up preaching in 1783 and by 1787 he was "a complete unbeliever." He was already devoting himself to literature. After a *Life of Chatham* (1783), *Sketches of History, in Six Sermons* (1784), and considerable hackwork, he published the famous *Enquiry Concerning Political Justice* (1793), in which were presented the most radical theories of French philosophy on morals and government. By this book he is best known. It was followed by *The Adventures of Caleb Williams* (1794), a remarkable novel, intended to illustrate the political views advanced in the *Political Justice* and by *The Enquirer* (1797), a collection of essays on morals and politics. In 1796 he formed an alliance with Mary Wollstonecraft (q.v.). After some months they yielded so far to custom as to be married. His wife died a short time after, in giving birth to a daughter, the future wife of the poet Shelley. In 1799 he published a successful romance entitled *Saint Leon*. In 1801 he married a Mrs. Clairmont. To secure a more certain support, Godwin and his wife started in 1805 a small publishing business, which, however, failed in 1820; but he also worked indefatigably with his pen to the end of his life. He wrote many school books; *Life of Chaucer* (1803); *Fleetwood*, a novel (1805); *Mandeville*, a novel (1817); *Of Population* (1820), a reply to Malthus; *History of the Commonwealth of England* (1824-28); *Cloudesley*, a novel (1830); *Thoughts on Man* (1831); *Deloraine*, a novel (1833); and *Lives of the Necromancers* (1834). As he grew old, he modified his opinions on politics and society, and especially on marriage, which he warmly commends in some of his later works. Many of his books were translated into foreign languages. He died in London, April 7, 1836. Consult: Paul, *William Godwin: His Friends and Contemporaries* (London, 1876); Hazlitt, essay in the *Spirit of the Age* (ib., 1825); Stephen, *English Thought in the Eighteenth Century* (ib., 1876). See GODWIN, MARY WOLLSTONECRAFT.

GODWIN-AUSTEN, göd'win-ās'ten. One of the highest mountain peaks in the world, exceeded probably by Mount Everest only, situated in the Mustang Range of northern Kashmir (Map: India, C 1). It was named after Lieutenant Colonel Henry H. Godwin-Austen (q.v.). Its altitude is placed at 28,265 feet. It is also called K 2.

GODWIN-AUSTEN, HENRY HAVERSHAM (1834-1923). An English topographer and geologist and one of the pioneers of scientific geography. He was born at Teignmouth, the son of Robert A. C. Godwin-Austen; was educated at the Royal Military College, Sandhurst; obtained a commission in the Twenty-fourth Regiment of Foot in 1851 and joined it in India in the following year. He served with distinction in the Second Burmese War and after its close became an assistant topographer in the East Indian Trigonometrical Survey. In 1857 he was connected with the Government Survey in Kashmir, where he made the discovery of the important Baltoro glacier at the head of the Shigar River. In 1862-63 he conducted surveys in

Ladakh, making 13 ascents of mountain peaks, among them that of Mata, 20,607 feet high. He served in the Bhutan campaign in 1874 and took part in the expedition against the Daffas in the eastern Himalayas. He retired from the army in 1877 with the rank of lieutenant colonel. He was elected a fellow of the Royal Geographical Society, in 1910 was presented the Founder's medal for his work in exploration, and Mt. Godwin-Austen (q.v.) was named for him. His writings include numerous important articles and monographs for various scientific magazines and society reports. His works include: *On the Land and Fresh Water Mollusca of India* (1882-99), a monumental work in 11 parts, and *The Fauna of British India*, vol. *Mollusca* (1908).

GODWIN-AUSTEN, ROBERT ALFRED CLOYNE (1808-84). An English geologist, born near Guildford, the son of Sir H. E. Austen. He was educated at Midhurst School, at a military college in France, and at Oxford, where, after graduation, he was elected a fellow of Oriel College. Here he studied geology under William Buckland. In 1833 he married a daughter of Gen. H. T. Godwin, upon whose death in 1854 he prefixed, by royal license, the name of Godwin to his own. His geological studies and discoveries, covering a period of more than half a century, were extensive and valuable, and his contributions to geological literature were considered authoritative, particularly the result of his investigations in Devonshire. He edited, as literary executor, the *Memoir on the Fluvio-marine Tertiaries of the Isle of Wight* (1856), left by Edward Forbes in manuscript, and completed the *Natural History of the European Seas* (1869), begun by the same author. In addition to these he wrote numerous original articles and notes in various geological journals. He was made a fellow of the Geological Society of London in 1830, a fellow of the Royal Society in 1849, and was twice president of the Geological Section of the British Association.

GODWINE. See **GODWIN**.

GODWIN'S OATH. A proverbial expression for a false oath, originating in the story that Godwin, Earl of Kent, was choked to death by a piece of bread while calling Heaven to witness his innocence of the murder of Alfred, the brother of Edward the Confessor.

GODWIT (of doubtful etymology; possibly from A.S. *gōd*, good + *wit*, wit; hardly from *gōd*, good + *wiht*, wight, creature, or from *god*, God + *wit*, wit, or *wiht*, wight, creature). A genus (*Limosa*) of large curlew-like shore birds of the snipe family (Scolopacidae), with very long bill, slightly curved upward, and long slender legs. All the species frequent marshes and shallow waters, often those of the seacoast, where they seek their food by wading and plung-

BILL OF MARBLED GODWIT.

ing the long bill into the water or mud like snipes. They sometimes also run after small crustaceans or other animals and catch them on the sands from which the tide has retired. All are noted for their loud, yelping cries. Two species are confined to North America—the great

marbled godwit (*Limosa fedoa*) and the Hudsonian godwit (*Limosa hemastica*). Neither is very numerous, and both are visible only when passing back and forth from their northern breeding haunts to their tropical winter homes: the marbled godwit, however, nests in Iowa and northward. The general hue of these birds is rufous or cinnamon, the marbled godwit being paler than the Hudsonian, but both vary greatly with age, sex, and season; the former has the reddish tail barred with black and without any white, while the latter has a black tail broadly white at the base. The females are uniformly larger than the males. Godwits build their nests anywhere on the ground, not necessarily near water, and lay three and four eggs, olive drab spotted with umber brown. Four or five other species of godwit are found in the Old World. The flesh of all is good, and in Elizabethan England it was regarded as an expensive delicacy, often celebrated in the prose and verse of the period. The incessant pursuit of this bird, particularly by netting on the fens, nearly exterminated it in Great Britain. It is taken by gunners whenever encountered, but is not much sought after nor especially valued either for sport or food. See Colored Plate of SNOW BIRDS.

GOEBEL, gŭbel, JULIUS (1857-). An American Germanic scholar, born at Frankfort-on-the-Main, Germany. He was educated at the universities of Leipzig and Tübingen (Ph.D., 1882). He came to the United States in 1882; was instructor in German at Johns Hopkins University (1885-88), professor of Germanic philology and literature at Leland Stanford (1892-1905), and lecturer on Germanic philology at Harvard (1905-08), and became professor of Germanic languages at the University of Illinois in 1908. He was editor of the *Belletristisches Journal* in 1888-92 and of the *Journal of English and Germanic Philology* after 1909; edited Goethe's *Poems* (1901), Schiller's *Poems* (1903), Goethe's *Faust* (1907), *German Classics* (1909), *Year Book of the German American Historical Society* (1913), *Germanic Literature and Culture* (1913); and wrote *Ueber die Zukunft unseres Volkes in Amerika* (1883); *Ueber tragische Schuld und Sühne* (1884); *Gedichte* (1895); *Das Deutschland in den Vereinigten Staaten* (1904).

GOEBEL, gŭbel, KARL, RITTER VON (1855-). A German botanist, born in Bietigheim, Baden, and educated at Tübingen, Strassburg, and Würzburg. He became professor of botany at Rostock (1882), at Marburg (1887), and at Munich (1901), where he was director of the New Botanical Gardens. He traveled in India, Ceylon, and Java in 1885-86, in Venezuela in 1890-91, and in Australia in 1898-99. Goebel received honorary degrees from Cambridge, Geneva, and St. Andrews, and was knighted in 1909. Among his important works are: *Grundzüge der Systematik und der speziellen Pflanzen-Morphologie* (1882; in English, by Garnsey, 1887); *Vergleichende Entwicklungs-geschichte* (1883); *Pflanzenbiologische Schilderungen* (1893); *Organographie der Pflanzen* (1898-1901; 2d ed., 1913; in English, by Bayley Balfour); *Einleitung in die experimentelle Morphologie* (1908).

GOEBEL, gŭbel, WILLIAM (1850-1900). An American politician, born in Sullivan Co., Pa. He removed to Covington, Ky., in early boyhood, studied law, was admitted to the bar, and won

a reputation as a trial lawyer, and as a political speaker and leader in the Democratic party. In 1887 he was elected to the Kentucky State Senate, to which body he continued to be re-elected at every election up to and including 1898. He built up a strong political machine. One of his personal quarrels culminated in his shooting and killing Col. John D. Sandford, for which he was acquitted on the grounds of self-defense. In 1897 he secured the passage of the "Goebel law," relieving the courts of all power in the appointment of election officials, and creating a State election commission of three members, chosen by the Legislature, which should have the power to appoint local boards on the same principle. This act was intended to assure Democratic ascendancy. It was passed over the veto of Governor Bradley (Republican), and was held constitutional by the State Supreme Court in December, 1898. In June, 1898, Goebel was nominated for Governor by the Democratic party. Seceding Democrats nominated John Young Brown, and W. S. Taylor, the Republican candidate, was elected by about 2300 votes. Goebel contested the election, and a legislative committee was about to report in Goebel's favor, when, on January 30, he was shot in front of the State Capitol by an assassin concealed in a neighboring building. The Democratic members of the Legislature immediately declared him Governor, and the oath of office was administered to him on January 31. He died on February 3. Consult *My Own Story* (Indianapolis, 1905), by Caleb Powers, Republican nominee for Secretary of State, convicted of complicity in the murder of Goebel.

GOEBEN, gē'ben, AUGUST VON (1816-80). A German soldier. He was born at Stade in Hanover, entered the Prussian military service at the age of 17, but in 1836 went to Spain as a partisan of Don Carlos, and took an active part in the fighting between 1836 and 1840, being repeatedly wounded and twice taken prisoner. After the end of the Carlist War he returned to Germany and wrote an account of his Spanish experiences, entitled *Vier Jahre in Spanien* (1841). Reëntering the Prussian army, where he served on the staff, he took part in the campaign against the revolutionists in Baden in 1849, and became, in 1855, chief of staff of the Fourth Army Corps. In 1860 he was Prussian attaché with the army of the Spanish General O'Donnell in the campaign in Morocco. In 1864 he took a prominent part in the war against Denmark and became in the following year lieutenant general and commander of the Thirteenth Division. At the head of this division he first entered Hanover in the War of 1866 and then fought successfully at Kissingen and other places in Bavaria. In the Franco-German War, as commander of the Eighth Army Corps, he distinguished himself at Saarbrücken and Gravelotte and took part in the siege of Metz. In January, 1871, Goeben was appointed commander of the First Army Corps and fought a decisive battle at Saint-Quentin (January 19), when he defeated General Faidherbe and caused the disbanding of the French Army of the North. Besides the excellent account of his experiences in Spain, Goeben wrote valuable articles in military journals on the wars of 1866 and 1870-71. He was decorated with the Iron Cross and commanded at Coblentz until his death there, in 1880.

GOEDEKE, gē'de-ke, KARL (1814-87). A

German historian of literature. He was born at Celle and was educated at Göttingen, where he was professor from 1873 until his death. He was a remarkably prolific author and, after writing several novels and the drama *König Kodrus, eine Missgeburt der Zeit*, under the pseudonym of Karl Stahl, devoted himself to critical and biographical literature. The long list of his publications includes: *Deutschlands Dichter von 1813 bis 1843* (1844); *Elf Bücher deutscher Dichtung von Sebastian Brant bis auf die Gegenwart* (1849); *Deutsche Dichtung im Mittelalter* (2d ed., 1871); and the monumental *Grundriss zur Geschichte der deutschen Dichtung* (3d ed., under the editorship of Edmund Goetze, 1910 et seq.), his principal work. His biographies of Lessing, Goethe, and Schiller are well known. Consult Schreck, *Karl Goedeke* (1894).

GOEHRE, gē're, PAUL (1864-). A German author and politician, born in Wurzen, Saxony, and educated at Leipzig and Berlin. He studied theology and was a Lutheran pastor at Schönbach, near Löbau, in 1888-90; then was a workman in Chemnitz; had charge of a church in Frankfurt in 1894-97; and, after two years' work in the National Socialist party, in 1899 joined the Social Democrats. He was elected to the Reichstag in 1903, but resigned almost immediately, and was elected again in 1910. He wrote: *Drei Monate Fabrikarbeiter und Handwerksbursche* (1891), a great success, translated into English (1895), Norwegian, and Danish; *Die evangelische-soziale Bewegung* (1896; also translated into English; in 1891 he was general secretary of the Evangelical Social Congress); *Wie ein Pfarrer Sozial-Demokrat wurde* (1900); *Die Kirche im 19. Jahrhundert* (1902); *Die Waarenhaus* (1907); *Der deutschen Arbeiter-Konsumverein* (1910); *Die sächsischen Volksschule und ihre Reform* (1911).

GOEJE, gō'ye, MICHAEL JAN DE. See DE GOEJE.

GOEKINGK, gē'kēnk, LEOPOLD FRIEDRICH GÜNTHER VON. See GÖCKINGK.

GOERCKE, gē'r'ke, JOHANN (1750-1822). A German physician, born at Sorquitten, East Prussia. He entered the Prussian army as a surgeon at the age of 17 and in 1789 was appointed one of the three chief surgeons in the army. Meanwhile he had traveled extensively in Austria, Italy, France, and in England, where he entered into friendly relations with John and William Hunter, Bell, Cooper, Hamilton, and other equally celebrated surgeons. In 1797 he was appointed chief surgeon of the Prussian army, in which capacity he rendered invaluable services during the various campaigns terminating with the battle of Waterloo. He founded several educational institutions for military surgeons, the most important of which was the celebrated Pepinière, afterward known as the Medicinisch-Chirurgisches Friedrich-Wilhelms-Institut. His literary works include *Pharmacopœia Oastrensis Borussia* (1805) and *Beschreibung der Krankentransportmittel bei der königlich-preussischen Armee* (1814).

GOES, gō's, or TERGOES, tēr'gō's. A seaport and market town of Holland, situated on the island of South Beveland, Province of Zeeland, about 3½ miles from its northern coast and 11 miles east of Middelburg (Map: Netherlands, B 3). The town has a fine Gothic church, a city hall, dating from 1442, with fine paintings, and the remains of an ancient castle of

Jacqueline of Bavaria. It has a harbor formed by a canal communicating with the East Scheldt, shipbuilding docks, and an active trade in hops, salt, and grain. It also has saw mills and establishments for bookbinding and cigar making. Pop., 1889, 6000; 1900, 6919; 1910, 7620.

GOES, gō'ash, **BENITO DE**, or **BENTO DE** (1562-1606). A Portuguese traveler and Jesuit priest. He was born on the island of San Miguel, one of the Azores, and until his twenty-sixth year led the life of an adventurer in the East Indies. In 1588 he entered the Order of Jesus and in 1603 was sent on a mission to the Great Mogul and thence to Cathay. At the court of the Emperor Akbar he acquired an extensive knowledge of the geography of Asia, ascertaining after his arrival at Suchau (1605), on the Chinese frontier, that Cathay and China were identical. His interesting notes and observations were published after his death by the Italian Jesuit missionary Matteo Ricci. Many translations into German, French, and English were also made, one of them entitled *The Report of a Mahometan Merchant which had been in Cambalu, and the Travels of Bento de Goes . . . from Lahor to China by Land* (1625).

GOES, **DAMÃO DE** (1501-73). A Portuguese historian and diplomat, born at Alemquer (Estremadura). King John III of Portugal sent him on several important diplomatic missions to Flanders (1523), Poland (1529), Denmark and Sweden (1533). He then spent several years in Italy, engaged in philosophical and historical studies. At the siege of Louvain in Flanders by the French in 1542, Goes aided in the defense and saved the city from plunder, but was taken prisoner. He returned to Portugal in 1545 and three years afterward was placed in charge of the national archive, but his ideas were too advanced for the age. Suspected of Lutheranism, in 1572 he was condemned to imprisonment in the monastery at Batalha by the Inquisition and there died in obscurity. Among his works are: *Legatio Magni Imperatoris Presbyteri Joannis . . . de Indorum fide, ceremoniis, religione . . .* (1532); *Fides, religio, moresque Aethiopum sub imperio Pretiosi Joannis* (1541); *Commentarii Rerum Gestarum in India* (1539); *Hispania* (1542); *De Bello Cambraico Ultimo* (1549); *Chronica do felicissimo rei Dom Emmanuel* (1568-67); *Chronica do principe Dom Joam* (1567).

GOES, gō's, **HUGO VAN DER**. See **HUGO VAN DER GOES**.

GOES, **JAN ANTONISZ** (Lat. form, **JOANNES ANTONIDES**) **VAN DER** (1647-84). A Dutch poet, born at Rotterdam. Owing to the success of his first efforts at poetic composition, he found a patron in a wealthy gentleman of Flushing, who paid for his education at Utrecht, where he studied medicine. Afterward he became a member of the Admiralty at Rotterdam. Goes was a poet of considerable power and may in many respects be regarded as the last of the Dutch classics. He was very precocious, and before the age of 25 eulogies had already been written in his honor by Kaspar Brandt, Vollenhove, Huygens, Oudaen, Vondel, and other distinguished authors. One of his best productions is *Ystroom* (1671). The poem entitled *Bellone aan Bant*, celebrating the peace between France and Holland, also occupies a high rank in Dutch literature. His collected poems appeared in 1685.

GOES, gō'ash, **PEDRO DE** (1503-54). A Portuguese pioneer, born in Lisbon. In 1530 he went

to Brazil with the expedition of Martim Afonso de Sousa and some years later was granted a strip of territory on the coast, where he first successfully introduced the cultivation of sugar cane. His plantation was subsequently destroyed by Indians, and Goes went to Portugal to secure the assistance of the King in suppressing the native uprisings. In 1548 he was appointed to assist the newly appointed Governor-General, Sousa, and, returning at once to Brazil, contributed greatly to the pacification of the country and the establishment of organized government. He is said to have been the first to bring specimens of the tobacco plant to Europe (1547).

GOESSMANN, gō'smān, **CHARLES ANTHONY** (1827-1910). An American chemist. He was born at Naumburg in Hesse and was educated at Göttingen, where he became assistant in the chemical laboratory and (1855) privatdozent. In 1857 he came to America, was chemist and superintendent of a Philadelphia sugar refinery until 1861, and then accepted a position with a Syracuse salt company. In 1860 he became professor of chemistry in the Massachusetts Agricultural College at Amherst, in 1873 chemist to the State Board of Agriculture, and in 1886 chemist to the State Board of Health. These three positions he held until his death. In 1887 he was president of the American Chemical Society. His writings include: *Chemical Composition of the Brines of Onondaga* (1862); *Best Mode of Manufacturing Coarse or Solar Salt from the Brines of Onondaga* (1863); *Salt Deposits of Petite Anse, La.* (1867); *Salt Resources of Goderich, Canada* (1868); *Manufacture of Sugar in Cuba* (1865).

GOETHALS, gō'thalz, **GEORGE WASHINGTON** (1858-). An American military and civil engineer, engineer in chief of the Panama Canal, and first Civil Governor of the Panama Canal Zone. He was born in Brooklyn, N. Y., and after studying in the College of the City of New York entered the United States Military Academy. Graduating in 1880, he was appointed second lieutenant in the Corps of Engineers. Through successive promotions he reached the grade of colonel in 1909, further advancement being proposed for him in 1914. During the Spanish-American War he was lieutenant colonel and chief of engineers of United States Volunteers. From 1885 to 1887 he served as assistant professor of military engineering at West Point. His early river and harbor work included the construction of the Mussel Shoals locks and dams on the Tennessee River. He was made a member of the board of fortification and in 1903 a member of the general staff.

In 1907, President Roosevelt having decided that all bids for the construction of the Panama Canal be rejected, and that, instead of leaving the work in charge of a civilian commission, the government should undertake the construction directly, Colonel Goethals was appointed chairman, as well as chief engineer, of a new commission, composed on its technical side of army and navy officers. An able engineer, familiar with conditions attending the prosecution of government work, and a man of force and resources, strong in personality and able to inspire confidence and energy in others, Colonel Goethals straightway developed a system by which the excavation of the canal and the many allied problems could be handled efficiently and effectively. The army engineers soon had the

entire work of design and construction organized in harmony with the main general system, so that the actual construction could be undertaken at a rate not before realized—a rate which constantly improved with the progress of the work. Colonel Goethals, who regarded his work as that of an administrator rather than as that of an engineer, and who possessed a peculiar genius for detail, received ample executive powers. Largely through the exceedingly important services of Gen. William C. Gorgas (q.v.), the questions of sanitation, commissary, housing, and labor were all satisfactorily solved, and a complete social fabric as well as construction organization developed. The Panama Canal came to be known as a model of efficient labor and industrial contentment no less than as a piece of sound engineering. So vigorously was the work prosecuted that its virtual completion was possible in 1914, although the time scheduled had been June 1, 1915. Colonel Goethals received unstinted praise from visiting engineers and from the technical press of the entire civilized world. In 1913 the degree of LL.D. was conferred on him by the University of Pennsylvania, and in the spring of 1914 he was awarded medals by the National Geographic Society, the Civic Forum (New York), and the National Institute of Social Sciences. Late in 1913 and early in 1914 he was in demand for various administrative positions. He declined the police commissionership of New York City, offered him by Mayor Mitchel, and the "city managership" of Dayton, Ohio. On Feb. 3, 1914, he was appointed by President Wilson the first Civil Governor of the Panama Canal Zone. See PANAMA CANAL.

GOETHE, *gē'te*, AUGUST VON (1789-1830). The son of Johann Wolfgang von Goethe (q.v.). He was born at Weimar and occupied the position of chamberlain to the Grand Duke of Saxe-Weimar. He died Oct. 27, 1830, while visiting Rome. By his marriage with the Baroness Ottilie von Pogwisch, a highly accomplished woman, he had three children, of whom WALTHER WOLFGANG (1818-85) was known as a composer of operettas and songs, while his younger brother, WOLFGANG MAXIMILIAN (1820-83), was a jurist and poet. The third, ALMA VON GOETHE (1827-44), died in Vienna. These three grandchildren of the great poet left no offspring.

GOETHE, JOHANN WOLFGANG VON (1749-1832). The greatest German writer and one of the greatest of the world, excelling in every literary genre, distinguished in many branches of science and in literary and artistic criticism. He was born in Frankfort-on-the-Main, Aug. 28, 1749. Both his parentage and the place of his birth were significant for his future development. He was among the first of German literary men since the Meistersinger days to spring from a commercial environment and parents closely affiliated with political life in what remained of the old free cities. His father's father was a tailor and innkeeper. His father received a good education, traveled in Italy, attained the distinction of Imperial counselor, and, though never wealthy, was always in easy circumstances. He married (1748) Katherine Elisabeth Textor, and Goethe was the first of their four children, of whom only himself and a sister, Cornelia, survived childhood.

In the pages of Goethe's brilliant autobiographical *Dichtung und Wahrheit* we seldom see his father unbend from his philistine self-

satisfaction. But the mother must have been a very remarkable woman, simple, hearty, joyous, affectionate, not highly educated, but with a faculty of rapid assimilation that made her no unworthy companion or correspondent of persons of deeper culture or higher station. The relation of mother and child was ideal. His childhood and youth owed more to her direct influence than to all else besides. She died in 1808. Her *Letters* are published by the Goethe Society (1894). Consult Heinemann, *Goethes Mutter* (6th ed., Leipzig, 1900).

But Frankfort, too, had a molding influence on him. It was a commercial city, then even more than now one of the great centres of German financial life. Old and new in turn and together left their impress on the brilliant and receptive boy. He was precocious, knew something at eight of Greek, Latin, French, and Italian, had acquired from his mother a knack of story-telling and from a toy puppet show in his nursery a taste for the stage and a stimulus to imagination on which his autobiography lays much stress. He never went regularly to school and as a child showed consciousness of superiority. The French occupation of Frankfort in 1750 served to polish his French and still further to cultivate his interest in the stage. He continued to study books and men at Frankfort till he was 16, and had had one love affair, from which he of course recovered with the facile mobility of youth before he went to Leipzig to study law and be fascinated by his host's daughter, Käthe Schönlkopf.

Leipzig in 1765 was a "little Paris" in its social and literary ideals. Goethe's letters show that he quickly caught a spirit that accorded well with his nature. He studied little, wrote love songs, interested himself critically in art, learned far more about life than about law, and lost his health. By 1768 he had come to look at life on its seamy side, and showed his disillusionment in a drama, *Die Mitschuldigen*, where vice and meanness in manifold variety find it convenient to forgive and forget. This was completed later in Frankfort. Another drama, *Die Laune des Verliebten*, begun in Leipzig, is an embellished version of his relation to Käthe. It was his author's instinct to put into literary form every experience. All his works, he says, are confessions of his life. These two youthful dramatic essays, both in their matter and their form, show Goethe as a realist. He idealized neither the world nor individual characters.

Goethe returned ill to Frankfort in the autumn of 1768. He remained there sick or convalescent till April, 1770, gaining the while from the works of Lessing a sharpened aesthetic sense and a more balanced judgment. Here, too, he began the scientific studies that were later to round out his fame, and from an amiable acquaintance, Fräulein von Klettenberg, the "Beautiful Soul" of his *Wilhelm Meister*, he gained some insight into the phenomena of pietistic religious experience and became interested in alchemy and kindred lore, all of which proved useful for *Faust*.

With health restored Goethe went to Strassburg to continue his legal studies. This city, French in government and institutions, German in people and spirit, was a good place in which to complete a cosmopolitan training. Goethe set himself earnestly to work to pass his preliminary examinations and to learn to dance. He

studied also music, art, anatomy, and chemistry. He had begun to work on his dissertation when, in September (1770) he met Herder (q.v.) and in October made the acquaintance of Friederike Brion (q.v.) the winning daughter of a pastor of Sesenheim. He loved her and let her love him till her visit to Strassburg somewhat dulled the idyllic illusion. He would not, perhaps he felt he ought not, fetter his fortunes and his genius to any yoke. He left Strassburg (August, 1771), carrying with him a sore heart and a sense of wrong to be atoned. Similar situations haunt his literary work of the next years. The Marie of *Götz*, the Marie of *Clavigo*, the Clärchen of *Egmont*, the Gretchen of *Faust*, spring from this experience, of which he has left a charming and rather objective account in his autobiographic *Dichtung und Wahrheit*. Friederike died unmarried in 1813. They saw each other without strong emotion on either side in 1779.

Meantime Goethe had formed a close intimacy with Herder, who was confined for months to his room through an operation on the eyes. This was hardly less important to Goethe's literary development than the love affair at Sesenheim. They read literary masterpieces and talked of them. Goethe learned through Herder to distrust French classical canons, to appreciate Shakespeare, and to realize that all poetic development must be based on national character if it is to be enduring or beneficent. It was Herder, too, who brought Goethe under the influence of Rousseau, an influence apparent in *Götz*, and especially in *Die Leiden des jungen Werthers*. Herder's influence was inspiring, even when it was merely restraining, for Goethe was already meditating his *Götz* and even his *Faust*, and both profited by a maturing delay. But Herder finished his work for Goethe at Strassburg. When they met again (1776), Goethe felt he had little to gain, and presently it was he who repaid the old debt.

Goethe with his licentiate's degree went back to Frankfurt (1771) and began the nominal practice of law, contributing critical notices to the press and working on *Götz*, which he intended for a more daring proclamation of the newly claimed liberties of the German stage than Lessing, who had won them, would have ventured or approved. It was the trumpet call of the decade of Storm and Stress (q.v.), in which German young blood held high carnival, and in a blind following of Shakespeare naturally showed more of his faults than of his spirit. *Götz* was a dramatic adaptation of the autobiography of a robber knight of the sixteenth century, striking in its local color and naïveté. In his sturdy independence Goethe saw foreshadowed the reassertion of individualism in the eighteenth century, and he made *Götz*, far more than that knight had made himself, typical of the national revolt against the Roman law and church and the centralization of authority. For to Goethe at this time the only progress practicable for Germany lay in the stressing of individuality. But the play as written in 1771 proved too lawless even for his youthful taste. The first sketch was completed in 1771 and remains a curious monument of a period of ferment. It appeared much modified in 1773, struck an answering chord in every heart, and made its as yet unnamed author the literary leader of his time. It gave an immense stimulus to dramatic production, though in cast-

ing all thought of the unities to the winds Lessing thought the "captivating monstrosity" retarded the development of dramatic art. Goethe may have thought so, too; for he subjected it to a radical revision many years later (1804) for the Weimar stage.

This was a period of manifold activity. To it belong some fine songs, among them the *Wanderers Sturmlied*, orations, essays, reviews, and minor work in large quantity, to which he was stimulated by the shrewd and cautious criticism of Merck, an army paymaster at Darmstadt, some of whose traits Goethe used for Mephistopheles. This production was interrupted by a new experience. In 1772 Goethe went to Wetzlar to practice law and fell in love with Charlotte Buff (Lotte), the betrothed of his friend Kestner. From the rather delicate situation thus created Goethe suddenly withdrew (Sept. 11, 1772), and on his way back to Frankfurt managed to find heart for a flirtation with Maximiliane von Laroche, who afterward became the mother of one of his last adorers, Bettina von Arnim-Brentano. Literary expression he gave to his Wetzlar experiences in *Die Leiden des jungen Werthers*, which revealed powers in the German tongue till then unimagined and still unsurpassed. The story, which has been often translated into many languages, is sentimentally morbid and typical of its generation. It was suggested by the suicide of Jerusalem, a student who had formed an attachment for a friend's wife, similar to Goethe's for Lotte. But Goethe, having expressed the mood of his time and age, quickly recovered from it to enter on a period of great creative fecundity, the fruits of which were to appear later in *Faust*, *Prometheus*, *Egmont*, and *Stella*, as well as in many lyrics. Then came his passing betrothal to Lili Schönemann (died 1817), a banker's daughter, the nearest Goethe ever came to a love match. For her he wrote some very beautiful songs, and he cherished her memory till death. But for the time they drew apart (September, 1775), and soon after Goethe was invited by Karl August to be one of his court at Weimar. Meantime Goethe had written *Clavigo* (1774) and many slighter pieces, among them *Götter, Helden und Wieland*, and had found in Merck a friend and a caustically discriminating critic, of much value to him in the discipline of genius. His relations to Lili found expression a little later in *Stella* (1776). In May, 1775, he had made a journey to Switzerland with his friends the counts Stolberg, and there became intimate with Lavater, whom he had already met.

The coming of Goethe to Weimar (November, 1775) is a turning point in the literary life of Germany. From 1776 Goethe's influence begins to be paramount wherever German is spoken. Weimar was already beginning to be what it has remained till now, a pleasant residence for the cultured. Goethe made it the Athens of Germany, aided by Karl August and his mother, Amalie, hindered at first by Karl's prim wife, Luise, and by a jealous group of court officials. Goethe was received in Weimar with an effervescence of enthusiastic appreciation. For a time he and his Prince led the court a frolic dance, but presently he settled down to be a prudent and blameless man of affairs and found in this courtly life and the intimate contact with aristocratic society much to widen his mind and give his judgment a balanced calm. For the next 10 years (1776-86) he wrote little save

GOETHE

FROM THE PORTRAIT BY CARL STIELER IN THE NEW PINAKOTHEK AT MUNICH

occasional verses and dramatic trifles, of which the chief is *Die Geschwister*. He began work on *Wilhelm Meister* in 1777. Study of natural science, mineralogy, geology, osteology, intercourse with Herder, Wieland, and others, and his interest in the mines at Ilmenau, claimed his time, and he made a journey to the mining district of the Harz on their account, bringing back impressions that were of use, not only at Ilmenau, but for his *Faust*. He managed the Court Theatre (with some intermissions, till 1817) and the War Department, superintended the roads and bridges, accompanied Karl August on a journey to Switzerland, from which he gathered literary impressions, and above all he maintained a correspondence and intercourse with Charlotte von Stein, a remarkable woman, 33 years old and the mother of seven children, who, in making his life "an enduring resignation," gave his nature more refinement and self-control for the days of his emancipation. For when he had learned from her what she had to teach, he began to chafe both at this relation and at his court life, until in 1786 he asked of Karl August unlimited leave of absence, that he might visit Italy. The literary product of this decade is almost wholly lyric or epigrammatic; but he carried across the Alps the uncompleted *Iphigenie* (which in a prose form had been acted in 1779), *Egmont*, *Tasso*, and *Faust*—works not to be finished in the spirit of their inception.

For the Italian journey marks a most important epoch of Goethe's literary and moral development. All the work that follows is quite different from all that went before. Here Goethe found at last his moral balance. From 1788 till his death he went his way among men with the serenity of perfect self-possession. He went first to Verona, then to Padua and Venice, where he stayed two weeks, and then turned southward to Ferrara and across the Apennines to Florence, where he lingered but three hours, so eager was the impetuous traveler to see Rome (Oct. 20, 1786). Here the poetic stream that had long flowed so scantily was unsealed. By mid-January, 1787, he had turned *Iphigenie* into classic iambs, as a first fruit of the new influences, and was so sure that he was on the right track that he determined to do the same service for *Tasso* on a journey to Naples and Sicily, from which he returned in June.

In Rome he now remained nearly a year, perfecting *Iphigenie*, finishing *Egmont*, working on *Tasso* and *Faust*, and prosecuting zealously artistic and botanical studies. He also lived conubially with a Roman girl, and the connection seems to have revealed to him a joy of life dissociated from the somewhat morbid sentimentality that had characterized his previous relations, especially that with Charlotte von Stein. This new moral attitude is reflected in the *Römische Elegien* (1788), an epithalamium addressed to Christiane Vulpius, a young woman of Weimar, with whom he lived quasi-maritally from 1788 till their marriage in 1806, and afterward till her death (1816), to his own satisfaction, but to the scandal of the ladies of Weimar and the vexation of Bettina von Arnim-Brentano. According to Goethe's correspondence with Christiane, but recently published (*Goethe-Gesellschaft*, Weimar), she was the true and faithful companion of his after life, loving and beloved. His mother treated her from the first as "her daughter," and she earned, after the battle of Jena, the honor of a public recognition

of her place by preserving, at the risk of her life, Goethe's house from French marauders.

Goethe brought to Weimar (June 18, 1788) *Iphigenie* and *Egmont*, with *Tasso* almost in its present form, and an essentially altered conception of *Faust*. *Iphigenie* was planned in 1776 and written in prose in 1779. It was a literary projection of his relation to Charlotte von Stein. Orestes recovers a clear mind in the angelic presence of his sister, as Goethe imagined he would do if Charlotte would "be a sister" to him. Such ethics were unripe and unnatural, and the play lacks action. It was old work made over, and its exquisite versification did not wholly suffice to make it harmonize with his new spirit. There is the same discord of old and new in the prose drama *Egmont*, "the weak, aristocratic twin brother of *Götz*" (Hermann Grimm). *Tasso* has more unity of conception and execution, though it is deficient in dramatic action, and, indeed, was not put on the stage for 18 years after its publication (1790). It, too, in its pre-Italian prose form (1780-81) reflected Goethe "caught in the snare" of Charlotte von Stein, a situation that in 1786 had ceased to have living interest for him. He concentrated his thought on its form, and made the iambs of *Tasso* so perfect that Schlegel said their very beauty made them unsuited to dramatic dialogue. He also changed the close to conform to his new ethical position.

Goethe's first homogeneous work after his return from Italy was the *Römische Elegien*, in the spirit, he said, of Tibullus, Catullus, and Propertius, the most antique in thought of modern German verse. The frankly naïve sensualism that they exhibited, borne out by his conduct, caused Goethe a temporary loss of social popularity in the "imperfectly monogamous" society of Weimar, as well as a breach with Frau von Stein. He had outgrown her and the Weimar circle. Even his literary preëminence seemed to wane. In *Götz* and *Werther* he had led his countrymen. Now he had passed beyond them in his deepened æsthetic insight. For a time and until rejuvenated by the friendship of Schiller, he gave his time largely to scientific studies, to which he brought not only an original mind, but almost a seer's vision. In 1784 he had discovered the intermaxillary bone by a method that foreshadowed the science of comparative anatomy. In his essay *Die Metamorphose der Pflanzen*, he became, says Esenbeck, "the tender father" of a just-born science; his experiments in optics were ingenious and valuable, though his theory of colors was false, and he was first to perceive the vertebrate character of the human skull. Thus, while his contemporary botanists and anatomists were wandering aimlessly or making dry registration of facts, he gave them ideas whose fruitfulness is not yet exhausted. From these studies Goethe was won back to literature by the friendship of Schiller.

Schiller had been living in or near Weimar since 1787, but a strange irony of destiny kept the poets estranged till 1794, though Schiller was drawing, unperceived, into closer sympathy with Goethe's classic ideals. Meantime Goethe's son August was born (Dec. 25, 1789), the only one of several children to reach maturity. This and the storm clouds of the French Revolution led him to defer a visit to Italy, though in 1790 he went to Venice to meet the Duchess Amalie there, and wrote a group of *Venetianische Epi-*

gramme, that show how his quasi marriage had helped him to a calmer judgment of Italian culture than that of the *Elegies*. Work in lighter vein now attracted him, *Wilhelm Meister* and the Court Theatre (the management of which he undertook in 1791), till in the summer of 1792 he was summoned by Karl August to join him in the invasion of France that was to culminate in the defeat of the Duke of Brunswick at Valmy. Goethe recorded his six weeks' impressions in his *Kampagne in Frankreich* and returned to Weimar to find almost ready for his occupancy a mansion presented to him by the Duke and now, as the home of the Goethe Society and its museum, inseparably connected with his name. The pleasure of this enlarged domesticity is reflected in *Reineke Fuchs*, written in 1793 and published in 1794—the adaptation to social satire of an animal fable that can be traced back to Æsop and to India, though Goethe's immediate model was a German rendering of the mediæval Flemish version of the fable by a certain Willem (about 1250). Out of this comic epic he made, without local or personal illusions, a social and political satire full of ease and vigor, a humorous apotheosis of impudence that has become and is likely to remain one of his most popular poems, though at the time it passed almost unnoticed.

Goethe had met Schiller on several occasions since 1779 and had secured for him a professorship at Jena, though it had seemed to him that the author of *Die Räuber* stood in the way of development of classical taste which, since his return from Italy, Goethe had been desirous to foster. But Schiller was himself developing along these lines, and when they came to understand one another, in 1794, Goethe may well have felt that Schiller, more than any other in Germany, was fitted to appreciate and aid him. He was first to speak of friendship, first to visit his new-found friend. Their intercourse grew constant, especially after Schiller came to Weimar (1799), and was interrupted only by Schiller's death (1805). To Goethe the relation was of stimulating rather than of directing force. He contributed to Schiller's periodical *Die Horen* (1795-97) the *Unterhaltungen deutscher Ausgewanderten* and the *Römische Elegien*, and to the *Musenalmanach* (1796-1800) his share of the *Xenien*—couplets of stinging literary criticism that aroused great excitement and lifelong enmities.

Under this new influence *Wilhelm Meisters Lehrjahre* (1795) was completed—a novel with no definite plot, its purpose being the unfolding of characters drawn from varied social spheres, wonderfully realistic studies involving much ripened worldly wisdom and philosophy. Mignon and Philine are enduring creations, the songs interspersed in the novel are among the most exquisite in any literature, and the analysis of *Hamlet* is a very acute criticism. Some fine ballads and elegies belong to this period also, and it closes with that hymn to the family and masterpiece of classic realism, *Hermann und Dorothea* (1797). Here all is studied from life; there is no idealization, no sentimentality. It was an old story, but instinct with a conservative patriotism in these years of revolution and social upheaval. Other less important works of this period are a realistic drama, *Die natürliche Tochter*, held in higher esteem by more recent critics, and *Achilleis*, an attempt to continue the *Iliad*. Some work was done on *Faust*

also; but sickness and public cares interrupted it, and the first part was not published till it was included in the first edition of Goethe's *Works* (13 vols., 1808).

Meantime Goethe had lost many friends—Gleim, Klopstock, and Herder in 1803, Schiller in 1805, his mother in 1808. In that year Goethe came in frequent contact with Napoleon at Erfurt. It was about this time, too, that Bettina von Arnim-Brentano conceived that violent attachment for him that appears in her *Goethes Briefwechsel mit einem Kinde*, which, however, does not represent an actual correspondence; but Bettina could not endure Christianity, and the acquaintance ceased after 1811. In 1809 Goethe published his second novel, *Die Wahlverwandtschaften*, a story of the conflict of love and conjugal duty, with a tragic close. Though now little read, its influence has been great, for it is the starting point of German psychological fiction. It has also an autobiographical value. Charlotte is Frau von Stein, and Edward is what Goethe felt he might have become. Ottilie has been thought by some, probably wrongly, to be studied from a young Jena girl, Minna Herzlieb.

From 1811 to 1814 appeared the first three parts of *Dichtung und Wahrheit*, one of the most fascinating autobiographies in any language. It is early memories seen through a long vista of years and under the transforming influence of an artist's eye, beginning with infancy and closing with his coming to Weimar. Meantime the War of Liberation had restored national independence to Germany; but while the fate of his country was changing before his eyes, Goethe was studying the Oriental poets and checking the effect of their exuberance by renewed reading of Homer. It was in these years that he wrote in great part the *West-östlicher Divan* (1819), foreign in externals, mysterious and oracular in parts, but aiming to cultivate international sympathies, social and literary, in years of intense chauvinism. The *Zuleika* poems in the *Divan* have been thought to be addressed in gracefully platonic affection to Marianne Willemer, wife of his congenial host on a journey to the Rhine in 1815, but this is very doubtful. He also undertook at this time some antiquarian studies, standing intentionally aloof from the temporal aspirations of the German people that he might labor more effectively for their intellectual uplifting.

The *West-östlicher Divan* is the last work of Goethe's long connubial life. Christiane had died in 1816. He felt the blow severely and said that what remained of life to him was but time granted "that he might mourn her loss." His directorship of the Weimar Theatre he gave up in 1817. But the years that remained to him, "testamentary years," he called them, were to yield much of interest. *Wilhelm Meisters Wanderjahre* may indeed seem dreary reading, though it contains many wise pedagogical observations and some episodes that recall the narrative power of Goethe's prime. To these years, also, we owe the Second Part of *Faust*, the necessary complement of the former, with its teaching that men rise by unselfish altruistic effort. Here, as Scherer noticed, Faust chooses, not wealth, but work, and finds in that choice his salvation. Medately Gretchen brings him to the choice; immediately Helena, the incarnation of Greek ideals, as though to suggest that beauty is positive, creative, revealing the worth

of life, and freeing Faust at last from the Mephistophelean spirit of negation. So the teaching is the same as that of *Wilhelm Meister*. The scholar, as the poet, passes, in Goethe's conception, from a groping, contemplative, searching æsthetic existence under the spur of negative spirits and ideal models, to active, useful labor. Here is to be found Goethe's philosophy of life, which aims to realize the ideal by the idealization of the real, to correlate action with thought. "The rest of my life may be regarded as a free gift," he said as he sealed the manuscript of this Second Part of *Faust*. "It is now really indifferent what I do, or if I do anything at all." It was his philosophic testament to Germany.

It is to this last period, too, that we owe the Conversations (*Gespräche*) with Eckermann, which have preserved to us much keen criticism of men and things, for during these declining years he continued to be in closest touch with the intellectual movement of his own country and of others. Weimar became a goal of pilgrimage to men of many minds and nations. He seemed to Germans the survivor, almost the last, of a heroic age. Some of these visitors give us glimpses of the old man's life, among them Heine, Thackeray, and his old friend Lotte Kestner. After his wife's death he traveled but little, seldom farther than Jena, lingering especially over places associated with his prime, and towards the last working intermittently, as health permitted, on the annals of his Weimar life. In 1828 Karl August died, followed two years later by Goethe's son August, whose widow, Ottilie, cared for her father-in-law to the end. In the same year (1830) Grand Duchess Luise passed away. So Goethe was left, almost the last of his generation. He died in Weimar March 22, 1832, in his chair, so peacefully that men did not know the hour. Eckermann, who saw his body as it was prepared for burial, noted the deep peace and firmness of the features, the magnificence of the limbs, the broad, strong, and arched chest. Nowhere on the body, he says, was there a trace of wasting. "A perfect man lay in great beauty before me." This body lies now, with that of Schiller, in the ducal mausoleum of Weimar in front of the bronze coffins of the two princely patrons of both, Luise and Karl August.

This is the most completely rounded literary life in history—a life of monumental proportion and yet of perfect symmetry, responsive to all intellectual impulses of art, philosophy, and science, open to every light, yet self-poised and self-controlled till its calm seems Olympian. Goethe is at once the representative and the prophet of the modern spirit, reconciling the antinomies of the ideal and the real in the world wisdom of his *Faust*.

The literature that has gathered around Goethe would fill a library—indeed, it does so in the Goethe archives at Weimar, whence issues the great edition of his works, embracing also the *Tagebücher* and *Briefe*, now all but complete. The *Goethe-Jahrbuch* (annual) is devoted entirely to Goethe. An exhaustive bibliography of Goethe literature is to be found in Goedeke, *Grundriss zur Geschichte der deutschen Dichtung*, vol. iv (3d ed., 1910-). Recent comprehensive editions are those of Heinemann (Leipzig, 1900-), the *Jubiläumsausgabe* (Stuttgart, 1907-), the *Wilhelm*

Ernst-Ausgabe (Leipzig, 1908-), the *Propyläen-Ausgabe* (Munich, 1909-), the *Tempel-Klassiker-Ausgabe* (Leipzig, 1909-), the new *Hempel-Ausgabe* (Berlin, 1910-). Of the letters there are selections by Von der Hellen (Stuttgart, 1900-), Stein (Berlin, 1902-), Richard M. Meyer (Berlin, 1909-). The correspondence with Schiller is best edited by Graef and Leitzmann (Leipzig, 1912-), that with Frau von Stein by Fraenkel (Jena, 1908). Von Biedermann has edited Goethe's *Gespräche* (10 vols., 2d ed., Leipzig, 1909-); Houben has edited his *Gespräche mit Eckermann* (8th ed., Leipzig, 1909).

Of the lives of Goethe, Düntzer's (Leipzig, 1883) is the most complete (also in Eng. trans.). Excellent popular biographies are those by Heinemann (3d ed., 2 vols., Leipzig, 1903); Bielschowsky (25th ed., Munich, 1913; trans. by Cooper, New York, 1905-08); and Witkowsky (2d ed., Leipzig, 1913). Lewes's well-known life is largely superseded by these German works. Another biography in English, by Atkins, appeared in 1904 (London).

Among the later studies of Goethe, omitting all treatises on special works, the most significant are: Weissenfels, *Der junge Goethe* (Tübingen, 1899); Menzel, *Der Frankfurter Goethe* (Frankfurt, 1900); Scherer, *Aufsätze über Goethe* (2d ed., Berlin, 1900); Graefe, *Goethe über seine Dichtungen* (Frankfurt, 1901-); Bode, *Goethes Ästhetik* (Berlin, 1901); Vogel, *Goethes Selbstzeugnisse über seine Stellung zur Religion* (3d ed., Leipzig, 1903); Hermann Grimm, *Goethe-Vorlesungen* (7th ed., Stuttgart, 1903); Wasielewski, *Goethe und die Descendenzlehre* (Frankfurt, 1903); Richard M. Meyer, *Goethe* (3d ed., Berlin, 1905); Ludwig Geiger, *Goethe und die Seinon* (Leipzig, 1908); Vogel, *Goethes Studenten-Jahre* (3d ed., Leipzig, 1900); Diezmann, *Goethe und die lustige Zeit in Weimar* (4th ed., Weimar, 1909); Bernays, *Der junge Goethe* (new ed., Leipzig, 1909-12); Houston Stewart Chamberlain, *Goethe* (Munich, 1912; in German); Maass, *Goethe und die Antike* (Stuttgart, 1912).

GOETHE, KATHARINA ELISABETH, known as "Frau Rat" and "Frau Aja" (1731-1808). The mother of Johann Wolfgang von Goethe. She was born at Frankfurt on the Main and was a daughter of Johann Wolfgang Textor, a prominent citizen of that city. At the age of 17 she was married to Johann Kaspar Goethe, by whom she had four children. She was a woman of exceptional intellect, marked individuality, and a delightfully joyous cast of mind, as evidenced by her letters, and in the frequent references to her found in the works of her son, upon whose intellectual development she undoubtedly exerted a remarkable influence. She was made the heroine of the work by Bettina von Arnim entitled *Dies Buch gehört dem König* (1843) and is one of the central figures of Gutzkow's famous play, *Der Königsleutnant*. Much of the correspondence of Katharina Elisabeth Goethe has been published in *Goethe's Mother, Correspondence of Catharine Elisabeth Goethe with Goethe* (Leipzig, 1889). Her letters to the Duchess Anna Amalia were published at Weimar in 1885. Consult: Keil, *Frau Rat* (Leipzig, 1871); Erich Schmidt, *Charakteristiken* (Berlin, 1886); Heinemann, *Goethes Mutter* (7th ed., Leipzig, 1904).

GOETHITE, *ge'tit* (named in honor of Goethe). A hydrated iron peroxide that crys-

tallizes in the orthorhombic system, producing slender prisms which pass by gradations into crystalline aggregates and massive forms. The lustre is adamantine and the color yellow red to brown. It occurs with other iron oxides, especially hematite or limonite, in Nassau, Saxony, and elsewhere in Germany; at various localities in England; and in the United States in the Lake Superior region, Missouri, Colorado, California, and elsewhere. Goethite is sometimes found penetrating quartz, like rutile, forming sagenite or "Venus's hair stone," which, when cut, is used for seals and charms in jewelry.

GOETSCHIOUS, gŏ'chūs, PERCY (1853-). A distinguished American musical scholar, writer, and composer, born in Paterson, N. J. A graduate of the Stuttgart Conservatory of Music, he was in 1876 placed in charge of the English classes there and in 1885 was made royal professor. He at the same time contributed to the leading musical journals of Germany. He was called to Syracuse (N. Y.) University in 1890, as professor of harmony, musical history, and advanced pianoforte playing. In 1892-96 he had charge of the composition branch of the New England Conservatory. He was appointed organist of the First Parish Church of Brookline in 1897. In 1905 he became head of the theory department at the Institute of Musical Art in New York. His principal works are: *The Material Used in Musical Composition* (1882); *The Theory and Practice of Tone Relations* (1892); *Models of the Principal Musical Forms* (1895); *Syllabus of Musical History* (1895); *The Homophonic Forms of Musical Composition* (1898); *Exercises in Melody-Writing* (1900); *Applied Counterpoint* (1902); *Lessons in Music-Form* (1904); *Exercises in Elementary Counterpoint* (1909).

GOETZ, gŏ'ts, (LEOPOLD) KARL (1848-). A German Old Catholic theologian and historian, born in Karlsruhe and educated at Bonn and Bern. In 1892-1900 he was priest of the Old Catholic Congregation at Passau, for two years was professor in the theological seminary of that denomination at Bonn, and in 1902 became professor in the University of Bonn. His works on Church history, especially as it touched the points in controversy between Rome and the Old Catholics, and on early Russian history, include the following: *Busslehre Cyprians* (1895); *Geschichtliche Stellung und Aufgabe des deutschen Altkatholizismus* (1895-96); *Geschichte der Slavapostel Konstantinus und Methodius* (1897); *Lazaristen und Jesuiten* (1898); *Leo XIII* (1899); *F. H. Reusch* (1901); *Das Kiever Höhlenkloster als Kulturzentrum der vormongolischen Russlands* (1904); *Kirchenrechtliche und kulturgeschichtliche Denkmäler Altrusslands* (1905); *Staat und Kirche in Altrussland* (1908); and a great work on Russian law, vols. i-iv (1910-13).

GOETZ, gŏ'ts, THEODOR VON (1826-92). A German battle painter, born in Lieschen, Silesia. He studied at first under the genre painter Hantzsch in Dresden, but turned later to military subjects. He is particularly noteworthy for his faithful representations of the events of the Franco-German War of 1870-71, in which he took part as commander of a battalion of riflemen. His pictures are faithful in detail, but hard in color. The best known include: "Episode in Battle of Sedan" (1875); "Prince George of Saxony in Battle of Saint-Privat" (1876); and "Crown Prince Albert after the

Battle of Beaumont Congratulated by Prince George" (1887, Dresden Gallery).

GOETZ, or GÖTZ, VON BERLICHINGEN, gŏ'ts fŏn bŕ'lik-ing'en. See BERLICHINGEN.

GOETZE, gŏ't'ze, FREDERICK ARTHUR (1870-). An American mechanical engineer and educator. He was born in Jersey City, N. J., and was educated at Stevens Preparatory School (1882-85), at Cooper Union, New York (1885-87), and at the Columbia School of Mines (1893-95). From 1895 to 1907 he was assistant superintendent and superintendent of buildings and grounds of Columbia University, where he became dean of the schools of Mines, Engineering, and Chemistry, consulting engineer in 1907, and controller in 1913.

GOETZE, gŏ't'se, JOHANN AUGUST EPHRAIM (1731-93). A German theologian and naturalist, a brother of Johann Melchior Goeze. He was born at Aschersleben and studied theology at the University of Halle (1747-51). After occupying several pastorates he became deacon of the cathedral at Quedlinburg, where he died. He is best known for his researches in natural history. His microscopical investigations led to the publication of the important work entitled *Versuch einer Naturgeschichte der Ringgeschwürmer tierischer Körper* (1782; appendix, 1800). In 1773-74 he prepared about 75 translations of Bonnet's treatises on the natural history of insects.

GOETZE, JOHANN MELCHIOR (1717-86). A German Lutheran clergyman, born at Halberstadt (Province of Saxony, Prussia). Educated at Jena and Halle, he became pastor of the church of the Holy Spirit at Magdeburg in 1750, and in 1755 chief pastor of St. Catharine's Church at Hamburg. From 1760 to 1770 he held the seniority of the Lutheran clergy at Hamburg. He is known chiefly as a tireless controversialist, and in particular for his attacks on Lessing because of the latter's publication, in the "Wolfenbüttel Fragments," of the posthumous *Fragmente eines Ungenannten* (1774, 1777, 1778) of the freethinker Hermann Reimarus. He began the well-known contest in 1777, with an essay in Nos. 55 and 56 of the *Freiwillige Beiträge zu den Hamburgischen Nachrichten*, which he followed by *Einwas Vorläufiges gegen des Herrn Hofrath Lessings mittelbare und unmittelbare feindselige Angriffe* (1778), and *Lessings Schwächen* (1778), all acrid and personal. Lessing made his chief reply in 1778 in *Eine Duplik, Eine Parabel, Axiomata* and *Anti-Goeze*, among both the keenest of his writings and the foremost examples of the literature of the class. The pastor had little of the incisive thought, and yet less of the skillful expression, of his opponent. He was intolerant, even for the time, and a stickler for a narrowly literalistic interpretation of the Scriptures. His polemics against Lessing were edited by E. Schmidt in 1893. Consult his life by Röpe (Hamburg, 1860), and Cropp, "Lessings Streit mit Hauptpastor Goeze," in Heft 155 of the *Deutsche Zeit- und Streit-Fragen* (Berlin, 1881). See LESSING.

GOFF, JOHN W. (1848-1924). An American lawyer and judge. He was born at Wexford, Ireland, went to the United States at an early age, and was educated at Cooper Union, New York City. He studied law and in 1870 was admitted to the bar. From 1888 to 1891 he was assistant district attorney of New York City; later he attracted attention as counsel for the

Law Association in the investigation and prosecution of election frauds in New York and as counsel for the Lexow Senatorial Committee which investigated police administration in the same city. From 1894 to 1906 he was recorder of the city of New York, and he was elected justice of the Supreme Court of New York, first district, for the term of 1907 to 1920. In 1912 he presided over two of the most famous criminal trials ever held in New York—the first trial of Charles Becker, former police lieutenant, who was convicted of instigating the murder of the gambler Herman Rosenthal, and the trial of the four gunmen convicted of the actual shooting.

GOFF, NATHAN (1843-1920). An American legislator, born at Clarksburg, W. Va. He was educated at Georgetown College and at the University of the City of New York, and from 1861 to 1865 served in the Union army, rising from the rank of lieutenant to major. Admitted to the bar in 1866, he then was (Republican) member of the West Virginia House of Representatives in 1867, United States district attorney in 1868-81, Secretary of the Navy under President Hayes in 1881, again United States district attorney in 1881-82, and member of Congress (1883-89). In 1888 his election as Governor of West Virginia was successfully contested by his Democratic opponent. He served as United States circuit judge from 1892 to 1911 and as judge of the United States Circuit Court of Appeals in 1912-13, and was elected United States Senator for the term of 1913-19.

GOFFE, göf, WILLIAM (?-c.1680). An English regicide, born in Sussex, where his father was the rector of a church at Stammer. Apprenticed to a salter in London, he embraced the cause of the Parliament against Charles I and in 1645 was commissioned a captain in the New Model army, in which by his zeal and bravery he won rapid promotion. He was one of the judges at the trial of Charles I and signed the death warrant. He commanded Cromwell's old regiment at the battle of Dunbar and distinguished himself at Worcester. He was elected to Parliament in 1654 and was promoted major general in 1655, with command in Sussex, Berkshire, and Hampshire. In 1656 he supported the proposition to offer the crown to Cromwell, by whom he was appointed a member of the newly constituted House of Lords. At the Restoration he was excepted from the Act of Indemnity and escaped with his father-in-law, General Whalley, to America, settling first at Cambridge, and thence removing to New Haven in 1661 to escape arrest. He remained in hiding in and about New Haven and Guilford until 1664, when he fled for safer refuge to the house of the Rev. John Russel in Hadley, Mass. There is a tradition that he appeared on the occasion of an Indian attack upon Hadley on Sept. 1, 1675, rallied the frightened townsmen, and drove off the raiders. But there is no other record of even an attack on the town at that time. However, the incident has been used by Scott in his *Peveril of the Peak* and by Cooper in his *Wept of Wish-ton-Wish, or The Borderers* and forms the subject of "The Gray Champion" in Hawthorne's *Twice-Told Tales*. There is an affidavit alleging that Goffe was in Hartford in 1680, but there is no other trace of him subsequent to 1679. Consult Stiles, *History of Three of the Judges of King Charles I* Vol. X.—J

(Hartford, 1794), and a close study by Sheldon in the introduction to the new edition of Judd's *History of Hadley* (Springfield, 1903).

GOFFSTOWN. A town in Hillsborough Co., N. H., 8 miles northwest of Manchester, on the Boston and Maine Railroad, and on the Piscataquog River (Map: New Hampshire, G 7). It contains the St. Anselms College and a public library. Goffstown is a summer resort and has manufactories of sashes and blinds. The town was first settled in 1748 and incorporated in 1761. Pop., 1900, 2528; 1910, 2579.

GOG AND MAGOG. In Ezek. xxxviii. 1-xxxix. 20, an oracle is directed against Gog, Prince of Rosh, Meshech, and Tubal, announcing that he will be led to invade Palestine, accompanied by Paras, Cush, Put, Gomer, Togarmah, and people from "the sides of the north," only to meet with a crushing defeat on the mountains of Israel and to be buried with all his host in "the Valley of the Travelers to the Sea." "To the land of Magog" has the appearance of being an interpolation in xxxviii. 2, and the Greek translator seems to have read "Gog" and not "Magog" in xxxix. 6; the glossator evidently regarded Magog as a term covering the realm over which Gog ruled. Gog also occurs in the Greek version of Num. xxiv. 7 and Amos vii. 1; but the original reading in the first passage is doubtful, and the second is probably a late interpolation. Magog appears as one of the sons of Japhet in Gen. x. 2. As all the other sons represent well-known peoples—the Cimmerians, Medes, Greeks, Moschi, Tibarenes, and Tyrrhenians—Magog, no doubt, also stands for a definite people. If the name has been correctly transmitted, it may yet come to light in ancient inscriptions. It may be an expansion of Gog, which occurs in the form of Ga-ga in a letter of Amenhotep III (1411-1375 B.C.) to Kadeshmanharbe (*Amarna Tablets*, i, 38) as the name of a people, and seems to have survived to the time of Strabo in Gogarene, north of Sacasene, near the Cyrus River (xi, 14). Josephus (*Ant.*, i, 123) and Jerome (*Com. in Ezech.*) understood Magog as referring to the Scythians. In Gen. x. 3 Ashkenaz (Ass. Ashkuza), son of Gomer (q.v.), appears to represent the Scythians. But just as the terms "Scythian" and "Sakae" were used by Greeks and Persians of many ethnic elements, so Gog, or Magog, may have come to include in later times both the Scythians proper and many other nations, like the Sarmatians, the Roxalani, the Bastarnians, and the Massagetae.

Some modern interpreters, among them Wellhausen and Smend, regard Gog as a fictitious personage representing the reflection of the Scythian invasion in 625 B.C. expected by Ezekiel to recur again. Others, like Bousset and Gressmann, who regard the two chapters as later than Ezekiel's time, consider Gog as a mythical figure and look to Babylonian lore for an elucidation of the oracle. Others have felt that a distinct historic personage is in the author's mind. Grotius was led by a suggestion already thrown out by Polychronius, the brother of Theodore of Mopsuestia, to the idea that Ezekiel used the name of the Lydian King Gyges in prophesying the career of Antiochus III. Seignette thought of Antiochus IV Epiphanes. Winckler assumed that the writer was a contemporary of Alexander the Great and referred to his invasion of Syria. But neither Antiochus III nor Antiochus IV nor Alexander could well be designated as "prince of Rosh, Meshech, and

Tubal." Schmidt suggested that "prince of Meshech and Tubal" would be a most appropriate title of Mithridates VI of Pontus, a native and ruler of the territory associated with these names. If "Rosh" is the name of a people and refers to the Roxalani, the Ros of Georgius, Simon Logotheta, Zonaras, and Tzetzes (Gesenius, *Thesaurus*, s. v.), the appropriateness, after the victory over this people by Mithridates, is even more striking. Among his forces were Persian auxiliaries, Egyptian ships, Cappadocian troops, Armenian contingents, and Scythian, Sarmatian, and Bastarnian soldiers. His terrible massacre of 80,000 Italians in Asia Minor, and his robbery of 800 talents from the Jews on Cos, then in league with Rome, would naturally have aroused hatred and excited the fear that he would invade Syria, as his ally Tigranes afterward did, and also the hope that he would be defeated on the old battlefields in the valley of Esdraelon, and that the ruler of Scythia would be buried in the city of Scythopolis (Beth Shean). If this identification is correct, the name "Gog" would be natural, and the position of the oracle in the Book of Ezekiel would be due to a reader or copyist familiar with his style. In Rev. xx. 8 Gog and Magog are nations gathered from the four corners of the earth by Satan to the last war after the millennium. It was probably through Christians that Mohammed became familiar with them. He alludes to Yagug and Magug as nations against whom Dhu'l Karnain (Alexander) built a marvelous wall (Koran, xviii, 93-97), and also as peoples that were to appear in the distant future (ib., xxi, 95 f.). A poem by a Christian of Edessa published by Knös (*Chrestomathia Syriaca*, Göttingen, 1807) also refers to Alexander and the wall of brass. Rumors of the Chinese Wall, built by Shi Hwang Ti, are probably at the basis of the legend. Mohammed's references to the wall naturally awakened curiosity; and al Wathik is said to have sent an expedition from Samarra in 842 A.D. to seek for it, which reported to have found it 27 days' journeys beyond Derbent on the Caspian Sea. They could not have reached the Chinese Wall in that time; and if they had, they would have known that it was not of brass. Arabic geographers relate that Yagug and Magug are of small stature and live chiefly on fish. The description applies well to the Massagetae, a Scythian people in the wider sense of the term, whose name seems to mean "fish eaters." In Arabic as well as later Hebrew eschatology Gog and Magog are to come to the last war across Lake Tiberias to the plain of Esdraelon. Consult: the commentaries on Ezekiel by Jerome, Polychronius, in Migne, *Patrologia Graeca*, Grotius, vol. clxii (Paris, 1854-60); Rosenmüller, Hitzig, Smend, Knabenbauer, Bertholet, Kritschmar, Skinner, Toy, Lofthouse; also Wellhausen, *Israelitische und jüdische Geschichte* (7th ed., Berlin, 1914); Seinecke, *Geschichte des Volkes Israel*, vol. ii (Göttingen, 1884); Winckler, *Altorientalische Forschungen*, vol. ii (Leipzig, 1898); Schmidt, art. gen, 1784-92); Gesenius, *Thesaurus* (Leipzig, 1835-53, "Rosh" by Roediger); Montgomery, "Gog and Magog," *The Jewish Encyclopedia*, vol. vi (New York, 1904).

Gog and Magog are names popularly given to the two wooden statues of giants preserved in the Guildhall at London. According to the story, the living prototypes of the two figures were the survivors of a race of giants found in Britain by Brute, son of Antenor of Troy, and by him subdued. They were brought prisoners to London, where they were chained to the gates of a palace on the site of the Guildhall and kept as porters. When they died, their effigies were set up in their place. This is Caxton's account; but there is another, which represents one of the giants as Gogmagog and the other as a British giant who killed him, named Corineus. The two giants have been the pride of London from time immemorial. On London Bridge they welcomed Henry V in 1415; in 1558 they stood by Temple Bar when Elizabeth passed through the city gate. The old giants were burned in the great fire, and the new ones were constructed in 1708. They are 14 feet high and occupy suitable pedestals in the Guildhall. The ancient effigies, which were made of wickerwork and pasteboard, were carried through the streets in the Lord Mayor's shows, and copies of the present giants were in the show of 1837.

GOGABLI. See GOGRA.

GOGEBLY, gō'jēr-lī, DANIEL JOHN (1792-1862). An English missionary and scholar, the founder of Pali scholarship. Born in London, of German descent, he left England in 1818 to take charge of the Wesleyan Methodist printing office in Colombo, entered the ministry in 1822, and labored as a Methodist missionary in Ceylon. He developed remarkable linguistic talent, could preach in Singhalese and Indo-Portuguese, and was the first European to master the ancient sacred Buddhist language of Pali, the native language of Magadha, the country of the Buddha. He not only compiled a *Dictionary* of 15,000 words, but had the Buddhist priests write out the whole of their Pali books with their authorized glossaries or comments, a collection he bequeathed to the mission. In 1838 he became superintendent of the mission. He translated the *Jātaka-pāṭa* (the Book of 550 births of Buddha), and by his translations and discussions was the first to introduce to European scholars a scientific knowledge of the Pali in original Buddhism. He also published in 1862 the first able defense of Christianity in Singhalese, a book which led by reaction to the awakening of the Buddhist consciousness in Ceylon. He died at Colpetty, Ceylon.

GOG'GLE-EYE' (so called from its protruding eyes). The rock bass (*Ambloplites rupestris*), locally so called. See ROCK BASS; WARMOUTH.

GOG'GLE-NOSE' (so called from the round, black spots on its nose, which resemble goggles). A local name among American gunners for the surf scoter (duck). See SCOTER.

GOGH, gōg, VINCENT VAN (1853-90). A Dutch figure, still-life, and landscape painter, one of the leaders of post-Impressionism (q.v.). He was born at Groot-Zundert, a village of North Brabant (Holland), the son of a Protestant clergyman. Destined for an art dealer, he was until his twenty-third year in the employ of the firm of Goupil and Company, at The Hague, London, and Paris. He was a school-

master in England, studied theology in Amsterdam, and then became an evangelist among the gold miners of Belgium. Although he had always designed and modeled, he did not begin the study of painting until 1882, at The Hague. In 1884 he studied a short time at the Academy in Antwerp, whence he removed to Paris, joining his younger brother, Theodore, an art dealer of Modernist predilections, who brought him in touch with the Impressionists. He afterward removed to southern France, painting at Arles and Saint-Remy. At this time he was much in the company of Gauguin (q.v.), who greatly influenced his work. Always in delicate health, he spent his last days in a hospital for nervous diseases at Auvers-sur-Oise, and there he committed suicide.

His work naturally falls into two periods, separated by the year 1885—a Dutch period of preparation and the French period of his mature art. His earliest works were powerful peasant pictures, such as "Winter" and "The Shepherds" (both in the Peletier collection, Utrecht) and the remarkable "Potato Eaters." His landscapes of the country about Arles and elsewhere in southern France are characterized by broad surfaces of color, skillful treatment of light, and linear rhythm. A fine "Autumn Landscape" is in the Museum of Meudon. He also painted characteristic figure pieces, such as several peasant women of Arles, Dr. Gachet, and his own portrait in several versions, and the powerful and gloomy "Prison Court." He was, above all, a colorist, who worked in broad surfaces of pure color rather than in values. His letters to his brother Theodore, who supported him throughout his artistic career and died of grief as a result of his death, and to his friend Emil Bernard, were published by the latter in 1911. They contain strikingly original views on art, expressed with force and lucidity. An English version of his letters was published under the title *Letters of a Post-Impressionist* (Boston, 1913). Consult the monographs by Meyer-Graefe (Munich, 1910) and Bremer (Amsterdam, 1911).

GOGOL, gŏ'gŏl, NIKOLAI VASILIEVITCH (1809–52). One of the greatest of Russian writers, born in the Province of Poltava (Little Russia), of a family of Cossack origin. On graduating at the Nyezlin Lyceum he went to St. Petersburg (1828) and was a clerk in the Department of Appanages in 1830–32. During these years he published a series of sketches, *Evenings at a Farmhouse near Dikanka*. In these he exploited his personal knowledge and his grandfather's stories of Cossack everyday life. These sketches attracted immediate attention and introduced their author into the select circle of Pushkin and Zhukovsky (qq.v.), who obtained for Gogol an instructorship in literature and in 1834 an adjunct professorship in history. This latter position he soon resigned for purely literary work. During 1832–34 appeared a second series of Ukrainian sketches, *Mirgorod* (collected in 1835), containing among others, *Taras Bulba*, *Old World Proprietors*, and *How the Two Ivans Quarreled*. *Taras Bulba*, rewritten and enlarged in 1842, is a glowing picture of the Cossack struggles with the Catholic Poles and Mohammedan Tatars in the sixteenth century. It is an epic in poetic prose and the best historical novel of the time. The two other sketches are minute studies of the picturesque life of Little Russian (Ukrainian) villages.

After these inimitable bits of realism Gogol wrote two series of sketches in a more romantic vein—*Arabesques* (1834) and *Tales* (1836), dealing with Great Russian life, chiefly of St. Petersburg. In 1836 appeared the comedy *Revizor* (Inspector General), which held up to ridicule the ignorance, corruption, trickery, and arbitrariness of provincial officialdom. A distressed cry of treason went up from all who were supported by state money, and but for the will of Nicholas I, who heartily enjoyed the bold comedy, it would have been immediately withdrawn from the stage. The intense mortification at the general protest his play aroused undermined Gogol's constitution, and for 12 years thereafter he lived mostly abroad, searching in vain for health. In 1842 he published the first volume of *Dead Souls*, describing the adventures of one Chichikov, who travels all over Russia in pursuance of a scheme to become an estate holder by purchasing the dead serfs (souls of the dead), who are officially counted as living until the next census is taken. This almost plotless novel presents types of all walks of Russian life, drawn with all of Gogol's former art and with a mastery still more marked. The second volume was almost ready in 1845; but the author, in a fit of hypochondria, of which he had become a victim and which made him a religious mystic and champion of autocracy, consigned the precious manuscript to the flames. A rough draft and detached scraps of it found after his death were pieced together and published by his friends. It clearly reflects his dwindling intellectual powers; the personages are mostly figures of the "respectable" type, drawn not from actual life, but simply as a foil to the characters in the first volume. The *Excerpts from the Correspondence with my Friends* (1847) presented the painful spectacle of recantation and negation of his artistic work, in a manner anticipating Tolstoy's similar utterances. Gogol died in Russia, after a pilgrimage to Jerusalem in 1848. He is generally considered the founder of the Natural school, and the father of realism and the modern period of Russian literature. The latest complete edition of his works in Russian is that of Bykov (Moscow and St. Petersburg, 1911), containing a good biographical sketch by Dmitry Merezhkovsky. Almost all his works are available in both French and German. The English translations are: Hapgood, *St. John's Eve and Other Stories*; *Taras Bulba*; *Tchitchikoff's Journeys*, or *Dead Souls* (New York, 1886); Mandell, *The Revizor* (New Haven, 1910).

GOGRA, or **GOGARI**. One of the largest affluents of the Ganges (q.v.), British India, joining that river from the left near Dinapur after a generally southeast course of 600 miles. It rises in lat. 30° 28' N. and long. 58° 40' E., on the southern declivity of a Himalayan range near the border line of Nepal and Tibet. After receiving many tributaries on both sides, it enters the great plain of Hindustan, 148 miles from its source, and 70 miles lower down becomes navigable for craft of considerable burden. Farther down it is navigable for boats of all sizes at all seasons and is one of the most important waterways of India. The principal affluents are the Sarju (a name sometimes applied to reaches of the Gogra) and the Rapti.

GOHIER, gŏ'yă', LOUIS JÉRÔME (1746–1830). A French politician, born at Semblançay (Indre-et-Loire). A distinguished advocate, he was

deputy from Ille-et-Vilaine to the Legislative Assembly of 1791, where he strongly opposed the civil constitution for the clergy. The following year he became Secretary of the Department of Justice and then Minister of Justice (1793), succeeding Garat. He was president of the criminal court, judge of the Court of Cassation, and last President of the Directory (1799). He refused to participate in Napoleon's coup d'état. In 1802 Napoleon made him Consul General to Holland and wished to send him in the same capacity to the United States (1810), when Gohier retired from public life. His *Mémoires* were published in 1824.

GOIL, goil, Loch. A small sea loch in Argyllshire, Scotland, a branch of Loch Long, 6 miles in length and less than 1 mile in breadth. Its shores are very steep, wild, and rugged, but diversified by extensive woods of hazel. Loch-goilhead is a favorite summer watering place.

GOING, CHARLES BUXTON (1863-). An American engineer, author, and editor, born at Westchester, N. Y. Graduating from Columbia College School of Mines in 1882, he at once took up, in the Middle West, active work in industrial chemistry and corporation management. He joined the staff of the *Engineering Magazine* in 1896, becoming managing editor in 1898 and editor in 1912. In this connection he did much to discern, define, and establish the now fully recognized profession of "industrial engineering." He became special lecturer on this subject at Columbia, Harvard, New York University, and the University of Chicago, and much of the best literature on this subject appeared under his editorial encouragement. He received the degree of M.Sc. (hon.) from Columbia in 1910. His writings include *Methods of the Santa Fé* (1909) and *Principles of Industrial Engineering* (1911), and, in lighter vein, *Summer-Fallow* (1892) and *Star-Glow and Song* (1909); also, in collaboration with Marie Overton Corbin (later Mrs. Going), *Urchins of the Sea* (1900) and *Urchins at the Pole* (1901). He was a contributor to the second edition of the NEW INTERNATIONAL ENCYCLOPÆDIA.

GOITO, gò'è-tò. A town in the Province of Mantua, Italy, on the right bank of the Mincio, 11 miles northwest of the city of Mantua (Map: Italy, C 2). Its vicinity to Mantua has made it the scene of numerous battles, notably that between the Piedmontese and the Austrians in April and May, 1848, when the former were victorious. Pop. (commune), 1901, 5694; 1911, 6702.

GOITRE (Fr., from Lat. *gutter*, throat). An enlargement of the thyroid gland (q.v.) occupying the front of the neck, and sometimes of such a size as to project downward over the breast and even admit of being thrown over the shoulder. Goitre is, for the most part, an endemic or local disease, being found in the mountainous regions of the Alps, Andes, and Himalayas, in the Pennine Range, and in Derbyshire, England (whence Derbyshire neck), in the Rhone valley, in the Indian Punjab, and in north Italy, especially, it is said, where lime prevails largely as a geological formation. The connection of goitre with drinking water is a very ancient belief. Goitre wells are mentioned by Pliny and Vitruvius. Mungo Park is said to have found evidence of the belief in Africa, and Gago discovered a similar one in the West Indies in the seventeenth century. Men subject to military service drink the water of goitre wells in order to acquire the disease and thus

escape conscription. On the other hand, families living in goitre districts have been known to escape the malady by drinking only rain water or wine. Again it has been noted that goitre streams or wells may change their character. Sometimes a well may acquire goitre-producing qualities. Some rivers produce goitre only at particular points in their course. In certain goitre districts in Italy and Switzerland the disease has been controlled by the introduction of water from a goitre-free region. Women are oftener affected with goitre than men. An explanation offered for this fact is to the effect that they drink more water than men. Rôpin, in 1908, found a high degree of radioactivity, due to radiothorium, in the waters of the Swiss Alps. Goitre is met with endemically to a slight extent in various parts of Scotland, but on a very small scale indeed as compared with Switzerland, in which it is a very important deformity, especially when connected with cretinism (q.v.). Sporadic goitre may occur in any country. The pathological changes which underlie the enlargement of the thyroid in goitre are not always the same in all cases. The enlargement of the gland may be due to a general hypertrophy of all the tissues, *simple goitre*; or depend on an overgrowth of the fibrous elements alone, *fibrous goitre*; or one or several of the normal alveolar spaces may become dilated, constituting *cystic goitre*; in other cases there is little new gland formation, the increase in size being due to dilatation of the blood vessels, which causes an expansile pulsation in the mass, *pulsating goitre*; later on, the gland may become indurated from the deposition of lime salts, forming the variety known as *calcified goitre*. The thyroid gland often becomes temporarily enlarged in women during the menstrual period or at puberty. In the form of goitre known as exophthalmic goitre (see BASEDOW'S DISEASE), which is marked by protrusion of the eyes (*exophthalmos*) and functional disturbance of the heart action, there is increase in the size of the thyroid, which is in most cases a condition of active glandular proliferation. From the symptoms of this disease taken in connection with the known effect of thyroid extract upon the system, there is little doubt that the change in the gland is the pathological basis of the disease. The treatment of goitre, not of the exophthalmic variety, consists in the administration of very minute doses of iodine for a long time internally, locally by innunction, or locally by cataphoresis. The X-ray alleviates or cures in a large percentage of cases. (See ELECTRICITY, MEDICAL USES OF.) In a few rare cases the administration of thyroid gland has cured. In others the administration of thymus gland has cured. In India, especially, applications of the biniodide of mercury to the tumor, followed by exposure to the sunlight, has proven a successful method of treatment. Consult article on "Goitre" by Dock, in Osler's *Modern Medicine* (2d ed., Philadelphia, 1914), and McCarrison, *Etiology of Endemic Goitre* (London, 1913).

GOKHALE, gò'khal'-a', GOPAL KRISHNA (1866-1915). An East Indian educator and political leader. He was born in Bombay and, after receiving an excellent education in native and English colleges, became a professor in Ferguson College, Poona. There he remained for 20 years, during which he devoted himself to promoting education among his Mahratta fellow

countrymen. He became actively identified with the National Indian Congress movement, and by his moderation and enlightened views came to be accepted as a safe leader of the Indian Progressives. In 1905 he was elected President of the Indian Congress. He gave evidence before the Indian Expenditure Commission in London. In 1905 he founded the Servants of India Society and in 1912 was appointed a member of the Royal Commission on Public Services in India. He was elected a fellow of Bombay University. As a writer and speaker also, he became well known.

GÖKINGK, gē'kīnk, LEOPOLD FRIEDRICH GÜNTHER VON. See GÖCKINGK.

GOKTCHA, gōk'chā, or **SEVANGA** (syē-vīn'gā) **LAKE**. A lake in the Transcaucasian Government of Eriyan, situated at an altitude of about 6300 feet and surrounded by high barren mountains of volcanic origin (Map: Russia, G 6). It is about 45 miles long, 23 miles wide, 67 fathoms deep, and has an estimated area of 540 square miles. It receives a large number of mountain streams. The outlet is through the Sanga, a tributary of the Aras. In the northwestern part of the lake is the lava-formed island of Sevang, with an old Armenian monastery.

GOLAW, gō'lāv, SALOMON VON. The pseudonym of the German epigrammatist Friedrich Logau (q.v.).

GOLCON'DA. A ruined city and fortress in the Nizam's dominions, India, 5 miles west-northwest of the capital, Hyderabad, in lat. 17° 22' N. and in long. 78° 25' E. The ruins of the ancient city, once the metropolis of the Kingdom of Golconda, the solid mausolea of its former sovereigns, which form a vast group at a distance of 600 yards from and overlooking the fortress, and the fortress itself, are all of great archaeological importance and interest. The fort is now used as a state prison and as the Nizam's treasury. Golconda is proverbially famous for its diamonds, which, however, were merely cut and polished here, being generally found at Purlial, near the southern frontier of the Nizam's dominions.

GOLD (AS, OHG. *gold*, Ger. *Gold*, Goth. *gulþ*; connected with AS. *geolw*, Eng. *yellow*, Lat. *helvus*, grayish yellow, Gk. *χλωρός*, *chlōros*, yellowish green, Skt. *hari*, yellow). A metallic chemical element, probably the first metal known to man. The alchemists regarded gold as the most perfect metal, compared it to the sun, and designated it by the same symbol by which they represented that orb; their efforts were constantly directed towards the transmutation of baser metals into pure gold. Gold is widely distributed in nature and is frequently found native, though usually alloyed with silver and containing small quantities of copper or iron; it is also associated with palladium, rhodium, and bismuth. It is sometimes found crystallized, usually as octahedra or tetrahedra, but more commonly in thin laminae or grains in sand or gravel. Its presence in this condition is believed to have been caused by the disintegration of gold-bearing rocks, and it is readily collected from such alluvial sources by washing the auriferous soil. The purest specimens of native gold have yielded from 99.7 to 99.8 per cent of the pure metal, the average California gold containing 88 per cent, while Australian gold sometimes runs as high as 96 per cent pure

metal. Gold also occurs in combination with mercury as electrum, with silver and tellurium as sylvanite, and with tellurium and lead as nagyagite. It is further found in various sulphides, as those of copper, lead, iron, and zinc; also in other ores, and in very small quantities in sea water.

Gold (symbol, Au; atomic weight, 197.2) is of a bright yellow color when pure and has a high metallic lustre. It is the most malleable of all metals and has been hammered into a leaf 0.00009 millimeter in thickness. In this condition it appears green by transmitted light. Gold is very ductile and can be drawn into wire so fine that 166 meters weigh but a single gram. Its specific gravity is 19.31, and it melts at about 1075° C. It is a good conductor of both heat and electricity. Whatever the temperature, neither water nor oxygen is capable of attacking it; and it is not affected by fusion with potassium chlorate. It yields, however, to alkalis and nitrates and especially to sodium or potassium cyanide. It is not dissolved by any single acid, except selenic, but readily passes into solution when treated with aqua regia (a mixture of nitric and hydrochloric acids) or with other acid liquids in which chlorine or bromine is evolved. Pure gold, being too soft for all ordinary purposes, is generally alloyed with other metals. With copper it yields a reddish alloy, which is quite hard; the standard metal used for coinage is made up of 900 parts of gold and 100 of copper. With silver it yields so-called "white alloys," which are used for jewelry. It amalgamates readily with mercury, forming a white amalgam of a pasty consistency. The most extensive uses of gold are for coinage, jewelry, gilding purposes, electroplating, and in dentistry.

Compounds. With oxygen gold forms a monoxide, or *aurous oxide*, and a trioxide, or *auric oxide*. The former is obtained by decomposing aurous chloride with cold dilute potassium hydroxide; the latter by heating a solution of gold trichloride with an excess of magnesia and well washing the precipitate with nitric acid. Auric oxide, which is the more common of the two, combines with bases, forming salts called *aurates*. Perhaps the most important of the compounds of gold with acids is auric chloride, which is readily obtained by dissolving metallic gold in aqua regia and evaporating the solution to crystallization. The resulting orange-red crystals may be further purified by recrystallization. It is a very deliquescent salt and is chiefly employed for toning silver prints in photography.

Fulminating Gold, which was originally described in a work published under the name of Basil Valentine, is a green or brown powder that readily explodes when dry; it may be obtained by the action of ammonia on gold hydroxide, or by precipitating gold chloride with ammonia or its carbonate.

Gold Purple, or **Purple of Cassius**, which was originally prepared by Andreas Cassius, and described in 1685, is a flocculent purple precipitate obtained by treating a solution of stannous and stannic chlorides with gold chloride. The resulting product is believed to be a mixture of tin oxide and finely divided gold. The color of ruby glass is due to small proportions of this pigment.

Mosaic Gold is a fine flaky yellow variety of tin bisulphide; it is prepared by heating a mix-

ture of seven parts of sulphur, six parts of ammonium chloride, and 18 parts of a powdered amalgam consisting of two parts of tin to one of mercury. When the odor of hydrogen sulphide is no longer perceptible, the heat is raised to low redness, and the mercurous chloride, ammonium chloride, and mercuric sulphide are volatilized. The mosaic gold thus obtained is used as an imitation bronze in the arts.

Production of Gold. The supply of gold in ancient times was derived mostly from surface deposits of sands and gravels which yielded their values by simple processes of washing. Gold was thus mined at a very early period in India, Central Asia, the southern Urals, and in the region bordering the eastern Mediterranean. With the progress in metallurgical knowledge attention was directed to the exploitation of auriferous veins, a branch of the industry which seems to have attained to some importance before the opening of the Christian era. Ancient workings of this character, ascribed to the Egyptians, have been found in the mountains of Nubia; and Dr. Karl Peters has described extensive mines in the interior of South Africa, not far from the gold fields of Rhodesia—a locality believed by Dr. Peters to be the Ophir of the Israelites. The Romans operated mines in Hungary, Spain, and Great Britain at various periods. During the Middle Ages the mining industry seems to have made little progress. It is estimated that the total stock of gold in Europe when America was discovered did not exceed \$225,000,000.

The first gold mined in the United States came from the Appalachians. As civilization advanced west the production increased. With the discovery of new districts, such as California, South Africa, Australia, and Alaska, the increase in production was very marked. With improvements in the metallurgical extraction, low-grade deposits have become workable which only a few years ago were considered of no value; this has resulted in a gradual increase, not so marked as the discovery of new districts.

WORLD'S PRODUCTION OF GOLD 1493-1920

Annual Report, 1920, Director of the Mint

PERIOD	Years	Annual average production
1493 to 1600.....	107	\$4,337,000
1601 " 1700.....	100	6,064,000
1701 " 1800.....	100	12,628,000

		Total \$18,100,874,536

The accompanying statistics of world production were compiled by the late Adolf Soetbeer and by the United States Mint from the most authoritative sources. It is interesting to note

that the production for the 34 years from 1886 to 1920 has exceeded that of the previous 394 years.

The gold-producing countries mentioned in order of their importance, and the percentage of their output in 1920 as compared with the total output, were: Africa, 56 per cent; United States, 15.25 per cent; Australia, 7.4 per cent; Canada, 4.75 per cent; and Mexico, 4.6 per cent, leaving a balance of 12 per cent for the remaining countries of the world. Brazil, with 87,075 fine ounces or 0.575 per cent of the world's total, and Colombia with 280,575 fine ounces, or 1.78 per cent were the leading producers in South America. The table given below giving the gold output from the various countries of the world, is abridged from the Report of the United States Mint for 1921.

GOLD PRODUCTION OF THE WORLD FOR 1920

United States. In the United States, as elsewhere, the occurrence of gold is limited to areas of crustal and volcanic disturbances, these apparently being the prime factors that govern the formation of ore bodies the world over. There are, thus, two distinct regions in which gold is produced—the eastern region along the Appalachian Mountains, and the western, or Cordilleran, region. Gold has been found at numerous localities on the eastern slope of the Appalachians, and the mountain system might be said to be gold-bearing throughout its extent from Newfoundland to Alabama, although workable deposits occur only in Nova Scotia, Canada, and the Southern States. In the United States the

auriferous belt, varying from a few miles to 75 miles in width, extends from Virginia through North Carolina, South Carolina, and Georgia, into Alabama. Both veins and surface deposits are worked. The veins of auriferous quartz cut through the slates and schists, generally forming only small pockets of ore. Associated with the gold is usually a small percentage of the sulphides of copper and iron. Some pockets of ore are exceptionally rich, and specimens of quartz literally covered with gold are to be found. The Haile gold mine in South Carolina, no longer worked, was a large low-grade body of auriferous schist; this mine was operated for a number of years and attracted considerable attention. It was at this property that the Keith lead-lined chlorination barrel for the extraction of gold was developed. The Dahlonega district in Georgia has also attracted considerable attention, and placer or surface mines have been worked in this district. In North Carolina the tendency is for the gold to occur in quartz veins. The first gold shipped to the mint for coinage from the Southern States was from North Carolina in 1804. For 20 years following, the annual output from North Carolina did not exceed \$2500. In 1829 Virginia and South Carolina, in 1830 Georgia, in 1831 Alabama and Tennessee, and in 1868 Maryland, shipped gold to the mint for coinage. Since then the production, although small, has been fairly constant.

The Western gold fields are scattered over the whole region between the eastern foothills of the Rocky Mountains and the western slopes of the Sierra Nevada and Cascade ranges and extend from Alaska into Mexico. In 1848 gold was first discovered in California in an excavation made for the tailrace to a water-power mill. This discovery caused the gold-rush excitement of '49, when men from all parts of the world rushed by boats and by wagons across the prairies to the new gold district. The wonderful richness of this new discovery furnished the incentive for the exploration and development of the whole Far West.

The accompanying statistics for the Appalachian States are taken from the Annual Report of the Director of the Mint for 1921, which in the United States is the authoritative source of statistics in gold and silver.

GOLD PRODUCTION, APPALACHIAN STATES 1799 TO 1920

STATES	Total production	Production. 1920
Alabama.....	\$766,632	\$200
Georgia.....	17,825,268	700
Maryland.....	71,405	
North Carolina.....	23,829,580	1,100

Tennessee.....	264,502	5,900
Virginia.....	3,296,569
Total.....	\$51,035,798	\$3,200

The gold occurs in three types of deposits—river gravels, or placers, high gravels, and veins. The river gravels, found in the beds of the numerous streams that flow down the western slopes of the Sierras, have been derived from the higher levels, where the erosive processes have cut deeply into the auriferous rock formations. Most of the gold is generally found near

bed rock, and it is necessary to remove a heavy overburden before the values can be obtained. The gold particles vary from minute pellets or dust to nuggets of considerable size. The high gravels represent the work of ancient rivers whose channels are more or less parallel to those of the present day, but have been filled in with detrital materials and frequently buried beneath lava flows. They lie along the higher slopes of the Sierras up to 5000 feet above sea level and sometimes attain a thickness of 500 feet. The veins, which have furnished the gold found in both the placers and high gravels, occupy fissures in slates, schists, and igneous rocks, and are of variable extent and richness. Quartz is generally the gangue material, while the gold occurs in a free state or combined with sulphides, most commonly pyrites. A great series of these veins, called the "mother lode," extends across Tuolumne, Calaveras, Amador, and El Dorado counties; for a number of years it has been the source of much of the gold mined in the State. The Comstock Lode (q.v.) is situated on an eastern spur of the Sierras, extending into Nevada. Placers and veins similar to those of the Sierras are found also in Oregon and Washington.

The Rocky Mountains and the outlying ranges, which were first prospected by Californian miners in the early sixties, include an immense area of gold-bearing territory. Rich gravels have been worked near Leadville, Fairplay, and in San Miguel Co., Colo.; near Helena and Butte, Mont.; along the Snake and Salmon rivers, Idaho; near Deadwood, S. Dak.; at Santa Fe, N. Mex.; and in Alaska. The output from the gravels, although large, amounted to only 26.1 per cent of the total output for 1920, as shown in the accompanying table:

GOLD PRODUCTION IN THE UNITED STATES IN 1920

STATES*	Fine ounces	Value
Alaska.....	412,015	\$8,535,700

Total.....	2,476,166	\$51,186,900

*From Bureau of Mint Report, 1921.

The amounts of gold produced by the different States from deep mining requiring metallurgical treatment, and from residual deposits requiring only washing, are given in the accompanying table. In this table it will be noticed that Alaska produced 31 per cent, and California 56.5 per cent, of the total residual or placer gold produced in 1920, the greater part

of the California production being secured by dredges. See table below.

The total output of the mines of the United States and its insular dependencies was in 1920 approximately \$51,186,900.

California during 1920 produced 26.8 per cent or 716,477 fine ounces of which 350,740 ounces was from deep mining, 333,805 ounces from dredging and 7,752 ounces from other placers, of the total output of gold in the United States. The output was derived from 454 mines operating in 28 counties. The largest county production in California is reported to come from Yuba County, mainly from dredging operations. In deep mining the most productive in gold was Amador County.

Colorado during 1920 produced 13.4 per cent of the total output of gold from the United States. Cripple Creek, which has been one of the rich and large American producers, contributed 57.5 per cent of this production. This district became prominent in 1894, when the Independence mine was discovered. The ores were exceptionally high grade, the gold occurred in combination with tellurium, resembling silver, and the deposits were large. In 1905 approximately \$18,000,000 in gold was produced. The district has been a heavy producer and is now treating successfully low-grade ores by concentration and cyaniding by a special process developed by Philip Argall, of Denver, for handling this particular ore. The placer output amounts to only about .73 per cent of the total output of the State.

Nevada during 1920 produced 6.5 per cent of the total output of gold in the United States. The fields about Tonopah in Nye County were the largest producers followed by the mines at Jarbridge, while the Goldfields District in Esmeralda County, once the largest producing region, suffered a curtailed production. Most of the ore is from deep mining, and the gold is recovered by amalgamation and cyaniding. The Tonopah mine, discovered about 1902, caused the rush to Nevada which resulted in the development of the Tonopah District and the discovery and development of the Goldfields Dis-

trict. Exceptionally high-grade ore was produced in the Goldfields District. The output from Nevada has been decreasing; the largest decrease was from the mines of the Goldfields District.

Alaska during 1920 produced 15.3 per cent of the total gold output of the United States, amounting to \$8,365,500. About 47 per cent of the output was from placers, but the ratio of output of placer gold to lode gold had been decreasing as the richer gravels were being worked out and the deep or lode mines were being developed. Dredging was also extensively carried on and in 1919, 28 dredges recovered gold worth \$1,360,000. Up to the end of 1919 gold of the value of \$21,524,932 had been recovered by dredges. With the increased application of dredging the output of placer gold will probably be maintained for many years. The total output of gold from quartz mines in 1920 amounted to \$4,473,687; of this output the low-grade mines of South Eastern Alaska, especially in the Juneau district, where mining is carried on a large scale with the most modern machinery, were responsible for much of the production. There were 19 lode mines producing gold in Alaska in 1920, of which eight were in South Eastern Alaska; two in Kenai, three in the Willow Creek District, two in the Fairbanks District, and one in the Kantishna and McKinley Districts. In 1920 it was reported that the average value of the gold and silver contents for all siliceous ores mined was \$1.39 a ton.

The gold production from Arizona in 1920 was valued at \$4,786,122 in the production of which Mohave County with \$2,852,141 ranked first, followed by Cochise County with \$919,167 and Yavapai County with \$659,541. The largest part of the gold, or \$2,873,422, had its source in bullion from ore treated by amalgamation or cyanidation. The gold from deep mines was derived from the following sources: siliceous ore, \$3,090,812, copper ore \$1,579,378, lead ore \$110,640 and copper lead ore \$725. Practically all of the State's gold came from copper ore and siliceous ore combined, as placers produced only \$4,507 in gold. With each million pounds of copper the gold output was increased \$2,830 in 1920. In 1920 there were 318 mines producing gold and silver of which number only eight were placer mines. Most of the output came from the gold ores of the San Francisco District which was sufficiently rich to pay the cost of mining and milling.

South Dakota was maintaining its output of gold from the low-grade ores of the Black Hills, with the indication that it probably would continue to do so for many years to come. The yield is wholly from siliceous ores. Mining and metallurgical practice of the highest grade have been characteristic of the successful operations, and particularly was this true of the Homestake mines, which have produced the bulk of the output with interruptions due to labor troubles and such vicissitudes as fires. The milling practice consists of amalgamation followed by cyaniding. The total output of gold from the Black Hills of South Dakota from 1876 to 1920 inclusive was \$223,623,669, and the yield during 1920 amounted to \$4,676,470.

The States above discussed produced about 70 per cent of the total output during 1920. There are numerous smaller fields located in Utah, Montana, and elsewhere, which in the aggregate

GOLD MINING

GOLD MINING BY HYDRAULIC METHODS

GOLD MINING

A COMBINATION STAMP MILL AND EXTRACTION PLANT

produce about 30 per cent of the output, of which a large percentage is recovered from the smelting of copper, lead, and zinc ores.

The total output of gold derived from the mines of the United States in 1921 was approximately \$49,105,500 the smallest amount to be mined since 1895 when the production was valued at \$46,310,000.

Africa. The gold production for 1920 amounted to \$191,538,433. Of this amount the Transvaal, Cape Colony, and Natal produced \$168,648,178; British West Africa \$4,336,771; French West Africa, \$82,478; and Rhodesia, \$11,432,890. With the development of the "deep-deep" mines the cost of mining has increased, and this to some extent has been balanced by the reduction in total cost of operation by consolidating many properties and the building of large central mills for the recovery of the gold. The deposit consists of a conglomerate commonly called a "banket," varying from a few inches to several feet in thickness. It can be traced for several miles along the strike and for several thousand feet has retained its auriferous tenor in depth.

Australasia. The large output from alluvial deposits which first attracted the miner to the gold fields of Australia has largely been replaced by quartz mining due to exhaustion. The most productive states are Western Australia, with an output for 1920 of \$12,771,925; Victoria, \$3,158,486; New Zealand, \$3,893,265; Queensland, \$2,300,327; and New South Wales, \$1,010,997.

Russia. Most of the gold produced by Russia prior to the revolution was obtained from placer workings on the eastern slope of the Ural Mountains. During 1911 mining was stimulated by the high price of platinum, and during that year. In total gold production Russia and Siberia then ranked third being surpassed only by the United States and Australasia. In 1917 the gold production of Russia including Siberia was valued at \$18,000,000, but with disturbed conditions due to war and revolution mining suffered and in 1920 Russia and Siberia according to unofficial estimates produced but 70,000 ounces valued at \$1,447,028.

British North America. In 1920 the Dominion of Canada produced 766,912 fine ounces of gold valued at \$15,853,478. Of this amount 84,659 ounces, or 11 per cent, was derived from placer or alluvial mining; 582,852 ounces, or 76 per cent was in the form of bullion, while 44,982 ounces, or 5.9 per cent was in blister copper or lead bullion, 54,399 ounces, or 7.10 per cent, was in residues and ores imported. The Province of Ontario led in gold production with 564,959 ounces, valued at \$11,665,000, and the record for 1920 was 11.7 per cent greater than in 1919, and by far the greatest production ever recorded. In 1920 Ontario produced 73.7 per cent of the total output of gold in Canada. Of this amount the Porcupine District furnished 512,625 ounces, valued at \$10,690,562 derived from handling 1,162,065 tons of ore which carried on the average \$9.20 of gold per ton. The discovery of rich gold veins in Porcupine dates only from 1909 when it was found by a prospector, J. S. Wilson, and in 1910 the District was filled with prospectors and the beginning of activity made which has continued ever since. The output in 1910 was valued at \$35,539, and during 1911 claims changed hands at high figures, with no other showing than the

snow or possibly a "rock cropping." Mills were freighted in and boilers shipped by express to the end of the railroad so that they could be hauled over the snow and frozen lakes before the spring thaw and "break up." The summer of 1911 saw the entire district, mills and equipment, wiped out by a forest fire, with a heavy toll of life. In 1912 the two large mines, the Hollinger and the Dome, dropped their stamps for the first time and commenced the regular production of gold. The output from the Porcupine District in the early years was as follows: 1910, \$35,539; 1911, \$17,187; 1912, \$1,731,000; and 1913, \$4,285,000.

In British Columbia the output of gold in 1920 was 127,387 ounces, a decrease of 23.8 per cent from 1919, and much below normal, which was stated as from 220,000 to 298,000 ounces per year. The placer gold in 1920 amounted in value to \$221,600 and that from lode mines to \$2,481,302. The Yukon territory by 1920 had declined considerably in its gold output from the earlier days, and in that year the production was 72,140 ounces, derived almost wholly from alluvial gravels with a small amount from the ores of the Conrad District. The production of gold in Nova Scotia in 1920 was 690 ounces, an amount which also represented a considerable decline. The Province of Quebec in 1920 yielded 955 ounces derived from pyritic ores of the Eastern Township and the Notre Dame des Anges of Portneuf County.

GOLD MINING

Gold-mining operations may be divided into two classes—placer mining, where the gold occurs in river beds or ancient river beds and in the native state scattered through sand and gravel; and vein or quartz mining, where the gold occurs native or associated with sulphides in a vein or ore body. Placer mining may again be subdivided into hydraulic mining and dredging, depending on the method used in excavating the gravel.

Hydraulic Placer Mining. This method of mining was first attempted in a crude way in 1852 in Placer Co., Cal., and was largely practiced until laws were passed practically prohibiting this method in the State. This method was later followed in Alaska, as the conditions leading to suppression in California did not exist in that territory. In California and also in Alaska hydraulic mining has largely been replaced by dredging. Briefly described, hydraulic mining consists of directing a powerful stream of water under a heavy head through a "giant" (nozzle) against the gold-bearing gravel bank, which breaks down the material and washes it away through specially constructed sluices, where the gold is saved. The sluices are large and built of heavy material to withstand the pounding of heavy boulders washed through them. The first length of sluice terminates with a grizzly, or screen, consisting of parallel bars of iron; the large boulders are removed at this point, and the smaller material carrying the gold passes through the grizzly into the second section of sluices. In this section are placed specially designed riffles to permit the coarser gold to settle from the gravel. At intervals the bottom of the sluice is replaced by a grating or grizzly to permit the finer material to go through and enter sluices which are built at right angles to the main sluice; in these cross sluices riffles

are also placed to catch the gold. Mercury is added behind the riffles to amalgamate with the gold and prevent its washing away. When conditions are favorable *ground-slucing* is sometimes resorted to. In this process a stream or portion of a stream is diverted and caused to flow steeply and rapidly across the placer bed, eroding and bearing away large quantities of gravel. In the pit where the speed of the current diminishes, one or more giants serve to sweep the gravel into the sluice boxes.

Dredging. On rivers, or where hydraulic mining is prohibited, dredges are used. These consist of flat-bottomed boats which carry the necessary machinery for excavating the gravel and recovering the gold. When dredges are used on dry placers, or deposits away from the river, it is necessary first to dig a hole of sufficient size in which to build the dredge. Provision must be made to supply the dredge with a constant stream of water sufficient to float it and furnish the water which is lost in discharging the wet tailings at the rear. The dredge is equipped with powerful machinery, large excavating buckets closely attached to an endless chain consisting of large heavy bars of iron, a heavy cylindrical screen for separating the large bowlders and discharging them over the side of the boat, sluices quite similar to those used in hydraulic mining, and a tailings stacker at the stern to dispose of the gravel after the gold has been recovered. This method of mining is practiced in Australia and California, and also in Alaska and Central America. A large steel dredge costing about \$650,000 was in operation in the Yuba River field, California, in 1920.

Quartz Mining. The mining of gold veins is conducted in much the same way as that of other metalliferous veins. Shafts are sunk, drifts are driven laterally on the vein from the shafts, and the method of breaking and handling the ore is determined by the size of the ore body, inclination or dip, and local conditions. In a few cases tunnels on the ore body are driven, or cross-cut tunnels through the barren rock are driven to the ore body. After the ore body is opened up or developed, the ore is blasted, loaded into cars, trammed or transported to the shaft, and hoisted to the surface, where the ore is delivered for metallurgical treatment.

METALLURGY

The method of extracting gold from the ores depends on the character of the ore and the location of the property. Heavy gold sulphide ores, such as copper, lead, etc., are smelted. Ores containing only a small percentage of sulphides with free gold or gold finely disseminated in the sulphides are usually treated at the property by amalgamation or cyaniding, or a combination of both. Progress has been very rapid in recent years, and processes such as the chlorination have been almost, if not wholly, replaced by the cyanide process. The reader is referred to publications on gold metallurgy for detailed descriptions of these several processes. Briefly, the chlorination process consists of converting the insoluble gold into the soluble chloride of gold, leaching with water, and precipitating the gold with a suitable precipitant, such as charcoal, sulphate of iron, or sulphuretted hydrogen.

Stamp Milling and Amalgamation. This process, which is the oldest method of crushing ores for the extraction of gold, is still in use to-day, and the modern stamp mill owes much

to South Africa for its existence. It has been threatened many times by new machines and in many cases of gold milling has been replaced; where amalgamation is necessary for the recovery of the gold, or a portion of the gold, the stamp mill is always found as the preliminary crusher. (For a detailed description of the construction of the stamp mill, see GRINDING, CRUSHING, AND PULVERIZING MACHINERY.)

The stamp mill is usually the preliminary crusher to amalgamation; the ore, as delivered from the mine cars, first enters the ore bin, from which it is fed to breakers and broken to fragments about $1\frac{1}{2}$ to 2 inches in size; from the breakers the ore is again transported to the ore bins immediately in the rear of the stamp mill; from these bins the ore is fed mechanically, together with a stream of water, to the stamp mill to be crushed; and the crushed product is splashed through a screen to the amalgamated plates, or apron plates, placed directly in front of the mill for recovery of the gold by amalgamation. The process of extraction by amalgamation consists of crushing the ore sufficiently fine to liberate or free the native gold and then catch the gold in mercury. The gold does not combine chemically with the mercury, but amalgamates with it, forming a stiff pasty mass known as amalgam. In stamp milling, copper or silver-plated copper plates covered with mercury are used for catching the gold. The plates may be located inside of the stamp battery or housing surrounding the stamps, suspended in front of the discharge screen, when it is known as the splash plate, and in front of the stamp battery, placed at a slight angle to permit the pulverized ore to be washed over; in the latter case they are known as apron plates. The length of the apron plates varies greatly, but the width is regulated by the width of the mortar. To prepare the amalgamating plates they are first thoroughly washed, and all grease spots, if any, removed; mercury is then sprinkled on and rubbed into the plate—with copper plates sodium amalgam is often used for this purpose; all excess of mercury is removed with a stiff brush; this leaves the plates bright with a thin coating of mercury. The pulverized ore is then washed across the plates from the stamp battery, and the free or native gold adheres to the mercury; more mercury is sprinkled on the plates as required. At certain periods the amalgam is scraped off the plates and the gold separated, as described later.

Pan amalgamation has been largely used, but at present it has been replaced to a large extent by other processes. Pan amalgamation consists of feeding comparatively fine ore or concentrates to a grinding pan, adding the proper amount of mercury, and pulverizing the ore in close contact with the mercury; following this operation, the grinding miller is raised off the bottom, the pulp diluted, and more mercury added to collect any suspended amalgam; the amalgam sinks to the bottom of the pan and is drawn off. Investigations have shown that amalgam containing coarse gold carries a higher percentage of gold than that containing fine gold, although the physical characteristics appear to be the same. In recovering the gold from the mercury the amalgam is placed in a large wedgwood mortar, more mercury added to reduce the plasticity, and then hot water is added, and the amalgam washed by working with the pestle; sand and foreign matter is by

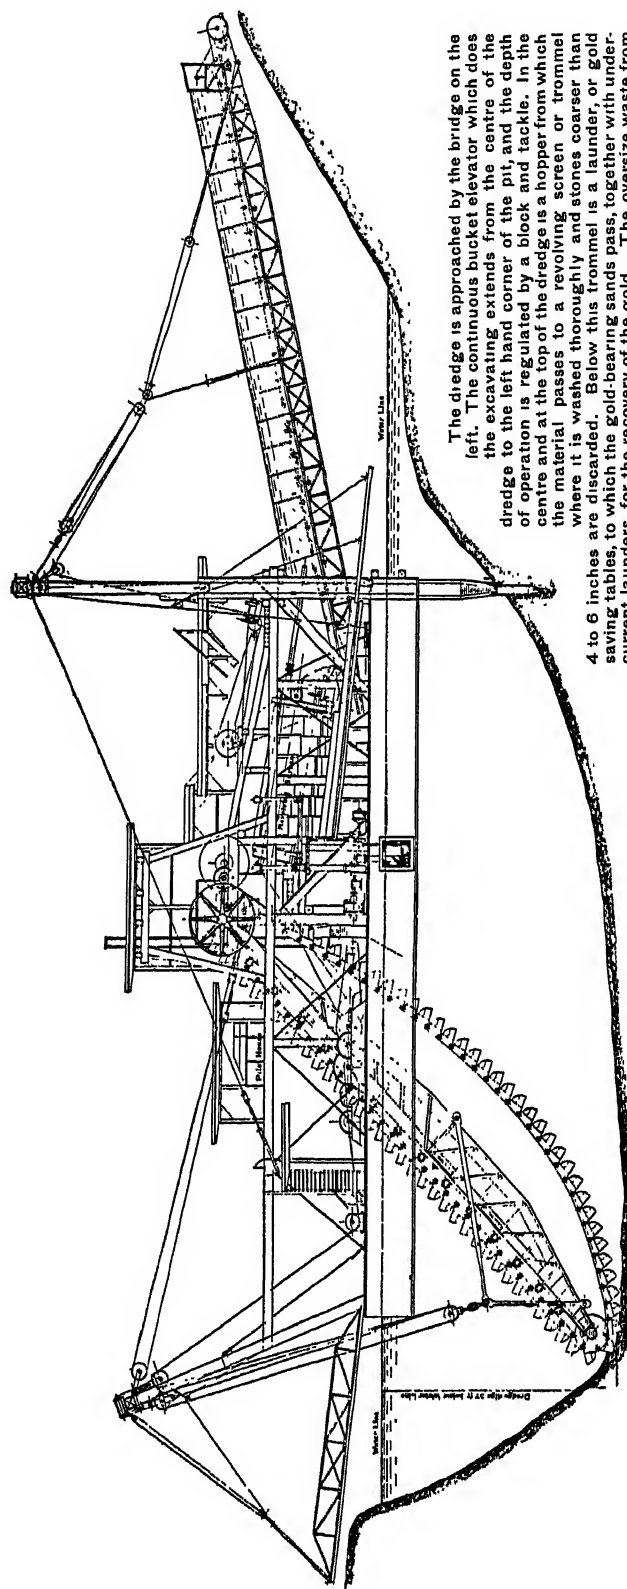

GOLD MINING

A GOLD DREDGE

THE ABOVE VIEW ILLUSTRATES THE METHOD OF MINING THE GOLD-BEARING SANDS SITUATED ALONG RIVER AND CREEK BOTTOMS IN SUCH REGIONS AS ALASKA AND CALIFORNIA. THE DREDGE ILLUSTRATED IS OF FIVE CUBIC FEET CAPACITY OF THE CONTINUOUS BUCKET ELEVATOR TYPE, AND IS CAPABLE OF DIGGING THIRTY-SEVEN FEET BELOW THE WATER LINE

GOLD MINING

The dredge is approached by the bridge on the left. The continuous bucket elevator which does the excavating extends from the centre of the dredge to the left hand corner of the pit, and the depth of operation is regulated by a block and tackle. In the centre and at the top of the dredge is a hopper from which the material passes to a revolving screen or trommel where it is washed thoroughly and stones coarser than 4 to 6 inches are discarded. Below this trommel is a launder, or gold saving tables, to which the gold-bearing sands pass, together with undercurrent launders, for the recovery of the gold. The oversize waste from the trommel, after the gold has been extracted, is delivered to the tailings stacker consisting of an endless belt, shown on the extreme right. The dredge is held in position or anchored by means of a spud located at the stern of the dredge, the position of the bow is changed by means of two guy lines fastened to stakes in the ground in front of the dredge.

CROSS-SECTION OF A MODERN ELECTRICALLY-DRIVEN GOLD DREDGE, SHOWING METHOD OF OPERATION

this means removed. The clean amalgam is then placed in a chamois bag, and the excess mercury squeezed out, leaving a hard amalgam; this hard amalgam is made into balls, covered with paper to prevent the gold sticking to adjacent balls or the sides of the iron retort, and retorted. The temperature of the retort is slowly increased so as to prevent too rapid distillation of the mercury. The mercury vapor is passed through condensing tubes and recovered. The remaining gold is then melted into bars, assayed, and shipped to the mint. The purity of the gold brick is reported in parts in 1000, such as 627 fine in gold, and 258 fine in silver; the balance of 115 would represent base metal, such as copper. The pulverized rock from the stamp mill, after being washed across the apron plates, is known as plate tailings. In most cases the plate tailings contain sufficient gold to warrant further treatment. The method adopted to recover this gold depends upon the value and character of the tailings. When the ore contains auriferous sulphides, the tailings are usually concentrated; when the tailings are comparatively free from sulphides, the gold is usually extracted by dissolving it in cyanide solution; in many cases a combination of concentration followed by cyaniding is used. The concentrates produced are either shipped to the smelter or treated on the property, depending on local conditions.

Cyanide Process. That gold was soluble in cyanide solution had been known for many years before a commercial process based on this principle was developed for recovering the metal from the ores. The first attempt to use this process commercially was made by J. H. Rae, who secured patents from the United States in 1867; Rae's process made use of the electric current in connection with a solution of cyanide salts. In 1885 J. W. Simpson, of New Jersey, proposed using a 3 per cent solution of cyanide together with a small percentage of ammonium carbonate. In the following year (1886) J. S. MacArthur and R. W. and William Forrest, of Glasgow, started their experiments and were finally successful in commercializing the process which for many years was known as the MacArthur-Forrest process. It was in 1890 that the MacArthur-Forrest process was introduced into South Africa to replace the chlorination process, which up to that time had been the standard method of extracting gold. The chief advantages which the cyanide process offered over the chlorination process were reduction in cost of operation by eliminating the preliminary roasting and the recovery of the silver with the gold by one leaching. The process is dependent upon the fact that very fine particles of gold, or exceedingly fine sheets of gold, are rapidly soluble in a weak solution of potassium cyanide in the presence of free oxygen; coarse gold is practically insoluble in such a solution, as it is necessary to bring in contact with the gold free oxygen for the reaction to take place. At first solutions containing from 1 to 2 per cent of potassium cyanide were used, but it was soon found that weaker solutions dissolved the gold in practically the same length of time and greatly reduced the cost of chemicals required; the first, or the strong solutions, now vary from 0.1 to 0.2 per cent, depending on local conditions. It was in South Africa that this process was commercially developed, and the first few volumes of the *Transactions of the*

South African Mining Society are mostly confined to the cyaniding process.

The process as developed in South Africa consisted of stamp milling followed by amalgamation; the tailings from the amalgamating plates were then classified into sands and slimes and treated separately. The sands were conveyed into large cylindrical shallow tanks holding many tons; the cyanide solution was then introduced under pressure through the bottom of the tank and allowed to permeate the sands until the surface of the tank was covered with solution; after a few hours the solution was drawn from the bottom of the tank and fresh solution added to the top of the tank. After such treatment for several days, wash water was added to the top of the tank to replace the gold solution and wash the sands of any dissolved gold. The slimes were conveyed to large settling tanks and allowed to settle, followed by decantation of the water; cyanide solution was then added, and the slimes agitated by mechanical means for several hours, allowed to settle, and the gold-bearing cyanide solution decanted. This operation was repeated until the soluble gold had been extracted from the slimes. Following this treatment, the slimes were washed as free as possible of any dissolved gold. This method of treating the slimes required large tankage and considerable time, and was soon improved upon in the United States by the invention of the Moore filter, and many other filters using the principle suggested by George Moore.

The Moore process consists of adding cyanide solution to the slimes, conveying the slimes to a filter tank, collecting a cake of slimes on the filter leaves by vacuum, transferring the filter leaves containing the cake, while the vacuum is on, to a second tank containing wash water, replacing the gold solutions in the slimes by wash water, and finally transferring the leaves containing the washed filter cake to a third tank, where the slimes are discharged from the filter leaves by introducing compressed air into the leaf in place of the vacuum. By this process the original tankage investment has been minimized and a much better extraction obtained from the slimes. Recently this latter process has been greatly improved by the introduction of the Dorr countercurrent settling tanks, followed by the Moore-Oliver filter. These tanks are the invention of J. V. N. Dorr and have met with success throughout the United States. In this process the slimes travel through a series of tanks in an opposite direction to the cyanide solution, and the process is known as the Dorr countercurrent cyanide process. The slimes from the last tank are thickened and fed to a rotary filter. This rotary filter is a large revolving cylinder the surface of which consists of vacuum chambers connected to a central vacuum and pressure valve on the shaft. The vacuum chambers are covered with woven wire, cocoa matting, canvas, and wound spirally with wire. The surface of the cylinder with the vacuum attached is slightly immersed in the thickened slimes; the slimes adhering to the cylinder are elevated by the revolving of the cylinder, washed with a spray of water near the top of the cylinder, and are discharged after washing by a scraper; immediately preceding the scraper the vacuum is replaced by compressed air. The advantage which this process offers is that it is continuous and less expensive to operate. The soluble gold and silver go

into solution as a double cyanide with the potash. The gold from this solution is extracted by passing the solution over zinc shavings. In many mills this method of precipitation has been replaced by the introduction of zinc dust into the cyanide solution as it is conveyed to filter presses. The gold and silver are precipitated as a fine black powder. This precipitate is then treated with dilute sulphuric acid to dissolve any small pieces of zinc and pumped to a filter press. The cake obtained in the filter press, consisting of practically pure gold and silver, is then dried, mixed with the proper fluxes, and melted in graphite crucibles. The gold and silver obtained after melting is cast into bars and shipped to the mint.

Extraction by Washing. Extraction of gold by washing alone is possible only in the case of ores carrying native gold. Hydraulic mining and dredging are the two commercial methods. Hand operations are only practiced when the pockets of ore are very rich and too small to warrant the erection of a plant; mines of this character have been operated in Australia. For testing the value of placer ground the gravel obtained from drilling is washed by hand; prospectors also make use of the "gold pan" to test samples and specimens of rock for free gold. In uncivilized countries hand washing is often practiced. Unless carefully conducted the losses by hand washing are liable to be very heavy. Hand washing may be performed by means of pans, cradles, long toms, and sluices. The operation of panning is the simplest and consists of placing the material in a flat-bottomed pan, known as a "gold pan," the sides of which slope at an angle of about 60°. The pan is then placed under the surface of the water, and an oscillating motion given to it, so that the free gold will settle, and the mud and fine sand will wash over the edge, which is gradually lowered until there is little left in the pan other than the heavy minerals and gold. The pan is then lifted and shaken so as to spread out the material, when the yellow specks, or "colors," of gold are visible. The cradle is a box provided with a sieve at the feed end, the whole resting on rockers so that it can be rocked by means of a handle. The gold-bearing mineral is placed on the sieve and washed with water, the coarse particles being removed from the sieve by hand and the fine particles, together with the gold, passing through and falling on an inclined bottom, where the light material runs off with the water, and the heavier gold sinks to the bottom and is retained by transverse slats known as riffles. The long tom consists of two troughs, the lower one of which has cross riffles on its inclined bottom. The upper trough is about 14 feet long by 20 inches wide at the upper end and 30 inches wide at the lower end, which is closed by a sieve. The lower end of the upper trough discharges into the upper end of the lower trough. The lower trough is about 12 feet long by 3 feet wide, and by means of a strong stream of water flowing in at the upper end of the upper trough the material is washed through both troughs, the gold being caught in the riffles in the lower box and the coarse material being discharged by hand from the upper box.

Parting. As the greater part of the gold produced by the preceding processes carries silver (see **SILVER**), the parting of the gold from the silver is an important process in the metallurgy of gold. Parting is performed in what are

known as the dry way and the wet way and by electrolysis. The dry method of parting depends upon the fact that silver can be converted into sulphide or chloride, while gold is attacked by neither sulphur nor chlorine at high temperature. The wet method depends upon the solubility of silver and the insolubility of gold in nitric acid and in boiling concentrated sulphuric acid. The electrolytic method depends upon the property of silver to pass from a bar of gold-silver alloy employed as an anode to the cathode, when the two poles are immersed in an acidulated solution of nitrate of silver, and an electric current established. The wet process, using sulphuric acid as the solvent, and the electrolytic process are the two parting processes most employed at present. For the metallurgy of gold, consult Schnabel, *Handbook of Metallurgy* (translated New York, 1889).

Commercial Uses. It is estimated that about one-fourth of the annual production of gold is employed in coinage, the remainder being consumed in the arts and in making good the annual loss. The purposes for which gold is employed in the arts are familiar to every one. Some of the items are jewelry, gold leaf, gilding, etc.

GOLDAU, gôl'dau. A village in the Canton of Schwyz, Switzerland. It was formerly situated between Mount Rigi and the Rossberg and was the scene of the terrible landslide from the Rossberg, Sept. 2, 1806, which destroyed Goldau and three other villages, burying 457 people and filling up part of Lauwerz Lake. The present village of Goldau, built near the mines, contains a population of about 500.

GOLDBEATER'S SKIN. A delicate membrane prepared from the cæcum, or blind gut, of the ox, and used as the fabric for court-plaster, etc., but chiefly by goldbeaters. The outer or peritoneal membrane is used for this purpose. The intestine is first subjected to a partial putrefaction, by which the adhesion of the membranes is sufficiently diminished to enable them to be separated; the separated membrane is then further cleaned from adhering muscular fibres, dried, beaten, and pressed between paper, besides being treated with camphor or alum, isinglass, and white of egg, the object of which is to obtain the pure continuous membrane free from grease and impurities and thus prevent weakening by putrefactive processes. When thus prepared, goldbeater's skin may be beaten continuously for several months with a 12-pound hammer without material injury. The intestines of about 380 oxen are required to furnish the 950 leaves that form one packet, or *mold*, as it is technically called. The manufacture is extremely offensive. Chlorine has been introduced both as a disinfectant and to assist in the separation of the membrane.

GOLDBEATING. The process by which gold is hammered into thin leaves. The use of gold leaf for gilding is a very ancient art, having been practiced by the Egyptians and Greeks many centuries before the Christian era, and gold used for this purpose is usually alloyed with silver or copper, according to the color required. The consumption of gold leaf by dentists is also general, as the material in this form is extensively used for fillings. As gold leaf is not sold by weight, but by superficial measure, and as increasing the quantity of alloy diminishes the malleability, there is but little temptation to use the baser metals as an adulteration. The gold, which is first alloyed with a small amount of pure copper and silver, 12 grains of each to the ounce of gold 998 fine, is first cast into oblong ingots or bars about 1 inch wide. The ingot or bar is flattened out into a ribbon of about $\frac{1}{16}$ of an inch in thickness by passing it between polished steel rollers until it is about 24 feet long and weighs about 55 pennyweights. This is annealed or softened by heat, and then cut into 210 pieces approximately 1 inch square; these are placed between leaves of vellum or tough paper specially made in France, each piece of gold in the centre of a square leaf, another placed above, and so on till the pile of 210 is formed. This pile, called a *cutch*, is inclosed in a double parchment case, placed upon a marble block, and beaten with a 16-pound hammer. The elasticity of the packet considerably lightens the labor of beating, by causing the hammer to rebound with each blow.

The beating is continued until the inch pieces are spread out to $3\frac{1}{2}$ -inch squares; they are then taken out and cut into four pieces. The squares thus produced are now placed between layers of goldbeater's skin (q.v.), instead of vellum, made into piles, and inclosed in a parchment case, and beaten as before, but with a lighter hammer weighing about 10 pounds. Another quartering and beating produces 3360 leaves, each with a thickness of about $\frac{1}{100}$ of an inch. An ounce of gold is thus extended to a surface of about 100 square feet. A still greater degree of thinness may be obtained, but not profitably. A thinness has been attained of 387,500 leaves to the square inch, and a

grain of gold is thus made to cover 52 square inches. After the last beating the leaves are taken up with wooden pincers, and a tool called a "wagon," placed on a cushion, blown out flat, and their ragged edges cut away, by which they are reduced to squares of $3\frac{1}{4}$ inches. Twenty-five of these are placed between the leaves of a paper book, previously rubbed with red chalk to prevent adhesion of the gold, and are sold in this form, 20 books being included in a pack. It is stated that an amount of gold weighing 4 pennyweights 8 grains and worth \$4.25 commands at wholesale, in the form of a pack of gold leaf, about \$7.25. Attempts have been made to apply machinery to goldbeating, but its application is very limited; and most of the gold leaf is still beaten by hand.

GOLD BUG, THE. One of the most noted of Poe's tales (1843). The scene is the vicinity of Charleston, S. C., where a recluse, Legrand, locates an enormous treasure in gold and jewels by means of an intricate cipher found on an old parchment.

GOLD CARP. See GOLDFISH.

GOLD COAST. A British Crown colony in West Africa, extending along the Gulf of Guinea about 334 miles, and bounded by the French colony of the upper Senegal and Niger on the north (about the parallel of 11° N. lat.), Togoland on the east, and the French Ivory Coast on the west (Map: Africa, D 4). The area of the colony excluding the Northern Territory and Ashanti (q.v.) is estimated at 25,000 square miles; the total area, 80,253 square miles. The coast region is rather low, with rocky cliffs lining the shores and reaching a height of 2000 feet. The interior is mountainous. In the southeast is the Akuapem Range. South of it runs the Adanse Range, covered with dense forests and constituting a great natural barrier along the coast district. The western part of the interior is generally hilly; the eastern part is formed mainly of extensive terraces. The chief rivers flowing south are the Volta, which is a part of the German boundary line, the navigable Ankobra, emptying into the sea near Axim, the Pra, and the Toji. The climate of the colony, although not so deadly as that of the west coast, is very unhealthy for Europeans. April is the hottest month. There are two rainy seasons—from April to August and from October to the end of December. The rainfall varies along the coast, being heavy in the west, 79 inches per year, and light in the east, 27 inches. Impassable forests of palms, gum trees, and the giant karkum seriously interfere with the development of the interior. The level regions in the south, and the savannas north of the Akuapem Mountains, are overrun with herds of elephants, buffaloes, and other wild animals.

The soil is of great fertility, producing coffee, cacao, tobacco, cotton, and other tropical products. Agriculture has received little attention, but a botanical station at Aburi aids in the cultivation of colonial products—coconut, rubber, cocoa, coffee, cotton, pepper, nutmeg, pimento, and croton. The chief products are derived from the forests and mines. The trade of the colony is prosperous and increasing. Imports increased from £2,125,464 in 1902 to £4,023,322 in 1912, and exports from £774,186 to £4,307,802. In 1912 imports from the United Kingdom amounted to £2,622,932, and exports thereto, £2,680,973. The chief exports in 1911

were: cacao, £1,613,468; gold and gold dust, £1,071,616; rubber, £219,447; palm kernels, £175,801; lumber, £138,821; palm oil, £128,916. Gold, both alluvial deposits and quartz, is widely diffused throughout the colony, Ashanti, and some parts of the Northern Territories. The output was 281,257 ounces (valued at £1,194,743) in 1908; 253,976 ounces (£1,079,024) in 1911; 352,957 ounces (£1,490,469) in 1912. Shipping entered and cleared in the foreign trade, in 1912, 2,849,248 tons. There is a government railway from Secondee on the coast to Coomassie, 108 miles; and a line is in operation between Accra and Mangoase, 40 miles. Road construction is progressing rapidly. There are about 1500 miles of telegraph line, and at Accra is a wireless telegraph station. The colony is administered by a governor, and by an executive and legislative council, the members of which are chosen from officials and colonial merchants. The colony proper is divided into three provinces—Western, Central, and Eastern—each under a commissioner; Ashanti and the Northern Territories are each under a chief commissioner. Revenue and expenditure in 1902 were £511,502 and £547,607 respectively; in 1907, £708,718 and £617,124; in 1911, £1,111,632 and £914,501; in 1912, £1,230,850 and £1,157,091.

The negro inhabitants are divided into a large number of tribes more or less independent of each other, but with similar customs and forms of government. As education and civilization spread, there is an increasing tendency to tribal disintegration. The population in 1911 was probably in excess of the census returns of that year. The census disclosed 1,503,386 inhabitants, divided as follows: the colony, 853,766; Ashanti, 287,814; the Northern Territories, 361,806. Europeans numbered 1700. In 1912 there were 11 government primary schools and 148 assisted schools controlled by various Christian religious bodies; enrollment in primary and secondary schools, 18,524; average attendance, 14,118. The chief towns include Accra, the capital (pop., 19,585 in 1911), Coomassie, the capital of Ashanti (18,853), Cape Coast Castle (11,364), Secondee (7725), Saltpond, Quittah, Winnebah, Akuse, Axim, and Aburi. There are a large number of small towns, with populations ranging between 2000 and 5000.

The Gold Coast is thought to have been discovered by the Portuguese in 1470. In 1481 a Portuguese colony of about 700 men under Diogo d'Asambuja landed at the present seaport of Elmina, and erected the fort of St. George. The Dutch by 1642 had succeeded in driving away the Portuguese. Meanwhile the English began to arrive, but their first attempts at establishing themselves were frustrated by the Dutch. After the establishment of the Royal African Company in 1672, the English succeeded in erecting a number of forts on the coast and soon concluded an alliance with the Fanti, whose old enemies, the Ashanti, had allied themselves with the Dutch. The slave trade was the chief source of commerce. In 1821 the English possessions on the Gold Coast were taken out of the hands of the African Company of Merchants, who had succeeded the previous monopoly, and made a dependency of Sierra Leone. The Fanti, with the aid of the British, decisively defeated the Ashanti in 1826, and in 1831 the rule of England was recognized over the territory lying south of the upper Pra. In 1872 the Dutch ceded their holdings to the British for trading privileges,

and since then the rule of the English has been supreme in the Gold Coast. In 1874 the territory was made a crown colony distinct from Sierra Leone. For a further account, see **ASHANTI**. Consult: Macdonald, *The Gold Coast, Past and Present* (London, 1898); Reindorf, *History of the Gold Coast and Ashanti* (Basel, 1895); H. W. Redwar, *Comments on some Ordinances of the Gold Coast Colony* (London, 1909); John Lang, *The Land of the Golden Trade* (Edinburgh, 1913); C. P. Lucas, *Historical Geography of the British Colonies*, vol. iii (3d ed., Oxford, 1914).

GOLD-CREST' (so called from the yellow spot on its head), **GOLDEN-CRESTED WREN**, or **FIRE-CREST**. English names for European species of kinglets. See **KINGLET**.

GOLDEN. A city and the county seat of Jefferson Co., Colo., 16 miles by rail west of Denver, on Clear Creek, and on the Colorado and Southern and the Denver and Inter-Mountain railroads (Map: Colorado, D 2). It is the seat of the Colorado School of Mines, opened in 1874, and of the State Industrial School for boys. There are extensive deposits of coal and clay in the vicinity, and the city has smelting works, a brewery, and manufactures of pressed and fire brick, tile, pottery, flour, etc. The water works are owned by the city. Pop., 1900, 2152; 1910, 2477.

GOLDEN AGE. In Greek and Roman mythology the earliest of the four ages; the ideal period when the earth, under Saturn's reign, produced fruits without cultivation, when there was no warfare, and man lived in perfect happiness before sin entered the world. The characteristics of the golden age, and of the ages of silver, brass, and iron which followed, are described in the first book of Ovid's *Metamorphoses*. The term is used to represent the period of highest development in literature, art, and history. Consult K. F. Smith, "Ages of the World (Greek and Roman)," in Hastings, *Encyclopædia of Religion and Ethics*, vol. iv (New York, 1908). See **AGE**; **SATURN**.

GOLDEN APPLE. See **PARIS**.

GOLDEN ASS (Lat. *Asinus Aureus*). A fable or romance written by Apuleius, a Latin writer of the second century. The work is entitled *The Metamorphoses, or the Golden Ass*, and was modeled after a similar work by Lucian, which Apuleius paraphrased and embellished with other tales, among which the one best known is that of Cupid and Psyche. The hero is punished for his curiosity by being changed into an ass, but after a series of most wonderful adventures he is purified and resumes his natural form. This story is thought by some to have been written as a satire on priests, magicians, and debauchees. The moral and religious conditions of Apuleius' time are portrayed with much humor and truth. The language, although abounding in clever turns, often contains obsolete and provincial phrases. The *editio princeps* was published in Rome in 1469. The story of *Cupid and Psyche* was first translated in 1566, by Adlington; this translation was republished in 1887 with an introduction by Andrew Lang. For further bibliography, see **APULEIUS**.

GOLDEN BEETLE. The golden beetles (family Chrysomelide, tribe Cassidini) are among the most beautifully colored of all beetles. They are usually small, with a gold or greenish iridescence which in many species fades completely as soon as the insect dies, so that mu-

seum collections give no conception of the beauty of these beetles when alive and on their food plant, but the brilliancy is said to vary with the excitation of the beetle. They are flattened below and convex above, hence they have also been named tortoise beetles. The margins of the prothorax and elytra are expanded so as to form an oval flat frame about the convex part of the beetle. Both the adults and the larvæ of *Oasida*, or *Coptocycla*, *aurea* feed on the morning-glory and sweet potato, and a large yellow and black species feeds on the sunflower. The caudal end of the larva is forked, and to it are retained the molted skin and frass, which are held up over the body like a shield. Pupation takes place on the underside of the leaves of the food plant.

GOLDEN BELL. See FORSYTHIA.

GOLDEN BIBLE. A name given on its pretended discovery to the Book of Mormon, which was described as being written on sheets of metal resembling gold.

GOLDEN BOOK. See LIBRO D'ORO.

GOLDEN BULL (Lat. *bullæ aurea*, so called from the gold case in which the seal attached to the bull was inclosed). The Imperial edict issued by the Emperor Charles IV, in 1356, for the purpose of settling the form of the Imperial election and coronation, the persons to whom the right of election belonged, and their duties and privileges. Up to that time some uncertainty had prevailed as to the rights of the electoral body, claims having frequently been made by several members of the lay electoral families and divisions having repeatedly arisen from this uncertainty; the effect of such divisions being to throw the decision for the most part into the hands of the Pope. In order to obviate these inconveniences, the Golden Bull defines that one member only of each electoral house shall have a vote, viz., the representative of that house in right of primogeniture, and, in case of his being a minor, the eldest of his uncles paternal. The seven electors were declared to be the archbishops of Mainz, Trèves, and Cologne, the King of Bohemia, the Count Palatine of the Rhine, the Duke of Saxony, and the Margrave of Brandenburg. The place of election of the Emperor was fixed at Frankfort; the coronation was to take place at Aix-la-Chapelle. On the great question as to the dependence of the Imperial office on the Pope, and as to the right of the Pope to examine and approve the Imperial election, the Golden Bull is silent, although it declares the Emperor competent to exercise jurisdiction in Germany from the moment of election. It invests the vicariate, together with the government of the Empire during an interregnum, in the Elector Palatine and the Elector of Saxony; but it is to be noted that this applies only to Germany. Of the vicariate of Italy, which was claimed by the popes, nothing is said. The Golden Bull also contains some provisions restraining the so-called *Faustrecht* (lit. 'fast law,' or right of private redress). It was promulgated in a diet at Nuremberg in 1356 and ratified at Metz in the same year, and original copies of it were furnished to each of the electors and to the city of Frankfort. The electoral constitution, as settled by this bull, save for the number of electors, was maintained almost unaltered till the extinction of the Empire. There is a translation into English of the Golden Bull in Henderson, *Historical Documents of the Middle Ages* (London, 1892). In Hungarian history there is

a constitutional edict called by the same name. It was issued by Andrew II in 1222. It strengthened the monarchy, although limiting its functions. It contained guarantees of individual liberty and insured periodical meetings of the assemblies. It preserved the power of the nobles by preventing further subdivisions of fiefs. Consult Hahn, *Ursprung und Bedeutung, der Goldenen Bulle Karls IV* (Breslau, 1902).

GOLDEN CALF. The molten image fashioned, according to Ex. xxxii. 2 et seq., at Sinai by Aaron. When requested by the Israelites to make a god for them, he demanded their golden earrings, made of them a molten image, and said (so 2 Hebrew Manuscripts and the Greek), "This is thy god, O Israel, who brought thee up out of the land of Egypt." The Masoretic text, supported by the versions, reads: "These are thy gods"; but the singular is used in Neh. ix. 18, where the words are quoted, and the plural is manifestly a later change intended to suggest the heathenish character of the bull worship. As Aaron says: "There will be a festival to Yahwe to-morrow," there can be no question as to whose image the golden calf was intended to be. It was ground to powder by Moses; the people were obliged to drink it, mixed with water; and 3000 were slain by the Levites to atone for the sin. The narrative points to the existence of the worship of Yahwe under the form of a bull among the Hebrews. For this there is abundant evidence. Images of bulls overlaid with gold stood in the ancient sanctuaries at Dan and Bethel, though this cult is not traced further back than the days of Jeroboam (1 Kings xii. 28 et seq.; 2 Kings x. 29). In Samaria likewise the bull cult was introduced (Hos. viii. 5). In the temple at Jerusalem there were also images of bulls. The brazen sea, representing the primeval ocean, rested on oxen; and in the Holy of Holies gold-covered images of winged bulls (see **CHERUB**) stood on the lid of the sacred chest. (See **ARK OF THE COVENANT**.) It is difficult to say, however, how far these were regarded as representations of Yahwe. The story of Aaron's making a golden calf may have been told originally to establish the antiquity of the bull cult and its legitimacy as a part of the worship of Yahwe; but in the hands of redactors, who were opposed to all image worship, the story was reshaped so as to make it appear that Aaron in reality committed a grievous sin for which atonement had to be made.

GOLDEN CHAIN. See LABURNUM.

GOLDEN CIRCLE, KNIGHTS OF. See KNIGHTS OF THE GOLDEN CIRCLE.

GOLDEN CROSS, UNITED ORDER OF. A fraternal organization, founded in 1876. It had, in 1913, 11 grand commanderies and 488 subordinate commanderies. Its members numbered about 171,000. The order has disbursed since its organization a total of \$11,650,032. The disbursements for each year average about \$400,000.

GOLDEN-CROWNED SPARROW. A large and sprightly sparrow (*Zonotrichia coronata*) of northwestern America, distinguished by a broad stripe of yellow on the crown of the head. It is related to the familiar white-throated and white-crowned sparrows of the Eastern States and like them has a most pleasing song. It breeds along the coast from northern California to Alaska, nesting on the ground, and is widely migratory.

GOLDEN-CROWNED THRUSH (so called from the yellow spot on its head), or **WAGTAIL**

(q.v.). An American wood warbler (*Seiurus aurocapillus*). See OVENBIRD.

GOLDEN-CROWNED WREN. See KINGLET.

GOLDEN EAGLE. See EAGLE.

GOLDEN-EYE. A duck of the genus *Clangula*, having the bill shorter than the head and the nostrils well forward; a garrot. The typical species (*Clangula clangula americana*) is a common winter visitant, appearing in small flocks, most frequently in severe weather, not only in estuaries, but on the lakes and rivers of inland parts of North America, as it does on those of all the central and southern parts of Europe, and equally on those of the temperate parts of Asia. The wings are pointed and rather short, with the first quill the longest, and the tail of 16 feathers is rounded and of medium length. In the male the coloration is pied black and white, while it is brown and white in the female. The golden-eye takes its name from the golden-yellow hue of the iris, and the male may be recognized by the metallic green of the head and upper neck, the white patch at the base of the beak below the eye, and by the scapular region being striped with white. The length of the European bird is about 18 inches; the American form (*americana*) is somewhat larger. A second North American species is Barrow's, or the Rocky Mountain golden-eye (*Clangula islandica*), which is larger and has the white loreal spot more extended; it is more northerly and less numerous than the other. Though classed among the sea ducks, and like them subsisting largely on animal food, these ducks are scattered inland all over the continent, and are well known to gunners by sound as well as by sight, for their wings make a loud and characteristic whistling in flight; hence a common local name is "whistler," or "whistling." They go in small parties, mix with other ducks, especially bluebills, and are extremely watchful, often alarming their companions and leading the whole flock swiftly away before any other kind has suspected danger. They breed from Quebec and Dakota northward and throughout northern regions generally as far as trees go, making their nests of straw, feathers, etc., in cavities of dead trees and tall stumps, and laying 8 to 10 ashy-green eggs. Consult: Dresser, *Birds of Europe* (London, 1881); Job, *Among the Waterfowl* (New York, 1902); Oakley, *Wild Ducks: How to Rear and Shoot Them* (ib., 1905); Shaw, *Wild Fowl* (ib., 1905).

GOLDEN-EYED FLY. A lace-winged fly of the family Chrysopidae, so called because in some lights the eye seems made of burnished gold. See LACEWING.

GOLDEN FLEECE. In Greek tradition, the fleece of the ram Chrysomallus, the recovery of which was the object of the Argonautic expedition. (See ARGONAUTS.) The golden fleece has given its name to a celebrated order of knighthood in Austria and Spain, founded by Philip the Good, Duke of Burgundy, and sovereign of the Netherlands, at Bruges, on Jan. 10, 1430, on the occasion of his marriage with Isabella, daughter of King John I of Portugal. This order was instituted for the protection of the Church, and the fleece was probably assumed for its emblem as much from being the material of the staple manufacture of the Low Countries as from its connection with heroic times. The founder made himself grand master of the order, a dignity appointed to descend to his successors. This order ranks among the highest on the Con-

tinental. The knights were consulted before the sovereign undertook a war, and his deeds were subject to review by all the members of the order. After the death of Charles V the Burgundo-Spanish line of the house of Hapsburg remained in possession of the order; but at the close of the War of the Spanish Succession the Emperor Charles VI laid claim to it in virtue of his possession of the Belgian Netherlands and, taking with him the archives of the order, celebrated its inauguration with great magnificence at Vienna in 1713. Philip V of Spain contested the claim of Charles, and the dispute, several times renewed, was at last tacitly adjusted by the introduction of the order in both countries. In Austria the Emperor may now create any number of knights from the old nobility. In Spain princes, grandees, and personages of peculiar merit are alone eligible; if Protestants, the Pope's consent is required. The insignia are a golden fleece hanging from a gold and blue enameled flint stone emitting flames, and borne in its turn by a steel forming the letter B. On the enameled obverse is the legend *Pretium Laborum Non Vile* (No mean recompense for effort). The decoration was originally suspended from a chain of alternate firestones and rays, for which Charles V allowed a red ribbon to be substituted, and the chain is now worn only by the grand master. The costume consists of a robe of deep-red velvet, lined with white taffeta, and a long mantle of purple velvet lined with white satin and richly trimmed with embroidery, containing firestones and steels emitting flames and sparks. On the hem, which is of white satin, is embroidered in gold *Jo Vay empris* (I have dared it). There is also a cap of purple velvet embroidered in gold, with a hood; the shoes and stockings are red. Consult Paul, "The Order of the Golden Fleece," in *Scottish Historical Review* (Glasgow, 1908). See ORDERS.

GOLDEN GATE, THE. See SAN FRANCISCO BAY.

GOLDEN HORDE. The name (1) of a great body of Tatars who, under Batu Khan, grandson of Genghis Khan, overran eastern Europe; and (2) of the khanate, or empire, which they established on the banks of the Volga, and which is also known as Kiptchak (q.v.). The army led by Batu (known also as Sain Khan, 'the good prince,' and described by Marco Polo as "a very puissant king") was one of three sent out in 1235 by Ogotai Khan, the successor of Genghis. Crossing the Ural River in 1237, they invaded Russia, penetrating to the very centre of the country, pillaging, burning, devastating, and murdering, defeating army after army, and showing no mercy. Moscow and Kiev and other cities were taken and burned, and their inhabitants put to the sword. From Russia they passed into Poland, Silesia, and Hungary, carrying devastation and bloodshed everywhere. Lublin and Cracow were destroyed in 1240, Breslau was burned in 1241, and at Liegnitz, on the field since known as the Wahlstatt, an army of Silesians, Poles, and Teutonic knights, under Henry II, Duke of Silesia, was overcome, although with great loss to the victors, April 9, 1241. Unsuccessful in the siege of Neustadt, the Horde turned eastward, and Batu pitched his gorgeously embroidered silk tent (which gave rise to the name "Golden") on the banks of the Volga, and summoned the Russian princes to his presence to do him homage. This settle-

ment was called *Sir Orda* (Golden Camp), from which originated the expression "Golden Horde." The empire established by him over the Russians was maintained until the power of the khans was broken by Ivan III towards the close of the fifteenth century. Consult: Lane-Poole, *Mohammedan Dynasties* (London, 1893); Howorth, *History of the Mongols* (ib., 1876-85); Schurtz, "Hochasien," in vol. ii of *Helmolts, Weltgeschichte* (Leipzig, 1902). See KIPTOCHAK; MONGOL DYNASTIES.

GOLDEN HORN. See CONSTANTINOPLE.

GOLDEN HOUSE OF NERO (Lat. *Aurea Domus*). A remarkable structure planned by Nero after the fire of 64 A.D., between the Palatine and the Esquiline hills, covering an area of a square mile. It embraced farms, vineyards, game preserves, sulphur and sea baths, ponds and waterfalls, and elaborate colonnades and halls, adorned with the most lavish expenditure. Among its celebrated features were a vestibule containing a colossal bronze statue of Nero, 120 feet in height; a portico 3000 feet long; and a banquet hall with a revolving ceiling of carved ivory representing the firmament. In other halls the ceilings dropped flowers and perfumes on the guests. The walls were incrustured with rare marbles, mosaics, mother-of-pearl, precious stones, and paintings, and the courts and apartments contained hundreds of rare columns and statues. The depression where the Coliseum now stands was occupied by a lake. The Golden House had been pulled down before 75 A.D., and its remains were used as foundations for later buildings, particularly for the baths of Trajan and Titus, while the grounds were given back to public use. Within the extensive remains of the Golden House excavations have again been made recently, by Weege; consult his article, "Das Goldene Haus des Nero," in *Jahrbuch des Kaiserlich Deutschen Archäologischen Instituts*, xxviii, 127-224 (Berlin, 1913), summarized by Winter, in *The Classical Weekly*, vii, 163-164 (New York, 1914).

GOLDEN HUMMER. A Peruvian humming bird (*Heliothrix aurita*), having a golden gloss upon its plumage. Also called black-eared fairy. See Colored Plate of HUMMING BIRDS.

GOLDEN LEGEND (Lat. *Legenda Aurea*). A celebrated collection of hagiology, which for a time enjoyed almost unexampled popularity, having passed through more than 100 editions, and translations into almost all the European languages. It is the work of James of Viraggio, better known as Jacobus de Voragine, who was born at Viraggio (now Varazze), on the coast, near Genoa, about the year 1230. He entered the Dominican Order (1244) and was provincial of the order in Lombardy from 1267 to 1286. In 1292 he became Archbishop of Genoa, and by his ability, moderation, and exemplary life he played a most influential part in the public affairs of his time. He died in Genoa in 1298. The *Legenda* consists of 177 sections, each of which is devoted to a particular saint or festival, selected according to the order of the calendar. It presents nearly the entire narrative portions of the Bible, with many homilies and much information, some curious, concerning Church characters. In its execution the work, as may be supposed from its age, is far from critical. It was primarily a book of devotion, and is deserving of study as a literary monument of the period and as illustrating the religious habits and views of the Christians at

that time. The work, entitled *Legenda Sanctorum* by its author, is also called *Historia Longobardica*, because it appends a brief Lombard chronicle to the life of Pope Pelagius. A translation of the *Golden Legend* was made by William Caxton for the Earl of Arundel and first published in London (1483); it was reprinted, edited, and modernized by Ellis (London, 1900). The classical edition of the original Latin is by Graesse (Breslau, 1890).

GOLDEN LEGEND, THE. A religious dramatic poem by Longfellow, published in 1851. With *New England Tragedies* and *The Divine Tragedy*, it forms a trilogy entitled *Christus*. It is a mediæval tale, faintly resembling *Faust*.

GOLDEN (or CAPE) MOLE. A member of a family of insectivores, Chrysochloridæ, confined to South Africa, having an external resemblance to, and the habits of, moles, but in structure more closely allied to the tenrecs and potamogales. They do not dig, as do the true moles, with forefeet modified into hands, but mainly with the enormous claws of the two middle fingers. They take their name from the brilliant and varying bronzed lustre of their fur.

GOLDEN NUMBER (Lat. *numerus aureus*). The number of any year in the Metonic cycle (q.v.). As this cycle embraces 19 years, the golden numbers range from 1 to 19. The cycle of Meton came into general use soon after its discovery, and the number of each year in the Metonic cycle was ordered to be engraved in letters of gold on pillars of marble. Since the introduction of the Gregorian calendar the point from which the golden numbers are reckoned is 1 B.C., as in that year the new moon fell on January 1; and as by Meton's law the new moon falls on the same day (January 1) every nineteenth year from that time, we obtain the following rule for finding the golden number for any particular year: "Add one to the number of years, and divide by nineteen; the quotient gives the number of cycles, and the remainder gives the golden number for that year; and if there be no remainder, then nineteen is the golden number, and that year is the last of the cycle." The

3. BUSHY GOLDENROD (*Solidago lanceolata*).

4. WHITE SNAKEROOT (*Eupatorium ageratifolium*)
ROD (*Solidago casea*).

has been used in medicine as an aromatic, diaphoretic, and tonic. Blue-stemmed goldenrod (*Solidago caesia*), and the varieties of *Solidago virgaurea*, *serotina*, *memoralis*, and *racemosa*, are among the most interesting. Sheep readily eat various species of goldenrod, and as a forage it is considered valuable in parts of New York and elsewhere. When prepared in the same manner as hemp, the stalks of *Solidago canadensis*, which attain a height of 4 to 6 feet, are said to yield a strong fibre that might be utilized.

GOLDEN ROSE (Lat. *rosa aurea*). A rose formed of wrought gold and blessed with much solemnity by the Pope in person on the fourth Sunday of Lent, which is called, from the first word of the introit for the day, *Lætare Sunday*. The prayer of blessing contains a mystic allusion to Christ as "the flower of the field and the lily of the valley." The rose is anointed with balsam, fumigated with incense, sprinkled with musk, and is then left upon the altar until the conclusion of the mass. It is then usually presented to some Catholic prince or princess whom the Pope desires especially to honor, with an appropriate form of words. The origin of the ceremony is uncertain, but the most probable opinion as to its date is that of Martène and Du Cange, who fix it in the pontificate of Innocent IV (1243-54). Consult Barry, *The Sacramentals* (Cincinnati, 1858). See *LETARE MEDAL*.

GOLDEN RULE, *REGULA AUREA*, *RULE OF THREE*, *REGULA DE TRIBUS*, *MERCHANTS' RULE*, and *REGULA MERCATORUM*. Terms once applied in arithmetic to designate the operation of simple proportion. See *PROPORTION*.

GOLDEN SEAL. See *HYDRASTIS*.

GOLDEN SEAL, *ORDER OF THE*. A fraternal insurance organization, incorporated under the laws of New York State in 1902. It is governed by a supreme court. Membership carries with it insurance against accident, sickness, and death. Every six years a distribution of the profits is made, and members receive a cash dividend. In 1914 there were about 500 local courts, with about 15,000 certificates of membership in good standing. The annual benefits dis-

posed of straw, feathers, etc., in cavities of dead trees and tall stumps, and laying 8 to 10 ashy-green eggs. Consult: Dresser, *Birds of Europe* (London, 1881); Job, *Among the Waterfowl* (New York, 1902); Oakley, *Wild Ducks: How to Rear and Shoot Them* (ib., 1905); Shaw, *Wild Fowl* (ib., 1905).

GOLDEN-EYED FLY. A lace-winged fly of the family Chrysopidae, so called because in some lights the eye seems made of burnished gold. See *LACEWING*.

GOLDEN FLEECE. In Greek tradition, the fleece of the ram Chrysomallus, the recovery of which was the object of the Argonautic expedition. (See *ARGONAUTS*.) The golden fleece has given its name to a celebrated order of knighthood in Austria and Spain, founded by Philip the Good, Duke of Burgundy, and sovereign of the Netherlands, at Bruges, on Jan. 10, 1430, on the occasion of his marriage with Isabella, daughter of King John I of Portugal. This order was instituted for the protection of the Church, and the fleece was probably assumed for its emblem as much from being the material of the staple manufacture of the Low Countries as from its connection with heroic times. The founder made himself grand master of the order, a dignity appointed to descend to his successors. This order ranks among the highest on the Con-

Schnitt (ib., 1884), who has claimed the golden section as the æsthetic law in nature (see *ÆSTHETICS*), and by Bochenek, *Kanon aller menschlichen Gestalten und der Tiere* (Berlin, 1885), who has applied it in matters of art. Consult also: Wittstein, *Der goldene Schnitt und die Anwendungen desselben in der Kunst* (Hanover, 1874); Pfeifer, *Der goldene Schnitt* (Augsburg, 1885); Matthias, *Die Regel von goldenen Schnitt im Kunstgewerbe* (Leipzig, 1886).

GOLDEN SPUR. A papal order, founded probably by Paul IV, but also attributed to Constantine and to Pope Sylvester II. The decoration was so freely bestowed that the value was impaired, and the order was reconstituted in 1841. It is now conferred for special distinction and for services to the Catholic church.

GOLDEN STATE. California. See *STATES*, *POPULAR NAMES OF*.

GOLDEN TERGE, *THE*, or *THE GOLDYNN TABGE*. An allegorical poem by William Dunbar, published in 1508 by Chepman and Myllar.

GOLDEN VERSES (Gk. *έρη χρυσά, από χρύσα*). A traditional collection of gnomic sayings of the Pythagoreans, containing the teachings of virtue in practical form.

GOLDEN WARBLER. The commonest of American wood warblers (*Dendroica aestiva*), more frequently called summer warbler, yellow warbler, or summer yellowbird. (See *WARBLER*.) The golden-winged warbler is a different but closely allied species (*Vermivora chrysop-tera*), one of the swamp warblers (q.v.).

GOLDEN WEDDING. See *WEDDING ANNIVERSARIES*.

GOLDEN-WINGED WOODPECKER. See *FLICKER*.

GOLDFINCH. 1. A pretty European finch (*Carduelis carduelis*), belonging to the Fringillidæ family. It is a favorite cage bird, on account of its soft and pleasing song, its intelligence, its liveliness, and the attachment which it forms for those who feed and caress it. The goldfinch is about 5 inches in entire length; black, blood red, yellow, and white are beautifully mingled in its plumage. The colors of the female are duller than those of the male. It is widely diffused throughout Europe and some parts of Asia and is to be seen in small flocks on open grounds, feeding on the seeds of thistles and other plants or in gardens and orchards. Its nest is made in a tree, bush, or hedge, is remarkable for its extreme neatness, and is always lined with the finest downy material that can be procured. The eggs are four or five in number, bluish white, with a few spots and lines of pale purple and brown. The goldfinch is much employed by birdcatchers as a call bird. It can be trained to the performance of many little tricks, such as the raising of water for itself from a well in a bucket the size of a thimble. It has been introduced into America and is now fairly well established in the vicinity of New York City and to a less degree about Boston. See *PLATE OF CAGE BIRDS*.

2. The American goldfinch (*Astragalinus tristis*), more generally called "yellowbird" and "thistle bird," is very similar to the European species in habits and song and displays the same interesting liveliness and affection in domestication. The nest is also of the same elegant structure. It is a common bird in most parts of North America. It is hardly 5 inches in length

GOLDENROD ETC.

1. ROUGH-LEAVED GOLDENROD (*Solidago patula*).
2. "EVERLASTING" (*Anaphalis margaritacea*).

3. BUSHY GOLDENROD (*Solidago lanceolata*).
4. WHITE SNAKEROOT (*Eupatorium ageratifolium*)
5. BLUE-STEMMED GOLDENROD (*Solidago caesia*).

and is bright yellow, with the crown, wings, and tail black. The female is much duller, grayish brown, more or less tinged with yellow beneath. In winter the male assumes a plumage very similar to that of the female. The goldfinch is eminently gregarious, except during the breeding season, and it seems loath to give up its social life, for it is the last of our birds to go to house-keeping; the eggs, which are spotless, are rarely laid before the end of June. The nest is a delicate cup of soft materials, sometimes wholly of vegetable down, and is placed in a bush or low tree. It is often invaded by the cowbird (q.v.), in which case the goldfinches are likely to construct a second story—i.e., a new nest on the top of the original one—burying their own and the strange egg and laying a fresh set above. The flight of the goldfinch renders the bird easy to recognize on the wing, for it is always in a series of undulations, and generally is accompanied by a faint sweet twitter, which one writer translated as “per-chick-o-pee.” Several closely related species are found in the southwestern United States and in Mexico.

GOLDFINNY. See GOLDSINNY.

GOLD’FISH’, or GOLDEN CARP. A fish (*Carassius auratus*) closely related to the carp, a native of China, but now domesticated and naturalized in many parts of the world. It has been long common in many of the fresh waters of China and was introduced into England about the end of the seventeenth or the beginning of the eighteenth century. On account of the brilliancy of its colors and the ease with which it is kept in glass globes or other vessels in apartments, it soon became, and has continued to be, a general favorite. Its ordinary length is 5 or 6 inches, but it has been known to reach a foot. When young, it is of a blackish color, but acquires its characteristic golden red as it advances to maturity, some individuals (*silver-fish*) becoming rather of a silvery hue. Monstrosities of various kinds are frequent, particularly in the fins and eyes, a favorite Japanese variety having three large tails. Culturists can induce and strengthen the artificial golden color by controlling the amount of mineral in the water. Goldfish are easily kept in small glass aquaria. There should be some sort of water plant in the water, which should not be cold, and should be changed in part every few days. Occasional sunlight is good, to prevent the growth of fungi. The safest food is that prepared and sold for the purpose. Escaped specimens naturalized in rivers (as in the Potomac) revert to their native olivaceous green hue. For an elaborate account of these fish, consult Wolf, *Goldfish Breeds* (Philadelphia, 1908). An artificial grotesque variety is illustrated on the Plate of CARP AND ALLIES.

GOLDFUSS, gölt’foos’, GEORGE AUGUST (1782–1848). A German paleontologist and zoologist. He was born at Thurnau, near Bayreuth, Bavaria, was educated at Berlin, and in 1804 received the degree of Ph.D. at Göttingen, where he became professor of zoölogy in 1818. During the last 30 years of his life he was professor of mineralogy and zoölogy at Bonn, where he was also appointed director of the Zoölogical Museum. Besides his principal work, *Petrifaction Germania* (partly in collaboration with Count zu Münster, 1826–44), he published *Grundriss der Zoologie* (2d ed., 1834). He is said to have been the first to introduce the term “protozoa” into scientific nomenclature.

GOLD’IE, SIB GEORGE DASHWOOD TAUBMAN (1846–). A British administrator, the founder of Nigeria, born at the Nunnery, Isle of Man. After graduating from the Royal Military Academy at Woolwich he was lieutenant in the Royal Engineers for two years. He visited the Niger in 1877 and became interested in adding this territory to the British Empire. To this end he organized (1879) the British commercial interest of those regions into the United African Company, modeled on the defunct East India Company. The name was changed to the National African Company; its capitalization was raised from £125,000 to £1,000,000; new stations were opened; French interests were purchased; and in 1886 a charter was granted by the British government to the company under the new name of the Royal Niger Company, with Goldie as Vice Governor. In 1895 he became Governor. In spite of the activities of French and German political agents, Goldie built up the state and maintained the integrity of the territory, but finally, in 1900, the Royal Niger Company sold its territory to the British government for £865,000. Goldie was a royal commissioner on the South African War in 1902–03 and on war stores in 1905–06. He was created a K. C. M. G. in 1887, was chosen president of the Royal Geographical Society in 1905, and became a fellow of the Royal Society, a privy counselor (1898), and an alderman of the London County Council (1908).

GOLD’ING, ARTHUR (c.1556–c.1605). An English writer and translator. He was born probably in London and is said to have studied at Queen’s College, Oxford. He was a friend of Sir Philip Sidney, who, on leaving for the Low Countries, intrusted to him the completion of the translation of Philippe de Mornay’s treatise, *De la vérité de la religion chrétienne*, which Golding published under the title *A Worke Concerning the Treuenesse of the Christian Religion* (1589). He made many translations, devoting himself especially to those from the works of Calvin and Theodore Beza, but will be remembered chiefly for his rendering into English, in ballad metre, of the “fyrst fower bookes” of Ovid’s *Metamorphoses* (1565–67).

GOLD LACE. A fabric formed by weaving silken threads that have been previously gilded. The peculiarity of this manufacture consists in the gilding of the silk in such a manner that it shall retain sufficient flexibility for weaving. A deep yellow or orange-colored silk is used for the purpose. The usual method of doing this is by what is called “fibre plating.” A rod of silver is gilded by simply pressing and burnishing leaves of gold upon it. This gilded silver is then drawn into very fine wire, so fine that one ounce of metal can be extended to the length of more than a mile. It is then flattened between polished steel rollers, and further extended, so that a mile and a quarter weighs only one ounce; for the last drawing the wire is passed through perforated gems, such as diamonds or rubies. The film of gold upon this flattened wire is much thinner than beaten gold leaf and has frequently been quoted as an example of the divisibility of matter, as one inch of the highly gilded wire contains but the eighty-millionth part of an ounce of gold, while $\frac{1}{10}$ of an inch, which is a visible quantity exhibiting the color and lustre of gold, contains but $\frac{1}{1000000}$ of an ounce; or, in other words, one ounce of gold covers a length of wire of

more than 100 miles. This flattened gilded wire is then wound over the silk, so as to inclose it completely and produce an apparently golden thread. Other means of directly gilding the thread have been tried and for some purposes are successful; but none have yet been discovered which give the thread the same degree of lustre as the above, which was first practiced in a ruder manner by the Hindus. Much of the so-called gold lace of commerce is made of an alloy known as Dutch metal. SILVER LACE is made in the same manner as gold lace, except that the gold coating is omitted. Both gold and silver lace are used extensively for military and other uniforms and for ornamental effects in women's apparel.

GOLD LEAF. See GOLDBEATING.

GOLDMAN, gölt'män, EMMA (1860-). An American anarchist, born in Kovno Province, Russia. She lived in Königsberg, Prussia, in 1878-82, went to St. Petersburg, and in 1886 emigrated to the United States. The execution of certain participants in the Haymarket Square Riot (q.v.) in Chicago in that year aroused her sympathies and finally led her to support anarchism. After 1889 she was associated in New York with Johann G. Most, Alexander Berkman, and other agitators, among whom her fiery speeches in German and Yiddish soon made her popular. In 1893 she was sentenced to one year at Blackwell's Island (New York) for inciting to riot. She lectured in England and Scotland in 1895 and 1899 and made extended lecture tours in the United States in 1897, 1899, and 1907-10. Following the assassination of William McKinley in 1901, she lived under the name of "Miss Smith" to escape persecution. After 1906 she coöperated in the publication of *Mother Earth*, a monthly anarchist magazine. She had attended the First Anarchist Congress at Paris, in 1899, and in 1907 was a delegate to the Second Congress at Amsterdam. Her writings include *Anarchism and Other Essays*, with a biographical sketch by Hippolyte Havel (1910), and *The Social Significance of the Modern Drama* (1914).

GOLDMARK, gölt'märk', KARL (1830-1915). An Austrian composer. He was born in Keszthely, Hungary, and musically was largely self-taught, although he had some instruction on the violin from Jansa in Vienna in 1844 and three years later took lessons in composition from Böhm. Firmly believing in his musical talent, he devoted himself almost entirely to composition. Overcoming the most difficult obstacles, he so far succeeded as to give his first public concert in Vienna at the age of 26 years, a pianoforte concerto of his own being a feature of the programme. Outside of Germany he is better known through his orchestral suites and arrangements and small instrumental and vocal compositions than for his operas, although in his own country, as well as in Germany, they are regarded as standard. His published works include: operas—*Die Königin von Saba*, his chief operatic success; *Merlin* (1886); *Das Heinhöhen am Meer* (1896, from Dickens's *Cricket on the Heath*); *Die Kriegsgefangene* (1899); *Götze von Berlichingen* (1902); *A Winter's Tale* (1906). The overtures to *Prometheus Bound*, *Sappho*, *Sakuntala*, *Pemileisilea*, *Im Frühling*, and *In Italien* are universal favorites. Other compositions are: *Sturm und Drang* (for pianoforte, op. 5); symphonies—*Ländliche Hochzeit*, and one in E flat; scherzo in A (for orchestra);

a symphonic poem *Zriny*; two violin concertos; chamber music; songs; choruses.

GOLDMARK, RUBIN (1872-). An American composer, born in New York. From 1889 to 1891 he studied piano and composition at the Vienna Conservatory, and after his return to America continued the piano with Joseffy and composition with Dvořák. For six years he was director of the Colorado College of Music (1895-1901). In 1902 he returned to New York, devoting his time to composition and lecture recitals. His compositions include *Thema and Variations*, for orchestra, a concert overture *Hiacintha*, a symphonic poem *Samson*; some excellent chamber music, piano pieces, and songs.

GOLD OF PLEASURE, or FALSE FLAX (*Camelina*). A genus of plants of the family Cruciferae. The common gold of pleasure (*Camelina sativa*) (Fr. *Cameline*, Ger. *Dotter*) is an annual 1½ to 3 feet high, with smooth, bright-green, entire or slightly toothed leaves, and terminal racemes of yellow flowers and pear-shaped pods. Notwithstanding its high-sounding English name, the plant is of humble and homely appearance. It grows in fields and waste places of Europe and the north of Asia, but is not regarded as a native of America, although often found in fields, particularly of flax. Its seed is very commonly mixed with flaxseed imported from other lands. In many parts of Germany, Belgium, and the south of Europe it is extensively cultivated for the sake of its seeds, which are rich in oil, and the oil cake of which, as well as the seeds, though inferior to linseed and linseed-oil cake, is also used for feeding cattle. The oil, although sweet and pure at first, soon becomes rancid and is less valued than that of rapeseed or colza, with which it is often mixed. The value of the plant in agriculture depends much on its adaptation to poor sandy soils, although it prefers those of a better quality; and, on account of its rapid growth, to secondary cropping and green manuring. Since it readily scatters seed, it is likely to become a weed pest. The stems, which are tough, fibrous, and durable, are used for thatching and making brooms; their fibre is adapted for making coarse paper. See CAMELINA.

GOLDONI, göl-dō'né, CARLO (1707-93). The most celebrated Italian writer of comedy. He was born in Venice, Feb. 25, 1707, of a good family, which lost its property in his childhood. His father, a physician, took him to Perugia, where he first entered school. He was encouraged by his father in his strong taste for the literature of classic comedy and was given an opportunity for practice on the amateur stage. But the boy showed no aptitude for such performances and was sent to Pavia to study for the Church. Still less fitted, however, for being an ecclesiastic than for being an actor, he was finally expelled from college for writing scurrilous satires. He studied law and was admitted as an advocate, getting his degree from Padua in 1732, after his father's death. But the legal profession did not prove lucrative, and he relinquished its practice to set about composing comic almanacs, which became highly popular. In this early part of his career he wrote a few tragedies, among them *Belisario*, and several of his minor comedies were represented, attracting public favor by their novelty as well as their merits. In 1736 he married the daughter of a notary of Genoa, and about 1740 was for a short time Consul of Genoa at Venice.

Financial difficulties, however, occasionally hampered him in literary work, until, having obtained an introduction to Prince Lobkowitz, he was intrusted with the composition of an ode in honor of Maria Theresa, and with the organization of the theatrical entertainments of the Austrian army. Subsequently for a time he lived at Florence and Pisa. He returned to Venice in 1747 to write for a manager named Medebac, and five years later he made still more lucrative arrangements at the theatre of St. Luke, where much of his best work was done. In 1761 he was invited to France, where he was soon appointed Italian master to the royal children—a situation which allowed him to devote himself tranquilly to his literary occupations. He began again a time to write in French, and *Le bourru bienfaisant*, composed for the wedding of Louis XVI, excited the admiration even of Voltaire. On the breaking out of the Revolution Goldoni lost his pension, but after his death (Feb. 6, 1793) it was restored to his widow. He left about 150 comedies of very unequal merit, some of the most noted of which are: *La donna di garbo*; *La bottega del caffè*; *Pamela nubile*; *I Rusteghi*; *Todero Bron-talon*; *La casa nova*; *La locandiera*; *Il giocatore*; *Il vecchio bizzarro*; and *L'Adulatore*. His ambition was to dispense with some of the conventional accessories of the comic stage of his time and elevate that branch of the national drama from the buffooneries into which it had fallen. In this he succeeded. He was a great admirer of Molière, and the larger part of his works are inimitable representations of the events of daily life, under both their simplest and their most complex aspects.

Consult: the *Memoirs of Carlo Goldoni*, trans. by John Black, with an essay by Howells (Boston, 1877); Gherardini, *Vita di Carlo Goldoni*, prefixed to the collected comedies (Milan, 1821); Molmenti, *Carlo Goldoni* (Venice, 1875); Galanti, *Goldoni e Venezia, nel secolo XVIII* (Padua, 1883); Rabany, *Carlo Goldoni: Le théâtre et la vie en Italie au XVIIIème siècle* (Paris, 1896); Copping, *Alfieri and Goldoni: Their Lives and Adventures* (London, 1857); *Lettere di Carlo Goldoni, con prefazione e note di G. M. Urbani* (Venice, 1880); Dole, "Goldoni and Italian Comedy," in *The Teacher of Dante* (New York, 1908); Mathar, *Carlo Goldoni auf dem deutschen Theater des XVIII Jahrhunderts* (Montjoie, 1910); Chatfield-Taylor, *Goldoni: A Biography* (New York, 1913). The most complete edition of his plays is that of Venice, 1788, republished in Florence in 1827.

GOLDS, göldz. A people living on the Lower Amur, in southeastern Siberia, belonging physically and linguistically to the Tungusic group of Siberian peoples. Deniker (1900) describes them as "of a very pure type, and having a fairly well developed ornamental art." Laufer, who visited them in 1898-99, notes the great influence of Chinese symbolism and ornamental motifs upon the art products of the Golds; the dragon and the cock seem to have been introduced thus. The Golds have a rich mythology (with many archaic words and phrases), a considerable portion of which has evidently originated in Mongolian Central Asia. From the Chinese some of the Golds have learned the art of silk embroidery, in which they display great skill. Although fishers and hunters generally, a portion of them have taken to agriculture with not a little success. They are said to be losing of

late years their individuality through the mania for Russian fashions, etc. Laufer informs us that "a tendency to rationalism, due perhaps to continuous contact with Chinese culture, is one of the distinguishing traits of the Gold's character." It is to this "preponderance of intellect" that Laufer attributes the absence of many ceremonies, feasts, etc., among the Golds, and the dying out of belief in the old shamans, whose place the Russian physician now takes. Marriages of Golds and Chinese are said to be often infertile. A primitive people, under the influence of such differing cultures as the Chinese and the Russian, the Golds are of considerable ethnological importance. The best recent account of the Golds and other tribes of the Amur will be found in Schrenck, "Die Völker des Amurlandes," vol. iii of his *Forschungen in Amurland, 1854-56* (St. Petersburg, 1881-91), and Laufer, "The Amoor Tribes," in the *American Anthropologist* (New York) for 1900.

GOLDSBORO. A city and the county seat of Wayne Co., N. C., 50 miles by rail southeast of Raleigh, on the Southern, the Atlantic Coast Line, and the Norfolk Southern systems, and on the Neuse River (Map: North Carolina, E 2). It has Hermann Park, an Odd Fellows' Orphan Home, the Eastern Insane Asylum (colored), the Goldsboro Hospital, and the Spicer Sanitarium. The city is the commercial centre for an agricultural and cotton-growing region. Its industrial plants include cotton, oil, lumber, and rice mills, furniture factories, agricultural-implement works, veneer plants, brickworks, a tobacco stemmery, knitting mills, machine shops, and tobacco warehouses. Goldsboro was settled in 1838 and was incorporated three years later. Under a charter of 1901 the government is vested in a mayor, elected every two years, and a council. The water works are owned and operated by the municipality. Pop., 1900, 5877; 1910, 6107; 1914 (U. S. est.), 10,500; 1920, 11,206.

GOLDSBOROUGH, LOUIS MALESHERBES (1805-77). An American naval officer, born in Washington, D. C. He was appointed a midshipman in the navy in 1812, when only seven years old, but did not enter upon active duty until 1816. He served on the Mediterranean and Pacific stations and was promoted a lieutenant in 1825. He then spent two years in study in Paris on leave of absence. In the following year (1827), being again on duty in the Mediterranean, he distinguished himself by rescuing an English brig which had been captured by pirates in the Grecian archipelago. In 1833 he retired from the navy and settled in Florida, where he recruited and commanded a company of volunteer cavalry during the Seminole War. Returning again to the navy, he was promoted commander in 1841 and served in the Mexican War, acting as executive officer of the frigate *Ohio* at the bombardment of Vera Cruz. In 1849 he was a member of the joint army and navy commission in California and Oregon; was superintendent of the United States Naval Academy at Annapolis from 1853 to 1857, during which period (1855) he attained the grade of captain; and from 1857 to 1861 was again at sea. He was made flag officer at the outbreak of the Civil War, and on the abolition of that rank in 1862 became rear admiral. His first service was with the North Atlantic blockading squadron in September, 1861. He commanded the fleet which cooperated with General Burnside in his North Carolina expedition

in 1862, commanded the European squadron in 1865-67, and subsequently was commandant of the navy yards at Mare Island, California, and at Washington. In 1873 he retired from active duty as senior officer in point of length of service.

GOLDSCHMID, gölt'shmit. See **FABRICIUS**, GEORG.

GOLDSCHMIDT, gölt'shmit, ADALBERT VON (1848-1906). A German composer. He was born at Vienna and was educated at the conservatory in that city. Although not a musician by profession, he acquired an excellent reputation as a composer, notably through his three-part cantata *Die sieben Todsünden*, based upon the celebrated poem by Robert Hamerling. The cantata was first performed at Berlin in 1875. In 1884 Goldschmidt brought out an opera entitled *Helianthus*, which was followed, in 1880, by a trilogy, *Gaea*.

GOLDSCHMIDT, HANS (1861-1923). A German industrial chemist. He was born in Berlin; was educated in the sciences at Berlin, Strassburg, Heidelberg, and Charlottenburg; and then spent several years in travel. In 1886 he entered into partnership in the chemical manufactory established by his father, and together with his brother Karl he built up an important industry. He is chiefly known, however, for the "Goldschmidt process." See **ALUMINO-THERMICS**.

GOLDSCHMIDT, JENNY LIND. See **LIND**, JENNY.

GOLDSCHMIDT, MEIR AARON (1819-87). A Danish publicist and novelist, born at Vordingborg, of Jewish parents. He began journalistic work at an early age with the *Næstved Ugeblad*, which became later the much-feared *Corsaren* (1840-46). In 1847 he founded the periodical *Nord og Syd*, which under his management became an influential political organ. In 1861 he established the weekly paper *Hjemme og Ude*. He was a gifted story-teller, and his descriptions of Jewish life have never been surpassed. His numerous novels, tales, and dramas include: *En Jøde* (1845; 3d ed., 1890; Eng. trans. under the title *The Jew of Denmark*, by Mrs. Bushby, 1852); *Hjemløs* (5 vols., 1853-57; Eng. trans. by the author under the title *Homeless*; or, *A Poet's Inner Life*, 1861); *Rabbin og Ridderen* (1869), a drama; *Kjærlighedshistorier fra mange Lande*, a series of love tales of various lands (1867); *Avromoko Nattergal* (1873). In *Ravnen* (1867; 3d ed., 1890) and *Masor* he is at his best. A selected edition of his works was published in 1898 et seq. His autobiography, *Livserindringer*, appeared in 1877 in two volumes. Consult G. Brandes, *Levnede* (1908).

GOLDSCHMIDT, OTTO (1829-1907). A German-English pianist, conductor, and composer. He was born at Hamburg and was a pupil of Jakob Schmitt, Mendelssohn, and Chopin. In 1851 he accompanied Jenny Lind on her American tour and married her at Boston in the following year. After a sojourn of three years at Dresden (1852-55), the couple removed to London in 1858, after which Goldschmidt was prominently identified with the musical life of the British capital. He successively became professor and vice principal of the Royal Academy of Music (1863), and director of the Bach Choir (1876-86), a society founded by him in 1875. He also on several occasions conducted the celebrated Lower Rhine Festivals at Düsseldorf. Among his principal musical publications are: *Ruth*, an oratorio (1867); *Choral-Book for*

England (with Julius Benedict): a pianoforte concerto, op. 10; a pianoforte trio, op. 12; and several other pianoforte compositions and songs.

GOLDSCHMIDT PROCESS. See **ALUMINO-THERMICS**.

GOLD SEED. See **DOG'S-TAIL GRASS**.

GOLD'SINNY, or **GOLD'FINNY**. A small, bright-yellow European wrasse (*Symphodus melops*), frequenting rocky coasts and sometimes taken by anglers.

GOLD'SMID, SIR FREDERICK JOHN (1818-1908). A British soldier, explorer, and Orientalist. He was educated at King's College, London, in 1830, entered the army of the East India Company, and served in the China War in 1840-41 and in the Crimea with the Turkish army in 1855-56. He retired in 1875 with the rank of major general. Goldsmid became known more especially for his services in establishing the Indo-European telegraph, of which he was director general from 1865 to 1870. Having obtained telegraph treaties, he superintended the construction of the lines across Persia and Baluchistan to India. In 1870-72 he adjusted boundary claims between Persia and Baluchistan and between Persia and Afghanistan. He was controller of the crownlands of Daira Sanich in Egypt in 1881-82, conducted a diplomatic mission for the British government to Constantinople in 1882, and in 1883 was administrator in the Congo for King Leopold II of Belgium. Versed in Hindustani, Persian, Arabic, and Turkish, Goldsmid was considered an authority on Oriental questions. He published *Telegraph and Travel* (1874), *Eastern Persia* (2 vols., 1876), and the *Life of Sir James Outram* (2 vols., 1880; 2d ed., 1881).

GOLDSMID, SIR ISAAC LYON (1778-1859). An English Jewish financier and philanthropist, born in London. He was bullion broker of the Bank of England and of the East India Company. University College, London, owes much to him; from 1839 to 1857 he was treasurer of the University College or North London Hospital, which he helped to found in 1834. He was zealous in the cause of Jewish emancipation—the ultimate passage of the Jewish Disabilities Bill, first introduced in 1830, was greatly due to his energy. In 1841 he was created Baronet, the first Jew to win that distinction in England. For settling the monetary dispute between Portugal and Brazil the Portuguese government made him Baron da Palmeira in 1846.

GOLDSMITH, LEWIS (c.1763-1846). An English journalist, whose parents or grandparents were Jews from Portugal. He was born in London and was educated there for the law. A strong sympathizer with the Revolutionists in France and Poland, he published, in 1801, *The Crimes of Cabinets, or a Review of the Plans and Aggressions for the Annihilation of the Liberties of France and the Disemboweling of her Territories*, and the following year removed to Paris, where, with the assistance of Talleyrand, he established a triweekly paper, the *Argus*, in the interests of Napoleon. But Napoleon having demanded of him services of espionage and intrigue that he refused to render, he returned to London in 1809 and two years later founded the *Anti-Gallican Monitor*, in which he vehemently pleaded for drastic measures to effect Napoleon's overthrow. He also published: *A Secret History of the Cabinet of Bonaparte* (1810); *Secret History of Bonaparte's Diplomacy* (1812); and *An Exposition of the Con-*

duot of France towards America (1810). He became a disciple of Robert Owen, again removed to Paris in 1825, and died there Jan. 6, 1846. In 1832 he published *Statistics of France*.

GOLDSMITH, OLIVER (1728-74). An Irish author. He was born, according to long-accepted belief, at Pallas, County Longford, Ireland, or, as now seems more probable, at Elphin, County Roscommon, Nov. 10, 1728. His father, Rev. Charles Goldsmith, was a clergyman of the Established church. When six years old, Oliver was placed in the village school kept by an old soldier, Thomas Byrne, described in "The Deserted Village." On leaving Byrne's school, he suffered permanent disfigurement from a bad attack of smallpox. He subsequently attended other small schools and at length entered Trinity College, Dublin, as a "sizar," or poor scholar (June 11, 1744). Neither at school nor at the university did he display any conspicuous talents. But he had long been interested in chapbooks and the ballads of the peasantry and had attempted verse. Disliking his tutor and his studies, humiliated by his position, and becoming involved in trouble over a convivial entertainment in his college rooms, at which, contrary to rules, persons of both sexes were present, he sold his books and ran away to Cork. Through the influence of his brother Henry he was induced to return to the university, where he was graduated B.A. (Feb. 27, 1749). His uncle, the Rev. Thomas Contarine, who had helped Goldsmith at the university, now tried to induce him to take orders. He became a candidate for the ministry, but was rejected, on what grounds history does not record, by the Bishop of Elphin. Thereupon he went to Cork to embark for America, but missed his ship. His uncle next gave him £50 to study law in London; but Goldsmith soon returned, having got no farther than Dublin, where he lost his money at a gaming house. Again aided by Mr. Contarine, he succeeded in reaching Edinburgh, where he began the study of medicine in 1752; but towards the end of the next year he sailed for Leyden and then set out on the grand tour, wandering on foot through Flanders, France, Germany, and Italy, paying while in France for the hospitality of the peasants by playing on his flute. In 1756 he returned to England with empty pockets and soon began to practice medicine in Southwark. He quickly abandoned his profession to become, in turn, proof reader, usher in an academy at Peckham, and then hack writer at "an adequate salary" for the *Monthly Review*. In 1758 he was nominated physician and surgeon in the India service, but the appointment was not confirmed; and being examined the same year at Surgeons' Hall for the post of "hospital mate," he was found "not qualified." The very clothes in which he appeared before his examiners were borrowed; and, being in great distress, he pawned them.

Besides several articles in the *Monthly Review*, Goldsmith had by this time translated the *Memoirs of Jean, Marquis de Bergerac* (1758). In April of the next year he attracted some attention by the *Enquiry into the Present State of Polite Learning in Europe*. He was employed on three periodicals started in this year, writing probably all the articles for the *Bee*, a weekly that ran through only eight numbers. On Jan. 24, 1760, he contributed to the *Public Ledger* the first of the celebrated

letters of a Chinese, which were collected and published in book form two years later under the title of *The Citizen of the World*. In 1762 appeared also the *Life of Richard Nash*, the famous Bath beau. His literary work had already gained him the friendship of Bishop Percy and Dr. Johnson. In 1764 the Literary Club was founded, and Goldsmith was one of the nine original members. He was thus brought into intimacy with some of the most eminent men of the time. This year he published *A History of England*, in a series of letters, which was followed by "The Traveler" in 1764, a poem which placed him at once in the front rank of contemporary poets. In 1766 came his only novel, *The Vicar of Wakefield*, which, with all its faults, is one of the most delightful stories in English literature. It has passed through more than 100 editions. Turning now to the drama, he produced *The Good-Natured Man*, performed at Covent Garden, Jan. 29, 1768. It did not meet with great favor. Disheartened, he turned again to hack work; but in 1770 he published his finest poem, "The Deserted Village." On March 15, 1773, *She Stoops to Conquer*, unsurpassed among later English comedies, was performed at Covent Garden, and met with instant success. Goldsmith died in his chambers at the Middle Temple, April 4, 1774, and was buried in the grounds of the Temple Church. The Literary Club erected a monument to his memory in Westminster Abbey, bearing an epitaph by Dr. Johnson. His statue stands at the portal of Trinity College, Dublin. While Goldsmith was producing his finest work, he was also compiling histories and writing reviews. Among productions not mentioned above are: *The History of Greece* (1774); the incomplete *History of Animated Nature* (1774); and the delightful poems, "Retaliation" (1774) and "The Haunch of Venison" (1776). Goldsmith did not possess Johnson's massive intellect, nor Burke's passion and general force; but he wrote the finest poem, the most charming novel, and—with the exception perhaps of *The School for Scandal*—the best comedy of the period. Than his style, nothing could be more natural, simple, and graceful. For his life, consult the memoir from Bishop Percy's materials in *Miscellaneous Works* (London, 1831); Forster (ib., 1848; enlarged ed., 1854); Irving (New York, 1849); Black, in *English Men of Letters* (London, 1879); Dobson, in *Great Writers* (ib., 1888); the critical biography by H. S. Krams in the first volume of the *Turk's Head* edition (10 vols., New York, 1908), which emphasizes the Irish aspects of Goldsmith's work; Moore, *Life of Oliver Goldsmith* (London, 1910); also Boswell, *Life of Dr. Johnson* (ib., 1889), and the Wakefield edition of the *Complete Works* (12 vols., ib., 1900). J. J. Kelly's *Early Haunts of Oliver Goldsmith* (Dublin, 1905) contains original material concerning the topic indicated by the title of this book, and also strong arguments in favor of Elphin as Goldsmith's birthplace.

GOLDSMITH, OLIVER (?1787-c.1848). A Canadian writer. He was born in Annapolis County, Nova Scotia, and was educated in the public schools, entered the commissarial department as a clerk, and eventually attained the rank of commissary general. He collected material for, but never published, a biographical work on the distinguished men of Nova Scotia. His poem, *The Rising Village* (1825), was highly

praised. It commemorates the busy life of a new settlement and is a sentimental contrast to *The Deserted Village* of the distinguished relative for whom he was named. See CANADIAN LITERATURE.

GOLDSMITH BEETLE. A large scarabæid beetle (*Cotalpa lanigera*) of the eastern United States, allied to the dung beetles, and golden yellow in color. The specific name *lanigera*, or wool bearer, refers to the dense hairy coat which covers the underside of the body. It is especially fond of willow trees, where it hides and nests among the leaves in the daytime, going abroad only at night. It deposits its large eggs singly in the soil, and the larval stages,

GOLDSMITH BEETLE.
(*Cotalpa lanigera*.)

which extend over about three years, are passed underground. The name is applied in a more general way to all the beetles of the group Ruteline, of which many of the largest and most brilliantly metallic inhabit Central America.

GOLDSMITH MAID. A bay trotting mare, sired by Abdallah, and famous between 1866 and 1878. In 1871 she took the mile trotting record from Dexter in 2:17; but in 1874 was beaten by Rarus (2:13¼).

GOLDSMITH'S WORK. See JEWELRY; PLATE.

GOLD STICK. An officer in the English Royal Bodyguard, and a captain in the Corps of Gentlemen-at-Arms. They are so called because, on state occasions, they carry a gilded baton. See GENTLEMEN-AT-ARMS.

GOLDSTÜCKER, gölt'shtuk-ër, THEODOR (1821-72). A German-English Sanskrit scholar. He was born of Jewish parents at Königsberg, Prussia, and was educated in that city and in Bonn and Paris, where he studied under Burnouf. After a visit to England and a sojourn of two years at Königsberg, he went to Berlin, where he contributed valuable material on Indian affairs to Humboldt's *Kosmos*. Expelled from Berlin because of his political opinions in 1848, he accepted Wilson's invitation to come to England and in 1852 was appointed professor of Sanskrit at University College, London. During an activity of nearly 30 years at that institution he did much towards the advancement of Oriental science. He was an able controversialist, but frequently permitted himself to be carried too far in his attacks on such distinguished scholars of the German school as Böhtlingk, Weber, and others. He began an extensive revision of Wilson's *Sanskrit and English Dictionary* in 1856, but was obliged to interrupt this colossal undertaking before reaching the end of the letter A (480 pp., London, 1856-64). His writings include: *On the Deficiencies in the Present Administration of Hindu Law* (1871); *Pāṇini: His Place in Sanskrit Literature* (1861); an anonymous translation of Krishna Miśra's *Prabodha-Chandrodaya* (Königsberg, 1842); and his posthumous edition of the *Mañbhāṣya* (3 vols., London, 1874), which also contains a biographical note (vol. i, pp. 5-16). Many of his minor contributions are collected in his *Literary Remains* (2 vols., London, 1879).

GOLD THREAD. See COPTIS.

GOLD-TIT, or VERDIN. A most curious little bird (*Auriparus flaviceps*) of the titmouse family (Paridae). It is 4 inches long, and abundant in the valleys of the Rio Grande and Colorado and in Lower California. The upper parts are ashy, the under parts whitish, and the whole head golden yellow. Its habits and manner partake of those of both the chickadees and the warblers; and it makes a remarkable nest, often as large as a man's head, woven of twigs into a globular mass, and placed in a thorny tree. It is lined with down and feathers, and the eggs are four to six, pale bluish speckled with brown. Consult Coues, *Birds of the Colorado Valley* (Washington, 1878).

GOLD WASP. See CUCKOO FLY.

GOLDZIEHER, gölt'se-ër, LUNAZ (1850-). An Hungarian Orientalist, born at Stuhlweissenburg. He studied at the universities of Budapest, Berlin, and Leipzig, and made special investigation of Oriental manuscripts in the libraries of Leyden and Vienna. He was appointed a lecturer at the University of Budapest in 1872 and became professor there in 1894. In 1876 he was elected a corresponding member, and in 1892 a full member, of the Hungarian Academy. He visited Egypt, Syria, and Palestine in 1873-74. His writings in Hungarian comprise a large number of contributions to the publications of the Academy, including papers on Oriental bookmaking (1874), on the history of philological study among the Arabs (1878), and on the progress and results of archaeology in Palestine (1886). His chief publications are in German, among them such scholarly works as *Studien über Tanchûm Jerûschalmi* (1871); the treatise *Der Mythos bei den Hebräern und seine geschichtliche Entwicklung* (1876; Eng. trans., 1877); *Mohammedanische Studien* (2 vols., 1880-90); *Abhandlungen zur arabischen Philologie* (2 vols., 1890-99); *Vorlesungen über den Islam* (1910; Hung. trans., 1912; Fr. trans. by Arin, 1914). Goldziher is considered one of the foremost European scholars in subjects connected with Mohammedanism.

GOLER, GEORGE W. (1864-). An American health officer. He was born in Brooklyn, N. Y., and graduated from the medical department of the University of Buffalo in 1889. Between 1888 and 1897 he served at the Infants' Hospital at Charlotte, N. Y.; was medical inspector of the Rochester (N. Y.) Board of Health in 1892-96, and health officer after 1896. In 1897 he established in Rochester municipal milk depots that have served as models for health officers throughout the United States and Europe. In addition, Dr. Goler instituted a vigorous and sustained campaign against unsanitary conditions in the dairy farms forming the source of the city's milk supply. In 1904 he became attending physician of the Rochester Hospital for Infectious Diseases, which he had been instrumental in founding. He served at one time as president of the Hospital Medical Society and is author of papers on the problems of milk supply and on tuberculosis.

GOLETTA. The port of Tunis, Africa.

GOLF (perhaps from Dutch *kolf*, O.H.G. *cholbo*, Ger. *Kolbe*, *Kolben*, club, Icel. *kolfr*, bolt, *kylfa*, club). Par excellence, the national game of Scotland, though possibly of Dutch origin. The Romans had a game called *paganica*, played with a crooked stick and a ball of leather stuffed with feathers, and in England, during the reign of

GOLF

1. TOP OF THE SWING
2. FINISH

3. HALF MASHIE SHOT
4. ADDRESSING THE BALL

Edward III, the game was called *bandy ball*, or *cumbuca*. The Dutch game differs greatly from the Scottish, and it is maintained that golf is a lineal descendant of the game of *shinty*, but it is more probable that it is a combination of both. Shinty is a rude game of force; golf, a game of skill.

In 1457 golf was so much played in Scotland that it took the place of archery and other ancient games. The year following, Parliament passed an act that the game be abandoned, and it was not until 1491 that Parliament ceased to interfere with it.

In 1592 the Town Council of Edinburgh ordained that none of the inhabitants "be sene at any pastymes or gammis within or without the town upoun the Sabbath-day sic as Golf, Archerie, etc." Even during the seventeenth century similar acts were passed, and offenders were severely punished. This extract from the Kirk-Session Books of the Parish of Cullen, Banffshire, is an excellent example: 1641. "James and George Duffus and Charles Stevinson convict in break of ye Sabbath for playing at ye golff efternoyne in time of sermone and yrfor are ordaynev evrie ane of them to pay half a merk and mak yr repentance ye next Sabbath." When James VI of Scotland succeeded Queen Elizabeth on the English throne, his Scottish train played the game on Blackheath; whereby came about the curious fact that the oldest organized golf club is English. It was an exotic, however, and remained the only one south of the Tweed for 250 years. James VI secured a special "club-maker to his Hienes" and therefore established a monopoly of ball making to prevent gold and silver from going out of his kingdom for buying golf balls. The Duke of York (afterward James II) was very fond of the game, and one day, with an Edinburgh shoemaker as his partner, he defended Scotland's claims in the sport against two English noblemen. The Duke and his partner completely outplayed their opponents in the foursome. This was the first great match of which we have record. Meanwhile in Scotland the game maintained its popularity and was so generally indulged in by all classes of society that any village in East Lothian could be sure of competitors, from the village cobbler to the laird of the neighborhood. The early conditions were as democratic as the company.

Henceforward the history of golf is marked mainly by the formation of societies and clubs for the practice and promotion of the game. Some of the most celebrated of these institutions were the Honourable Edinburgh Company of Golfers, the Edinburgh Burgess Golfing Society, and the Royal and Ancient Golf Club of St. Andrews, established in 1754, now the national club of Scotland.

A tent erected upon special occasions was the only rendezvous of the local golfers; and the links were laid out across a tract of common land by the seaside, over which every inhabitant of the district had some right. The prize was seldom more than a club with a silver band round it, or a dozen balls, or later on a simple medal; even the great national prize was only a silver club, and that never became the property of the winner. The association for which the winner played had its custody until the next yearly contest. The earliest implements with which the game was played were practically as good as they are to-day, except in the case

of the balls, which were formerly simply a leather case stuffed with feathers. The two great Scottish associations, while younger than the English one mentioned above, are of far greater importance to the history of the game.

The first clubs established outside Great Britain were the Calcutta Golf Club of East India, established in 1829, and the Royal Bombay Club, incorporated in 1842. Another club was in full vigor in Madras at a somewhat later date. The next foreign settlement was at Pau, in southern France, where numerous Scotchmen were in search of health. It was not until 1864 that the invasion of England proper began, with the establishment of the Golf Club of Westward Ho, in Devonshire, followed in the next year by the London Scottish, at Wimbledon; and shortly afterward by the Hoylake, at Liverpool; and then by hundreds of others throughout the country. Canada caught the infection in the early seventies, resulting in the organization of the Royal Montreal Golf Club in 1873.

In the United States, New York was the first to take up the game, although it is stated that the game of golf was played on the Pacific coast by a band of old sea captains in the sixteenth century. The St. Andrews Golf Club was the first formed in the United States (Nov. 18, 1888), followed almost immediately by others throughout the country, so that at the beginning of the twentieth century public links were to be found in the public parks of the large cities, and nearly every town and village in the country had its public or private golf links.

The game was played with a ball made of gutta-percha having a diameter of 1¾ inches and weighing from 25 to 28 pennyweights. Previous to 1848 the balls had been made of leather stuffed with feathers, and the manufacture was very difficult. During that year the gutta-percha ball was invented and remained in vogue for many years, until the advent of the rubber-cored ball. Many golfers believed that the old gutta-percha ball was better than the present rubber-cored; so a match was planned in England during the latter part of March, 1914, which resulted in a decisive victory for the rubber-cored. Four of England's leading professionals were chosen to participate in the match. The loss of distance to the rubber-cored ball was not great in the driving, but the difference was felt in the second shots, especially when the players using rubber cores could get up comfortably with irons. Their opponents had to slug desperately hard and even then were generally short. In playing the gutta-percha ball every ounce of power had to be utilized, and at the end of the round the gutta-percha professionals were dead. In the afternoon the sides were changed so as to eliminate as much as possible the personal equation.

Golf is played over a course laid out on an open stretch of country, and the object is to hit the ball into each of the holes made for its reception successively in the fewest number of strokes. These holes are about 4 inches in diameter, usually lined with iron to keep them from getting too large, while a flag at each indicates to the golfer the correct direction. The number of holes is usually 18, but where the area available is limited, a nine-hole course is played twice. The distance of each hole from the tee depends upon the nature of the intervening land; from 110 to 650 yards is the usual limit. In laying

them out advantage is taken of such natural obstacles to straightforward play as ditches, walls, trees, hills, roads, or hollow places, so as to break up the total length into difficult portions, compelling the player to exercise judgment and skill. If there are no natural obstacles or hazards, artificial ones are introduced, such as traps made by hollowing out the earth and leaving it loose like sand in front of a hole, or an embankment raised at some selected spot, called a bunker. The game is played by one, two, three, or four persons in either "medal" or "match play." In the former all the strokes of the game on each side are added together at the end of the 18 holes, and the side which has completed the round in the lowest number of total strokes wins; or, if match play, each hole is counted separately to the one who makes it in the fewest strokes, the winner being the one who has most holes to his credit.

The play is begun by one player teeing, or placing his ball on the tee, which is usually a section of ground about 10 feet in diameter, either sand or turf, and striking it with one of his clubs, usually the driver, such a distance as will best land it in a favorable place for the next stroke. Then his opponent drives off, and they both proceed to where their respective balls have fallen. In the ensuing strokes, and the choice of clubs with which to make them, the players must be guided by conditions—the length of the hole, the conformations of the ground to be covered, and the obstacles to be safely passed. The game is divided into three parts—distance shots, approaching, and putting. For the distance shots three clubs are generally used—the driver and the brassie, made of wood, and the driving iron, made of steel. When the ball has been driven to within 100 or 150 yards of the hole, the approach shot, of which the object is accuracy rather than distance, may be made by using the mid-iron, mashie, or mashie-niblick. Around the hole the grass is cut short and the ground made as level as possible. This is called the putting green. Putting, the third department of the game, consists of tapping the ball lightly with a short club with the object of rolling the ball into the hole. The conventional set of clubs consists of the driver, brassie, cleek, mid-iron, mashie, niblick, putter, and driving iron. There are, however, variations of these types, such as the spoon, hollow-faced cleek, jigger, mashie niblick, putting cleek, and many other modern clubs.

The rules are based upon those of the St. Andrews Golf Club of Scotland. Players are of two classes, professional and amateur, and the national championships are three—one for men (amateurs), one for women (amateurs), and an open championship for amateurs and professionals.

In America the central authority is the United States Golf Association, organized Dec. 22, 1894, when it consisted of the Chicago Golf Club, the Country Club of Brookline, the Newport Golf Club, and the St. Andrews Golf Club of Yonkers. It now (1914) consists of nearly 200 clubs, and there are subsidiary associations, the Metropolitan, Western, Southern, Intercollegiate, Western Pennsylvania, Florida, and Trans-Mississippi associations, the League of the Lower Lakes, the Pacific Northwest, New Jersey State, Indiana State, and several women's associations. Not included in these associations

are hundreds of separate clubs. There are over 750,000 golfers in the United States.

In the men's amateur championship the entries are reduced by a preliminary sifting at medal play to the 64 lowest. These then play match play every consecutive day, whereby the numbers are day by day reduced, first to 32, then to 16, then to 8, then to 4, and finally to 2, the finals. The woman's championship is not so exhaustive as the men's. In it the entries are reduced by one round at medal play to 32, who thereafter meet at match play in a round of 18 holes every consecutive day, as in the former case. In England there is sometimes more than one course played over, usually due to the number of entries. The open championship is a contest of four times round the links, 72 holes, at medal play.

GOLGI, gól'jé, CAMILLO (1844-1926). An Italian histologist and neurologist, born in Corteno and educated at the University of Pavia. He studied medicine, practiced at Abbiategrosso, and was professor at Siena and then at Pavia, where he was director of the histological and general pathological cabinet. In 1870 he first used silver nitrate to color nervous structure and about 1885 revolutionized the theory of nervous physiology by proving that there was not a net, but only an interlacement, of nerves. A class of nerve endings found in tendons are called the "organs of Golgi." His most important work in pathology was the discovery of three varieties of malaria parasite. In 1906 he divided the Nobel prize for medicine with Cajal. His collected works appeared in three volumes in 1903—the first and second on histology, the third on pathology. He wrote for the great Italian medical encyclopedia and for Italian medical journals.

GOL/GOTHA. See HOLY SEPULCHRE.

GOLIAD. A town and the county seat of Goliad Co., Tex., 134 miles south of Austin, on the San Antonio River, and on the (Halveston, Harrisburg, and San Antonio Railroad (Map: Texas, D 5). It contains a fine courthouse and interesting remains of the old Spanish mission, La Bahía. The town has cotton gins, whose products with live stock constitute a considerable trade. Pop., 1914 (local est.), 2250. Here in 1747 was established the mission Espíritu Santo de Zúñiga, and the presidio of Santa María de Loreto del Espíritu Santo, generally known as La Bahía, which had been founded about 1722 on the site of La Salle's Fort St. Louis and removed to the Guadalupe River about 1727. In 1829 the place was raised to the rank of a villa and was named Goliad (Goliath). In 1812-13, during the war between Mexico and Spain, Gutierrez was be-

sieged here for a short time by a large Spanish force; on Oct. 9, 1835, the place, then garrisoned by a Mexican force of about 50, was captured by an equal number of Texans under Captain Collingsworth. On Dec. 20, 1835, a declaration of Texan independence was made here, several months before the official declaration was made at Washington (Texas), and on March 27, 1836, in what is known as the "massacre of Goliad," more than 300 Texans and Americans under Colonel Fannin were murdered near here in cold blood by the Mexicans, at Santa Anna's orders. See FANNIN, JAMES W.

GOLIARDIC LITERATURE, or **CARMINA BURANA**. The songs of the wandering students in the later Middle Ages. These called themselves Goliardi, i.e., children or followers of Goliath. Nothing is definitely known about this Goliath. By some the poems bearing his name have been attributed to Walter Mapes, but there is no possibility that the songs of the Goliards represent the creation of any one man or even of a few men. They bear the stamp of universality. A song, originally sung by one poet or rhymester, was adopted, changed, resung, by others, until it became the common property of the student body. The poems as a whole may be divided into two general classes. The first class comprises the satirical songs. With the impatience and enthusiasm of youth the students attacked the vices of all classes except their own, and the members of the Church fared worst. Their poems are exceedingly irreverent to the ecclesiastical dignitaries, and this fact alone was sufficient to prevent any author from putting his name to his verses. In the second class the noticeable facts are the purely pagan spirit, the love of outdoor life, the zest for enjoyment, the feeling that all things which yield pleasure are lawful. Their themes are three—nature, wine, and women—all of which they loved ardently. Some of their songs are popular at the present time. The German Corps students still sing at the grave of a departed brother, *Gaudeamus igitur, juvenes dum sumus*. The best known of the drinking songs is *Mihi est propositum in taberna mori*. The *Lauriger Horatii* is believed to be the work of the Goliardi. Consult: Symonds, *Wine, Women, and Song* (London, 1884); Schmeller, *Carmina Burana* (3d ed., Breslau, 1894); Wright, "Latin Poems Commonly Attributed to Walter Mapes," in *Camden Society Publications* (London, 1841); Pernwerth von Bärnstein, *Carmina Burana Selecta* (Würzburg, 1879); Haessher, *Die Goliardendichtung und die Satire im 13. Jahrhundert in England* (Leipzig, 1905); Lundius, *Deutsche Vagantenlieder in den Carmina Burana* (Kiel, 1907); Wright, *History of French Literature* (New York, 1912).

GOLIAS. See GOLIARDIC LITERATURE.

GOLI'ATH. A Philistine giant, born in Gath, and slain by a Judean hero. According to 1 Sam. xvii, it was the youthful David who killed this giant, felling him with a stone from his sling and cutting off his head with the fallen champion's sword. (See **DAVID**.) An older and more reliable tradition ascribes the deed to one of David's warriors, Elhanan, of Bethlehem (2 Sam. xxi. 19). If this Elhanan is identical with Elhanan ben Dodo, of Bethlehem, mentioned in 2 Sam. xxiii. 24, his father's name, Dodo, is omitted in 2 Sam. xxi. 19, and the reading "Jairi," "the Jairite," indicating the clan to which he belonged, should be preferred to

"Jair," supposed to be the name of his father. In that case the name of Dodo and the birth-place may have facilitated the transfer of the story to David. It is a common occurrence, however, that a famous king receives the credit for deeds done by his men. In 1 Chron. xx. 4-8, Elhanan is said to have slain Lahmi, the brother of Goliath, and in the Authorized Version the words "the brother of" are introduced, without the slightest warrant either in the Hebrew text or the ancient version, to accord with this. By a comparatively slight emendation, which fortunately the Samuel text escaped, the Chronicler or a later copyist harmonized the two narratives.

GOLIATH BEETLE. Any of several huge cetonian beetles of the family Scarabaeidae and genus *Goliathus*, specifically *Goliathus giganteus*, which is about 4 inches long by 2 inches wide. This species is West African, and according to Uhlet is subject to so much variation that several names have been given to its varieties. It is generally chalky white, with velvety-black markings, prominently six black lines on the prothorax. These beetles frequent the tops of forest trees and are said to feed on the sap. They are near allies of the Hercules beetles (q.v.).

GOLITZIN, gò-lits'in, or **GALITZIN**. A princely family of Russia, tracing its descent from Gedimin, Grand Prince of Lithuania, ancestor of the Jagellon kings of Poland.—**PRINCE MIKHAIL GOLITZIN** was a celebrated military commander under Basil IV, Grand Prince of Moscow. He fought in the Crimea and in Lithuania and in 1514 led an army against the Poles. He was defeated at Orsha and taken prisoner, remaining in captivity until 1552. He died in a convent at Moscow soon after his release.—**VASILY VASILYEVITCH GOLITZIN**, great-grandson of Mikhail, played an important rôle at the time of Boris Godunoff and the false Demetrius. He was sent as Ambassador to Poland with the offer of the Russian crown for Prince Ladislas, but was cast into prison by the Poles, and died in 1610.—**BORIS ALEXEYEVITCH GOLITZIN** (1641-c.1713) was the preceptor of Peter the Great and one of the regents of the Empire during Peter's travels abroad. He became subsequently Governor of Kazan and Astrakhan and enjoyed great favor with the Czar.—**VASILY VASILYEVITCH GOLITZIN**, known as the Great (1643-1714), distinguished himself in military operations against the Cossacks of the Dnieper, gained the title of Ataman, and after 1680 was Minister of State. He was the lover of Sophia, sister of Peter the Great, who acted as regent during the young ruler's minority. As such, Golitzin was the virtual ruler of Russia, carrying on the government with great ability and firmness. He made the beginnings of military reform, thus preparing the way for the thorough organization of the army by Peter the Great. Upon the assumption of the government by Peter in 1689, Vasily suffered disgrace and was banished to Siberia, where he died. (Consult R. N. Bain, *The First Romanoffs*, London, 1905.)—**DMITRI GOLITZIN** (died 1738) was Russian Ambassador to Turkey and Austria and subsequently Superintendent of the Imperial Finances. He was one of the leaders of the aristocratic party which, upon the accession of Anna Ivanovna (q.v.), sought to impose a constitution upon the Empress by the terms of which the chief power would have

been vested in the hands of a small faction of the nobility. The attempt, however, failed, and Dmitri died in prison at Schlüsselburg.—**MIKHAIL GOLITZIN** (1674-1730), brother of Vasily, entered the army at the age of 12 and early distinguished himself against the Turks. In 1700 he commanded a Russian corps, operating against the Swedes in Lithuania; in 1708 he gained the important victory of Lyssnaya and in 1714 overran Finland and was Governor of the country until 1721, in which year he conducted the negotiations leading to the Peace of Nystad. Golitzin was one of the greatest generals Russia has ever produced and a man of many abilities and admirable character. As Governor of Finland, his conduct was marked by such justice and kindness as to gain him, from a conquered population, the title of *Finskibog* (Godhead of the Finns).—**ALEXANDER MIKHAILOVITCH GOLITZIN** (1718-83), son of Mikhail, after acting in the diplomatic service of Russia at Constantinople and Dresden, entered the army and fought with distinction in the Seven Years' War. In 1769 he took Khotin from the Turks. He was subsequently Governor of St. Petersburg and field marshal.—**DMITRI ALEXEYEVITCH GOLITZIN** (1735-1803) was a well-known diplomat and man of letters. From 1765 to 1773 he was Russian Ambassador at Paris, where he lived in close touch with Voltaire and other literary men of the time. In 1773 he became Ambassador at The Hague, whence, on the outbreak of the French Revolution, he retired to Germany, where he devoted himself to the study of the physical sciences. He wrote: *Description physique de la Tauride* (1788); *Traité de minéralogie* (1792); *L'Esprit des économistes* (1796).—His wife, **ADELHEID AMALIE** (1748-1806), was a fervent Catholic. She made her home at Münster and became the centre of a band of religious enthusiasts and mystics, whose efforts were directed towards counteracting the prevailing materialism of the age. Her son **DMITRI** was a Catholic missionary in the United States. (See **GALITZIN**, **DMITRI**).—**ALEXANDER NIKOLAYEVITCH GOLITZIN** (1774-1844) was one of the most influential counselors of Alexander I, with whom he had been brought up. He became Procurator of the Holy Synod in 1803 and from 1817 to 1824 was Minister of Education and Public Worship. His liberal views aroused the opposition of the conservative element among the clergy, and with the accession of Nicholas I he lost all influence. (Consult **Angelo S. Rappoport**, *The Curse of the Romanoffs*, London, 1907).—**EMANUEL MIKHAILOVITCH GOLITZIN** (1804-63) was born in Paris and studied at the Ecole Polytechnique under Gay-Lussac. He entered the Russian army in 1825 and distinguished himself at the storming of Varna (1828), but retired from the army in the following year. He led a life of dilettante scholarship in the capitals of western Europe, his chief interest lying in geography. He contributed to the *Bulletin de la Société de Géographie* in Paris and translated Ferdinand von Wrangel's *Voyage to Siberia* from the Russian. He also wrote *La Russie du 17ème siècle dans ses rapports avec l'Europe occidentale*, which was published two years after his death.—**NIKOLAI SERGEYEVITCH GOLITZIN** (1808-92) entered the army in 1825 and rose to be lieutenant general. He wrote *A Military History of the World from the Most Ancient Times* (13 vols., 1872 et seq.).

GOLIUS, גוליוס, **JACOBUS** (1596-1667). A Dutch Orientalist and mathematician, born at The Hague and educated at the University of Leyden. In 1624 he became professor of Arabic at Leyden and in 1629 professor of mathematics. He wrote *Lexicon Arabico-Latinum* (1653).

GOLLANCZ, גולאנקס, **ISRAEL** (1864-). An English scholar, professor of English literature in King's College, University of London, and secretary of the British Academy. He was born in London, graduated from Cambridge (B.A., 1887; M.A., 1891), became lecturer in English at University College, London (1892-95), and lectured in university extension courses and at Cambridge. He edited and translated many Old and Middle English texts, as the *Pearl* (1891), Cynewulf's *Christ* (1892), and the *Exeter Book* (1895). He edited the *Temple Shakespeare* (1894-96) and *Hamlet in Iceland* (1898). In 1913 he was, as he had been for some years previous to that date, general editor of *The King's Library*.

GOL'OMYN'KA. See **OIL FISH**; **BAIKAL**.

GOL'ONDRINA. The common green house-swallow (*Tachycineta leucorrhoa*), abundant everywhere south of the Amazonian forests. It is closely related to the white-bellied tree swallow of the United States, and, like that and other species, has forsaken its native wildness and custom of nesting in hollow trees for intimate association with men, and nest making beneath the eaves of buildings. It is richly green, with a white breast and rump. Many interesting things are related of it by Hudson, *Naturalist in La Plata* (4th ed., London, 1903). See **SWALLOW**.

GOLOSHES, ג'לוש'עז (Fr. *galoches*, ML. *calopedes*, Gk. *καλοπέδιον*, from *καλον*, *good* + *π'εδος*, *foot*). Originally wooden sandals or shoes; later, large, high overshoes; now, warm and heavy overshoes of rubber and cloth, buckling around the ankle. See **SHOES**.

GOLOVATSKY, ג'ול'ו-וויט'סקי, **YAKOV FEODOROVITCH** (1814-88). A Russian (Ruthenian) ethnographer, born in Czepiele, eastern Galicia. After study at Pest and Lemberg, he became professor of the Russian language and literature at the University of Lemberg in 1848. From 1867 he resided in Russia. His chief work is a collection of the folk songs of the Russian peoples in Galicia, Hungary, and Bukowina, *Narodnyia p'sni Galickoi i Ugorskoï Rusi* (1878).

GOLOVNIN, ג'ול'ו-נ'נ'ן. A native settlement on Golovnin Bay, Alaska, 10 miles east of Bluff. It has a population of about 200. The United States maintains a school, and the Swedish Evangelical Union conducts a mission. The natives have reindeer herds exceeding 2000 head. See **SEWARD PENINSULA**, **ALASKA**.

GOLOVNIN, **VASSILI MIKHAILOVITCH** (1776-1831). A Russian sailor and explorer, born at Ryazan. He served in the English navy under Nelson and Cornwallis, and on his return to Russia in 1806 was put in command of the sloop *Diana* to make a trip of exploration around the world. In 1811 he was captured in Japan and kept prisoner until 1813. A second trip around the world was made (1817-19) in the Russian corvette *Kamchatka*. From 1821 till his death he held the highest positions in the Russian navy, dying with the rank of vice admiral. His complete works, which contain descriptions of both voyages and of his adventures while in captivity, were published in five volumes at St. Petersburg in 1864. Golovnin Bay and Golovnin Sound, in Bering Sea, are named for him.

GOLP, or **GOLPE**. A heraldic charge. See **HERALDRY**.

GOLTERMANN, gól'tér-mán, GEORG EDUARD (1824-98). A German violoncellist and composer. He was born at Hanover and received his musical education under Prell, Menter, and Lachner. After completing his studies he traveled for two years giving concerts, in which he frequently performed his own highly successful compositions. In 1852 he received a position as musical director at Würzburg and in the following year was appointed assistant conductor of the orchestra of the Stadttheater at Frankfurt on the Main, of which he became chief conductor in 1874. Besides a symphony (1851) and two *Festspiel-Overtures* (op. 24 and 94), his compositions include sonatas, songs, and numerous works for the violoncello.

GOLTER, gól'tér, WOLFGANG (1863-). A German writer on ancient and mediæval German legends. He was born in Stuttgart and was educated at the University of Munich. In 1895 he became professor of German philology at Rostock, where he was rector of the university in 1909-10. He wrote: *Das Rolandslied der Pfaffen Konrad* (1887); *Die Sage von Tristan und Isolde* (1887); *Studien zur germanischen Sagen-geschichte* (1888); *Geschichte der deutschen Litteratur im Mittel-Alter* (1891); *Deutsche Heldensage* (1894; 2d ed., 1909); *Götterglaube der Germanen* (1894; 2d ed., 1911); *Handbuch der germanischen Mythologie* (1895); *Die sagen-geschichtlichen Grundlagen der Ringdichtung Richard Wagners* (1902); *Wagner als Dichter* (1904); *Altnordische Literaturgeschichte* (1905); *Religion und Mythos der Germanen* (1909); *Die deutsche Dichtung im Mittel-Alter* (1912); *Parsifal und der Gral* (1913); and edited various early texts and Richard Wagner's letters and (1914) his collected works.

GOLTZ, gólts, ALEXANDER D. (1857-). An Austrian historical and decorative painter. He was born in Hungary, of German parentage, but was brought up in Vienna. Beginning to paint at his fourteenth year, he studied in the academies of Vienna and Munich, especially under Feuerbach, and at Paris with Puvis de Chavannes. One of the most prominent contemporary painters of Austria, he is represented especially in the museums of Vienna: in the Hof Museum by "Christ and the Women," in the Municipal Museum by "A Peasant Madonna," and in the Moderna Gallerie by "Vintage in Lower Austria." He is widely known as a decorative painter, having painted the curtains of the court theatre at Wiesbaden, and of the city theatre at Salzburg, and decorated the aula of the University of Graz. He painted, besides, many portraits and figures, and landscapes, chiefly of his home in Lower Austria.

GOLTZ, AUGUST FRIEDRICH FERDINAND, COUNT VON DER (1765-1832). A Prussian statesman, born at Dresden and educated at Leipzig and Frankfurt on the Oder, where he studied law. He was Prussian Ambassador to Denmark, Sweden, and Russia; was the Plenipotentiary of Prussia at the Congress of Erfurt (1808); and concluded the last negotiations (1812) with France under direction of Hardenberg. After the termination of the Napoleonic wars he was appointed Prussian Councillor of State (1817), and was member of the Bundestag of Prussia in 1817-24.

GOLTZ, BOGUMIL (1801-70). A German humorist, satirist, and moral philosopher. He

was born in Warsaw, attended the Gymnasia at Marienwerder and Königsberg, studied agriculture from 1817 to 1821, and for a time attended lectures on philosophy and philology at the University of Breslau. In 1823 he purchased, near Thorn, an estate which he subsequently abandoned to settle in Gollub and devote himself to the study of literature and æsthetics. In 1847 he removed to Thorn, whence he made extensive travels and where he died. In 1847 appeared his *Buch der Kindheit*, in which, with a mystic tenderness akin to that of Jean Paul, he depicts the impressions of his own childhood. This was followed by *Ein Jugendleben* (1851), in similar vein. *Der Mensch und die Leute* (1858) is a penetrative and peculiarly original study of various races, *Die Deutschen* (1860) revealing the same method applied to the German national genius. He was a profound though eccentric thinker; but his style, though often spirited, lacks technical finish and frequently displays the grotesqueness of Jean Paul without the latter's imagination. His further works include: *Ein Kleinstädter in Aegypten* (1853); *Typen der Gesellschaft* (2 vols., 1860); *Feigenblätter* (1861-64); *Die Bildung und die Gebildeten* (1864); *Die Weltklugheit und die Lebensweisheit* (1869).

GOLTZ, FRIEDRICH (1834-1902). A German physiologist, born at Posen. He was educated at Königsberg and was there appointed a professor in 1865. In 1870 he became professor of physiology at Halle and from 1872 to his retirement in 1901 occupied a similar chair at Strassburg. His most important researches concern the functions of the nerve centres and in particular reflex nervous action. His writings include: *Beiträge zur Lehre von den Funktionen der Nervencentren des Frosches* (1869) and many contributions to the *Archiv für pathologische Anatomie, Physiologie und klinische Medizin* of Virchow.

GOLTZ, KOLMAR, BARON VON DER (1843-1916). A German soldier and military author. He was born at Bielkenfeld, East Prussia, was educated at the Military Academy, Berlin, and served in the Austro-Prussian War of 1866. After the Franco-German War, in which he participated, he was appointed to the historical department of the general staff at Berlin and subsequently became instructor in the Military Academy. He resigned from the German service in 1883 and entered that of Turkey, where he conducted the department of military education until 1896. In that year he returned to Germany and was made general of division. He became general of infantry in 1900, commander of the First Army Corps in 1902, in 1907 general inspector of the Sixth Army Corps, in 1908 lieutenant general, and in 1908-10 he reorganized the Turkish army. Made general field marshal in 1911, he was afterward general inspector of the Second Army Corps until 1913. In August, 1914, he was appointed military governor of Belgium after the German armies had successfully invaded that country and captured Brussels. (See **WAR IN EUROPE**.) His works include: *Léon Gambetta und seine Armee* (1877; also translated into French, 1877); *Das Volk in Waffen* (4th ed., 1890); *Der thessalische Krieg und die türkische Armee* (1898); *Krieg- und Heerführung* (1901); *Von Jena bis Eylan* (1907); *Kriegsgeschichte Deutschlands im XIX. Jahrhundert* (1910).

GOLTZ, MAX, BARON VON DER (1838-1906).

A German naval officer, born at Königsberg. He entered the Prussian marine in 1853, was appointed naval ensign in 1859, in 1870 was detailed for service in the Ministry of Marine, and in 1875 attained the rank of captain. During the disturbances in Egypt in 1882 he was commanding officer of Germany's Mediterranean squadron, in 1888 became vice admiral and commander of the Wilhelmshaven Naval Station, and in 1895 was retired, with the rank of admiral, at his own request.

GOLTZ, THEODOR, BARON VON DER (1836-1905). A German agriculturist, born at Coblenz and educated at Erlangen and Bonn. In 1802 he was appointed instructor at the Royal Academy of Waldau, East Prussia, into which province he introduced the first agricultural schools. He was professor of agriculture at Königsberg from 1869 to 1875, when he was appointed director of the Agricultural Institute in that city. In 1885 he was made professor of agriculture at Jena and in 1895 at Bonn. His publications include: *Die landwirtschaftliche Buchführung* (9th ed., 1903); *Landwirtschaftliche Taxationslehre* (3d ed., 1903); *Agrarische Aufgaben der Gegemcart* (2d ed., 1895); *Leitfaden der landwirtschaftlichen Betriebslehre* (1897; new ed., 1911); *Vorlesungen über Agrarwesen und Agrarpolitik* (1899); *Handbuch der landwirtschaftlichen Betriebslehre* (1896; 4th ed., 1912); *Geschichte der deutschen Landwirtschaft* (1902-03).

GOLTZIUS, gól'tsi-us, HENDRIK (1558-1616). A Dutch line engraver and painter. He was born at Millebrecht, near Venloo, of a family of artists. He was a pupil of Coornheert, and of Philip Galle, at Haarlem, where he later set up as a printer. In 1850 he began a tour of several years through Germany and Italy; he was much influenced by Michelangelo. In his later years he executed several paintings in a mannered Italian style, much inferior to his engravings. In his command of the burin Goltzius was hardly surpassed by Dürer himself, although he lacked the latter's imagination and invention. He made great progress in the plastic treatment of engraving, his modeling being especially fine. His remarkable ability to adapt his technique to any style is evinced in his six master prints: "The Annunciation," after Raphael; "The Visitation," after Parmeggiano; "The Adoration of the Shepherds," after Bassano; "The Holy Family," after Baroccio; "The Adoration of the Kings," after Lucas van Leiden; and "The Circumcision," after Dürer. However excellent in technique, most of his engravings, of which about 330 survive, are mannered in form and hollow in content. His engraved portraits, however, are excellent in finish as in characterization. One of the best is the life-size portrait head of the artist himself.

GOLUCHOWSKI, gól'ú-kóv'ski, AGENOR, COUNT VON (1812-75). An Austrian statesman, born in Galicia and educated at the Jesuit Convent of Tarnopol and at Lemberg. He entered government service and was Governor of Galicia from 1847 till 1850, when he was made Minister of the Interior. He gave up this position in 1860 and the next year entered the House of Lords. In 1866-67, and from 1871 until his death, he was again Governor of Galicia and very active in favoring the thorough Polonization of the province.

GOLUCHOWSKI, AGENOR, COUNT (1849-). An Austrian statesman, son of the preceding. He was early in the diplomatic service

as attaché at Berlin (1872), attaché and counselor at Paris, and Minister at Bucharest (1887-94). As Austro-Hungarian Minister of Foreign Affairs (1895-1906), he made the maintenance of the Triple Alliance and especially of close relations with Germany the basis of his policy; temporarily, as it proved, he adjusted with Russia Balkan difficulties; he arranged for concerted action of the European powers during the Armenian difficulties of 1896, and again in 1902 urged joint action in obliging the Sultan to grant reforms in Macedonia. In 1905 he also led the concert of Powers in forcing Turkey by an international naval demonstration to accept European control of Macedonian finances. The Hungarians, who hated Goluchowski, finally compelled him to retire from the ministry.

GÓMAR, gó'mä-rä, FRANCISCO LÓPEZ DE (1510-c.1560). A Spanish historian, born at Seville. He studied at the University of Alcalá and became professor of rhetoric there. Leaving the university, he took orders and about 1540 became secretary and chaplain to Hernando Cortés. In this capacity he may have gone with him to America, but it is not probable. He wrote one of the first histories of America, which, however, is not reliable. The title of the work is *Historia general de las Indias con la conquista de México y de la Nueva España* (1552-53). The second part of this work described Mexico and was reprinted as a separate volume, *Crónica de la Nueva España, con la conquista de México* . . . (1554). A modern edition, with a biography, is in the *Biblioteca de autores españoles*, vol. xxii (Madrid, 1884).

GOMARUS, FRANCIS (1563-1641). The most strenuous opponent of Arminius. He was born at Bruges, Jan. 30, 1563, studied at Neustadt, Heidelberg, Oxford, and Cambridge, where he received the degree of B.D. in 1584. He was pastor of the Reformed church at Frankfurt from 1587 till 1594, when he became professor of theology at Leyden. Here he signalized himself by his vehement opposition to the views of Arminius, who became his colleague in 1603. In the disputation at The Hague in 1608 his zeal was very conspicuous; and at the Synod of Dort (1618-19) he was mainly instrumental in securing the expulsion of the Arminians from the Reformed church. Gomarus resigned his professorship when, after the death of Arminius, an Arminian was appointed to the vacancy (1609). He was professor at Saumur (1614-18) and at Groningen from 1618 till his death (Jan. 11, 1641). Though prejudiced, even bigoted, and more Calvinistic than Calvin himself, nevertheless Gomarus was a man of learning, and not the contentious personage he is sometimes represented. His works were published at Amsterdam after his death (1645). Those who sided with Gomarus in the Arminian controversy are often called, from his name, Gomarists. See ARMINIUS, JACOBUS; ARMINIANISM; DORT, SYNOD OF.

GOMBERG, MOSES (1806-). An American chemist. He was born at Elizabetgrad, Russia, where he was educated at the Gymnasium; in 1890 he graduated from the University of Michigan (M.S., 1892; Sc.D., 1894); and he also studied at the universities of Munich (1890-97) and Heidelberg (1897). At the University of Michigan he became instructor in chemistry in 1893, assistant professor of organic chemistry in 1899, junior professor in 1902, and full professor in 1904. He is author of con-

tributions to the *Journal of the American Chemical Society*, the *Berichte der Deutsche Chemische Gesellschaft*, and other periodicals, dealing especially with quino-carbonium salts, tetraphenylmethane, and trivalent carbon.

GOMBERVILLE, gŏn'bār'vél', MARIN LE ROY, SIEUR DU PARC ET DE (1600-74). A French novelist of considerable imaginative originality, one of the first to make the novel a vehicle of exotic and geographic description and of historic information. He was born in Paris and was a wealthy nobleman, a cherished member of the Précieux bluestocking circle, to whose vocabulary he contributed some gems, as may be seen from Somaise's *Dictionnaire des précieuses*. While still a youth, he wrote *Carthée* (1621), whose heroine furnished the type for Sorel's burlesque *Dulcinea* in the *Berger extravagant*. Eleven years later Gomberville published the first draft of *Polexandre* (1632), which he extended in 1634 by the injection of a story of Mexican adventure, and, since this piqued curiosity, he again greatly extended the story in 1637. Meantime Gomberville had aided in founding the Academy. A few years later he fell under the influence of Port-Royal, and, in penitential regret for having amused a worldly generation, he published *Young Alcidiade* (1652). He was a facile polygraph, but *Polexandre*, which in its final shape contains 4409 closely printed pages, is his only significant work. It rejuvenated the interest in the romance of chivalry by transporting it to the New World in a generation whose imagination was intoxicated by strange voyages and undreamed-of conquests. The story is almost wantonly inartistic, but Gomberville is the first important pedagogue of fiction, bent on remolding the "perfect lives" of the old romances into a model for the gentlemen of the seventeenth century. He died in Paris, June 14, 1674. Consult Körting, *Geschichte des französischen Romans im XVII. Jahrhundert*, vol. i (2d ed., Oppeln, 1891), and R. Kerviler, *Marin Le Roy de Gomberville* (Paris, 1876).

GOMBO. See HIBISCUS.

GOMBROON'. See BENDER ABBAS.

GOMEL, gŏ'mély', or **HOMEL**. A district town of the Russian Province of Mohilev, situated on the Soje, an affluent of the Dnieper, about 113 miles southeast of Mohilev (Map: Russia, D 4). It is the centre of the Russian hop industry, lies on two railway lines, has a number of sugar refineries, paper and oil mills, and a good river trade with Mohilev and Kiev. Pop., 1897, 36,846; 1911 (est.), 47,000, mostly Jews. There was a massacre of Jewish inhabitants in September, 1903.

GOMER. The form of powder chamber generally used in smoothbore guns. It was in the form of the frustum of a cone with a hemispherical end, the base of the cone joining the cylinder of the bore. The name was derived from that of its inventor.

GOMER (Heb.; Ass. Gimirrai, Bab. Gimir, Gk. Κίμμεριος, *Kimmerioi*, Lat. Cimmerii, Armen. Gamir'). An ancient people, probably belonging to the Iranian family of nations. About the beginning of the first millennium B.C. they lived on the northern shores of the Black Sea. Here Homer locates them (*Odys.*, xi, 14). In the reign of Sargon II (722-705) they appear in Asia Minor, where they threaten the Kingdom of Urartu (see CHALDIANS), according to letters sent by Sennacherib to Sargon, and the letters of one of his generals. In the reign of Esarhaddon (681-

668) the Cimmerians were forced by the Scythians, who were in league with the Assyrians, farther west. They fell upon Phrygia and put an end to the kingdom of Midas. When attacked by the Cimmerians, Gyges, King of Lydia (689-655), appealed for help to Asurbanipal (668-625), sending to the Assyrian court a couple of Cimmerian prisoners "whose language no interpreter understood." Sardis was besieged by the Cimmerians (c.657 B.C.), and Gyges fell in the battle with them (c.655 B.C.). In the time of Ardys (655-625), who entered into closer relations with Assyria, the Cimmerians were finally crushed in a great battle in Cilicia, near the Mediterranean. Remnants of them survived in Cappadocia, which was called by the Armenians Gamir. In Gen. x, 2, 3, Gomer appears as the son of Japhet (q.v.). Consult: Rogers, *History of Babylonia and Assyria* (New York, 1900-01); Winckler, *Altorientalische Forschungen*, vol. i (Leipzig, 1897); id., *Die Keilinschriften und das Alte Testament* (3d ed., Berlin, 1902); Alfred Jeremias, *Das Alte Testament im Lichte des Alten Orients* (Leipzig, 1906); Ed. Meyer, *Geschichte des Altertums* (3d ed., Stuttgart, 1913).

GOMERA, gŏ-mā'rā. One of the Canary Islands, situated 20 miles west of Tenerife, in lat. 28° 6' N. and long. 17° 8' W. (Map: Portugal, F 5). Area, 145 square miles. It is of volcanic origin, like the whole archipelago, and has no good harbors. Its elevations, which in some parts of the interior approach 4000 feet, are well wooded with bay and palm trees. Dromedaries are bred, and the chief industry is cattle raising. Some silk and potatoes are exported. Pop., 1900, 15,358; 1910, 19,736. Chief town, San Sebastián de Gomera; pop., 3187.

GOMES DE AMORIM, gŏ'mësh dā il'mô-rân'. FRANCISCO (1827-91). A Portuguese poet and dramatist, born at Avelomar (Minho). Born in poverty, he was sent to Brazil early in life, where he was compelled to labor under severe conditions, yet he found time to study the language and customs of the wild peoples in the primeval forests bordering the Amazon and the Xingu. In 1846 he returned to Portugal; in 1848 wrote "Garibaldi," "A liberdade," and other verses in celebration of that revolutionary year; and though at first compelled for support to learn the hatter's trade, he obtained a post in the government service in 1851 and in 1859 was appointed librarian to the Ministry of Marine and curator of the Museum of Naval Antiquities. In his literary career he was much encouraged by Almeida-Garrett (q.v.), whose *Camões* he read in Brazil, and in regard to whom he wrote the appreciative *Memórias biograficas* (1881), which is in fact a history of the literary movement represented by Garrett. The volumes of poems, *Cantos matutinos* (3d ed., 1874) and *Ephemeris* (2d ed., 1866), were followed by a series of dramas—*Ódio de raça*, *A proibição*, *Figados de tigre*, *Os incógnitos do mundo*, *Ghigi*, *A viúva*, and others—many of which, like *O cedro vermelho* (with a commentary), are derived from Brazilian life. The works of fiction *Os selvagens* (1875), and its sequel, *O remorso vivo* (1876), have the same source. There is a collected edition of Gomes's works in Portuguese (Lisbon, 1866 et seq.), and several of the dramas have been rendered into French by Richon and Denis. Consult Reinhardt-toettner, *Aufsätze und Abhandlungen* (Berlin, 1887).

GÓMEZ, gŏ'más, ANTONIO. See ORSINI, FELICE.

GÓMEZ, ESTEVAN (c.1474-c.1530). A Portuguese navigator. In 1519 he started from Spain with Magellan, as pilot on the *Trinidad*, of which vessel Magellan himself acted as captain; but in the Strait of Magellan he commanded a successful mutiny on the *San Antonio*, to which vessel he had been transferred, and, leaving the rest of the fleet, returned to Spain. Sent by Charles V on a voyage to discover a western passage to the Moluccas in 1524-25, he sailed along the coast of North America, between lat. 40° N. and Newfoundland. It is not known whether he sailed from north to south, or vice versa. The results of his voyage were incorporated in the map of Diego Ribeiro (1529), where the eastern portion of the United States is called *Tierra de Estevan Gómez*. Consult HARRISSE, *Discovery of North America* (London, 1892), and BOURNE, *Spain in America* (New York, 1904.)

GÓMEZ, JOSÉ MIGUEL (1858-1921). A Cuban soldier and politician, born in the Province of Santa Clara. The son of a rich cattle raiser, he spent much of his life in this occupation. He served with distinction in the patriot army during the Ten Years' War (1868-78) and again in the revolution of 1905, rising to the rank of major general. During the First American Intervention he was Governor of the Province of Santa Clara and a member of the Constitutional Convention. He was again Governor of Santa Clara under the presidency of Estrada Palma. In 1905 he was the candidate of the Liberal party for the presidency, but withdrew before the election, claiming that the Conservative (administration) party were using corrupt means to secure the victory. His activity in the revolution of 1906 against the régime of Estrada Palma was cut short by his arrest at the beginning of the movement and his imprisonment in Havana, where he remained until the Second American Intervention began. In 1908 he was elected President by the Liberals, and on Jan. 28, 1909, Governor Magroon turned over the government to the new President. Laws were immediately passed legalizing cockfights and the lottery and establishing long-distance telephones. There was much extravagance in the administration of finances during his term. Charges of corruption led in 1912 to a revolt, which was crushed, and a year later President Gómez quietly retired from office.

GÓMEZ, JUAN VICENTE (1859-). A Venezuelan politician, born in San Antonio de Tachira. He devoted his early life to agricultural pursuits and entered politics in 1892. Having been elected Vice President, he was left in charge of the government by General Castro when the latter went to Europe in 1908. Learning of a plot for his own assassination, Gómez assumed control of affairs and was chosen provisional President. He at once adjusted the difficulties in which Castro's acts had involved Venezuela with various foreign countries. In 1910 he was elected constitutional President for a term of six years. Consult J. HUMBERT, "Le Président Gómez et la politique Vénézuélienne," in the *Bulletin de la Bibliothèque Américaine* (Paris, 1910).

GÓMEZ DE AVELLANEDA Y ARTEAGA, gŏ'máth dā ā'vél-yā-nā'thā ē ā'r'tā-ā'gā, GERTRUDIS (1814-73). A Spanish poet drama

tist, and novelist, born on the island of Cuba, where her father, a naval officer, was then serving. In 1840 she went to Madrid and in the same year produced a successful drama, *Leoncia*. She wrote many novels, among which are *Dos mujeres* (1842), *Espatolino* (1844), and *El mulato Sab* (1839), this last-named work being a tale resembling *Uncle Tom's Cabin*; but they are mostly forgotten, and she survives as dramatist and poet. In addition to *Leoncia*, she wrote several other dramas, chief of which are *Saúl* (1849), one of the most daring and happy strokes of genius that Spain has seen, and *Baltasar* (1858), a classic drama with a biblical subject and considered by most critics her masterpiece. Her *Poesías líricas* first appeared in 1841, and critics have been unanimous ever since in proclaiming her without a rival of her sex among writers of Castilian in the nineteenth century. Fitzmaurice-Kelly, who is not fond of superlatives in criticism, goes so far as to say that Doña Gertrudis has no superior (with the single exception of Christina Rossetti) among modern poetesses in any language. A single example will show how her work was judged even when it was not known to be hers. At a literary competition held by the Liceo de Madrid in 1845 two prizes were offered for the two odes that should most worthily praise the Queen's clemency in pardoning a certain political criminal. Doña Gertrudis presented two odes—one signed with her own name and the other with that of her maternal half brother, Felipe de Escalada—and won both prizes. The Liceo then voted her a crown of honor, which was placed upon her head by the Infante Francisco de Borbón. Her *Obras literarias*, vols. i-v (Madrid, 1869-71), are still incomplete.

GÓMEZ-FARÍAS, gŏ'más-fā-rŏ'ās, VALENTÍN (1781-1858). A Mexican statesman. He was born and educated at Guadalajara, where he received a professorship in the university in 1810. He was a pronounced Liberal in the First Constituent Congress, became Vice President upon the election of Santa Anna, and assumed the reins of government upon the absence of the latter (April 1, 1833). In consequence of his pronounced antagonism to the Church party, he was, after a constant struggle of two years against continuous opposition, compelled to resign in 1835 and exiled. Although received by the masses with general acclamation upon his return, his political influence aroused the fears of the party in power, and, after suffering imprisonment and vainly endeavoring to foment a revolution, he was again banished. He was again Vice President at the time of the war with the United States, when Santa Anna was compelled to take the field. After the abolition of the vice-presidential office he became a member of Congress. He later took an active part in overthrowing the dictatorship of Santa Anna and became Postmaster-General under his successor Alvarez.

GÓMEZ Y BÁEZ, gŏ'más ē bi'ās, MÁXIMO (1826-1905). A Cuban general, born at Bani, Santo Domingo. He served in the Spanish army in Santo Domingo and in Cuba, but in Cuba he became disgusted with Spanish rule. He left the Spanish army, settled down as a planter, and in the insurrection of 1868-78 joined the insurgents and was made colonel by the Cuban President Céspedes. He was active and able and after Agramonte's death was put in command of

the insurgents in Puerto Príncipe. When peace was signed with Campos in 1878, Gómez went to Jamaica and then to Santo Domingo, where he lived on his farm until 1895, when the second revolution broke out. He became general in chief of the forces of the Republic of Cuba and was especially active in Puerto Príncipe, where his perfect familiarity with the country stood him in good stead. He did little open fighting, but accomplished much by harassing the Spaniards and destroying their supplies. He put his small force at the disposal of the Americans as soon as they landed in Cuba and was markedly friendly to this country. In March, 1899, he was deposed from his supreme command by the Cuban Military Assembly for receiving for his army the \$3,000,000 voted by the United States government, but his general popularity remained undiminished, and the city of Havana gave him the summer home of the former Spanish Governor-General. Among his sketches of warfare in Cuba are *Panchito Gómez* and *Mi Escolta* (1896). Consult Carrillo, *In the Saddle with Gómez* (New York, 1898).

GOMME, göm, SIR (GEORGE) LAURENCE (1853-1916). An English antiquary and folklorist, born in London. He became statistical officer and later clerk to the London County Council, was the founder of the Folklore Society, an organization that has done important work in the preservation of records of the rural customs of England. Of this society he was elected successively secretary, president, and vice president. He was also appointed a lecturer in the London School of Economics and edited the *Archæological Review*, the *Folklore Journal*, and the *Antiquary*. In 1911 he was knighted. His publications include: *Primitive Folk-Moots* (1880); *Folklore Relics of Early Village Life* (1883); *The Village Community* (1890); *Ethnology in Folklore* (1892); *Lectures on the Principles of Local Government* (1897); *Folklore as an Historical Science* (1908); *The Making of London* (1912).

GOMORRAH. See SODOM and GOMORRAH.

GOMPERS, SAMUEL (1850-1924). An American labor leader, born in London, England. Apprenticed to the trade of cigar making, he came to the United States in 1863 and in 1864 became the first registered member of the Cigar-Makers' International Union, of which he was secretary and president, and which he made one of the most successful of American trade unions. He was elected vice president of the American Federation of Labor, which he helped to organize in 1881, and from 1882, with the exception of the year 1894, when he was defeated by John McBride, representing the coal miners, was its president. Under his direction the American Federation of Labor grew into a powerful organization, including most of the stronger and more conservative unions of the country. Its influence in politics has been exerted for the most part indirectly, but has counted in such matters as the extension of the eight-hour day to work on government contracts, the short-hour movement in enterprises of a public-service character, employers' liability laws, etc. In 1908 Gompers sought, without marked success, to throw the strength of the Federation to the Democratic party, on the ground that the Republican candidate was unfriendly to organized labor. He consistently opposed socialistic tendencies in the labor movement and actively promoted industrial concilia-

tion. He served as first vice president of the National Civic Federation. In 1907 Gompers and other officers of the American Federation were enjoined by a Federal court from publishing the name of the Buck Stove and Range Company in the list of "unfair" concerns in the organ of the Federation. In consequence of failure to observe the injunction he was tried for contempt and sentenced to a term in prison. Through successive appeals the case was dragged out until 1914, when the Supreme Court decided that further action was barred by the Statute of Limitations.

GOMPERZ, göm'perts, THEODOR (1832-1912). An Austrian classical scholar. He was born at Brünn and studied at Brünn and at the University of Vienna, where he was professor of classical philology from 1860 to 1901, when he entered the House of Peers. He is best known for his decipherment of the papyri at Herculaneum (q.v.). He wrote, besides many other works and articles: *Demosthenes der Staatsmann* (1864); *Philodemi de Ira Liber* (1864); *Herculaneische Studien* (2 vols., 1865-66); *Beiträge zur Kritik und Erklärung griechischen Schriftsteller* (7 vols., 1875-1900); *Die Bruchstücke der griechischen Tragiker und Cöbets neueste kritische Manier* (1878); *Herodoteische Studien* (1883); *Zu Philodems Büchern von der Musik* (1885); *Platonische Aufsätze* (3 vols., 1887-1905); *Griechische Denker, eine Geschichte der antiken Philosophie* (3 vols., 1893-1900; vols. i and ii in a second edition, 1911-12; translated into English by Magnus and Berry, 4 vols., New York, 1905-12). He also edited the German edition of the works of John Stuart Mill (12 vols., 1860-80).

GOMPHOCERAS, göm-fös'e-ras (Neo-Lat., from Gk. γόμφος, *gomphos*, nail, bolt + *keras*, horn). A genus of tetrabranchiate cephalopods, allied to *Orthoceras*, and found in the Paleozoic rocks, with short, thick, straight, or curved shells, and restricted lobate aperture. The siphuncle is situated near the ventral wall and is usually beaded. The shell, when curved, turns away from the ventral side. *Gomphoceras* presents variations that grade towards *Phragmoceras*, of which it perhaps presents, in a loose sense, an ancestral stage. About 150 species of *Gomphoceras* have been described from rocks of Ordovician and Silurian age of Europe and North America. They are especially abundant in the Silurian basin of Bohemia. See CEPHALOPODA; ORTHOCERAS; NAUTILUS.

GOMPHOSIS (Neo-Lat., from Gk. γόμφωσις, a nailing together, from γόμφω, *gomphōō*, to nail, from γόμφος, *gomphos*, nail, bolt). A joint in which one bone is implanted into a process in another bone, as in the case of the teeth, implanted into the alveolar processes of the jaw.

GOMUTI, gō-mōo'ti (Malay), ARENG, or EJOO PALM, also called WINE PALM (*Arenga saccharifera*). An important palm which grows in dry ground in Cochin China and in the interior of Java, Sumatra, Celebes, and Amboyna. The stem is 20 to 40 feet high; the pinnated leaves 15 to 25 feet long. The flowers, which are produced but once, are in bunches 6 to 10 feet long, succeeded by yellowish-brown, three-seeded, extremely acid berries of the size of a small apple. The stem, when young, is entirely covered with sheaths of fallen leaves, and black horsehair-like fibres, which issue in great abundance from their margins; but as the tree increases in age, these drop off, leaving a beauti-

ful naked columnar stem. The strongest of the fibres, resembling porcupine quills in thickness, are used by the Malays as styles for writing on the leaves of other palms. The finer fibres, or Ejoo fibre, well known in Eastern commerce as gomuti, are by far the most valuable. They are much used for making strong cordage, particularly for the cables and standing rigging of ships, European as well as native. Want of pliancy renders them less fit for running rigging and for many other purposes. They need no preparation but spinning or twisting. No ropes of vegetable fibre withstand wet as well as those made of gomuti fibre. At the base of the leaves of the gomuti palm there is a fine woolly material, called bara, much employed in calking ships and stuffing cushions. The saccharine sap, obtained in great abundance by cutting the spadices of the flowers, is evaporated to make a brown sugar, the so-called jaggery. It is also a beverage and by fermentation yields an intoxicating wine (neroo), from which a spirituous liquor called brum is made. According to Roxburgh, the pith of the tree yields sago, as much as 150 pounds being taken from a single specimen. After fruiting, the tree dies, and the stems, which become hollow, are used for troughs, spouts, etc. The young fruits are employed for making preserves.

GONAÍVES, gô'ná'iv'. A seaport town of Haiti, with an excellent harbor, situated on the west coast, about 67 miles northwest of Port-au-Prince (Map: West Indies, D 3). It is a prosperous place, with a large trade in cotton, coffee, and logwood. It has played a prominent part in the history of Haiti; Dessalines proclaimed the independence of the country here (Jan. 1, 1804). In 1914 two important battles were fought here between the rebels and the government forces. Its population is estimated at 13,000. Gonaïves is the seat of a United States consul.

GONAQUAS, gô-ná'kwáz. A mixed Hottentot-Kaffir people of Cape Colony. See GRIQUAS.

GONÇALVES DIAS, gôn-sil'vêsh dē'ish, ANTONIO (1823-84). A Brazilian poet, born in Maranhão. He was educated at the University of Coimbra, Portugal, but, returning to Brazil in 1846, there published his first volume of poems, *Primeiros cantos*, which won him immediate fame. Two years later his *Segundos cantos* appeared. In 1849 he was chosen to fill the newly created chair of Brazilian history in the Imperial College of Pedro II. The publication in 1851 of his *Últimos cantos* practically closed his poetical activity, for in that year he was appointed to investigate educational conditions in northern Brazil. In 1852 he was sent to Portugal to collect from the archives there documents relating to Brazilian history, and in 1860 he was a member of a scientific expedition to Ceará to report on history and ethnography. His last years were spent in Europe in declining health, and he died at sea during a storm which sank the ship and with it his remains and the results of his last three years' labors. Possessing the blood of the three races of Brazil, he represents that which is most national in her poetry, besides being the bard of the Indians. His writings include history, drama, and lyric poetry, in the latter of which he ranks first in Brazil. Besides his *Cantos*, his writings include the epic *Os Tymbiras* (1857), *Dicionário da língua Tupy* (1858), *Historia dos Jesuitas de*

America (incomplete), and numerous reports on his special commissions. Consult his *Obras posthumas . . . precedida de uma noticia de sua vida e obras pelo Dr. A. Henriques Leal* (Maranhão, 1868), and Verissimo, *Estudos de literatura brasileira, segunda serie* (Rio de Janeiro, 1901).

GONCHAROV, gôn'chá-rôf', IVAN ALEXANDROVICH (1812-91). A great Russian novelist. He was born at Simbirsk, of a very wealthy family. At 10 he was sent to school at Moscow, whence he went to visit his home only during vacations. Completing his university course in 1836, he accepted a position in the Ministry of Finance. His literary career began with *A Common Story* (1847), which had a great success. In 1856-57 he published the *Frigate Pallas*, a collection of letters describing his voyage around the world, made in the frigate *Pallada*. These letters constitute one of the choicest works of the kind in Russian literature. In 1858 he wrote the novel *Oblomov* and a little later was appointed to a position in the Department of Censorship. Then he became editor of the official organ, the *Northern Post*, and retired with a pension in 1873. In 1868 his *Precipice* appeared in the *Messenger of Europe* and greatly aroused the public and critics by the caricature of Young Russia in the dissolute Volokhov. His later short sketches and critical essays, the most striking of which is *A Million Tortures*—a powerful analysis of *The Woes of Wit* by Griboedov (q.v.)—added little to the fame of the author of *Oblomov*, a masterpiece which ranks with the best novels of Tolstoy and Turgenev (qq.v.). The diseased will and chronic indolence which its hero, Oblomov, typifies have given Russia the term "Oblomovism." The power of generalization reached here by the author has never been surpassed in Russian literature. The best complete edition of his works was published at St. Petersburg in 1886-87. Consult: Morezhkovsky, *Dostoyensky, Goncharov, Maikov* (St. Petersburg, 1908); Vengerov, *Drushinik, Goncharov, Pisemsky* (ib., 1911); Liatsky, *Goncharov: His Life, Personality, and Work* (ib., 1912). In English a good brief study may be found in Kropotkin's *Russian Literature* (New York, 1905).

GONCOURT, gôn'kôor', EDMOND DE (1822-96) and JULES DE (1830-70). Brothers, important in the development of French fiction. They fostered naturalism by the minuteness of their observation and so continued the naturalistic method of Flaubert and regarded themselves as masters of a school in which Zola was the most brilliant pupil; while, on the other hand, in the tortured artificiality of their style they preface the painful striving of the Symbolists (q.v.) to express feeling and emotion by sound. Their intensely modern style, often bizarre, sometimes intentionally faulty, always achieving its effect, made all their contemporary novelists in some degree their debtors, while it estranged the general public. Their work consists of unimportant dramas, of minute and valuable studies in the social life of the French eighteenth century: *Histoire de la société française pendant la révolution* (1854); *Histoire de la société française pendant le directoire* (1855); *La révolution dans les mœurs* (1854); *Portraits intimes du XVIIIème siècle* (1856-58); *Maria Antoinette* (1858); *Les maîtresses de Louis XV* (1860-70); *La femme au XVIIIème siècle* (1862); *L'Art au XVIIIème siècle* (1874); *L'Amour au XVIIIème*

siècle (1877); to which Edmond added historical studies of *Watteau* (1876), *Prud'hon* (1877), and *Les actrices au XVIIIème siècle* (1855-90); of articles that first directed French attention to Japanese art; and, finally, of novels: *Charles Demailly* (1860); *Sœur Philomène* (1861); *Renée Mauperin* (1864); *Germinie Lacerteux* (1865); *Manette Salomon* (1867); *Madame Gervaisais* (1869); to which Edmond added: *La fille Elisa* (1878); *Les frères Zemganno* (1879); *La Faustin* (1882); *Chérie* (1884). All these are minutely realistic, composed of facts and observations strung together without much regard for unity of composition. Their observation, however, for all its minuteness is apt to be superficial and morbid. *Germinie Lacerteux* is to be "the clinic of love," and *La fille Elisa* pushes to its utmost paradox the divorce between fiction and conventionality, though in *Renée Mauperin* they succeeded in giving a most characteristic portrayal of the young Parisian society girl. Their ability to reproduce a series of sensations by a series of images is what most attracts. Edmond left the larger part of his fortune to endow an Academy of the Goncourts. This was first organized in 1904 with 10 members, each to receive an annual income of 6000 francs. Every year a prize of 10,000 francs is awarded to the author of a meritorious work in prose. Among the members named by Goncourt in his will were Alphonse Daudet, Léon Hennique, J. K. Huysmans, Paul Margueritte, and the Rosny brothers. Their *Journal* (1887-96) is a most valuable document on the literary movement of their period. Consult: Delzant, *Les Goncourts* (Paris, 1889); Brunetière, *Le roman naturaliste* (ib., 1896); Wells, *A Century of French Fiction* (New York, 1898); Gustave Abel, "Le labeur des de Goncourt," in *Mélanges de Philologie* (Paris, 1901); M. Fuchs, *Leique du Journal des de Goncourt* (ib., 1912).

GONDAR, or **GUENDAR**. The former capital of Abyssinia, in Amhara, situated about 25 miles north of Lake Tsana (Map: Egypt, D 5). It lies on an isolated hill in a spur of the Wogara Mountains, at an altitude of over 6000 feet. It is poorly built, with crooked, narrow streets, and is divided into several parts, which are located at some distance from each other. In former times Gondar had a large number of churches, of which only one is now in perfect preservation. Near by is the ruined fort of Gip, constructed by the Portuguese. The palace is a fine example of Abyssinian architecture. The inhabitants, once estimated at 50,000, now number about 7000, including many monks and other ecclesiastics. Gondar is on the route of the partly constructed railway line from Massawa (q.v.). There are many skilled artisans here, who produce gold ornaments and textiles. Gondar is the seat of the abuna, the head of the Abyssinian church, and has several ecclesiastical schools. Its decline dates from the reign of Theodore II, whose hostile attitude towards the Mohammedans caused a great decrease in the population. Of late years Gondar has shown signs of returning prosperity, and the Mohammedan population is rapidly on the increase. Consult P. H. G. Powell-Cotton, *A Sporting Trip through Abyssinia* (London, 1902).

GONDI, or **GONDY**, gôn'dé', JEAN FRANÇOIS PAUL DE. See RETZ.

GON'DIBERT. A religious epic in elegiac stanzas by Sir William Davenant, begun late in 1649, in Paris, and finished during imprison-

ment in the London Tower. It was published in 1651.

GONDOKORO, gôn-dôk'ô-rô, or **ISMAILIA**, êz'mâ-ê'lê-â. A small settlement in Uganda, capital of the northern province of that protectorate, 1070 miles south of Khartum, situated on the upper Nile, in lat. 4° 55' N. (Map: Egypt, C 6). It was formerly an important trading centre for ivory and slaves. Its commerce began to decline after its annexation to Egypt in 1871, though it is still important commercially as the head of the navigation of the Nile and is the outlet for much of the produce of northern Uganda. It is also a military post of some distinction. Gondokoro figures prominently in the history of the explorations of Africa.

GONDOLA (It.). The ordinary passenger boat used in the canals of Venice. Gondolas were formerly the only means of getting about the city, but they are now being displaced in part by small launches. An ordinary gondola is 30 feet long and 4 or 5 feet wide and is flat-bottomed, so that the draft is light. The bottom rises slightly above water at the ends, while at the bow and stern slender ornamental stem and stern pieces reach to about the height of a man's breast. The stem piece is surmounted by the *ferro*, a bright iron beak of uniform shape, the *rostrisque tridentibus* of Vergil, common to old Roman galleys. There is a covered shelter for passengers in the middle of the boat, which is easily removable. In accordance with a mediæval regulation, gondolas are painted black. The gondolier stands erect, with his face towards the bow, and propels the boat with a forward stroke, making his way through the narrow and often crowded canals with amazing dexterity.

GONDS. An important Dravidian people, inhabiting mainly the Central Provinces of India, but found also in other sections of the country, and numbering about 1,500,000. The wilder and uncivilized tribes of the Gonds, who inhabit the forested hills of the Vindhya and Satpura ranges, preserve more of the primitive Dravidian physical type, social institutions, religious and mythological beliefs and practices than do those whose culture is more advanced, who have to a considerable extent adopted Hinduism, and with whom the higher classes are more or less mixed with Hindu blood. The Gonds are said to have formerly offered up human sacrifices to some of their deities, but now they sacrifice instead an image of straw. The Gond women have a curious festival, called the Gurturua (sugar breaking), in which the men figure to some disadvantage. It often ends in a saturnalia. Among the Gonds the worship of such plagues as smallpox, cholera, etc., prevails, and many of them reverence the dog, the horse, and the tiger to an extraordinary degree. The Gonds are to a large extent monogamous and have many curious marriage and premarital customs. The Gonds are not to be confounded with the Khonds, another Dravidian people to the east of them. Besides the earlier works of Campbell, *Wild Tribes of Khondistan* (London, 1863), and Hislop, *Aboriginal Tribes of the Central Provinces* (Nagpur, 1866), reference may be made to Forsyth, *Highlands of Central India* (3d ed., London, 1889); V. A. Smith, *The Early History of India* (ib., 1908); T. W. Holderness, *Peoples and Problems of India* (New York, 1912).

GONDWANA, günd-wâ'nâ (the land of the

Gonds) (q.v.). A name vaguely applied to a hilly tract in Central India, lying between lat. 18° and 24° 30' N. Most of the region is included in the Central Provinces.

GON'ERIL. The more wolfish of the unnatural daughters of King Lear, in Shakespeare's tragedy of that name.

GON'FALON (archaic *gonfamon*, OF. *gonfanon*, Fr. *gonfalon*, from ML. *gonfano*, *guntfano*, banner, from OIG. *gundfano*, battle flag, from *gund*, battle + *fano*, *rano*, Ger. *Fahne*, flag). The ensign or standard, indicative of authority, which was carried before, and sometimes by, the chief magistrate (hence called *gonfaloniere*) of many of the Italian cities in the latter part of the Middle Ages. The title was also used by the counts of Vexin, and when Vexin passed to the crown the French King became the "Gonfalonier de S. Denis."

GONG. See TAM-TAM.

GÓNGORA Y ARGOTE, gōn'gō-rà ē ār-gō'tá, LUIS DE (1561-1627). A Spanish poet, born at Cordova. He studied law at the University of Salamanca and there composed the greater part of his erotic poems, romances, and satires. At the age of 45 he took orders, obtained a small prebend in the cathedral of Cordova, and was afterward appointed honorary chaplain to Philip III. Góngora's poetic career divides itself into two periods. In his first or youthful period he yielded himself up entirely to the natural tendencies of his genius and to the spirit of the nation. His lyrics of this period are *villancicos*, *letrillas*, romances, and sonnets in the old genuine Spanish style, and, as regards their caustic satire and burlesque wit, are among the most admirable specimens of the class of poems to which they belong. Góngora, however, wished to outdo all his predecessors and to furnish something wholly new and unheard of; and the result of this unfortunate ambition was the introduction of a new poetic phraseology, called the *estilo culto*, or the 'cultivated style.' From this point the second period in Góngora's literary career dates. To popularize the *estilo culto*, he wrote his *Polifemo*, *Soledades*, and the *Piramo y Tisbe*—productions of the most pedantic and tasteless description, poor in invention and thought, but rich in high-sounding, pompous phrases, and overloaded with absurd imagery and mythological allusions, expressed in language of studied obscurity. In this way he became the founder of a new school, the *Gongoristas*, or *Outleranos*, who even surpassed their master in the depravity of their literary tastes. The baneful influence of Gongorism, a style quite like that of Euphuism in England and that of Marinism in Italy and France, continued down through the eighteenth century. None of Góngora's poems were printed during his lifetime; but in 1627, immediately after his death, they were published at Madrid by his friend Vicuña, as the *Obras en verso del Homero Español*. Some additions are found in the later editions of 1633, 1654, and 1659, as well as in the edition of 1636-49, for which Salcedo Coronel prepared a commentary, made necessary by the studied obscurity of Góngora's style. He died at Cordova. A critical edition of the poet's work is still a desideratum.

Bibliography. Quintana, *Poesías selectas*, vol. iii (Madrid, 1807); Churton, *Góngora: An Historical and Critical Essay, with Translations* (London, 1862); *Poesías escogidas de Góngora, con varias inéditas* (Madrid, 1863); *Revue His-*

panique, vol. iv (Paris, 1897), containing 49 unedited poems published by Rennert; Foulché-Delbosc, "Note sur trois manuscrits des œuvres poétiques de Góngora," in *Revue Hispanique*, vol. vii (1900), "Vingt-six lettres de Góngora," ib., vol. x (1903), "Poesías atribuidas à Góngora," ib., vol. xiv. (1906), "Bibliografía de Góngora," ib., vol. xviii (1908); Thomas, *Góngora et le gongorisme considérés dans leur rapports avec le marinisme* (Paris, 1911); *Biblioteca de autores españoles*, vol. xxxii (Madrid, 1849-80), unsatisfactory as to text.

GONIATITES, gō'ni-à-ti'téz (Neo-Lat., for **Gonialites*, from Gk. γωνία, *gōnia*, angle + λίθος, *lithos*, stone, in allusion to the angulate sutures). An extinct tetrabranchiate cephalopod, the shell of which resembles that of the *Ammonoidea* in form, but differs from it in having a simple suture line that shows undulating or zigzag curves without secondary crimping. The *Goniatites* have smooth unornamented shells of discoid or globular form, with open or closed umbilicus. They vary in size from 1 to 4 inches, though some species from the Devonian system attain a diameter of over 12 inches. The name "*Goniatites*" has long been used in a generic sense; but the group has proved to be heterogeneous, and the species have been redistributed among a number of new genera and four new suborders, the *Microcampyli*, *Mesocampyli*, *Eurycampyli*, and *Glossocampyli*, these names referring to the form of the saddles of the sutures in the types of the different groups. The old genus *Goniatites* was considered to be an intermediate form between the *Nautiloidea* and the *Ammonoidea*, and the above-mentioned suborders represent, in a broad way, transition groups between certain races of nautiloids and certain races of ammonoids.

The species of *Goniatites* appear first in the lowest Devonian rocks, and they disappear in the Triassic system; their period of maximum development was during Upper Devonian and Lower Carboniferous time. They are thus index fossils of the Upper Paleozoic age. They are found in Europe, Asia, Australia, and North America, often in such abundance that the beds containing them have received the names of *Clymerien-kalk* and *Goniatites limestone*. See *AMMONOIDEA* and *CEPHALOPODA*, and the bibliography given under the latter title.

GONID'IA (Neo-Lat. nom. pl., from Gk. γονή, *gonē*, seed). The algal cells of a lichen. Also applied by some botanists to the asexual spores of algae and fungi and including the well-known conidia of those groups. See *LICHEN*.

GONIOCERAS, gō'ni-ōs'ēr-ās. A widely aberrant genus of nautiloid cephalopods, characterized by its flat triangular shape, with broad lateral wings, recurving septa, and moniliform siphuncle. It is best known by *Gonioceras anceps* from the Ordovician limestones of New York and Canada, but has been found in the far north of America and in China, apparently having been restricted to the Pacific and Arctic oceans and their continental invasions. See *CEPHALOPODA*; *NAUTILUS*.

GONIOMETER (from Gk. γωνία, *gōnia*, angle + μέτρον, *metron*, measure). In mineralogy, an instrument used to measure the angles of crystals. The simplest form is the contact goniometer, which consists of a pair of arms which move about a pivot like a pair of shears and can be clamped in any position and connected with a protractor for the reading of

angles. The *reflecting goniometer* makes use of a beam of light reflected successively into a telescope from different faces of a crystal as the crystal is revolved upon a single axis. The direct readings of this instrument give by their numerical difference the supplement of the angle desired. The most modern type of goniometer is constructed on the principle of the theodolite and measures angles in two planes at right angles to each other. This is known as the *theodolite goniometer*, or *two-circle goniometer*, and its introduction has not only extended the possibilities of measurement, but greatly simplified the calculation of crystal forms. See CRYSTALLOGRAPHY.

GONIOMETRY. A branch of trigonometry concerned with the functions of angles in general and with their relations. The word signifies "angle measure." See TRIGONOMETRY; GONIOMETER.

GÖNNER, gën'nër, NIKOLAUS THADDÄUS VON (1704-1827). A German jurist, statesman, and author. He was born at Bamberg, where he was appointed to the chair of law (1780). Ten years afterward he accepted a similar position at Ingolstadt, where he exercised a most beneficial influence upon the development of the university, which by his suggestion was subsequently removed to Landshut. From 1811 until shortly before his death he held many judiciary offices at Munich, where he was appointed Councilor of State in 1820. His principal works include *Handbuch des deutschen gemeinen Processes* (2d ed., 4 vols., 1804) and *Deutsches Staatsrecht* (1804).

GO'NOCOC'CUS. See GONORRHEA.

GONORRHEA, gŏn'ŏ-rĕ'ă (Lat., from Gk. γονόρροια, *gonorrhŏia*, from *gonos*, semen + *rhoi*, *rhoia*, a flow, from *rhein*, to flow). A name which was formerly applied almost indiscriminately to all discharges from the genital passages in both sexes. At present the name designates a specific inflammatory disease of the mucous membrane of the urethra, caused by a germ, the gonococcus, which was discovered by Neisser. The disease is never caused by "taking cold," or a "strain," by mere uncleanness or injury. The access to the urethra of mucus or pus containing the gonococcus occurs, in the vast majority of cases, during sexual intercourse. From 2 to 10 days after the sexual intercourse a slight watery discharge appears at the mouth of the urethra, the lips of which become red and swollen. The discharge quickly becomes abundant and white, later yellowish, possibly greenish or bloody. Itching follows, with burning pain, especially on urination, which becomes frequent. In the male painful erections of the penis occur, principally at night, during which the organ is curved. This condition is called *chordee*. Disease of deeper parts often follows an acute attack, and the prostate gland, seminal vesicles, and neighboring lymphatics become infected. General infection is frequently followed by "gonorrhœal rheumatism," which is an arthritis, or joint disease, with stiffness and pain, caused by the toxins which are formed by the disease germs. It is extremely difficult to treat the disease when it invades the prostate gland or the seminal vesicles. In a woman the vagina, bladder, uterus, Fallopian tubes, and ovaries may be attacked. In many cases acute symptoms are absent or slight, and the patient may not know she has the disease till uterus and tubes are attacked.

From three to five days after contracting the disease most patients suffer from fever, headache, slight nausea, possibly preceded by a chill. During this stage the patient should be in bed, on low diet, and should take a cathartic and drink large quantities of plain water. Injections taken too early or in too concentrated a form may drive the infected mucus deeper, or injure the urethra. Injections of solutions of protargol, argyrol, nitrate of silver, permanganate of potash, sulphate of zinc, etc., are prescribed. Irrigations with bichloride of mercury are sometimes used. Internally cubeb, copaiba, salol, oil of sandal, saw palmetto, and many other drugs are given. When the infection is deep-seated or when the joints are involved, vaccines are frequently curative. All alcoholic beverages must be absolutely prohibited, and all sexual intercourse positively stopped, till two weeks after the patient is cured. The disease is not at an end when the discharge stops, unless the urine is perfectly clear, and the mucus from the prostate gland as well as the seminal fluid contains no gonococci discoverable by the microscope. Infection of a wife may occur when there is no discharge from the disease if the germs lurk in the seminal vesicles. Extreme care should be taken by one suffering with gonorrhœa to catch the discharge in gauze, which should be burned. If the fingers be soiled with the discharge, the eyes may become infected, and blindness may result. The testicles should be supported by a snug suspensory bandage. Patent medicines should be shunned. If gonorrhœa persists for a considerable time and the discharge becomes thin and scanty, the term "gleet" is applied to it.

The *Gonococcus*, or *Micrococcus gonorrhœa* is an extremely minute organism. It occurs in pairs, with flattened sides lying in apposition. For this reason it is often referred to as the *Diplococcus gonorrhœa*. It grows readily on human blood serum, with or without agar, at the temperature of the body, not on the more common media. The mucous membranes of the lower animals do not seem susceptible to gonorrhœal infection, but the human urethra reacts promptly to inoculation with pure cultures. In the mucous membrane it sets up an exudative inflammation and may be found either free in the exudate or inclosed in the cast-off epithelial cells. Its presence within the cell bodies, taken in connection with its occurrence in pairs, and its behavior when subjected to a special stain known as Gram's stain, complete its identification. Quite frequently the pus-producing organisms are associated with the gonococcus. It is believed that gonorrhœal infection from the vagina of the mother during parturition is responsible for *ophthalmia neonatorum*, a severe form of conjunctivitis which often results in blindness through the destruction of one or both eyes.

GONORRHEAL OPHTHALMIA. See CONJUNCTIVITIS.

GONSALVO DE CORDOBA, gŏn-sălv'vô dă kŏr'dô-bă (GONZALO HERNÁNDEZ Y AGUILAR). A celebrated Spanish commander. He was born at Montilla, near Cordova, in 1453 (according to some in 1443). He distinguished himself in the war waged by Queen Isabella of Castile against Portugal and in the war against the Moors and was charged in 1491 with the conduct of the negotiations for the surrender of

Granada. In 1495 he was sent by Ferdinand of Aragon to the assistance of Ferdinand, King of Naples, against the French. In less than a year Gonsalvo, with his limited resources, had delivered the greater part of the kingdom and obtained the appellation of *El Gran Capitán*. In 1498 he returned to Spain and was received with signal marks of distinction by the King. Having been placed in command of a fleet in the Mediterranean, he took Cephalonia from the Turks at the beginning of 1501 and restored it to Venice. When the partition of the Kingdom of Naples was determined upon by a compact between Louis XII of France and Ferdinand the Catholic, entered into at Granada in 1500, Gonsalvo de Córdoba led the invading Spanish army. The conquest of the kingdom was speedily achieved, but the conquerors soon quarreled over the partition of the booty, and war broke out between them in 1502. Gonsalvo de Córdoba vanquished the French at Cerignola, April 28, 1503, took possession of Calabria, the Abruzzi, Apulia, and the city of Naples itself, and then laid siege to Gaeta, but was compelled to retreat before a superior force of the enemy. On December 27 of the same year, however, he fell upon them unexpectedly near the Garigliano and obtained a complete victory. The French army was almost annihilated, the fortress of Gaeta fell, and the possession of Naples was secured to the Spaniards. King Ferdinand bestowed the Duchy of Sesia upon the conqueror and appointed him Viceroy of Naples with unlimited authority. His good fortune, however, made him many powerful enemies, and his popularity with the Neapolitans awoke the King's jealousy. Gonsalvo was recalled to Spain, where the King treated him with marked neglect. He now betook himself to his estates in Granada; but after the defeat of the new Viceroy in Naples by Gaston de Foix, he was again appointed to the command of the Spanish army in Italy. Mental suffering, however, had undermined his health, and on Dec. 2, 1515, he died at Granada. Consult Quintana, *Vida de españoles célebres* (Madrid, 1807), and Prescott, *Ferdinand and Isabella* (Philadelphia, 1864).

GONTARD, gôn'tärt, KARL VON (1731-91). A German architect, born at Mannheim. He studied under Richter at Bayreuth and François Blondel at Paris. In 1765 he entered the service of Frederick the Great, with whom he became a favorite, and who intrusted him with several architectural commissions. His structures include two tower-like domes erected on previously existing churches on the Gendarmenmarkt, Berlin; the colonnades of several fine bridges at Berlin; and the marble palace at Potsdam, completed by Langhans.

GONTAULT, gôn'tô', CHARLES DE. See BIRON, CHARLES DE GONTAULT, DUC DE.

GONTAUT-BIRON, gôn'tô'-bê'ron', A. L. DE. See LAUZON, DUC DE.

GONVILLE AND CAIUS (kêz) COLLEGE. A college of Cambridge University, which is usually called Caius College. It was founded in 1348 by Edmund Gonville, sometime vicar-general of the diocese of Ely; but the sudden death of the founder and the insufficient provision for support of the scholars led Gonville's executor, William Bateman, Bishop of Norwich, to remodel the statutes, rechristen the house as the College of the Annunciation, and divert the students to the special

study of theology and canon and civil law. Soon after, the college was moved from its original site to the place it now occupies. It was then of little importance and seems to have consisted only of a master and three or four fellows. In 1558 Dr. John Caius, who was physician to the court, refounded the college, altering the name to its present form; added much to the college buildings as well as to the endowment; and became master of the college, which office he held till his death in 1573. Owing to his influence, the college has since been famous for its attention to medical studies, and some of the greatest of English physicians have been among its members, of whom Harvey, the discoverer of the method of the circulation of the blood, is the most distinguished. Gonville and Caius College consists of a master and 29 fellows. It has 36 scholarships and exhibitions, besides several studentships in medicine and natural science. Among its great names are those of Sir Thomas Gresham, Jan Gruter, Jeremy Taylor, and Lord Chancellor Thurlow. Consult J. Venn, *Caius College* (London, 1901).

GONZAGA, gôn-zî'gà. HOUSE OF. A princely Italian family whose members for a number of centuries ruled over Mantua and Montferrat. It claimed descent from the German Emperor Lothair. The rule of the Gonzaga in Mantua was established in 1328 by the final defeat of the Bonacolsi family and the murder of their chief, Passerino de' Bonacolsi, by his brother-in-law Luigi I. In 1432 the captaincy was changed to a marquisate and in 1530 to a dukedom. In 1536 the Gonzaga became marquises of Montferrat, in 1539 they acquired the Duchy of Guastalla, and in 1565 that of Nevers. Other important possessions of the family at various times were the duchies of Solferino, Rethel, and Sabbionetta, the Principality of Bozzolo, the Marquisate of Medola, the countships of Torelli and Novellara, and the Principality of Castiglione. The members of the house of Gonzaga were the faithful champions of Imperial interests in Italy and waged war with the Visconti, dukes of Milan. They produced many men who became famous soldiers, statesmen, churchmen, and patrons of art and letters. The most illustrious of these were: GIOVANNI FRANCESCO (died 1444), in whose favor Mantua was created a marquisate by the Emperor Sigismund, in return for services to the Empire.—GIOVANNI FRANCESCO II (reigned 1484-1519), who was defeated by Charles VIII of France at the battle of Fornovo, on the banks of the Taro, in 1495, and who took part in the engagement of Atella (1496), which led to the capitulation of the French forces in Naples. His son, FEDERIGO II (reigned 1519-40), was invested by the Emperor Charles V with the ducal dignity in 1530 and also obtained the Marquisate of Montferrat in 1536. During the reign of this prince the court of Mantua was one of the most magnificent in Europe.—GUGLIELMO (1550-87), son of Federigo, proved a wise and enlightened ruler; his secretary was Bernardo Tasso, father of the poet.—VICENZO (1587-1612), son of Guglielmo, was the warm friend and patron of Tasso. His brother LUIGI (1568-91) was a Jesuit scholastic, and died while attending those stricken of the plague in Rome. He was canonized as St. Aloysius in 1726 and is the patron saint of students. Vicenzo was followed by his three sons, FRAN-

CESCO, FERDINAND, and VICENZO, all of whom died without heirs, and thus the direct line of the ducal branch became extinct in 1627. A collateral branch in the person of Charles I, Duke of Nevers, son of Ludovico, the brother of Guglielmo, mentioned above, claimed the duchy, which was contested by his cousin, CESARE, Duke of Guastalla. This family feud led to a war, in which France supported Nevers, while the Emperor Ferdinand II claimed the right of adjudging Mantua, as an Imperial fief, to a candidate of his choice. Spain supported Austria in this War of the Mantuan Succession. Mantua was stormed, sacked, and stripped of all its treasures by the Imperialists in 1630 and never regained its former splendor. The war was terminated a few months later, CHARLES DE NEVERS being recognized by the Emperor. The successors of Charles were weak and dissipated rulers, and the tenth and last Duke of Mantua, Charles IV, was the worst of all. As he had allied himself with the French in the War of the Spanish Succession, the Emperor Joseph I placed him under the ban of the Empire, and he was deprived of his possessions, the Duke of Savoy seizing Montferrat, and Austria taking Mantua and the minor fiefs. This division was confirmed by the treaty of peace that followed. Charles died in exile in 1708, leaving no issue, and the family became extinct, save for the branch which ruled Guastalla until 1746. Consult: Symonds, *The Renaissance in Italy* (7 vols., London, 1897-98); E. Solari, *Erocole Gonzaga* (Venice, 1904); C. Hare, *A Princess of the Reformation: Giulia Gonzaga, her Family and Friends* (New York, 1912).

GONZAGA, gôn-zá'gá, THOMAZ ANTONIO (1744-1807). A Portuguese poet, born at Oporto. He studied law in the University of Coimbra, receiving his degree in 1763. In 1768 he went to Brazil, and, after having acted for some years as local magistrate at Beja and elsewhere, he was appointed judge at Villa Rica in the Province of Minas. Before this time he developed some talent for versification, and his literary tastes soon brought him into intimate association with Claudio Manoel da Costa, Alvarengo Peixoto, and other writers of the so-called Minas school; but the love which inspires the poet did not come upon him until he had made the acquaintance (c.1788) of Dona Maria Joaquina Dorothea de Seixas, the Marília of his masterpiece, the *Marília de Dirceu* (the latter being the name adopted by the poet himself). These verses form the most remarkable collection of erotic poetry, dedicated to a single person, ever written in Portuguese. Gonzaga had just been nominated a member of the Supreme Court of Bahia and was on the eve of his marriage when discovery was made of the treasonable plot of Minas, and he was arrested on suspicion of having been implicated in it. On inconclusive circumstantial evidence he was condemned (1792) to banishment for life to Pedras de Angoche, a sentence which was afterward commuted to one of 10 years' exile at Mozambique. Here he made some effort to practice as an advocate, but he never recovered from the depression with which his cruel lot had affected him. He was attacked by nervous fever, which undermined his health, and after years of increasing melancholy, which occasionally alternated with fits of acute mania, he died. His poems are still favorites with the

Portuguese-speaking peoples, chiefly because of the charm of their style, their melody, and their refined sentiment. Some 20 editions of the *Marília de Dirceu* appeared before 1854. The best edition is that published in 1862 at Paris. There are biographies prefixed to the editions of Rio de Janeiro (1845 and 1862).

GONZALES, gôn-zá'léz. A city and county seat of Gonzales Co., Tex., 76 miles east of San Antonio, on the Galveston, Harrisburg, and San Antonio, and the San Antonio and Aransas Pass railroads, and on the Guadalupe River (Map: Texas, D 5). Cotton, cottonseed oil, brick, and tiles are produced. Gonzales was the scene of the first battle in the struggle for Texan independence from Mexico (see TEXAS). Pop., 1910, 3139.

GONZÁLEZ, gôn-sá'lés, MANUEL (1833-93). President of Mexico from 1880 to 1884, born near Matamoros, Tamaulipas, Mexico. He attained prominence as reactionary leader under Marcelino Cobos. In the succeeding civil wars he received a wound in action which resulted in the loss of an arm. Under Juárez he fought brilliantly during the French invasion, was promoted brigadier general for bravery in 1867, and after the fall of the city of Mexico was appointed by Juárez governor of the government palace. In 1871 he was arrested on a charge of complicity in the stealing of the gold and silver plate that had belonged to Maximilian, but in the revolution of the same year escaped and joined Díaz. He took part in the third rebellion of Díaz in 1876, distinguished himself in the decisive battle of Tecuac, and in 1878 was appointed by Díaz Secretary of War. In 1880 he resigned his portfolio to become a candidate for the presidency, to which office he was elected. His administration was marked by financial mismanagement and disaster. His attempt to compromise the English debt, and his decree suppressing the liberty of the press, aroused such opposition that he resigned in 1884, in favor of Díaz. A resolution of impeachment for misappropriation of funds was introduced in the national Congress, but was not pressed, and he afterward successfully administered the affairs of the State of Guanajuato, of which Díaz appointed him Governor.

GONZÁLEZ CARVAJAL, gôn-thá'lath kár'-vá-ál', or **CARBAJAL**, kár'-ná-hál', TOMÁS JOSÉ (1753-1834). A Spanish poet and statesman. He was educated in Seville, where he studied theology and jurisprudence and became a noted Hellenist and Latinist. After holding, in the Treasury Department and elsewhere, a number of offices of importance, and refusing to swear allegiance to Joseph Bonaparte as King of Spain, he was obliged to flee in disguise from Madrid to Seville in January, 1809. In March, 1813, he was made Secretary of State and Secretary of the Treasury Department, but resigned both positions in August of the same year in order to become director of the Estudios Reales de San Isidro, where, by establishing a chair of international law and by his liberal ideas, he offended the government and was imprisoned for five years. He was reinstated by the revolution of 1820 and became Councilor of State, but was forced into exile by the counterrevolution three years later. After 1820 he became successively Minister of the Supreme Council of War, member of the Royal Council of Spain and the Indies, and Knight Grand Cross of the Order of Isabella the Catholic. Carvajal was the author

of metrical translations of the poetical books of the Bible and of other works in prose and verse, which earned for him membership in the Real Academia Española and in the Real Academia de la Historia; and his name figures in the *Catálogo de autoridades de la lengua* published by the Spanish Academy.

GONZÁLEZ DÁVILA, di'vé-lä, or **DE ÁVILA**, GIL (c.1578-1658). A Spanish historiographer, born at Ávila. He held a minor ecclesiastical office at Salamanca and was appointed royal chronicler of Castile (1612) and the Indies (1641). His *Teatro eclesiástico de la primitiva iglesia de las Indias Occidentales* (1645-55) holds a high place as a general Church history of New Spain. The same may be said, for Spain, of his *Teatro eclesiástico de las ciudades e iglesias catedrales de España* (Salamanca, 1618) and of his *Teatro eclesiástico de las iglesias de España* (2 vols., Madrid, 1640-50).

GONZÁLEZ NAVEIRO, EMILIANO (1861-). A Paraguayan politician. He was educated at the University of Asunción. In 1887 he was appointed criminal judge and later a member of the Superior Court. Entering politics, he was elected senator by the Liberal party. In 1905 he was made Minister of Finance in the cabinet of President Ferreira. The next year he was chosen Vice President and in 1908 succeeded to the presidency. He called the most distinguished men of the country to his aid and endeavored to foster better relations with the rest of Latin America.

GONZALO DE BERCEO, gón-thä'lo dá här-thä'ó (†1180-†1247). The earliest Castilian poet whose name we know with certainty. Born at Berceo (Old Castile), he became a secular priest in the Benedictine monastery of San Millán de la Cogolla. He became deacon in 1221 and priest in 1237. He appears as a witness in an Act of 1246, which is the last certain date we possess for his life. In addition to the 13,000 verses (written in the four-verse couplets known as the *cuaderna vía*) which compose the nine long works that are known to be his, the 10,000 verses of the *Libro de Ayo-jandre* have also been attributed to him; but not all scholars are convinced of the justification for this latter claim. In 1736 appeared the first edition of any of his works, *La Vida de Santo Domingo*, published by Vergara; and in 1780 Tomás Antonio Sánchez published the complete works. Recently two of his works have been given careful editions: J. D. Fitz-Gerald published a critical edition of *La Vida de Santo Domingo de Silos* (Paris, 1904); and in 1913 A. G. Solalinde published a paleographic edition of *El Sacrificio de la Misa*. Consult also: J. D. Fitz-Gerald, *The Versification of the Cuaderna Vía as found in Berceo's Vida de Santo Domingo de Silos* (New York, 1905); "Gonzalo de Berceo in Spanish Literary Criticism before 1780," in the *Romantic Review*, i, 290-301 (ib., 1910); R. Becker, *Gonzalo de Berceos Milagros und ihre Grundlagen* (Strassburg, 1910); F. Hanssen, "Notas á la Vida de Santo Domingo de Silos," in *Anales de la Universidad de Chile*, vol. cxx, 715-763 (Santiago, Chile, 1907).

GOO'BER. See PEANUT.

GOOCH, gōch, SIR DANIEL (1816-89). A British mechanical engineer and inventor, born at Bedlington, Northumberland. He learned the

principles of locomotive design under Robert Stephenson. From 1837 to 1864 he was locomotive superintendent of the Great Western Railway and in this connection became known for the original design and general excellence of his locomotives. In 1843 he invented the "suspended link motion with the shifting radius link" for locomotives. In 1865-66 Gooch had charge of laying cables across the Atlantic Ocean, upon the successful completion of this task being created Baronet. In 1866 he took charge of the reorganization of the Great Western Railway, which he soon placed on a sound financial footing. From 1865 to 1885 he was a member of Parliament. Consult his *Diaries* (London, 1892).

GOOCH, FRANK AUSTIN (1852-). An American chemist, born at Watertown, Mass., and educated at Harvard University (A.B., 1872; Ph.D., 1877). In 1873 he became instructor in chemistry in the Lawrence Scientific School. A year later he was assistant in the chemical laboratory and in 1877 assistant to Wolcott Gibbs. In 1879 he was connected with the chemical laboratory of the Geological Survey at Newport as a special agent of the tenth census, in 1881 was appointed chemist to the Northern Transcontinental Survey, and in 1885 became professor of chemistry at Yale. His writings include: *Outlines of Inorganic Chemistry*, with C. F. Walker (1905); *Outlines of Qualitative Chemical Analysis*, with P. E. Browning (1906; 3d ed., 1911); *Methods in Chemical Analysis* (1912).

GOOCH, SIR WILLIAM (1681-1751). An English soldier and Colonial Governor in America. He was born in Yarmouth, served with distinction in the English army, and from 1727 to 1747 was Governor of Virginia. He was a man of considerable ability, and his administration was, on the whole, a wise and prosperous one. In 1740 he led the Virginia troops which accompanied Admiral Vernon on his futile expedition against Cartagena, New Granada. On his return to England in 1749 he was made Baronet.

GOOD, JAMES ISAAC (1850-1924). An American Reformed church clergyman and historian, born at York, Pa. He graduated at Lafayette College in 1872 and at Union Theological Seminary in 1875. He was settled in pastorates in York, Pa. (1875-77), Philadelphia (1877-90), and Reading, Pa. (1890-1905). Between 1890 and 1907 he was professor and dean of the school of theology of Ursinus College (Philadelphia), then becoming professor of Reformed church history and liturgies at the Central Theological Seminary (Dayton, Ohio). He was elected president of the General Synod of the Reformed Church in the United States. He wrote: *The Origin of the Reformed Church in Germany* (new ed., 1913); *The History of the Reformed Church in Germany* (1894); *Rambles around Reformed Lands; History of the Reformed Church in the United States* (1899); *Famous Places of the Reformed Churches* (1910); *History of the Reformed Church in the United States in the Nineteenth Century* (1911); *History of the Swiss Reformed Church since the Reformation* (1913); *The Heidelberg Confession in its Newest Light* (1914); and he contributed to the NEW INTERNATIONAL ENCYCLOPEDIA.

GOOD, JOHN MASON (1764-1827). An English physician and author, born at Epping in

Essex. In 1784 he practiced as surgeon in Sudbury, but removed to London in 1793, with the view of obtaining literary employment. He published various poems, translations, and professional treatises. Among his translations are: *The Song of Songs, or Sacred Idyls*, from the Hebrew (1803); *The Nature of Things*, from Lucretius (1805); *The Book of Job* (1812). His chief professional works are *The Study of Medicine* (4 vols., 1822) and *The Book of Nature*, a series of lectures at the Surrey Institution, 1811-12 (1826). He likewise published, in conjunction with Olinthus Gregory, a dictionary of the arts and sciences completed in 12 volumes (1813). The translation of Lucretius, valuable for its parallel passages, is included in Bohn's Classical Library. He died in London. For his *Life and Writings*, consult Gregory (London, 1828).

GOODALE, ELAINE (1863-) and **DORA READ** (1866-). American poets, sisters, who were born in Berkshire Co., Mass. They showed remarkable poetic precocity. Poems of Elaine appeared as early as her eighth year, in *Sky Farm Life*, a monthly conducted by herself. In 1887 verses of both sisters began to appear in *Saint Nicholas* and their contributions to periodicals were thereafter frequent. The most noteworthy of their books are: *Apple Blossoms* (1878); *In Berkshire with the Wildflowers* (1879); *All round the Year* (1880); and *Verses from Sky Farm* (1880). In 1881 Elaine published *The Journal of a Farmer's Daughter*. In 1883 she became teacher in the Hampton (Va.) Institute for the education of Indians and negroes, and in 1885 made a tour of observation through the Sioux Reservation. In the next year she received a government appointment to teach Indians at White River Camp in Dakota and in 1890 was made superintendent of all Indian schools in that State. In 1891 she was married to Dr. C. A. Eastman (q.v.), an Indian. Dora wrote also *Heralds of Easter* (1887).

GOODALE, GEORGE LINCOLN (1879-1923). An American botanist, born at Saco, Me. He graduated at Amherst College in 1890 and at the Harvard Medical School in 1893. He practiced his profession at Portland, Me., until 1897; became professor of natural science and applied chemistry at Bowdoin; and at Harvard was appointed instructor in botany and university lecturer on vegetable physiology (1872), assistant professor of the latter subject (1873), professor of botany (1878), and (1888) Fisher professor of natural science, a chair formerly held by Asa Gray. After 1879 he served also as director of the botanical museum. In 1909 he retired. In 1889 he was president of the American Society of Naturalists and president of the American Association for the Advancement of Science. In addition to monographs and contributions to scientific journals, his publications include: *Wild Flowers of North America* (1882); *Vegetable Physiology* (1885); *Vegetable Histology* (1885); *Useful Plants of the Future* (1891); *Concerning a Few Common Plants* (1879; 3d ed., 1903).

GOOD BEHAVIOR. As a legal expression, used chiefly as synonymous with keeping the peace. Thus, if one person assaults or threatens another or provokes him to a breach of the peace, the offense is punishable summarily by a justice of the peace, who, besides inflicting a fine, may bind over the offending party to keep the peace and be of good behavior for a

specified period. The mode of doing this is by requiring the offending party to enter into a recognizance with or without surties, which is, in fact, the giving of a bond for a specified sum to the court, and if it is broken, the recognizance is forfeited and the offending party may be again punished.

In early English law the expression was employed to denote the obligation of chastity imposed upon a widow who enjoyed real property derived from her deceased husband, as in the case of the dower right known as free bench (q.v.), or of a devise by a husband to his widow *um se bene gesserit*, so long as she should be of good, i.e., chaste, behavior.

GOOD-CONDUCT BADGES. Special distinctions given to enlisted men in the United States navy for proficiency, sobriety, and obedience. Any person when discharged, either at expiration of enlistment of four years or within three months of expiration of enlistment, who is recommended for a good-conduct medal by his commanding officer is entitled to this badge. Recommendations are based on the following final averages in marks: for petty officers, proficiency 4.5, sobriety 4.5, obedience 4.5; for men of lower ratings, proficiency 4, sobriety 4.5, obedience 4.5. The first badge is a medal; subsequent badges are bars with the name of the vessel from which each was given engraved thereon, and are worn on a ribbon above the medal. The holder of a medal cannot be deprived of it except by sentence of a general court-martial. Every enlisted man, except a mate, receives 83 cents per month, in addition to pay of his rating, for each medal or bar he is awarded.

GOOD CONSIDERATION. In English and American law, the relationship which subsists between the parties to certain conveyances of land and which is relied on, in lieu of an actual consideration of money or money's worth, to sustain such a conveyance. The former, sometimes called the "consideration of blood," i.e., of blood relationship, or of "love and affection," was known as a "good" consideration, as distinguished from the latter, which was described as a "valuable" consideration. Any relationship of consanguinity, no matter how remote, was sufficient to constitute good consideration. It was required where a freehold estate was conveyed by the device known as a covenant to stand seised to the use of another or to give effect to a conveyance made without an express declaration that it was made to the use of the grantee or of some one else as beneficiary. As distinguished from the "covenant to stand seised," which required a "good" consideration, the conveyance by "bargain and sale" called for a valuable consideration. It is to be noted that neither form of consideration was necessary to the validity of a conveyance made in any other form, as by livery of seisin or the modern deed of grant, if only the instrument declared that the conveyance was for the use of the donee or grantee. Modern statutory forms of conveyancing have rendered the presence of a good consideration less important than it once was, but it would seem that it is still generally required where a deed of land fails to state that the conveyance is for the use of the grantor and where there is no valuable consideration therefor. See *USES*; *TRUSTS*.

As used in the famous statute concerning fraudulent conveyances (13 Eliz., c. 5), where

it is provided that the statute is "not to extend to any estate or interest in lands, etc., on good consideration and bona fide lawfully conveyed to any person not having notice," etc., the expression "good consideration" does not bear the technical sense in which it is employed in conveyancing, but signifies lawful, i.e., valuable, consideration. A conveyance otherwise forbidden by the statute would not be protected because made to a blood relation, but only if to an innocent purchaser for value. See CONSIDERATION.

GOOD COUNSEL, BOOK OF. See HİTÖPADESA.

GOODE, GEORGE BROWN (1851-96). An American ichthyologist, born in New Albany, Ind. He graduated in 1870 from Wesleyan University, at Middletown, Conn., and then studied under Louis Agassiz. From 1871 to 1877 he was curator of the museum at Wesleyan University, and in 1873 he became an assistant in the United States Fish Commission and also a member of the scientific staff of the United States National Museum, of which he was made assistant director in 1881. From 1887 until his death he served as the assistant secretary of the Smithsonian Institution in charge of the National Museum. He also was prominently connected with various popular and scientific exhibitions, as commissioner of the United States to the fisheries exhibitions at Berlin in 1880 and London in 1883, as representative of the Smithsonian Institution at the exhibitions at New Orleans in 1884, Cincinnati in 1888, Louisville in 1888, and Atlanta in 1895, and as successively commissioner and commissioner general of the United States at the Columbian Historical Exposition at Madrid in 1892-93. He planned classifications for, and was one of the directors of, the United States government exhibit at the World's Columbian Exposition at Chicago in 1893. In 1888 he was elected to the National Academy of Sciences; and at various times he received foreign honors, including the decoration of the Spanish Order of Isabella the Catholic, with the grade of Commander. His publications number about 400, of which these are important: *Catalogue of Fishes of the Bermudas* (1879); *History of the Menhaden* (1880); editor of *Fisheries and Fishery Industries of the United States* (7 vols., 1884-87); *American Fishes: A Popular Treatise upon the Game and Food Fishes of North America* (1888); *Oceanic Ichthyology*, with Tarleton H. Bean (1896). Goode was an authority on the management of museums and wrote: *Museums of the Future* (1890); *Principles of Museum Administration* (1896); *Annual Reports*, as director of the National Museum. He was also interested in historical studies and wrote: *The Beginnings of Natural History in America* (1886); *The Beginnings of American Science* (1889); *The Origin of the National Scientific and Educational Institutions of the United States* (1890).

GOODELL, HENRY HILL (1839-1905). An American agricultural educator, born at Constantinople, Turkey. He graduated at Amherst College in 1862 and served in the Union army during the Civil War. He was professor of modern languages and English literature in the Massachusetts Agricultural College (1867-86) and in 1886 became president of that institution. The degree of LL.D. was conferred on him by Amherst College in 1891. For many years, as chairman of the executive committee of the Association of American Agricultural

Colleges and Experiment Stations, he exerted a wide influence in the great movement for agricultural education in the United States.

GOODELL, THOMAS DWIGHT (1854-1920). An American classical scholar, born at Ellington, Conn. He was graduated at Yale in 1877 and received the degree of Ph.D. in 1884. He was classical teacher in the high school, Hartford, Conn., from 1877 to 1888, and in the latter year was appointed professor of Greek at Yale. In 1911 he was elected president of the American Philological Association. He is author of various philological papers in the learned journals, and of *Chapters on Greek Metric* (1901), an important work, and *A School Grammar of Attic Greek* (1902).

GOODELL, WILLIAM (1702-1867). An American missionary. He was born at Templeton, Mass., educated at Phillips Academy (Andover), Dartmouth College, and Andover Theological Seminary. He was accepted as a missionary by the American Board and at the close of 1822 sailed for Malta and thence the next year went to Beirut, where he aided in establishing the station which has become the centre of the Syrian mission. In 1828, on account of threatened war between England and Turkey, the missionaries removed to Malta, where Goodell labored in preparing and printing books for the mission; until, in 1831, the way having been opened by the destruction of the Turkish fleet at Navarino, he went to Constantinople, where he commenced the Armeno-Turkish mission. During his missionary life he and his devoted wife cheerfully endured many trials and perils and were compelled to move their residence 33 times in 29 years. One of his chief labors was the translation of the Bible into Armeno-Turkish, in making and revising which he spent 20 years. In 1865, after 43 years of toil, he returned to the United States and died in Philadelphia at the residence of his son, Feb. 18, 1867. Consult his life by Prince (New York, 1876).

GOODELL, WILLIAM (1702-1878). An American editor and reformer, prominent as an abolitionist in the antislavery struggle before the Civil War. He was born in Coventry, N. Y.; was engaged in business successively at Providence, R. I., Alexandria, Va., and New York City; took part in the discussion of the Missouri Compromise, to which he was strongly opposed, and in 1827 established at Providence a paper called the *Investigator*. He subsequently edited successively the *National Philanthropist*, the *Moral Daily Advertiser*, the *Friend of Man* (Utica, N. Y.), the organ of the New York State Anti-Slavery Society, the *Radical Abolitionist*, and the *Principia*—all devoted to the cause of abolitionism. Among his publications are: *Views of American Constitutional Law* (1844); *The Democracy of Christianity* (1851); *Slavery and Anti-Slavery: A History of the Great Struggle in Both Hemispheres* (1852); *The American Slave Code* (1853). Consult a *Memorial of William Goodell* (Chicago, 1879).

GOOD FAITH (Lat. *bona fides*). In law, either (1) an absence of fraudulent design in the person acquiring real or personal property by conveyance from another, or (2) ignorance on the part of an assignee or grantee of the existence of claims of third persons affecting the property conveyed. The expression is used in the former sense in the statute (13 Eliz., c. 5)

making void conveyances in fraud of creditors, but saving conveyances "on good consideration and bona fide lawfully" made. This does not mean that the grantee must be ignorant of the fact that the effect of the conveyance will probably be to delay or defraud the creditors of the grantor, but that he shall not be a party to the fraud by participating in an unreal or fictitious conveyance. As thus employed, the expression does not differ materially in meaning from its ordinary sense as signifying honest dealing.

On the other hand, as used to denote the innocent holder, commonly known as the bona fide holder, of commercial paper, it signifies no more than that the present holder came into possession of the paper in due course and without notice of defenses, such as lack of consideration, which would have been available against the transferor. It is in this latter sense also that the expression is employed where property affected with a trust in favor of a third person is conveyed by the trustee to a purchaser who has no knowledge of the trust. The person acquiring the property under such circumstances takes it free from the trust, not because he is free from moral turpitude, but because, having paid value therefor in ignorance of the trust, it is deemed unconscientious to subject the property in his hands to the obligation which rested upon his grantor. See **NEGOTIABLE PAPER**; **TRUST**.

GOOD FRIDAY. The Friday before Easter, observed in commemoration of the crucifixion of Christ. That from a very early period it was a day of solemn mourning and special prayer is apparent from the *Apostolic Constitutions* (i, 18) and from Eusebius, who tells us that, when Christianity was established in the Empire, Constantine forbade the holding of markets, law courts, and other public proceedings upon this day. It is still a legal holiday in England and Ireland. A number of ancient popular customs, such as the eating of "hot cross buns"—cakes with a cross impressed on them—are connected with the day. For its ceremonial observance in the Roman Catholic church, see **CROSS**; **HOLY WEEK**. A service of modern origin, increasingly popular in Catholic and Episcopal churches, is the Three Hours' Devotion, consisting of addresses upon the seven last words of Christ, prayers and hymns, and occupying the hours from 12 to 3, when He hung upon the cross.

GOOD GRAY POET, THE. A popular designation of Walt Whitman.

GOOD HOPE. See **CAPE OF GOOD HOPE**.

GOOD/HUE, BERTRAM GROSVENOR (1860-1924). An American architect. He was born at Pomfret, Conn., was educated at Russell's Collegiate and Commercial Institute, New Haven, Conn., and studied architecture for six and a half years under J. Renwick. In 1891 he became a partner in the firm of Cram and Wentworth (later Cram, Goodhue, and Ferguson) and in this connection participated in the reconstruction and additions to the United States Military Academy and in the construction of numerous ecclesiastical, academic, library, and other buildings (for list of these, see **CRAM, RALPH ADAMS**). In 1914 he was engaged to plan a new building for St. Bartholomew's Church, New York. He made the decorations for *The Altar Book*, contributed articles to magazines and to Sylvester Baxter's *Spanish*

Colonial Architecture in Mexico (10 vols., 1903), and is author of *Mexican Memories* (1892).

GOODLAND. A city and the county seat of Sherman Co., Kans., 196 miles east of Denver, on the Chicago, Rock Island, and Pacific Railroad (Map: Kansas, A 4). It contains a Carnegie library, has railroad repair shops and a grain elevator, and carries on a trade in the products of the adjacent farming and stock-raising district. There are municipal water works. Pop., 1900, 1059; 1910, 1993.

GOODMAN'S FIELDS THEATRE. A London theatre, erected in 1729 and torn down in 1746. The theatre erected later upon its site was destroyed by fire in 1802. Garrick made his appearance on its stage in 1741, and many of his most successful performances occurred in this playhouse.

GOOD-NATURED MAN, THE. A comedy by Goldsmith, produced by Colman at Covent Garden, Jan. 29, 1768.

GOODNOW, FRANK JOHNSON (1859-). An American educator and legal scholar, born in Brooklyn, N. Y. He graduated at Amherst College in 1879, at the Columbia Law School in 1882, and studied at the Ecole Libre des Sciences Politiques, Paris, and at the University of Berlin. Appointed instructor in history and lecturer in administrative law at Columbia University in 1883, he was promoted to the rank of adjunct professor in 1887 and to a full professorship in 1891. In 1906 he was a member of the Public Ownership Commission of the National Civic Federation, which investigated municipal ownership undertakings in Europe. During the years 1913-14 he served as legal adviser to the Chinese government. In 1914 he became president of Johns Hopkins University. His works include: *Comparative Administrative Law* (1893); *Municipal Problems* (1897); *Politics and Administration* (1900); *City Government in the United States* (1905); *Principles of the Administrative Laws of the United States* (1906). He was editor of *Selected Cases on the Law of Taxation* (1905); *Selected Cases on Government and Administration* (1906); *Selected Cases on the Law of Officers* (1906); *Social Reforms and the Constitution* (1914).

GOOD PARLIAMENT. The English Parliament of 1376, famous for its attempts at political reform and for its impeachment of Latimer, Neville, and others.

GOOD QUEEN ANNE. A designation of Anne of Bohemia, wife of Richard II of England.

GOOD QUEEN BESS. A popular name for Elizabeth, Queen of England.

GOOD REGENT, THE. A title given to James Stuart, Earl of Murray, or Moray, who was Regent of Scotland between 1567 and 1570.

GOODRICH, ALFRED JOHN (1847-1920). A widely known American musical theorist. He was born at Chilo, Ohio, and was practically self-taught. He held appointments as professor of theory in many of the leading musical institutions in the United States and for two years served on the faculty of the Martha Washington College, Abingdon, Va. After 1899 he devoted himself to private teaching and writing. His essays and other published works include: *Musio as a Language* (1880); *The Art of Song* (1888); *Complete Musical Analysis* (1889); *Analytical Harmony* (1894); *The Theory of Interpretation* (1898); *Synthetic Counterpoint* (1903).

GOODRICH, CASPAR FREDERICK (1847-1925). An American naval officer, born in Philadelphia. He graduated from Annapolis in 1864 and served on the *Macdonian* in the summer of that year. Promoted through the various grades, he became captain in 1897 and rear admiral in 1904. He served as naval attaché on the staff of Sir Garnet Wolseley during the Tel-el-Kebir campaign in 1882, brought the Greely relief ship *Albatross* to New York in 1884, was in charge of the Torpedo Station in 1886-89, and was president of the Naval War College in 1897-98. During the Spanish-American War he commanded the *St. Louis* and *Newark*. He was commandant of the Portsmouth (Va.) Navy Yard in 1903-04 and of the New York Navy Yard in 1907-09 and was commander in chief of the Pacific squadron in 1905-06.

GOODRICH, CHARLES AUGUSTUS (1790-1862). An American author, brother of Samuel G. Goodrich (q.v.). He was born at Ridgefield, Conn.; graduated at Yale in 1812; was long pastor of congregations at Worcester, Mass., Berlin, Conn., and Hartford, Conn.; and became favorably known through his writings, which include: *Lives of the Signers to the Declaration of Independence* (1829); *Family Tourist* (1848); *Geography of the Chief Places Mentioned in the Bible* (1855); *History of the United States* (1852-55; rev. ed., 1867).

GOODRICH, CHAUNCEY ALLEN (1790-1860). An American scholar, born at New Haven, Conn., and son of Elizur Goodrich. He graduated at Yale University in 1810, was a tutor there from 1812 till 1814, and then studied theology. He was ordained pastor of the First Congregational Church in Middletown, Conn., in 1816; in 1817 he resigned his charge to become professor of rhetoric in Yale. This chair he held until 1839, when he was transferred to that of pastoral theology in the Divinity School. He published a *Greek Grammar* (1814); *Greek and Latin Lessons* (1832); *Select British Eloquence* (1852); and superintended the abridgment of Webster's *Dictionary* (1847). At the time of his death he was engaged in a revision of this work, which afterward was published under the supervision of Noah Porter (1864). From 1829 till 1838 Dr. Goodrich edited the *Quarterly Spectator*.

GOODRICH, ELIZUR (1734-97). An American Congregational clergyman. He was born in Wethersfield (now Rocky Hill), Conn., graduated at Yale in 1752, and from 1756 to 1797 was pastor of a church at Durham, Conn. He devoted much of his time to the study of the mathematical and astronomical sciences and wrote an excellent account of the aurora borealis of 1789.

GOODRICH, FRANK BOOTT (1826-04). An American author, son of Samuel Griswold Goodrich. He was born in Boston, graduated at Harvard in 1845, and was for some time the Paris correspondent of the *New York Times*, writing under the signature of "Dick Tinto." His articles were published in book form in 1854, under the title *Tri-Colored Sketches of Paris*. Goodrich also published: *The Court of Napoleon* (1857); *History of Maritime Adventure, Exploration, and Discovery* (1858); *Women of Beauty and Heroism* (1859); *World-Famous Women, from Semiramis to Eugénie* (1890); *Remarkable Voyages: or, Man upon the Sea* (1873).

GOODRICH, JOSEPH KING (1850-). An American writer on Oriental and other sub-

jects. He was born in Philadelphia and was educated in the Hopkins Grammar School of New Haven, Conn. He organized the department of ethnology in the United States National Museum at Washington in 1881-84, was assistant editor of the Smithsonian Institution in 1884-86, and from 1886 to 1910 served as professor of English at the Imperial Government College at Osaka, Japan, and later at Kyoto, Japan. He is author of *The Coming China* (1911); *Africa of To-Day* (1912); *Russia in Europe and Asia* (1912); *The Coming Mexico* (1913); *Our Neighbors—The Japanese* (1913); *Coming Hawaii* (1914); and articles on Chinese and Japanese art, language, and literature.

GOODRICH, SAMUEL GRISWOLD (1793-1860). An American author, who wrote under the pseudonym "Peter Parley," and perhaps was most widely known for his school histories. He was born in Ridgefield, Conn., Aug. 19, 1793. He was a book publisher in Hartford, and later in Boston, Mass., where he edited the *Tokos* (1828-32), an original annual noted for the encouragement given to young American authors. His numerous juvenile and educational works gave him a wide reputation. Altogether in his life he edited or wrote some 170 volumes under his pseudonym, of which, however, he was sole author of only the following: *The Outcast, and Other Poems* (1836); *Soir Well and Reap Well: or, Household Education* (1838); *Five Letters to my Neighbor Smith* (1839); *Sketches from a Student's Window* (1841); *Ireland and the Irish* (1842); *Poems* (completed, 1851); *Recollections of a Lifetime: or, Men and Things I Have Seen* (1856); *Peter Parley's Own Story* (1864). He was United States Consul at Paris in 1852, where he published a statistical work on the United States. He died at Hartford, Conn., May 9, 1860.

GOODRICH, or GOODRICKE, THOMAS (c.1485-1554). An English ecclesiastic. He studied at Corpus Christi College, Cambridge, and in 1510 was made a fellow of Jesus College. As rector of St. Peter Cheap (1529), he was consulted on the legality of the marriage of Catharine of Aragon and was appointed syndic of Cambridge for the settlement of that question (1530). Soon after he became chaplain to the King and in 1533 went to France on an embassy. In the following year he became Bishop of Ely and proved a zealous partisan of the Reformation, urging the spiritual headship of the King and helping compile the *Bishops' Book*. Under Edward VI he became a member of the Privy Council and was one of the compilers of the Book of Common Prayer. In 1552 he became Lord High Chancellor and sealed Edward's settlement of confession, but was ignorant of its contents. He was pardoned by Queen Mary for his part in placing Lady Jane Grey on the throne and, although he lost the chancellorship, was permitted to keep his bishopric until his death, May 10, 1554.

GOODRICH, (JOHN) WALLACE (1871-). An American musician, born at Newton, Mass. He studied at the Royal Academy of Music, Munich, in 1894-95, and in Paris and Leipzig for two years, and in 1897 joined the faculty of the New England Conservatory of Music, where he was appointed dean in 1907. He was organist of Trinity Church, Boston (1902-09), and of the Boston Symphony Orchestra (1897-1909), and conducted (1901-07) the Choral Art

Society of Boston, which he had founded, the Worcester County Musical Association (1902-07), the Cecilia Society of Boston (1907-10), and the Boston Opera Company (1909-12). He published *Syllabus of the Course of Lectures upon the Ritual Music of the Protestant Episcopal Church in the United States of America* (1912).

GOODRICKE, THOMAS. See **GOODRICH, THOMAS.**

GOODS AND CHATTELS. A legal as well as popular expression, in common use, to signify personal property. The two words are not identical in meaning, however, the term "chattels" being the more extensive in signification and including the other. The term "goods" corresponds closely in meaning to the *bona* of the common law and to *movables* of the civil law, i.e., chattels movable, including domestic animals and certain incorporeal rights such as copyrights, patent rights, etc.; whereas chattels includes as well certain rights in land, i.e., *chattels real*, such as estates for years, the interest of a mortgagee in mortgaged land, etc. The term "goods" is now generally employed as coextensive in meaning with the old expression, "goods, wares, and merchandises," used in the seventeenth section of the Statute of Frauds. See **BONA**; **CHATTEL**.

GOODSELL, DANIEL AYRES (1840-1909). An American Methodist Episcopal bishop, born in Newburgh, N. Y. He graduated at the University of the City of New York in 1859 and soon after entered the Methodist ministry. He was elected Bishop in 1888. Besides contributions to the religious press, he wrote *Nature and Character at Granite Bay* (1901), a book which in its general character suggests the genius of Burroughs; *The Things which Remain, an Address to Young Ministers* (1904); *Peter the Hermit*, in "Men of the Kingdom Series" (1906).

GOODSIR, JOHN (1814-67). A Scottish anatomist, born at Anstruther, Scotland. He studied at St. Andrews University; graduated in medicine at the Royal College of Surgeons, Edinburgh; practiced in Anstruther; was made conservator of the museum of the College of Surgeons, Edinburgh (1840); acted as lecturer on pathology of tumors from 1842 to 1843; was assistant professor of anatomy, University of Edinburgh, from 1844 to 1846; and succeeded Munro as professor of anatomy in 1846. Consult *Memoir*, by Turner (Edinburgh, 1868).

GOODSON, KATHARINE (1872-). A distinguished English pianist, born in Watford (Hertfordshire). In 1886 she entered the Royal Academy of Music, where she studied under Beringer until 1892. For four years (1892-96) she was a pupil of Leschetizky in Vienna. Immediately after her return she made her debut in London, meeting with unusual success. In 1899-1900 she made a triumphal tour of Germany and Austria. Her first American tour was in 1907, when she was received with such enthusiasm that she made several subsequent visits. Her special characteristics are a marked individuality of style and extraordinary magnetism. In 1903 she was married to the English composer Arthur Hinton (q.v.).

GOODSPEED, (JOSEPH) ARTHUR WILLIS (1860-). An American physicist, born at Hopkinton, N. H. He graduated from Harvard University in 1884 and in 1889 from the University of Pennsylvania (Ph.D.), where he was an assistant in 1884-85, an instructor in 1885-

89, an assistant professor in 1889-1904, and professor of physics after 1904. His scientific articles deal mostly with the Röntgen rays and their application, with radioactivity, and with constants of the induction coil.

GOODSPEED, EDGAR JOHNSON (1871-). An American Greek scholar, born at Quincy, Ill. He graduated from Denison University (Ohio) in 1890 and studied also at Yale. Chicago (Ph.D., 1898), and Berlin. After teaching the classics for several years in preparatory schools, he was appointed to the faculty of the University of Chicago, becoming associate professor in 1911. In 1902 he was made assistant director of the Haskell Oriental Museum. He joined the editorial staff of the *American Journal of Theology* and is editor or author of *Greek Papyri from Cairo Museum* (1902); *Asterius*, with Galusha Anderson (1904); *Homeric Vocabularies*, with William B. Owen (1906; 2d ed. 1909); *Index Patristicus* (1907); *The Epistle to the Hebrews* (1908); *Index Apologeticus* (1912); *Die griechische Apologeten*, with M. Sprengling (1914); *The Freer Gospels* (1914).

GOOD TEMPLARS, INTERNATIONAL ORDER OF. A world-wide fraternal society, having for its object the promotion of total abstinence for the individual and prohibition for the state and nation and the world, organized at Syracuse, N. Y., in 1851. The Right Worthy Grand Lodge was organized at Cleveland, Ohio, in 1855.

The order was introduced in England in 1868 and in a short time spread throughout the civilized world, its ritual being translated into some 18 different languages. The question of admission of colored persons in 1874 caused a schism in the organization; a section of the order then organized under the name of the Right Worthy Grand Lodge of the World. The two branches were reunited through the efforts of John B. Finch, R.W.G.T., at Saratoga, N. Y., in 1887. The Prohibition party was formed in 1869 by a committee appointed by the Right Worthy Grand Lodge. The Woman's Christian Temperance Union was formed in 1874 by Good Templar women. The Washingtonian House for Inebriates at Chicago, Ill., and the Orphans' Home at Vallajo, Cal., were founded by the order. The name of the supreme governing body of the order has been changed to International Supreme Lodge, which meets triennially. The College of Good Templary is maintained by the order. The course of study, covering from one to three years, is designed to inculcate the principles of the temperance reform movement. Its graduates receive the degree of Master of Temperance Literature.

The organization in 1914 comprised two national Grand Lodges (United States and Canada), 67 Grand Lodges, aggregating 680,665 members, including 263,410 in the Juvenile branch, distributed through the United States, Great Britain, Germany, Denmark, Sweden, Norway, France, Switzerland, Asia, South Africa, Australia, and New Zealand. Members are required to pledge "that they will never buy, sell, use, furnish, or cause to be furnished, to others as a beverage, any spirituous or malt liquors, wine, or cider, and will discountenance the manufacture and sale thereof in all proper ways."

GOOD WILL. The favorable disposition or inclination of persons to extend their patronage to a particular firm or corporation on account of the reputation it has established. Good will is something more than the probability that

old customers will resort to the old place. It includes every advantage or benefit accruing to a business establishment from its locality, name, or common reputation, from its business habits, connections, and standing, or from any other matter which identifies and distinguishes it from other establishments. The good will of a business is property as much the subject of valuation and transfer as any tangible chattel. It is an asset of a business and may be taken into account in deciding whether a business establishment is solvent or insolvent. In a litigated case in England the good will of a partnership was valued at £20,000. The New York Court of Appeals has decided that the good will of a corporation organized under the laws of another State, but having its place of business in New York, is taxable in New York as property employed there by the corporation. Under the dissolution of a partnership, as in case of death of a partner, the good will of the concern must be converted into cash and its proceeds distributed, precisely as though it were tangible property. Upon a sale of the entire partnership business and assets the purchaser becomes entitled to the good will. This includes the sole right to hold himself out as the successor of the firm. In England and in some of the United States he acquires the right to use the old firm name, subject only to the qualification that he must not hold out the former partners as doing business under the old name, while in other States such right can be acquired only by express agreement to that effect.

The extent to which the seller of the good will of a business can compete with the buyer is a subject upon which the authorities are at variance. The tendency of modern decisions in England is to limit the seller more narrowly than the courts have felt disposed to do in the United States. Accordingly they hold that the seller of a good will must not in any way solicit patronage from the customers of the old business, nor in any way represent himself as succeeding to such business. In the absence of a contract to the contrary, however, he may engage in the same line of business in the same locality and in his own name, although that name may be a part of the old business name. In the United States, on the other hand, the seller of a business may usually compete with the buyer provided the competition be fair and free from fraud. If the purchaser of a good will would cut the seller off from soliciting old customers he must secure from him a contract surrendering those rights. Consult: Pollock, *Digest of Partnership*, § 39 (8th ed., London, 1905); Sebastian, *The Law of Trademarks* (4th ed., ib., 1889); Hopkins, *The Law of Trademarks, Trade-names, and Unfair Competition* (2d ed., Chicago, 1905); Dicksee and Tillyard, *Goodwill and its Treatment in Accounts* (3d ed., New York, 1906); Lindley, *Treatise on the Law of Partnership* (8th ed., Toronto, 1912). See RESTRAINT OF TRADE, CONTRACTS IN.

GOODWIN, ARTHUR (1593-1643). An English soldier, prominent during the Civil War in England. He studied at Magdalen College, Oxford, with his lifelong friend, John Hampden, and with the latter contributed Latin verses to the college collection, *Luctus Posthumus*, published on the death of Henry, Prince of Wales. He became a member of the Inner Temple in 1613; entered Parliament in 1620 and was elected again in 1628, 1625, and 1640; and on

the outbreak of the Civil War was appointed colonel of a regiment of cavalry which proved of great assistance to the Parliamentary party. In 1642, aided by Hampden and Lord Brooke, he defeated the Earl of Northampton at Coventry in Warwickshire, and with the aid of Colonel Hurry drove Lord Digby from Wantage. In January, 1643, Goodwin was appointed commander in chief of the forces of Buckinghamshire, was defeated in an attack on Brill, and took an active part in the siege of Reading.

GOODWIN, HARRY MANLEY (1870-). An American physicist and chemist, born in Boston. He graduated in 1890 from Massachusetts Institute of Technology, where, though at intervals absent for study at Harvard University and at the universities of Leipzig and Berlin, he was a member of the faculty after 1890, in 1906 becoming professor of physics and electrochemistry with supervision of the department of electrochemistry. He is known for his studies on the voltaic cell, on the viscosity of mercury vapor and of fused salts, and on the electric conductivity of dilute acid solutions. He is author of *Physical Laboratory Experiments* (1904; 3d ed., 1911) and *Elements of the Precision of Measurements and Graphical Methods* (1908; 4th ed., 1913).

GOODWIN, JOHN (c.1594-1665). An English Puritan divine. He was born in the County of Norfolk about 1594, graduated at Queen's College, Cambridge, and obtained a fellowship there in 1617. Having married, he gave up his fellowship and took orders, officiating in various places in the county with much acceptance. In 1632 he removed to London and in 1633 succeeded John Davenport (q.v.) at St. Stephens. In 1635 he was admonished for leanings towards independency. In 1639 he occasioned dissatisfaction by insisting on the need of a learned ministry. In 1642 he published *Anti-Cavalierism*, in support of the Parliamentary cause, which received further commendation in *Might and Right Well Met* (1648). In 1643 he assailed the theory of the divine right of kings in his *Os Ossorianum; or, A Bone for a Bishop* and in 1644 denounced the Presbyterians as a persecuting party in *Θεομαχία; or, The Grand Imprudence of Fighting Against God*. In 1645 he was ejected from his living for refusing to administer the sacrament to all indiscriminately and formed an independent church, which was largely attended. At the Restoration he was one of 18 incapacitated from holding any public trust. He died in 1665. Many of his publications, though all in English, have Greek or Latin titles. He has been a favorite with Methodists and been called the "Wiel of Methodism." John Wesley abridged his *Treatise of Justification* (London, 1642). Samuel Dunn, a Wesleyan minister, edited his *Christian Theology* (London, 1836) from Goodwin's works and wrote his life. His *Redemption Redeemed* was republished in London in 1842. The standard life of Goodwin is by Thomas Jackson, another Wesleyan minister (London, 1822).

GOODWIN, NAT (NANIE) C (AHL) (1857-1919). An American actor. He was born in Boston and after a brief experience in business made his debut, on March 5, 1874, at the Howard Athenaeum, in a piece called *Law in New York*. His success in imitating personal peculiarities led him to the variety stage, and at Pastor's Theatre, in New York (1875), he became very popular. Later he made a hit in the burlesque

of *Black-Eyed Susan*. He married in 1877 Eliza Weathersby, an actress, under whose name his company toured successfully. Most of his work was in lighter comedy, till in 1889-90 he appeared as Woolcott in *A Gold Mine*. The following summer he first played in England. Among his productions since have been: *A Gilded Fool*; *In Mizzoura*; *An American Citizen*; *Nathan Hale*, his greatest success (produced in Chicago, Jan. 31, 1898); *The Cowboy and the Lady* (1899); *The Altar of Friendship* (1902); *A Midsummer Night's Dream* (1903); *Beauty and the Barge* (1905). In 1907 he toured in repertoire, in 1911 he played in vaudeville, and in 1912-13 he made a great success, artistic and financial, as Fagin in the centenary production of *Oliver Twist*. Consult: Strang, *Famous Actors of the Day in America* (Boston, 1900); McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896); Winter, *The Wal-let of Time* (2 vols., ib., 1913); and the autobiographical *Nat Goodwin's Book* (Boston, 1914).

GOODWIN, THOMAS (1600-80). An English divine of the later Puritan period. He was born at Rollesby, Norfolk, studied at Cambridge, and became a fellow in 1620. In 1625 he was licensed a preacher of the university, and three years later became lecturer of Trinity Church, Cambridge, and was presented the vicarage by the King in 1632. Harassed by the interference of his Bishop, who was an adherent of Laud, he resigned his preferments and left the university in 1634. He then seems to have lived for some time in London as a Separatist preacher. In 1639 he withdrew to Holland and for a few months was pastor of a small congregation of English merchants and refugees at Arnheim. Returning to London soon after Laud's impeachment by the Long Parliament (1640), he ministered for 10 years to an independent congregation in the parish of St. Dunstan's-in-the-East and rapidly rose to considerable eminence as a preacher. In 1643 he was elected a member of the Westminster Assembly and at once identified himself with the Congregational party. He frequently preached by appointment before the House of Commons, and in January, 1660, his talents and learning were rewarded with the readership of Magdalen College, Oxford, a post which he held until the Restoration (1660). He rose into high favor with the Protector and ultimately became somewhat prominent among his more intimate advisers. From 1660 until his death, Feb. 23, 1680, he lived in London and devoted himself exclusively to theological study and to the charge of a small congregation. Five volumes of his works were published at London (1682-1704; reprinted in Edinburgh, 1861-66).

GOODWIN, WILLIAM WATSON (1831-1912). A distinguished American classical scholar, born at Concord, Mass. He was graduated from Harvard in 1851 and then continued his studies at the universities of Bonn, Berlin, and Göttingen, receiving from Göttingen the degree of Ph.D. in 1855. He was tutor at Harvard (1856-60) and Eliot professor of Greek there (1860-1901). In 1901 he became Eliot professor emeritus. He was the first director of the American School of Classical Studies at Athens (1882-83) and in 1872 and 1885 was president of the American Philological Association. In 1860 he published the first edition of his *Syntax of the Moods and Tenses of the Greek Verb*. This work has contributed more than any other single book

in America and England to the elucidation of Greek syntax and it has received generous recognition in Germany. It was published in revised and enlarged form in 1865 and 1890. He published also a *Greek Grammar* (1870; last ed., 1893). Both these books owed much, in their later editions, to the writings of B. L. Gildersleeve (q.v.). He edited also Demosthenes *On the Crown* (Cambridge, 1901) and Demosthenes *Against Meidias* (ib., 1906), scholarly works both, showing thorough knowledge of Attic law and Greek history. He was also a contributor to American journals and scientific publications, especially to the *Transactions of the American Philological Association* and *Harvard Studies*. Professor Goodwin received the degree of LL.D. from Amherst (1881), Cambridge, England (1883), Columbia (1887), Edinburgh (1890), Harvard (1891), Chicago (1901), Yale (1901); D.C.L., Oxford (1890); and was also Knight of the Greek Order of the Saviour. Consult Gildersleeve, *American Journal of Philology*, xxxiii, 367-368 (New York, 1912), and Eliot, *William Watson Goodwin* (Boston, 1913).

GOODWIN SANDS. Dangerous banks of shifting sands stretching for a distance of about 10 miles northeast and southwest, 5 to 12 miles off the east coast of Kent, England (Map: England, H 5). The sands are divided into two portions by a narrow channel, and at low water many parts are uncovered. When the tide recedes, the sand becomes firm and safe; but during the flow the water permeates the mass, rendering the whole pulpy and treacherous, in which condition it shifts to such a degree as to render charts uncertain from year to year. They have always been dangerous to vessels passing through the Strait of Dover, bound either for the Thames or traversing the North Sea. They serve, however, as a breakwater to form a secure anchorage in the Downs (q.v.) when east or southeast winds are blowing, but become dangerous when the wind blows strongly off shore, at which time ships are apt to drag their anchors and to strand upon the Goodwin breakers, in the shifting sands of which their wrecks are soon entirely swallowed up. Many celebrated and terribly fatal wrecks have occurred here, and many gallant rescues by local seamen have been made. Numerous buoys, fog sirens, warning guns, four lightships, and the North and South Foreland lighthouses now afford a valuable system of warning and protection. These sands are said to have consisted at one time of about 4000 acres of lowland, fenced from the sea by a wall. At the period of the Norman Conquest these estates were taken from Earl Godwin and bestowed upon the abbey of St. Augustine at Canterbury, the abbot of which allowing the sea wall to fall into a dilapidated condition, in the year 1100, the sea rushed in and submerged the whole. Near the Goodwin Sands the Dutch won a naval victory over the English in 1652.

GOODWOOD. An estate of the Duke of Richmond and Gordon, 3 miles east of Chichester, Sussex, England, chiefly noted for the annual race meeting held in July on the course established in the park in 1802. The castle, an eighteenth-century structure, has a fine collection of portraits by old masters; the park is celebrated for the beauty and variety of its trees and contains herds of deer. In it is a temple containing a Roman relief of Neptune and Minerva found at Chichester.

GOODYEAR, CHARLES (1800-60). An

American inventor, born at New Haven, Conn. He was the son of an iron manufacturer, with whom, at the age of 21, he went into business in Philadelphia. Unsuccessful in the iron trade, his attention was attracted to the manufacture of India rubber, and he expended all his means in experiments with various mixtures and processes which should remedy the fatal defects of India rubber in its natural state, since it is brittle in cold weather and sticky in warm weather. His efforts were a series of failures, excepting a partial success in treating the surface of rubber goods with nitric acid, until he bought of one Hayward, a rival experimenter, an invention for mixing India rubber with sulphur. The great secret of vulcanizing—a process in which the two substances, submitted to a high temperature, are converted into the elastic, enduring, and heat-and-cold-defying material now in use—was an accidental discovery made by Goodyear while standing by a stove and idly subjecting a mixture of rubber and sulphur to its heat. This new product he patented in 1844, discovering new uses to which it could be applied, until it required 60 patents to secure his inventions. Some of these rights were secured by other persons in England, and in France they were forfeited by an informality; so that, by these means and from expensive lawsuits, he gathered little save the honors awarded to his skill and perseverance. See RUBBER. Consult biographical sketch in Parton, *Famous Americans of Recent Times* (Boston, 1897; 11th ed., 1897), and B. K. Peirce, *Trials of an Inventor* (New York, 1866).

GOODYEAR, ELLSWORTH D. S. (1827–1910). An American soldier and inventor, born at New Haven, Conn. In 1846 he moved to New York City, where he engaged in the rubber trade. Sharing in the experiments that have gained renown for his family's name, he himself invented a process of making hollow rubber goods. During the Civil War he was captain for three years of a company of the Tenth Connecticut Volunteers. Promoted lieutenant colonel, he commanded a regiment in General Grant's line of battle before Petersburg, Va. On April 2, 1865, he led the assault on Fort Gregg and in spite of frightful losses succeeded in holding the position gained by his regiment. For this service he was brevetted brigadier general. In 1867 he was a member of the Connecticut Legislature, and from 1868 to 1884 he was United States customhouse inspector at New Haven, Conn.

GOODYEAR, WILLIAM HENRY (1840–1923). An American art historian and curator. He was born in New Haven, Conn., the son of Charles Goodyear (q.v.), the inventor; graduated at Yale in 1867; and studied art history in Heidelberg and in Berlin (1867–70). He traveled extensively in Europe and the near Orient in making his original studies, especially in architecture. From 1881 to 1886 he was curator in the Metropolitan Museum of Art, New York, and after 1899 he was curator of fine arts in the Brooklyn Institute Museum. Professor Goodyear is especially known for his discoveries in the architectural refinements, particularly in mediæval church buildings. In numerous contributions to scientific periodicals he demonstrated that Egyptian, Greek, Roman, and mediæval buildings are constructed with intentional asymmetry, intended for optical effects. He became honorary member of societies

in Rome, Edinburgh, Milan, and Venice, and a corresponding member of the Society of American Architects. His principal publications include: *A History of Art* (1887); *The Grammar of the Lotus* (1891); *Roman and Mediæval Art* (1893); *Renaissance of Modern Art* (1894); *Greek Refinements* (1912).

GOODY TWO-SHOES. A familiar nursery tale, published by Newbery in 1765 and ascribed to Oliver Goldsmith.

GOOGE, GOOJ, BAENADE (1540–94). An English poet. He was born in 1540 at Alvingham in Lincolnshire, studied at Cambridge and at Oxford, traveled on the Continent, and on his return became one of the gentlemen pensioners in the court of Queen Elizabeth. Consult "Eglogs, Epitaphs, and Sonnetes"—originally published in 1563—in Arber, *English Reprints* (London, 1871), and *The Popish Kingdome* (1570), a verse translation from the Latin of Thomas Naogeorgus (i.e., Thomas Kirchmayer), ed. by Hope (London, 1880).

GOOKIN, DANIEL (1612–87). A New England soldier and historian, born in Kent, England. Gookin came with his father to Virginia in 1621, but, sympathizing rather with the Puritan than with the Cavalier, he moved, in 1644, to Cambridge, Mass., where he was soon made captain of militia and elected to the House of Deputies, of which he became Speaker in 1651. In 1652 he was elected magistrate and in 1656 appointed superintendent of all Indians under civil authority. He held this office till death in spite of unpopularity occasioned by the protection he gave to his wards during and after King Philip's War. He was associated with Eliot in mission work among the Indians. He visited England in 1656 and again in 1657, efficiently protecting on his return in 1660 the fugitive regicides Goffe and Whalley. In 1674 he wrote *Historical Collections of the Indians of Massachusetts* (published by the Massachusetts Historical Society, 1792), and later a never-published and now lost *History of New England*. In 1677 he finished *An Historical Account of the Doings and Sufferings of the Christian Indians of New England*, which was sent to England, and there lost for over a century and a half, when it was found and printed in 1836 by the American Antiquarian Society. In 1681 Gookin was made major general of the Colony and was an active assertor of popular rights in the agitation which preceded the withdrawal of the Colonial Charter (1686). He was a man of fine character and an historian of balanced judgment and dignified, though not easy, style. Consult F. W. Gookin, *Daniel Gookin . . . his Life and Letters* (privately printed, Chicago, 1912).

GOOLE, GOOL. A market town and river port in the West Riding of Yorkshire, England, 22 miles south-southeast of York, on the right bank of the Ouse at its junction with the Don, 47 miles from the open sea at the mouth of the Humber (Map: England, F 3). The town is well built and possesses fine modern public buildings. Water and gas are supplied by private companies. It has iron foundries, ship and boat-building establishments, and extensive manufacturing of woolen and cotton goods, ropes, sails, alum, sugar, and agricultural implements. It has a commodious harbor, wet and dry docks, quays, and warehouses, and imports raw wool, linen yarn, timber, logwood, indigo, oil, wines, farm produce, and groceries. Its chief exports are coal, woolen and linen goods, and machinery.

It has a passenger service with Antwerp, Amsterdam, Copenhagen, and other ports in north Europe. The value of its imports for 1912 amounted to about \$44,581,000 and its exports to \$54,891,000. The total tonnage of vessels entered and cleared in foreign and colonial trade was 1,449,161 tons. Its rise from an obscure hamlet dates from the opening of the Knottingly Canal, which brought about its establishment as a bonded port in 1829. Pop., 1901, 16,576; 1911, 20,332.

GOORKHAS, *gōōr'kas*. See GURKHAS.

GOOROO, *gōō'roo*. See GURU.

GOOSAN'DER. See MERGANSER.

GOOSE (AS. *gōs*, Icel. *gās*, OHG. *gans*, Ger. *Gans*; connected with Lat. *anser*, Gk. *χην*, *chēn*, Ofr. *géis*, Lith. *zansis*, Skt. *hamsa*, goose, also ultimately with OHG. *ganazzo*, AS. *ganot*, Eng. *gannet*, and AS. *gandra*, Eng. *gander*). A web-footed bird of the subfamily Anserinae, of the family Anatidae, order Anseres (q.v.). The geese are closely allied to the swans on the one hand and to the ducks on the other. They differ from the swans in having the lores feathered and from the ducks in having the tarsi reticulate and the sexes alike in color. The geese form a fairly well-defined group of about 40 species found in all parts of the world. They are mostly larger than ducks and have longer necks. They are more terrestrial and many times are to be seen feeding on land herbage. They walk better than ducks, the legs not being quite so far back. Most of them are good eating, but there are a few, which are animal feeders, whose flesh is rank. Like the swans, they resent intrusion by hissing with outstretched neck. They utter characteristic notes called *honking* when on the wing. They generally fly in companies, each led by an old gander, which they follow in a wedgelike formation.

Wild Geese. Of the ten or twelve species of geese occurring in the United States, all but two or three breed in the far north and are migrants and winter visitants south of Canada. The common wild goose (*Branta canadensis*) is abundant throughout North America. It is about 3 or 3½ feet long and 5 feet across the wings. The head and neck are black, with a white patch on the chin; general color brownish gray, paler below. The nest is usually on the ground, but sometimes in trees. The eggs are usually five or six, plain buffy white. A remarkable Arctic goose is the emperor goose (*Philaetea canagica*), about two-thirds as large as the common goose, abundant on the shores of Bering Sea; the flesh is said to be rank and unfit for food. The snow goose (*Oen hyperboreus*) is a pure-white one, found throughout America, but rather rare in eastern parts. The so-called "tree ducks" (*Dendrocygna*) are tropical American geese occurring as far north as Texas in the summer. They are only about 20 inches long and are colored with various shades of yellowish and reddish brown. They make their nests in hollow trees, often some distance from water.

Among the notable geese of the Old World must be mentioned the graylag goose (*Anser anser*), which is thought to be the ancestral stock of the common domesticated goose. (See Colored Plate with WATER BIRDS.) It is found in central Europe and Asia and in north Africa. Another, common in Great Britain, is the bean goose (*Anser fabalis*), small and brownish, with a black "nail" on the beak. The spur-winged

goose (*Plectropterus gambensis*) is a purplish-black bird, with prominent spurs on the wings, found in Africa. In Australia there are two very remarkable geese—one (*Anseranas semipalmata*) with the feet little more than half webbed, and the other (*Cyrenopsis novaehollandiae*), a scarcely aquatic bird, with long legs having the tibia partly bare and the bill small and membranous. Among the best known of the geese are the brants and barnacle geese (q.v.). Consult D. G. Elliot, *Wild Fowl of the United States and British Possessions* (New York, 1898); and L. H. D. Shaw, *Wild Fowl* (ib., 1905). See Plate of NORTH AMERICAN WILD DUCKS in the article DUCK.

Domestic Geese. The domestication of the goose was very easy and doubtless began as soon as men began to remain in fixed settlements. They are among the animals figured on the oldest Egyptian and Asiatic monuments, and the Oriental breeds were no doubt derived from local wild species, especially the great Chinese swan, or "guinea" goose (*Cygnopsis cygnoides*), whose true home is in the valley of the Amur River. This is the largest of living geese, and wild and domesticated specimens are freely crossed to this day with other breeds. The basis of the domestic geese of Europe, however, is the graylag above described; and this kind was imported by the early colonists to America, where some admixture has taken place with local wild geese. Formerly the cultivation of geese was more extensive and important than at present. Great herds of geese were annually driven slowly from western Europe to Rome, where both flesh and feathers (down) were in great demand. Previous to the invention of metallic pens goose quills supplied all the pens used and formed a large article of trade now almost obsolete. In southern England goose culture was formerly far more extensive than at present, many thousands being driven to market every fall; and goose fattening in Holland and Germany is still a great industry, especially in the neighborhood of Strassburg. The long domestication of geese, however, has brought about remarkably little variation. As is pointed out by Darwin in his *Animals and Plants under Domestication*, the change has been little more than a considerable increase in size and fecundity, and a tendency to lose the brownish tints of the wild stock and become spotted with white or altogether white. The last feature has resulted not only from a preference for pure white which has prevailed ever since the time of the Romans, but from the former cruel practice of plucking geese alive, the new feather produced by the injured skin being usually white.

The standard breeds commonly raised in the United States are gray Toulouse, white Embden, gray African, brown Chinese, white Chinese, gray Wild, and colored Egyptian. A number of crossbred geese have also given good results. In general Toulouse geese are more compact in form than are other breeds and for this reason are preferred by many. The head is rather large and short and the bill comparatively short. The neck is carried well up and is of medium length. The breast is broad and deep. The body of the Toulouse goose is moderate in length, broad, deep, and compact. In birds of good condition the belly almost touches the ground. The wings are large and strong, the tail comparatively short, the thighs and shanks stout. In color the plumage is gray. The standard weight of

the adult gander is 20 pounds; adult goose, 20; young gander, 18; and young goose, 15 pounds. They are termed Christmas geese, since they mature later than others and are in season at the holiday time. They are fairly good layers, averaging 40 eggs in a season. See Colored Plate of Ducks.

White Embden geese are beautiful birds of large size, tall and erect carriage, snow-white plumage, and are about as heavy as the gray Toulouse goose. They originally came from Embden in Westphalia and have been bred in the United States for many years. They are considered a very satisfactory breed to raise. Gray African geese are by many considered the most profitable of all. They grow very rapidly and are ready for market in 10 weeks, weighing at that age between 8 and 10 pounds. According to standard weights they are as heavy as Toulouse and Embden, but heavier specimens are not uncommon.

The brown and white Chinese geese are smaller than those previously mentioned, and probably for this reason less popular. The domesticated gray wild geese are satisfactory and are generally bred throughout the United States. They are very highly prized for table purposes, are good layers, hardy, and easy to raise. The standard weight of the adult gander is 16 pounds; adult goose, 14 pounds; young gander, 12 pounds; and young goose, 10 pounds.

The colored Egyptian geese are purely ornamental, being seldom bred for other purposes than the showroom. They are sometimes called Nile geese. They are tall and slender. The color of the head is black and gray; the bill is purple or bluish red, and the eyes orange. The neck and back are gray and black; the centre of the breast is chestnut, with the other part gray. The upper parts of the plumage of the body are gray and black, and the under parts are a pale yellow, penciled with black.

Breeding. Geese are long-lived birds, some having been known to attain the age of 40 years. Birds 15 and 20 years old are not uncommon. Mature geese, at least two years old, should always be used for breeding. Breeding stock should be pastured in the fall and later fed on grain with some beef scraps. Ten per cent of the ration should be green feed, stewed clover and cooked vegetables. The eggs may be hatched by hens or by geese. When goslings are four or five days old, they are able to take care of themselves, but should always be cooped at night. The first food of goslings is grass fed as sod, and a little corn meal sometimes mixed with a little sand and charcoal. Very soon they may be fed a mixture of ground grains, grass, and vegetable food. When young geese are fattened, they should be placed in a rather small pen, so that they may not exercise too much, and should be fed three times a day a mixture of corn meal and beef scraps. They should be kept as quiet as possible. At 10 weeks of age, or when the tips of the wings reach the tail, they should be ready for market. Geese require a wider range than do ducks and, unlike the latter, will not do well unless they have access to water.

Economic Uses. Geese are valuable for their feathers, quills, eggs, and as food. The flesh is most commonly roasted. It contains on an average some 18 per cent refuse (waste, bones, etc.) and 82 per cent edible portion. The edible portion has, on an average, the following percentage composition: water, 46.7; protein, 16.3;

fat, 36.2; and ash, 0.8. Goose livers are esteemed a delicacy. The liver, morbidly enlarged by excessive feeding combined with lack of exercise, is used for making a delicately seasoned food called *pâté de foie gras*, for the manufacture of which Strassburg is especially famous. In Germany the breast is pickled and smoked under the name of Pomeranian goose breast. Goose fat is used to a large extent for culinary purposes, especially by Mohammedans and Jews. Consult Howard, "Ducks and Geese," in *United States Department of Agriculture, Farmers' Bulletin No. 64* (Washington, 1897).

GOOSE, TAILOR'S. A name applied to the smoothing iron used by tailors and supposed to have been given on account of the shape of the handle, which somewhat resembles the neck of a goose.

GOOSE BARNACLE. See BARNACLE.

GOOSEBERRY, *gōoz'bēr-ri* or *gōōs'.* The fruit of a prickly shrub of the genus *Ribes*, family Saxifragaceae. The genus is common throughout the north temperate zone, being represented by numerous species in America, Europe, and Asia, the great majority of which belong to North America. Of all these only four or five species have attained prominence in cultivation. The currant (q.v.) (*Ribes rubrum*) is one of the most important representatives of the genus and carries its distribution into the Orient. In the gooseberry, however, we find a very popular shrub in both the New and the Old World; it is especially prized in England, where it has attained its highest perfection, and where it has been in cultivation from the sixteenth century. Since it occurs only sparingly in southern Europe, where the grape thrives so well, it is little wonder that the gooseberry was neglected by the Greeks and Romans, even if they were familiar with it. The European gooseberry (*Ribes grossularia*) is in its natural state a strong-growing upright shrub with very formidable spines upon the branches and a hairy, more or less spiny, fruit. It is the progenitor of all the mammoth-fruited

FRUITING TWIG OF GOOSEBERRY.

varieties which have caused so much emulation among the gardeners of England, who have produced fruits weighing as much as 30 pennyweights; the unimproved fruits hardly average four pennyweights in weight. Varieties of this species were brought to America by the early pioneers, but the climate was uncongenial, and they suffered from disease and soon perished. Not until the middle of the nineteenth century could America claim to have a cultivated goose-

berry, and then only a seedling of one of the wild forms, *Ribes oxycanthoides*, common throughout the country. This was Houghton's seedling, which, however, is not the most common wild species even at its place of origin (Massachusetts). It was soon followed by one of its own progeny, Downing's seedling, or Downing. The popularity and universal cultivation of these two, which are still in the lead, is due largely to their ability to resist mildew. With the advent of spraying to check plant diseases a new era opened for European gooseberries in America; and since 1890 the English varieties have been planted with more assurance of success. There are now numerous hybrids of the European with native species, which promise to combine the resistant characters of the latter with the desirable size, color, and form of the former.

The gooseberry is easily propagated by means of suckers, cuttings, and layers; cuttings are most frequently employed, as they grow readily and give a well-formed plant. The gooseberry thrives on all good arable soils and demands the same treatment as the currant. It is usually planted 3 by 6 feet apart in field culture, kept free from weeds, and sprayed with an arsenical poison early in the season to protect it from the worm which is as fond of it as it is of the currant. If the English varieties are grown, the poison must be supplemented with a fungicide. The fruits of the gooseberry are used extensively for jelly, jam, marmalade, etc., both in England and in America. The ripe fruits are also used to some extent in the manufacture of wines and vinegar.

Besides the two species above mentioned, the following species, being ornamental, should receive more attention than they do from horticulturists: the snow-flowered gooseberry (*Ribes niveum*), a native of the northwestern coast of America, is remarkable for its beautiful white pendulous flowers and its acid berries, which in size and color resemble black currants and which make delicious pies. *Ribes speciosum* is ornamental in pleasure grounds and is remarkable for its shining leaves, as well as for its flowers having four stamens, instead of five, as in other species, and for the great length of the filaments. *Ribes saxatile*, a native of Siberia, and other species, forming a subgenus called *Botryocarpum*, have a character somewhat intermediate between currants and gooseberries, being prickly shrubs, but having their flowers in racemes. *Ribes saxatile* has small, smooth, globose, dark-purple berries, like currants. Consult Card, *Bush Fruits* (New York, 1898).

GOOSEBERRY, INSECTS INJURIOUS TO THE. The gooseberry is injuriously attacked by several borers, etc., harmful to currants. (See CURRANT INSECTS.) Two caterpillars, however, are especially harmful. The most prominent one in the Old World is the magpie moth (*Abraas grossulariata*), closely related to the cankerworm, whose caterpillar is the worst enemy of the gooseberry in Europe. In the United States the most damage is done by the gooseberry fruitworm (*Dakruma convolutella*), the larva of a pyralid moth about an inch across the wings, which are "pale gray crossed near the base by a dark diffuse band which is divided by a whitish line." The eggs are laid by the female moths on the young fruit, one on each; and when the young hatch, they bore into the berry and feed on the pulp. The cater-

pillars are about an inch in length, pale green, with brownish heads. As they grow, they bind several berries together with silk. Finally they drop to the ground, form cocoons beneath the leaves, and spend the winter there in the pupa state, from which they emerge in the spring. The only practical and effective remedy seems to be to watch the bushes and pick off and destroy the reddish infected berries early in the season. The small clearwing (*Egeria tipuliforme*) is also harmful in some places.

GOOSEBERRY INSECTS.

a, gooseberry moth (*Abraas grossulariata*) and larva; b, currant borer, the clearwing (*Egeria tipuliforme*).

GOOSE BIRD. A gunner's local name in the United States for the Hudsonian godwit (q.v.).

GOOSE/FISH. See ANGLER.

GOOSE FLOWER. See ARISTOLOCHIA.

GOOSE/FOOT. See CHENOPODIUM.

GOOSE GRASS, or (CLEAVERS (*Galium aparine*). A coarse-stemmed annual species of bedstraw with whorls of six to eight leaves. The hispid stems, leaves, and fruit cling to clothing and to animals. A somewhat common species is *Galium tricornis*, introduced from Europe into a number of places in the United States. There are about 50 species in the United States, none of which are of much importance except as weeds. The name is also applied to some true grasses. See ELEUSINE; BEDSTRAW.

GOOSE HAWK. See GOSHAWK.

GOO'TOO (Jamaica negro). A name in Jamaica for various small globefishes (q.v.).

G. O. P. (GRAND OLD PARTY). A popular name for the Republican party (q.v.).

GOPHER. A name of somewhat indefinite significance. It is a corruption of the French word *gauffre*, a honeycomb, applied by French settlers in America to burrowing animals which "honeycomb" the soil.

1. Any of several American rodents, belonging to two distinct families, the Geomyidae and the Sciuridae, subfamily *Spermophilinae*. The true gophers belong to the first-mentioned family, the *spermophilines* being more properly ground squirrels (q.v.). The Geomyidae are known as pouched rats, or pocket gophers. They are characterized by very large external cheek pouches which are lined with fur. These do not communicate with the mouth, but open beside it. In some species they run along the whole side of the neck as far back as the shoulders. These pouches seem to be used largely for carrying food. The front feet have large claws and are otherwise fitted for digging. The tail is short, and the ears are small. There are only two genera—*Geomys*, with perhaps half a dozen species, and *Thomomys*, with four or five smaller species. All of the pouched rats are confined to the western half of North America, except two species of *Geomys*, which occur in the Gulf

States, and they range from Central America northward to British Columbia. The most common species (*Geomys bursarius*) is found in Canada, Missouri, Illinois, Iowa, Texas, Mexico, and the Gulf States, but not north of the Saskatchewan River. It is about 9 inches long, with an almost hairless tail about 2 inches long, and weighs about 13 ounces. Its legs are short; forefeet strong and well adapted for burrowing, having five claws, the three middle ones very large and long. The claws on the hind feet are small, but the two middle ones longer than the others, the interior one being almost rudimentary. It has 20 teeth—8 upper and 8 lower molars, and 4 incisors, which are very strong, especially the lower pair, which are much stronger than the upper. The ears are very small. The animal is reddish brown on the back and sides, ashy beneath, and has white feet. It burrows in sandy soils, throwing up the earth in little mounds, and its work is surprisingly rapid and extensive. It subsists on grass, roots, nuts, buds, and farm vegetables. The roots of trees often suffer severely from its attacks. The pouches which cover the side of the head are capable of being so distended as to enable the animal to carry a considerable load of provisions. The true Southern gopher, or Georgia hamster (*Geomys tuza*), is a larger animal, found in Alabama, Georgia, and Florida. By a strange misapplication of names the gophers of the Southern States are often called "salamanders," although the latter word is almost universally applied to the tailed amphibians, and its use should properly be confined to that group. On the Pacific coast there are several kinds of gophers. Some are $6\frac{1}{2}$ inches long, with a tail nearly 3 inches; cheek pouches large, resembling the thumb of a glove, hanging down by the side of the head. When in the act of emptying its pouches, the animal sits on its hams, like a marmot or squirrel, and squeezes the sacks against its breast with its chin and forepaws. All those not inhabiting warm climates hibernate. A familiar species in the Northwest is the camass rat (*Thomomys talpoides*).

Similar animals inhabit the plains of other parts of the world, as South Africa, Russia, Tartary, and India. Everywhere that civilization has caused a lessening of natural enemies, such as weasels, badgers, skunks, foxes, wolves, hawks, owls, serpents, and the like, these animals have increased to the proportions of a pest and must be combated by poison, by flooding their burrows, suffocating with sulphur fumes, or similar means; in view of which such native carnivorous animals and birds as the coyote, badger, skunk, ferret, and all the hawks and owls should be preserved to the limits of toleration as assistants in keeping down these and other harmful rodents, such as the mice. See accompanying Plate and article POCKET GOPHER for illustrations of skull, face, and claws. Consult: Coues, *Geomys and Thomomys* (Washington, 1875); Merriam, *Monographic Revision of the Pocket Gophers* (Washington, 1895); Herriek, *The Mammals of Minnesota* (Minneapolis, 1892); Seton, *Life-Histories of Northern Animals* (New York, 1909).

2. A tortoise. See GOPHER TORTOISE.

3. A serpent. See GÖPPER SNAKE.

GOPHER SNAKE (so called because it burrows like a gopher), or INDIGO SNAKE. A large colubrine serpent (*Comptosoma*, or *Spilotes*, co-

rais couperi) of the southern United States, 10 feet in length, black, with reddish markings about the mouth and forward part of the belly. It is regarded by the negroes as a mortal enemy of the rattlesnake (see KING SNAKE) and is rarely molested by them. This variety passes into a variety (*melanurus*) of Mexico and Central America, and that into the typical *Comptosoma corais* of South America, which is light brown, with a black oblique stripe on each side of the neck.

GOPHER STATE. Minnesota. See STATES, POPULAR NAMES OF.

GOPHER TORTOISE. A turtle (*Xerobates* or *Testudo*, *polyphemus*) of the sandy coast districts of the southern United States. The shell, brown and black above and yellow below, measures 15 inches in length, the females being larger than the males. These tortoises are strong animals, burrowing deeply into the soil, where they pass the hot part of the day in pairs and hibernate in winter, and whence they come out at night in search of vegetable food. They are numerous and somewhat gregarious, especially in Florida, and do much damage in gardens and among root crops. The rural negroes seek them for food and also search for their buried eggs, which are as large as the eggs of a pigeon and five in number. The animal is thus an important food resource in Florida, where it is captured largely in pit traps. Other similar species inhabit the southwestern Territories and northern Mexico.

GOPHER WOOD. The wood of which Noah's ark was made (Gen. vi. 14). The word occurs only in this passage, is not found in the Semitic languages other than Hebrew, and its true meaning is not known. It has been conjectured to be akin to the Hebrew *kopher* (bitumen) or *gophriith* (pitch), to be a resinous wood like the cedar or the cypress, or to correspond to the Assyrian *giparu* (reed). If the last meaning is accepted, it is well to remember that the kufa now in use on the rivers and canals of Babylonia are made of willow branches, palm leaves etc., closely interwoven like basketwork, with a coat of bitumen on the inside.

GÖPERT, göp'pört, HEINRICH ROBERT (1800-84). A German paleontologist and botanist, born at Sprottau and educated at Breslau and Berlin. He was teacher at the Medico-Chirurgical Institute in 1827-30 and in 1831 became professor of botany at the University of Breslau. During the last 31 years of his life he was director of the botanical garden of Breslau. Besides his important compilation and classification of all fossilized plants known before 1860 in Brown's *Index Palæontologicus* (1848-50), he wrote a very large number of works, chiefly on vegetable physiology and phyto-paleontology. Among these are: *Die fossilen Koniferen verglichen mit denen der Jetztwelt*, with 58 plates (1850); *Skizzen zur Kenntnis der Urcälder Böhmens und Schlesiens* (1868); *Ueber die fossile Flora der silurischen, devonischen, und unteren Kohlenformation* (1860); *Die Flora des Bernstein* (1883).

GÖPPINGEN, göp'ping-en. A town of the Kingdom of Württemberg, Germany, situated, 1030 feet above sea level, on the Fils, 26 miles by rail from Stuttgart (Map: Germany, C 4). It has an old castle, built in the sixteenth century. The town is an important industrial centre with manufactures of cloth, leather,

GOPHERS, LEMMINGS AND MARMOTS

1. POUCHED GOPHER (*Geomys bursarius*).
2. ALPINE MARMOT (*Marmota marmota*).
3. STRIPED GROUND SQUIRREL or GOPHER (*Spermophilus tridecemlineatus*).
4. LEMMING (*Lemmus lemmus*).
5. PRAIRIE DOG (*Cynomys ludovicianus*).
6. WOODCHUCK (*Arctomys monax*).

enameled ware, toys, agricultural machinery, wire netting, shoes, paper, hats, gelatine, chemicals, bricks, textiles, and glue. Pop., 1900, 19,384; 1910, 22,373.

GO'PURA, or **GO'PURAM** (Skt. *gōpura*, a city gate). In Hindu architecture, a tower-like structure erected over the gateway of a temple. The term is used almost exclusively of the Dravidian temple gateways of southern India (see **DRAVIDIAN ARCHITECTURE**). These sustain lofty pylons built in successively retreating stories decorated with an extraordinary complexity of architectural embellishments and figure sculpture. They have no utilitarian function. Some of the great temples have not only a gopura over each of the four gates to the outer wall, but gopuras also over the gateways of successive inner enclosures. That at Srirangam has twelve; that at Tiruvaleer nine. The unfinished gopura in front of the *choultrie* of Tirumulla Nayab at Madura measures 107 by 174 feet on the ground; the gateway is 57 feet high, and the structure, if completed, would have been probably over 300 feet high. The gopuras should not be confounded with the pagodas, *sikhras* and *vimanas*, which are tower-like shrines or parts of the temple proper. See **INDIAN ART, Architecture**. Consult Fergusson, *Indian and Eastern Architecture* (London, 1891).

GORAKHPUR, *gō'rūk-pūr'*. A division of the United Provinces of Agra and Oudh, British India, bounded on the north by Nepal and on the south by the Gogra River. Area of division, 9543 square miles. Pop., 1891, 6,508,800; 1911, 6,524,410. It comprises the three districts of Gorakhpur, Basti, and Azangari, and lies immediately south of the lower Himalayan slopes. It is intersected by numerous rivers and lakes well stocked with fish. In the north and centre dense forests abound, and the whole country presents a verdant appearance. The principal rivers are the Rapti, the Gogra, and the Great and Little Gandak. The tiger is found in the north, and many other wild animals abound. The chief productions are cotton, rice, bajra, jowh, moth, etc. Capital, Gorakhpur (q.v.). Gautama Buddha, the founder of Buddhism, died within the District of Gorakhpur, and it became the headquarters of the new creed. The district formed part of the territory ceded by Oudh to the British under the Treaty of 1801. During the mutiny of 1857 it was lost for a short time, but under the friendly Gurkhas the rebels were driven out, and the whole district once more passed under British rule.

GORAKHPUR. The capital of a district and division of the United Provinces of Agra and Oudh, British India, on the Rapti River, 100 miles northeast of Benares (Map: India, E 3). Its principal edifice is a beautiful mosque, built in the seventeenth century. A considerable river transit trade in grain and timber is carried on. Gorakhpur was formerly an important military station, but the troops have been moved, and the large cantonment on the west of the city is abandoned. Pop., 1901, 64,148; 1911, 56,892.

GOR'AL (East Indian). A goat antelope (q.v.) of the genus *Oemas*, inhabiting the mountain tops of Central Asia. Three species are separated by zoölogists, but those of Tibet and Mongolia are so little known that they may prove only varieties of Himalayan goral (*Oemas goral*). This antelope-like animal stands only 27 inches high and is grayish brown, with a

dark stripe along the back and another down the foreleg, and a curious white ring around the eye: the forehead, nose, and tail are black. Both sexes have short black horns curving backward and ringed near the base. They wander in small bands about the edge of the highest forest and are exceedingly vigilant and agile, so that goral stalking is a laborious and skillful as well as delightful pursuit for the sportsman. See **SEROW**, and **Plate of GOAT ANTELOPES**.

GORAMI, *gō'rā-mī*. See **GOURAMI**.

GOR/BODUC. A legendary King of Britain, who is mentioned in the early chronicles, and whose tragic fate, together with that of his sons, forms the plot of the first English tragedy. The play was written by Thomas Norton and Thomas Sackville, was acted in 1561, and was printed in 1565. It has been highly praised by Sidney and Pope, but is rather too sanguinary for modern audiences. It goes by the name of its hero, who has divided his possessions between his two sons, Ferrex and Porrex. The sons quarrel, and one is slain; the survivor is slain by his mother, who in turn is killed with her husband by an indignant populace.

GORBUSCHA, *gōr-bōō'shā*. The humpbacked salmon (*Oncorhynchus gorbuscha*). See **SALMON**; **HUMPBACKED SALMON**.

GORCOMIUM. See **GORKUM**.

GOR/CUM. See **GORKUM**.

GOR/DAN, **PAUL ALBERT** (1837-1912). A German mathematician, born at Breslau. He studied at various German universities and in 1862 received his doctor's degree from the University of Berlin. He became a lecturer at the University of Giessen in 1863 and professor in 1865. After 1875 he held a professorship at the University of Erlangen. Gordan was one of the chief workers in the theory of invariants. He coöperated with Alfred Clebsch in much of his work and was a collaborator on the *Mathematische Annalen* after 1873. His proof of the finiteness of the invariant system of binary forms (first published in 1869) was a very important contribution to the upbuilding of the theory of modern algebra. His publications include: *Ueber die Transformation der Theta Funktionen* (1863); *Theorie der Abel'schen Funktionen*, with Clebsch (1866); *Ueber das Formensystem binärer Formen* (1875); *Vorlesungen über invariante Theorie* (2 parts, 1885-87); and some 80 papers in mathematical journals.

GOR/DIAN. The English form of the name of three Roman emperors. See **GORDIANUS**.

GOR/DIAN KNOT (Lat. *Gordius nodus*). The traditional origin of this famous knot was as follows: Gordius, a Phrygian peasant, was once plowing in his fields, when an eagle settled on his yoke of oxen. Surprised at so wonderful a phenomenon, he sought an explanation of it and was informed by a prophetess of Telmessus that he should offer sacrifice to Zeus. He did so, and out of gratitude for the kindness shown to him married the prophetess, by whom he had a son, the famous Midas. Somewhat later, in consequence of factional quarrels, the Phrygians consulted an oracle concerning the choice of a king. In reply they were ordered to choose as king whoever should first come to them riding in a car. As Gordius and his family came to the assembly while the reply was under discussion, he was at once chosen king, or, according to another version, his son Midas became ruler. Gordius dedicated his car and yoke to

Zeus, in the acropolis of Gordium (a city named after himself, in Phrygia, on the road between Pessinus and Ancyra, near the river Sangarius); the knot of the yoke was tied in so skillful a manner that an oracle declared that whoever should unloose it would be ruler of all Asia. When Alexander the Great came to Gordium, he cut the knot in two with his sword and applied the prophecy to himself.

GORDIANUS. The name of three Roman emperors, father, son, and grandson.—The first, **MARCUS ANTONIUS GORDIANUS SEMPRONIUS**, surnamed **AFRICANUS** (c.158–238 A.D.), was descended on the father's side from the famous family of the Gracchi. He was remarkable for his attachment to literary pursuits. After being ædile, in which capacity he celebrated the gladiatorial sports with great magnificence, he twice filled the office of consul—first as the colleague of Caracalla in 213 A.D., and later as the colleague of Alexander Severus. Soon afterward Alexander Severus appointed him proconsul of Africa, where he gained the affection and esteem of the people. The tyranny and injustice of the Emperor Maximinus having at length excited a rebellion against his authority in Africa, the Imperial procurator there was murdered by a band of nobles who had formed a conspiracy against him on account of his cruelty. Gordianus, now in his eightieth year, was proclaimed Emperor after having vainly refused the dangerous honor (March 16, 238 A.D.). He received the title of Africanus, and his son was associated with him in the exercise of Imperial authority. The Roman Senate acknowledged both and proclaimed Maximinus, then absent in Pannonia, an enemy to his country. The younger Gordianus, however, was defeated and slain in battle by Capellianus, Governor of Numidia, before Carthage, and his father in an agony of grief put an end to his own existence, having been Emperor for little more than a month. In personal appearance the elder Gordianus is said to have greatly resembled Augustus.—**MARCUS ANTONIUS GORDIANUS** (192–238), commonly called **GORDIANUS PIUS**, Emperor 238–244 A.D., grandson of the older Gordianus, was raised to the dignity of Caesar along with Pupienus Maximus and Balbinus, who were also proclaimed emperors in opposition to Maximinus; and in the same year, after Pupienus, Balbinus, and Maximinus had fallen by the hands of their own soldiers, Gordianus was elevated by the prætorian guards to the rank of Augustus. Assisted by his father-in-law, Misi-theus, a man distinguished for his wisdom, virtue, and courage, whom he made prefect of the prætorians, he marched, in the year 242, into Asia, against the Persians, who under Shahpur (Sapor) had taken possession of Mesopotamia and had advanced into Syria. Antioch, which was threatened by them, was relieved by Gordianus, the Persians were obliged to withdraw from Syria beyond the Euphrates, and Gordianus was just about to march into their country when Misi-theus died. Philip the Arabian, who succeeded Misi-theus, stirred up dissatisfaction in the army against Gordianus by treachery and finally goaded on the soldiery to assassinate the Emperor, 244 A.D.

GORDIN, gôr-dyên, JACOB M. (1853–1909). A Jewish playwright and journalist, born in the Government of Poltava, Russia. He was privately educated and after a number of years spent in teaching began to write short stories

and general articles for newspapers in St. Petersburg and Odessa. From 1886 to 1890 he was the editor of various publications at Odessa and Yelizavetgrad. In 1879 he founded at Yelizavetgrad the Society of Spiritual Brethren of the Bible, whose aim was to reconstruct religion upon the sole basis of practical ethics, to the exclusion of all rites and ceremonies. In 1890 the society was suppressed by the Russian government, and Gordin came to New York, where he began almost immediately to write for the Yiddish stage, his first play, *Siberia*, appearing in November, 1891. Within the next 15 years he had produced about 60 plays, varying greatly in quality, among them many adaptations and translations, dealing for the most part with Jewish life in Russia and America. His adaptations are such in the sense only that the general outline of their plot is borrowed; the details of the action, the character drawing, and the underlying meaning of the play are most often original. *Gott, Mensch und Teufel*, one of his best plays, is the Job or Faust motive worked out in modern Jewish life, and in the same category are *Der jüdische König Lear*, *Die jüdische Suppho*, and *Kreutzer Sonata*. The last was produced in an English version in 1905–06. His plays are robustly realistic, but the ethical import is prominent. Others of his successful dramatic works are: *Mirele Efrath*; *Der wilde Mensch*; *Die Schechita* (The Sacrifice); *Die Schb'uo* (The Vow); *Medea*; *Schlome Chacham*, *Der russische Jude in Amerika*. Consult Hapgood, *The Spirit of the Ghetto* (New York, 1902).

GORDIUM. See **GORDIAN KNOT**.

GORDIUS (Lat., Gordian, sc. *nodus*, knot; so called from the intricate knots into which the animals twist). The type genus of the Gordioidea, second order of Nematoda (q.v.), including those nematodes in which the body cavity is lined by a distinct epithelium. See **HAIR-WORM**.

GORDIUS. See **GORDIAN KNOT**.

GORDON, THE FAMILY OF. A famous Scottish family. In 1305 Sir ADAM OF GORDON was a partisan of Edward I in his struggle for the Scottish throne. He was named joint justiciar of Lothian and was one of the representatives of Scotland in the Parliament of Westminster. Nevertheless, he was pardoned by Robert Bruce and given the lordship of Strathbogie, where the chief seat of the family henceforth lay. His descendant, Sir ADAM, fell at the battle of Homildon Hill, in 1402, and with him the direct male line ended. The name "Gordon" was, however, transmitted by his two half brothers to a wide circle of gentry in Mar, Buchan, and Strathbogie.

ELIZABETH OF GORDON, the only daughter and heiress of Sir Adam, married Alexander Seton, who afterward was given the title of Lord Gordon. Her son ALEXANDER assumed the family name of Gordon and was made Earl of Huntly in 1449 and Lord of Badenoch soon afterward. By marriage he acquired large possessions in Aberdeenshire. Her son GEORGE, second Earl of Huntly, married Annabella, daughter of James I, and was Chancellor of Scotland from 1498 to 1501. His son ALEXANDER commanded the left wing of the Scottish army at Flodden Field. The landed possessions of the family were greatly increased by this royal marriage, especially in Banffshire and Inverness-shire. GEORGE, fourth Earl of Huntly, acquired the earldom of Moray,

and held the offices of Lieutenant of the North and Chancellor of the Realm. Alarmed at his power, the crown deprived him of Moray. The Earl rebelled, and lost his life by a wound in 1562. His grandson GEORGE, the fifth Earl (see HUNTLY, GEORGE GORDON), headed the Catholic party in Scotland and defeated at Glenlivet a royal army sent against him in 1594. Nevertheless, he obtained a pardon and was made Marquis of Huntly. GEORGE, his successor, fought for Charles I in the Civil War and was beheaded at Edinburgh in 1649. His grandson, GEORGE, first Duke of Gordon (1684), held Edinburgh Castle for James II in the revolution of 1688. His son was the last Catholic chief of the race, while his great-grandson, LORD GEORGE GORDON (q.v.), was leader of the Gordon Riots of 1780 in London, directed against the Catholics. In 1836 the title became extinct, but it was revived in 1876 for the benefit of the Duke of Richmond.

Descendants of the first Marquis of Huntly became viscounts of Melgund and of Aboyne and finally inherited the marquisate of Huntly, which they still hold. Other members of the family became earls of Sutherland. The lords of Lochinvar, famous in poetry and song, were Gordons. One of them, WILLIAM, sixth Viscount of Kenmure, was beheaded in 1716 for his prominent part in the Jacobite rising. In 1682 SIR GEORGE GORDON of Haddo, Lord Chancellor of Scotland, was made Earl of Aberdeen. Other members of the family were Lord Byron, whose mother was a Gordon, and CHARLES GEORGE GORDON, the hero of Khartum.

Consult: Douglas, *The Baronage of Scotland* (Edinburgh, 1813); W. Gordon, *The History of the Ancient, Noble, and Illustrious House of Gordon* (ib., 1726-27); *The House of Gordon*, ed. by J. M. Bulloch (Aberdeen, 1903-12); Bulloch, *The Families of Gordon of Invergordon, Neichall, also Ardoch, Ross-shire and Carroll, Sutherland* (ib., 1906); id., *The First Duke of Gordon* (ib., 1909), *The Gay Gordons* (London, 1908).

GORDON, ADAM LINDSAY (1833-70). An Australian poet. He was born at Fayal in the Azores and was educated at Cheltenham College, and at Merton College, Oxford. In 1853 he emigrated to South Australia, where he became a trooper in the mounted police and later a horse breaker. In 1865 he was elected a member of the House Assembly for the District of Victoria. He became known as an expert steeplechase rider, opened a livery stable at Ballarat, Victoria, in 1867, and in 1869 moved to Melbourne. His writings were little known during his life, but after his death—he committed suicide—his reputation increased until he became the most popular of Australian poets. His volumes of verse include: *Sea Spray and Smoke Drift* (1867); *Ashlaroth: A Dramatic Lyrio* (1867); *Bush Ballads and Galloping Rhymes* (1870). Consult Marcus Clarke's biographical sketch in his edition of Gordon's poems (1880), and also J. H. Ross, *The Laureate of the Centaurs: A Memoir of Adam Lindsay Gordon* (1888). His poems, ed. by Douglas Sladen, appeared in London in 1912. See AUSTRALIAN LITERATURE.

GORDON, CHARLES GEORGE (1833-85). An English soldier, familiarly known as "Chinese Gordon" and "Gordon Pasha." The son of Henry William Gordon, lieutenant general of artillery, he was born at Woolwich, Jan. 28, 1833. He was educated at Taunton, and entered

the Royal Military Academy at Woolwich in 1848. Obtaining a lieutenant's commission in 1852, he served through the Crimean War with distinction. From 1850 to 1858 he was employed in surveying and settling the Russo-Turkish frontier in Asia and acquired an intimate knowledge of the people and the districts he visited. He was promoted captain, 1859, in 1860 joined the Anglo-French forces in China and was present at the capture of Peking. He remained at Tien-tsin in command of the royal engineers: he added to the geographical knowledge of China by several expeditions to the unknown interior, in 1862 became major, and in 1863 was appointed commander of the "Ever Victorious Army," which suppressed the formidable Taiping rebellion and opened up the rich provinces and cities of the silk districts. He refused the large money rewards offered him by the Chinese Emperor, who bestowed upon him the yellow jacket and peacock's feather of a mandarin of the first class, with the gold medal and title of Ti Tu, the highest Chinese military rank. In 1864 he received his brevet as lieutenant colonel, and on his return to England was made a C.B. From 1865 to 1871 he commanded at Gravesend the royal engineers, who were employed in constructing forts for the defense of the Thames, and was distinguished for his charitable work among the sick and poor. From 1871 to 1873 he represented England in the International Danube Commission at Galatz. In 1874 he was sent by Ismail Pasha to establish the authority of Egypt in the upper Nile basin, and was appointed Governor of the Equatorial Provinces. Subsequently he was created a pasha, and in February, 1877, the Khedive appointed him Governor of the Sudan. His administration was marked by wonderful energy and activity in establishing communication between widely separated districts, in the development of the natural resources of the country, and in suppressing rebellion and slavery. The deposition of Ismail in 1879 led to his resignation. In 1880 he accompanied the Marquis of Ripon to India as his private secretary, but, finding himself unsuited for the post, at once resigned, and on the invitation of Sir Robert Hart visited China to advise the government in connection with its strained relations with Russia.

In 1881-82 he commanded the royal engineers in Mauritius, where he attained the rank of major general. From March to October, 1882, he was connected with the Cape government in an attempt to terminate the Basuto trouble, but resigned in indignation at the intrigues of Mr. Sauer, Secretary for Native Affairs. The year 1883 he spent in a long-desired visit to the Holy Land. He had undertaken a mission to the Congo for the King of the Belgians when the catastrophe to Hicks Pasha's army, which was overwhelmed by the forces of the Mahdi, made the Gladstone government insist on the Khedive's abandonment of the Sudan. Gordon was commissioned to effect the withdrawal of the scattered garrisons and the evacuation of the country. He arrived at Khartum in 1884 and received a warm welcome; but his first battle with the hostile Sudanese was unsuccessful, owing to the treachery of two pashas, whom he at once sentenced to death. The capture of Berber by the rebels cut Gordon's communications with Cairo, and he was beleaguered in Khartum. By vigorous personal effort he successfully repelled the besieging hordes for over 10 months, but on

Jan. 26, 1885, when a tardily dispatched British army of relief, under General Wolseley, had arrived within two days' march of the place, Khartum fell through the treachery of Ferig Pasha, and the heroic commander was slain. Gordon's writings include: *Reflections in Palestine* (1884); *Last Journal* (1885); *Letters to his Sister* (1888). Consult: Andrew Wilson, *Ever Victorious Army* (London, 1863); Hill, *Gordon in Central Africa* (ib., 1881); Hake, *The Story of Chinese Gordon* (ib., 1884-85); and the various *Lives* by Archibald Forbes (ib., 1884), by his brother, Sir Henry Gordon (ib., 1886); Sir W. F. Butler (ib., 1899); D. Boulger (ib., 1911); W. S. Blunt, *Gordon at Khartoum* (ib., 1911); and the books on *the Egyptian Sudan*, by Ohrwald (trans., ib., 1892) and Slatin Pasha (trans., ib., 1896).

GORDON, CHARLES WILLIAM (1800-). A Canadian author. He was born in the County of Glengarry, Ontario, graduated at Toronto University, and studied theology at Knox College. He was ordained to the Presbyterian ministry in 1830. In the same year he went as a missionary to the Canadian Northwest Territories, where he worked among the miners and lumbermen for three years, and afterward succeeded in securing the help of Presbyterian churches in Great Britain in furtherance of Canadian missions. In 1894 he was appointed pastor of St. Stephen's Presbyterian Church at Winnipeg. All his writings were published under the nom de plume of "Ralph Connor." Gordon was elected vice president of the Canadian Society of Authors, and a fellow of the Royal Society of Canada. In 1911 he was chairman of the board of arbitration in the British Columbia and Alberta mines dispute. His works, several of which created a sensation, include: *Beyond the Marshes* (1897); *Black Rock* (1898); *The Sky Pilot* (1899); *The Man from Glengarry* (1901); *Glengarry School Days* (1902); *The Siccan Creek Blizzard* (1904); *The Prospector* (1904); *Breaking the Record* (1904); *The Doctor: A Tale of the Rockies* (1906); *The Angel and the Star*, sermons (1908); *The Life of the Late Rev. Dr. James Robertson* (1908); *The Dawn by Galilee* (1909); *The Forfeigner* (1909); *The Recall of Love* (1910); *Corporal Cameron of the Northwest Mounted Police* (1912). Consult "English-Canadian Literature," by Thomas Guthrie Marquis, in *Canada and its Provinces*, vol. vi (Toronto, 1913-14).

GORDON, DANIEL MINER (1845-). A Canadian educator. He was born in Pictou, Nova Scotia, and was educated at Glasgow and Berlin universities. Ordained to the Presbyterian ministry in 1866, he was minister of St. Paul's Church, Truro, Nova Scotia (1866-67); St. Andrew's Church, Ottawa, Ontario (1867-82); Knox Church, Winnipeg, Manitoba (1882-87); and St. Andrew's Church, Halifax (1887-94). In 1894-1902 he was professor of systematic theology in the Presbyterian College, Halifax; and in 1902 he became principal and vice chancellor of Queen's University, Kingston, Ontario. Long and actively interested in promoting the union of the Presbyterian churches in Canada, Gordon was a delegate to the General Assembly of the Church of Scotland in 1875, in 1906 was appointed a member of the committee on union of the Presbyterian, Methodist, and Congregational churches of Canada, was elected vice president of the Lord's Day Al-

liance, and in 1910 was a delegate to the World's Missionary Convention at Edinburgh. He published *Mountain and Prairie* (1880), the narrative of a journey made by him in 1879 from Victoria, British Columbia, to Winnipeg.

GORDON, GEORGE, LORD (1751-93). An English agitator whose name is connected with the "No Popery" riots in London in 1780. He was the third son of Cosmo George, third Duke of Gordon. He was born Dec. 26, 1751, and at an early age entered the navy, and rose to the rank of lieutenant, but quitted the service during the American War because Lord Sandwich refused him a ship. Elected in 1774 member of Parliament for Ludgershall, a pocket borough, he soon made himself conspicuous by his opposition to ministers and by the freedom with which he attacked all parties; but, though eccentric, he displayed considerable talent in debate and no little wit. When in 1778 a bill passed the Parliament for the relief of Roman Catholics from certain penalties and disabilities, the Protestant Association of London, among other societies, was formed for the purpose of procuring its repeal, and in November, 1779, Gordon was elected president. In June, 1780, he headed a mob of about 100,000 persons in a procession to the House of Commons to present a petition against the measure. Riots ensued in the city, lasting for several days, in the course of which many Catholic chapels and private dwelling houses, Newgate and other prisons, and the mansion of the Chief Justice, Lord Mansfield, were destroyed, and in the suppression of the disturbance by military force nearly 500 lives were lost. A vivid description of the riots will be found in Dickens's *Barnaby Rudge*. Gordon was tried for high treason, but acquitted. Thereafter he seemed insane. In 1786 he was excommunicated by the Archbishop of Canterbury for refusing to give evidence in a will case, and later he became a convert to Judaism. In 1787 he was convicted on two official informations—for a pamphlet reflecting on the laws and criminal justice of the country and for publishing a libel on Marie Antoinette, then Queen of France. While in prison at Newgate, he died of a fever on Nov. 1, 1793. In addition to the histories of England, consult: O'Beirne, *Considerations on the Late Disturbances, by a Consistent Whig* (London, 1780); Vincent, *A Plain and Succinct Narrative of the Riots in the Cities of London and Westminster and Borough of Southwark* (3d ed., ib., 1780); Watson, *Life of Lord George Gordon* (ib., 1795); Wemyss, *A Notable Woman and Other Sketches* (ib., 1803); Cobbett, *State Trials*, xxi; *Annual Register* for 1780, 1784, 1787.

GORDON, GEORGE, fifth EARL OF HUNTLY. See HUNTLY.

GORDON, GEORGE ANGLIER (1853-). An American Congregational clergyman, born in Aberdeenshire, Scotland. He came to America when but 18 years old and three years afterward entered the Bangor Theological Seminary, where he graduated in 1877. He preached for one year at Temple, Me., took a special course in Harvard College, and after his graduation in 1881 was for three years pastor at Greenwich, Conn., and in 1884 became pastor of the Old South Church in Boston. He was a university preacher at Harvard University from 1886 to 1890 and at Yale from 1888 to 1901. In 1897 he became an overseer of Harvard. In 1893 he received the degree of D.D. from Bow-

doin and from Yale, and the degree of S.T.D. in 1895 from Harvard and in 1903 from Columbia. His publications include: *The Witness to Immortality* (1893); *The Christ of To-Day* (1895); *Immortality and the New Theology* (1897); *The New Epoch for Faith* (1901); *Ultimate Conceptions of Faith* (1903); *Through Man to God* (1906); *Religion and Miracle* (1909; rev. ed., 1910); *Revelation and the Ideal* (1913).

GORDON, GEORGE HAMILTON, fourth EARL OF ABERDEEN. See ABERDEEN.

GORDON, GEORGE HENRY (1823-86). An American soldier. He was born in Charlestown, Mass., graduated at West Point in 1846, and served in the southern campaign in the Mexican War, earning the brevet of first lieutenant. In 1854 he resigned from the service, and from 1854 to 1861, after taking a course in the Harvard Law School, practiced law in Boston. On the outbreak of the Civil War in 1861 he organized and became colonel of the Second Massachusetts Volunteers. Largely in recognition of his skill and bravery in covering the retreat of General Banks's army from Strasburg to Winchester, Va., on May 24-25, 1862, he was promoted to be a brigadier general of volunteers in June, 1862, and served as such at Cedar Mountain, Chantilly, South Mountain, and Antietam. From March to June, 1865, he was in command of the Eastern District of Virginia, and on April 9, 1865, was brevetted major general of volunteers. On Aug. 24, 1865, he was mustered out of service and subsequently until his death practiced law in Boston, where for some time he also acted as collector of internal revenue for the Seventh Massachusetts District. He published: *History of the Second Massachusetts Regiment* (1876); *History of the Campaign of the Army of Virginia under Gen. John Pope from Cedar Mountain to Alexandria* (1880); *A War Diary of the Events of the War of the Great Rebellion, 1863-65* (1882); *Brook Farm to Cedar Mountain, 1861-62* (1883).

GORDON, SIR JAMES ALEXANDER (1782-1860). An English naval officer, born in Aberdeenshire. He entered the navy at the age of 11, served in the engagement off L'Orient in June, 1795, and in the battles of Cape St. Vincent and the Nile. In 1804 he was placed in command of the sloop *Raccoon*, subsequently participated in various actions in the West Indies, the Mediterranean, and the Adriatic, and particularly distinguished himself in the battle of Lissa, March 13, 1811, in which he commanded the frigate *Active*. In November, 1811, he lost a leg at the capture of the French frigate *La Pomone*. As commander of the *Sea Horse*, he joined Sir Alexander Cochrane in the Chesapeake in the fall of 1813 and subsequently commanded the squadron which, in August, 1814, entered the Potomac, reduced Fort Washington, and captured Alexandria, after destroying or capturing the vessels in the harbor. He also took part in the futile expeditions against New Orleans in 1814-15. Subsequently he was superintendent of Plymouth Hospital (1828-32), superintendent of Chatham Dockyard (1832-37), lieutenant governor of Greenwich Hospital (1840-53), and governor of that hospital from 1853 until his death (Jan. 8, 1869). He was made a vice admiral in 1848, admiral in 1855, and admiral of the fleet in 1868.

GORDON, JOHN. A Scottish soldier of fortune of the seventeenth century. He entered the Imperial army of Ferdinand II during the Thirty

Years' War and rose to the rank of lieutenant colonel and commandant of Eger. Upon hearing of the defection of Wallenstein, commander in chief of the Imperial forces, and the determination of that general to form an alliance with the Swedes, Gordon joined in the conspiracy with Butler and Leslie for the murder of Wallenstein and his most trusted adherents. In compensation for his services he received a considerable sum from the Imperial government. Gordon is one of the characters in Schiller's tragedy, *Wallenstein*.

GORDON, JOHN BROWN (1832-1904). An American soldier and politician. He was born in Upson Co., Ga., graduated at the State University in 1852, and followed the profession of law. In 1861 he entered the Confederate army as captain of infantry and rose to the grade of lieutenant general, being wounded five times. At the time of General Lee's surrender at Appomattox, General Gordon commanded one wing of the army. In 1868 he was the Democratic candidate for Governor of Georgia, but General Meade, military commander under the Reconstruction Act, declared his opponent, Rufus B. Bullock, elected. He defended his State in the Ku-Klux investigations, was elected to the United States Senate in 1873, reelected in 1879, and resigned in 1880. He was again elected in 1891, and was one of the leaders of the Democratic party. From 1887 to 1890 he was Governor of Georgia. He became well known as a lecturer on Civil War subjects, and for a number of years held the post of commander in chief of the United Confederate Veterans. He wrote *Reminiscences of the Civil War* (1905).

GORDON, SIR JOHN CAMPBELL, seventh EARL OF ABERDEEN. See ABERDEEN.

GORDON, SIR JOHN WATSON- (1788-1864). A Scottish portrait painter. He was born at Edinburgh, the son of Capt. James Watson of the Royal Artillery, and afterward added Gordon to his family name. He studied for four years under John Graham at the Trustees' Academy and frequented the studio of his uncle and Sir Henry Raeburn. After the death of Raeburn he became the principal portrait painter in Scotland. In 1850 he succeeded Sir William Allan as president of the Royal Scottish Academy, was appointed limner to the Queen, and received knighthood. Gordon excelled in transferring to the canvas those lineaments of character which are conceived to be preëminently Scottish. Among his best-known works may be mentioned: "Sir Walter Scott" (1831); "Dr. Chalmers" (1837); "Duke of Buccleuch" (1842); "Lord Cockburn" (1842); "Thomas De Quincey" (1843, National Portrait Gallery, London); "Lord Robertson" (1846); "Principal Lee" (1847); "Professor Wilson" (1851); "Earl of Aberdeen" (1852); and the "Provost of Peterhead" (1853), which received a gold medal at the Paris Exposition in 1855.

GORDON, JUDAH LOEB or LEON (1830-92). A Russian Hebrew writer. He was born and educated at Vilna. Although a graduate of a rabbinical seminary, all his life he strenuously opposed the backward and fanatic rabbis and their obscurantist supporters. For 20 years he was a teacher in various Jewish public schools in the Government of Kovno. In 1872 he was called to St. Petersburg to become secretary of the Society for the Dissemination of Culture among the Jews of Russia. Accused of political conspiracy in 1879, he was exiled to the Govern-

ment of Olonetz. Having proved his innocence, he was soon allowed to return to St. Petersburg and became one of the editors of the Hebrew periodical *Ha-Meliz*. The Jewish massacre of 1882 and the subsequent persecutions embittered the last years of his life. His writings comprise poetry (6 vols., 1898), prose fiction (3 vols., 1870-89), and letters (2 vols., 1894). Besides Hebrew, Gordon wrote considerably in Russian. Yiddish, however, he deprecated, although he published a volume of poems in that language (*Sichoth Chulin*, 1886). Gordon is the greatest poet of the Haskalah, or rationalistic school of Hebrew writers, his epics and rhymed fables being especially excellent. His letters reflect most faithfully the intellectual conditions of Russian Jewry in the nineteenth century. Consult Slouschz, *The Renaissance of Hebrew Literature* (Philadelphia, 1909).

GORDON, JULIEN. The pseudonym of Julie Grinnell Chance (q.v.), formerly Mrs. Van Rensselaer Cruger.

GORDON, LADY LUCIE (or LUCY) AUSTIN DUFF- (1821-69). An English author and translator, born in London. She was the only daughter of John Austin the jurist. Her knowledge of German was gained during a two years' stay in Germany (1826-28). In 1840 she married Sir Alexander Duff-Gordon and almost immediately began her translations. These include: *Studies of Ancient Greek Mythology*, from the German of Niebuhr (1841); Meinhold's *Mary Schwaedlet*; Lomping's *The French in Algiers* (1845); Feuerbach's *Remarkable Criminal Trials* (1846, with her husband); Ranke's *Memoirs of the House of Brandenburg*; De Wailly's *Stella and Vanessa* (1850); the Countess d'Arbouville's *The Village Doctor* (1853); and Ranke's *Ferdinand I and Maximilian II* (1853, with her husband). At this period she lived in London and counted among her friends Heine, Tennyson, Dickens, and Thackeray. About 1860 her health failed, and she made a voyage to the Cape of Good Hope, which her *Letters* describe (1861-62). The latter years of her life were spent in Egypt, and from there she wrote her two series of delightful letters, *Letters from Egypt* (1863) and *Last Letters from Egypt* (1865).

GORDON, PATRICK (1635-99). A Scottish soldier of fortune, general in the Russian army, and a friend of Peter the Great. He first served (1651) in Poland under Charles X of Sweden. Captured by the Poles, he entered their service, only to rejoin the Swedes when recaptured by them at Warsaw. Next the German flag claimed his allegiance, but he soon took service again in the Swedish and Polish armies successively. In 1661 he entered the Russian service, in which he remained until his death. The Czar Alexis sent him on a mission to England, where, in 1665, he had an interview with Charles II. Although raised to the rank of lieutenant general in the Russian service and in high favor with the boy Czar, Peter, yet on another visit to England in 1686 he greatly desired to enter the army of James II. Peter would not grant him his request and soon afterward promoted him to the highest rank, that of general. In the contest between Peter and his sister Sophia, which resulted in a revolution, it was chiefly through Gordon's help that Peter triumphed. His last years were spent in opulence and honor and in high favor with the Czar. Gordon kept a journal during the last 40 years of his life,

which was published at Moscow and St. Petersburg in three volumes in 1849-53, under the title *Tagebuch des Generals Patrick Gordon zum erstenmal vollständig veröffentlicht durch Dr. P. M. C. Posselt*, and a part of it was published in English in 1859, as *Passages from the Diary of General Patrick Gordon of Auchleuchries*.

GORDON, PATRICK (1644-1736). An English soldier and Colonial Governor in America. After serving for some years in the English army, he was appointed Governor of Pennsylvania in 1726 and held this position until his death. A man of ability and character, he was one of the most popular of the Colonial governors of the province and was successful for the most part in winning the confidence of the Indians, though it was during his administration in 1733 that they were virtually defrauded of part of their lands by the famous "walking purchase." Gordon published *Two Indian Treaties at Conestogoc* (1728).

GORDON, WILLIAM (1728-1807). An English clergyman and writer, born at Hitchin, Hertfordshire. He entered the independent ministry in 1752 at Ipswich, preached at Southwark from 1764 to 1770, emigrated to America in the latter year, settled at Roxbury, Mass., and remained in America until 1786, when he returned to England, where he subsequently held several pastorates. While in America, during the Revolutionary War, he strongly sided with the Patriot party and in 1788 published, in four volumes, a *History of the Rise and Independence of the United States, Including the Late War*, which for more than 100 years was considered one of the most valuable sources for the history of the Revolution, but which has recently been shown to have been plagiarized, in large part, from the *Annual Register*, and from Ramsey's *History of the Revolution in South Carolina*, which he saw in manuscript. Consult Libby, "A Critical Examination of Gordon's History of the Revolution," in the *Report of the American Historical Association* for 1899 (Washington, 1900). He also wrote a *Treatise Concerning Religious Affections* (1762) and was a contributor to the *Protestant Dissenter's Magazine*.

GORDON-CUMMING, CONSTANCE FREDERICA (1837-). A Scottish traveler and writer, the daughter of Sir William Gordon-Cumming, and a sister of R. G. Gordon-Cumming. She was born at Altyre. After 1867 she spent many years traveling in the East and published, among other books of travel, *From Hebrides to the Himalayas* (1876); *At Home in Fiji* (1882; 2d ed., 1886); *Fire Fountains of Hawaii* (1883); *Granite Crags of California* (1884); *In the Himalayas and on the Indian Plains* (1884); *Wanderings in China* (1886; 2d ed., 1900); *Two Happy Years in Ceylon* (1892). She also wrote *Work for the Blind in China* (1888), which is now incorporated in *The Inventor of the Numeral Type for China* (1899), an account of the life and work of the Rev. W. H. Murray, of Peking.

GORDON-CUMMING, ROUALEYN GEORGE (1820-66). A British traveler and African lion hunter, brother of Constance Gordon-Cumming. From an early age he was fond of sports. He served under the East India Company in 1838-40, in the Royal Veteran Newfoundland Companies, and in the Cape Mounted Rifles in 1843. Resigning his last commission, he started on a five-year hunting trip in South Africa, chiefly in Bechuanaland and in the Limpopo

valley. He returned to England in 1848 and two years later published the story of his hunting exploits in his book, *Five Years of a Hunter's Life in the Far Interior of South Africa*. This book was very successful; a third edition appeared in 1851, and an abridged edition under the title *The Lion Hunter of South Africa* came out in 1856 (new ed., 1904).

GORDON HIGHLANDERS. See **HIGHLANDERS**.

GORDONIA, gôr-dô'ni-â (Neo-Lat., named in honor of James Gordon, a London nurseryman of the eighteenth century). A genus of trees and shrubs of the family Ternstroemiaceæ, of which several species are natives of America. Of these the most important is the loblolly bay (*Gordonia lasianthus*), which is found in swamps near the seacoast from Virginia to the Gulf of Mexico. Moist tracts of considerable extent are often covered with this tree alone. It is a shrub, or small tree, with oblong leathery evergreen leaves and beautiful white sweet-scented flowers more than an inch in diameter. The bark is used for tanning. The wood is handsome, resembling mahogany, but is very perishable. In England it is cultivated with some difficulty and generally appears as a mere bush. *Gordonia altamaha*, an American species, is of interest on account of the entire disappearance of the tree in its original habitat: it is wholly unknown in a wild state. It is said to be hardy as far north as Massachusetts, and all the specimens now growing are believed to have sprung from a single tree that long stood in Bartram's garden in Philadelphia. A number of other species of this genus are found in eastern Asia. As ordinarily seen in cultivation, they are all shrubs. See **BAY**.

GORDON RIOTS. The name given to a mob uprising, directed against the Roman Catholics, which occurred in London in 1780. See **GORDON**, **GEORGE**, **LOEB**; **BARNABY RUDGE**.

GOEDY, JOHN PANCOAST (1851-1908). An American educator, born in Maryland. He received an academic education and also studied at Leipzig. He was professor of education at Ohio University (Athens) from 1886 to 1896, at the Ohio State University (Columbus) from 1896 to 1900, and in 1901 was appointed to a similar chair in New York University. His most important publication is the *Political History of the United States, with Special References to the Growth of Political Parties*, vols. i and ii (2d rev. ed., 1903). He wrote also: *Lessons in Psychology* (1890); *Growth and Development of the Normal School Idea in the United States* (1891); *New Psychology* (12th ed., 1898); *A Broader Elementary Education* (1903).

GORE. In heraldry an abatement of honor. It consists of two curved lines which meet in an acute angle at the centre of the escutcheon.

GORE, MRS. CATHERINE GRACE (1799-1861).

An English novelist, the daughter of a wine merchant named Moody, and born at East Retford, Nottinghamshire. In 1823 she married Capt. Charles Arthur Gore. Her first novel was *Theresa Marchmont, or the Maid of Honor* (1824). Some of her early novels, as the *Lettre de Cachet* (1827) and the *Tuileries*, were vivid descriptions of the French Revolution; but her greatest successes were her novels of English fashionable life, conspicuous among which were: *Cecil, or the Adventures of a Coacomb* (1841), and its sequel, *Cecil, a Peer* (1841); *The Ambassador's Wife* (1842); and *The Banker's Wife*

(1843). She also wrote a prize comedy entitled *Quid pro Quo, or the Days of Dupes*; a popular comedy called *The School for Coquettes* (1831); and several other dramatic pieces. Her novels and tales number about 100. Though very popular in their own time, they are now forgotten. They possess, however, great value as transcripts of contemporary fashionable society. Consult Thackeray's burlesque, "Lords and Liveries," in *Novels by Eminent Hands* (London, 1847).

GORE, CHARLES (1853-). An English theologian and prelate. He was educated at Harrow and at Balliol College, Oxford, and was a fellow of Trinity from 1875 to 1895. After ordination he held the position of vice principal of Cuddesdon Theological College from 1880 to 1883. On the foundation in 1884 of the Pusey House at Oxford, which was intended not only to provide a home for Dr. Pusey's large theological library, but to exercise spiritual influence over undergraduates by means of a staff of clerical librarians, he was appointed its head and remained there until 1893. Meanwhile, as editor and one of the principal contributors to the volume of essays called *Lux Mundi* (1890), he had aroused considerable distrust by the advanced and, as many thought, unsound nature of his views on the incarnate nature of Christ, especially the technical point known as the *kenosis* (q.v.); and his resignation was an obvious solution of the difficulty. While vicar of Radley, near Oxford (1893-94), he founded a quasi-religious clerical community called the Society of the Resurrection. He was canon of Westminster from 1894 to 1902 and continued to exercise considerable influence by his powers as a preacher. After 1898 he served as chaplain to the sovereign. In 1902 he was made Bishop of Worcester, in 1905 Bishop of Birmingham, and in 1911 Bishop of Oxford. His most important works are: *The Church and the Ministry* (1889); *The Mission of the Church* (1895); *Dissertations on Subjects Connected with the Incarnation* (1895); *The Body of Christ* (1901); *The Permanent Creed* (1905); *The New Theology and the Old Religion* (1908); *Orders and Unity* (1910); *The Question of Divorce* (1911), besides a strong controversial treatise called *Roman Claims* (1889), and commentaries on the epistles to the Ephesians (1899) and to the Romans (1899).

GORE, CHRISTOPHER (1758-1829). An American lawyer and politician, born in Boston, the son of a Loyalist who was banished in 1778 and restored to citizenship in 1787. He graduated at Harvard College in 1776, studied law in the office of Judge Lowell, and soon established himself as a successful lawyer in Boston. In 1789 Washington appointed him the first United States district attorney for the State of Massachusetts. He held this office until 1796, in which year he was appointed, with William Pinckney and Jonathan Trumbull, a commissioner to England, under the Jay Treaty, to settle the American spoliation claims, and he remained in England eight years. In 1803-04 he was chargé d'affaires at London during the absence of Rufus King, the American Minister. He returned to America in 1804 and resumed the practice of his profession in Boston. He allied himself with the Federalist party, by the leading members of which his advice was much sought. He was, in 1808, a vigorous opponent of the Embargo, and was accused by the Republicans, with Pickering and other members

of the Essex Junto, of planning the secession of New England and New York from the Union and erecting an independent confederacy under the protection of England. In 1809 he was elected by the Federalists Governor of Massachusetts. He was, however, defeated in 1810 by Elbridge Gerry. He was the unsuccessful candidate of his party again in the following year, being defeated a second time by Gerry. After several years spent in private life during a period of great political excitement, he was, in 1814, appointed to the United States Senate by Governor Strong to fill a vacancy, which appointment was confirmed by the Legislature in the following year. In 1817 he resigned from the Senate on account of ill health and passed the remainder of his life on his large country estate at Waltham, Mass. Consult a "Memoir," in *Massachusetts Historical Society Collections*, 3d series, vol. iii (Boston, 1833).

GORE, GEORGE (1826-1908). An English physicist and chemist, born at Bristol. He did not attend school after his twelfth year, but while earning his living he applied himself so industriously to study that he was able to make discoveries which secured for him an election as fellow of the Royal Society (1865), and the degree of J.L.D. from the University of Edinburgh (1877). His researches in the main were in the departments of electrochemistry, electrometallurgy, and chemistry, and were rewarded by many discoveries which are described in the leading English scientific journals. Gore was for many years lecturer on physics and chemistry at the Grammar School of King Edward VI at Birmingham. In 1891 he was awarded a civil-list pension of £150 a year in recognition of the national importance of his scientific discoveries, several of which have had widespread application in the arts. He was the author of *The Art of Scientific Discovery* (1878); *The Scientific Basis of Morality* (1892); *The Art of Electro-Metallurgy* (1877; 5th ed., 1891); *The Electrolytic Separation and Refining of Metals* (1890); and other works.

GORE, THOMAS PEYOR (1870-). An American legislator, born in Webster Co., Miss. When he was eight years old, an accident cost him the sight of his left eye, and, when eleven, he lost the sight of his right eye also. Nevertheless, he was able to graduate from the normal school at Waltham, Miss., in 1890 and from Cumberland University in 1892. He taught school in 1890-91 and was admitted to the bar and began the practice of law in Mississippi in 1892. Moving to Texas in 1895, he was candidate for Congress on the People's party ticket in 1898, but having become a Democrat the next year he did campaign work for his party in South Dakota in 1900 and in various States in 1904, becoming noted as an orator. In 1901 he moved to Oklahoma, where he was a member of the Territorial Council in 1902-05. Upon the admission of Oklahoma to statehood, he was elected United States Senator in 1907, being re-elected for a full term in 1909. In 1912 he became a member of the executive committee of the Democratic National Committee. In 1914, through what was afterward supposed to have been a political "frame-up," suit was brought by a woman against Senator Gore, accusing him of dishonorable conduct; he was completely exonerated, and was again re-elected.

GOREBILL. A garfish. See **GAB.**

GOECKI, gó-réts'ké, ANTON (1787-1861).

A Polish poet, born and educated in Vilna. He took an active part in the Polish revolution of 1830 and in consequence was obliged to flee to Paris. His complete works were published in two volumes at Leipzig in 1886. One of his best-known productions is entitled *The Death of the Traitor*.

GORÉE, gó'rá'. A small island southeast of Cape Verde, off the west coast of Africa. It is about 3 miles in circumference, and the larger part is occupied by the town of Gorée, once an important free port, but now of little commercial importance. Its present value lies in its climate, and it serves as a health resort for the French officials stationed on the west coast of Africa. It is fortified and has a population of about 2000. The island was first in the possession of the Dutch, but has belonged to the French colony of Senegal since 1814.

GORE HOUSE. A mansion in Kensington, London, famous as a gathering place for literary men, through its two tenants, William Wilberforce and the Countess of Blessington. The former took up his residence there in 1809. Upon the site now stands the Albert Memorial.

GORELL OF BRAMPTON, JOHN GORELL BARNES, BARON (1848-1913). An English jurist and judge, son of Henry Barnes, a Liverpool shipowner. He was educated at Peterhouse, Cambridge; became a solicitor, in 1876 a barrister of the Inner Temple, and in 1888 a Queen's counsel; practiced largely in admiralty cases; and in 1892-1905 was judge, and in 1905 president (succeeding Sir Francis Jeune), of the probate, divorce, and admiralty division of the High Court of Justice. He was made first Baron Gorell of Brampton in 1909. From 1910 to 1912 he was chairman of the Divorce Commission, of which his son, Henry Gorell Barnes (1882-), who succeeded to the title, was secretary.

GOREMYKIN, gó'r's-mík'in, IVAN LOGGINOVICH (1830-). A Russian statesman, born in the Government of Novgorod. In 1860 he entered the Imperial Law School of St. Petersburg (Petrograd) and four years later went, with the commission to form a new government, to Poland. There he stayed for several years, becoming Vice Governor of Plock in 1866 and of Kielce in 1869, and returning to Poland for the years 1873-79. In 1881 and 1893 he served on commissions on agrarian reform, and his reports on the condition of the peasants won him the Czar's confidence, so that (after serving in the Department of Justice in 1891 and in the Ministry of the Interior) he was Minister of the Interior in 1895-99, succeeding Durnovo. His administration was comparatively mild: Jews with university education were permitted to live outside the pale; the first census of the Empire was taken in February, 1897. Probably he helped plan the first Peace Conference. In 1897 he addressed a memorial to the Czar urging administrative reform. Witte's opposition to his plan (1899) to extend *zemstvo* representation forced Goremykin out of the cabinet. Succeeding Witte as Premier in May, 1906, although he had the Czar's confidence, he had to resign in July after a contest with the impractical and far from docile first Duma. In February, 1914, he became Premier again, succeeding Kokovtsoff. He wrote in 1869 a historical sketch of the Polish peasantry. For a brief sketch of his career, consult Cleinow in *Grenzboten*, Jahrg. 73, pp. 337-348 (1914).

GORGAS, gôr'gas, WILLIAM CRAWFORD (1854-1920). A distinguished American sanitarian, surgeon general in the United States army. He was born at Mobile, Ala., and graduated from the University of the South in 1875 and from Bellevue Hospital Medical College in 1879. After serving as an interne at Bellevue in 1878-80, he was appointed a surgeon in the army in 1880. From 1898 to 1902 he was chief sanitary officer of Havana, Cuba, where his methods of fighting yellow fever succeeded in eliminating that disease from the city. For these services Congress, by a special Act in 1903, made him assistant surgeon-general, with the rank of colonel. From 1904 to 1913, as chief sanitary officer of the Panama Canal, he established and maintained marvelously healthful conditions on the Isthmus throughout the great community of workers, most of whom had to become acclimated and to adjust themselves to the food and habits of a tropical land. The task of Colonel Gorgas was in its way as great as that of the engineers; without his resourcefulness, skill, and untiring labor the building of the canal would have meant immense sacrifice of life. He was a member of the Isthmian Canal Commission after 1907 and received numerous honors—he was elected president of the American Medical Association in 1908 and of the American Society of Tropical Medicine in 1910, was awarded the Mary Kingsley medal of the Liverpool School of Tropical Medicine in 1907, was delegate from the United States to the Pan-American Medical Congress at Santiago, Chile, in 1908, and was the recipient of honorary degrees from a number of American universities, among them Harvard, Brown, Columbia, Princeton, and Yale, and the degree of D.Sc. from Oxford (1914). He received a gold medal from the American Medical Association in 1914; and in the same year he was appointed surgeon-general in the United States army with the rank of brigadier general. See PANAMA CANAL.

GORGE. The rear opening between the faces or flanks of a fieldwork or fortification. The *gorge* is prepared for defense by obstacles or trenches, or both. See BASTION.

GORGED (from OF., Fr. *gorge*, throat, from Lat. *gurgus*, gulf). A term in heraldry (q.v.), applied to a lion or other animal having a collar round its neck. The collar is generally in the form of a crown or coronet.

GORGES, gôr'jës, SIR FERDINANDO (c.1566-1647). The founder of Maine and sometimes called "the father of English colonization in America." He was born probably in Ashton Phillips, England, entered the army, served in Normandy in 1591, distinguished himself and was knighted at the siege of Rouen, and from 1596 to 1629 he was, with but a short suspension in 1603, "Governor of the forts and island of Plymouth." He seems to have been engaged in the conspiracy led by the Earl of Essex, against whom he was witness in the trial of 1601. Becoming early interested in the settlement of the New World, he was one of the grantees in the royal charter of 1606 and was one of the founders of the unsuccessful Popham Colony at the mouth of the Kennebec River, in Maine, in 1607. Capt. John Smith, as agent for Gorges, made several unsuccessful attempts to establish other settlements; and in 1616 Gorges sent out a small party which encamped for the winter on the river Saco. In 1620 Gorges and his associates obtained a new charter, which

gave them title to the territory between the fortieth and forty-eighth parallels north latitude, extending westward from the Atlantic to the Pacific. Gorges and John Mason, in August, 1622, took from the Council for New England a grant of the district lying between the Merrimac and the Kennebec and extending 60 miles inland; and under the auspices of the former several settlements were made. In 1629 this grant was divided, Gorges taking the portion east of the Piscataqua. In 1623 Capt. Robert Gorges, son of Ferdinando, was appointed by vote of the Council for New England "General Governor of the country." Twelve years later the Council resigned the charter to the King, the elder Gorges expecting to be thereupon appointed Governor-General. Disappointed in this, he induced the King to grant him a charter constituting him lord proprietor of the Province of Maine and providing that his office should remain hereditary in his family. His son, Thomas, was sent out as Deputy Governor. The principal settlements were Agamenticus and Saco, the former being the place now called York, which was chartered as a city in 1642 under the name of Gorgeana. But the English Civil War, in which Gorges was a follower of the King, was unfavorable to his Colonial project. In 1643 the four New England Colonies formed an alliance for mutual defense, excluding therefrom the Gorges settlements, and after his death these settlements formed themselves into a body politic and submitted to the jurisdiction of Massachusetts. Gorges wrote a *Briefe Narration of the Originall Undertakings of the Advancement of Plantations into the Parts of America, especially showing the Beginning, Progress and Continuance of That of New England* (1658), which has been much used by historians and may be found in vol. ii of the *Maine Historical Society Collections* (Portland) and in the 3d series, vol. vi of the *Massachusetts Historical Society Collections*. Consult Baxter (ed.), *Sir Ferdinando Gorges and his Province of Maine* (3 vols., Boston, 1890), one of the "Prince Society Publications."

GORGET, gôr'jet (OF. *gorgette*, *gorgete*, Fr. *gorgette*, collar, dim. of *gorge*, throat). One of a series of surgical instruments, devised to facilitate the operation of lithotomy. Gorgets are now almost entirely out of use.

GÖRGEY, gër'gë-i, or **GORGEI**, ARTHUR (1818-1916). An Hungarian general in the revolution of 1848-49. He was born at Toporecz, in the County of Szepes (Zips), Jan. 30, 1818, received a military education, and was commissioned a lieutenant of hussars. While at Vienna, he combined a university education with his military work. He threw in his lot with the National party in the rising against Austria in 1848 and was at first employed in the purchase of arms in Belgium. In August, 1848, he received an important command and soon distinguished himself against the Croats, whom he prevented from crossing the Danube. He exhibited great military capacity after the rout of the Hungarian army near Schwechat, in October, 1848, conducting the retreat with consummate skill. Upon the appointment of Dembinski (q.v.) to the chief command of the Hungarian armies, Görgey showed his dissatisfaction in various ways, and it was said that his late arrival at the battle of Kápolna prevented a great Hungarian victory. He practically revolted against Kossuth and the government.

After Dembinski's resignation Görgey was made commander in chief in his place and succeeded in putting into the field an army of 40,000 men, with which he executed a brilliant advance against the Austrians under Windischgrätz. Pest was evacuated by the enemy, the siege of Komorn was raised, and before the month of April was over the Austrians had been almost driven out of Hungary. Buda, the ancient capital of the realm, well fortified and garrisoned, had still to be taken, and for this the victorious campaign was interrupted. The city was stormed May 21, but the three weeks' delay proved fatal. Russia intervened in behalf of Austria, and Radetzky sent several regiments from his victorious army in Italy. After an unsuccessful engagement at Komorn and a battle with the Russian main army at Waitzen (July 15), he made his way towards the upper Theiss. The Hungarians, outnumbered by the united Austrian and Russian armies, were gradually driven to the wall. Görgey, after some weeks, arrived in the neighborhood of Arad with an army decimated by continual fighting, by heavy marches, and by disease. On August 9 the army under Dembinski was vanquished in the battle of Temesvár, and on the 10th Görgey was declared dictator in place of Kossuth. But further resistance on the part of the Hungarians was hopeless, and on the 13th Görgey's army surrendered at Világos to General Rüdiger, the Russian commander. For this surrender Görgey was severely blamed and charged with treachery; but the facts are that on the day of surrender Görgey had only 24,000 men with 140 cannon, while five armies, with more than 200,000 men and 1000 cannon, were closing in upon him from every direction. Görgey was confined for a time at Klagenfurt in Austria, whence he was released on parole. All of his generals were court-martialed, but he escaped that ignominy. In 1852 he published at Leipzig *Mein Leben und Wirken in Ungarn in den Jahren 1848 und 1849*, a translation of which, *My Life and Acts in Hungary, 1848-49*, appeared in New York the same year. This was really a reply to the charge of treason to the Hungarian cause. He returned to Hungary in 1868. Consult Elemar, *Gorgei in 1848-49* (Budapest, 1886).

GORGIAS (Lat., from Gk. Γοργίας) (c.483-375 B.C.). A celebrated Greek rhetorician and Sophist. He was born at Leontini in Sicily, but spent most of his life in Greece, residing at Athens and at Larissa in Thessaly. The arrival of Gorgias at Athens as an Ambassador from his native state, in 427 B.C., was fraught with important consequences for the literary life of Athens, for in him the Athenians first saw an exponent of the art of rhetoric as it had been developed in Sicily. The success of Gorgias was immediate. The Athenians thronged to hear his speeches, and it is not too much to say that the great development of oratory at Athens during the fourth century was due primarily to this Sicilian orator. Numerous teachers of rhetoric, the Sophists (q.v.), sprang up, against whose doctrine of "form, rather than substance," Socrates and Plato directed their teaching. In the *Gorgias* of Plato we have an ideal dialogue between the Sicilian orator and Socrates. Two orations—the *Palamedes* (Παλαμήδης) and the *Encomium on Helen* (Ἐλένης Ἐγκώμιον)—have come down under his name, but scholars are not agreed whether they are

really by him or not. Consult: Blass, *Die attische Beredsamkeit*, vol. i (Leipzig, 1887); Jebb, *The Attic Orators*, vol. i (London, 1876); Gomperz, *Greek Thinkers*, vol. i (Eng. trans., ib., 1905); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. i (5th ed., Munich, 1908).

GORGO, or **GOR'GON** (Gk. Γοργώ, *Gorgō*, Γοργώνη, *Gorgonē*, Γοργάς, *Gorgas*, from γοργός, *gorgos*, grim). A sister of the Graæ (q.v.) and the daughter of Phoreys and Ceto. In the *Odyssey*, xi, 633, Odysseus fears that Persephone may send forth against him the Gorgon's head, which is therefore regarded as belonging to the Lower World. The later legend, given by Hesiod, knows Gorgo as a terrible female monster, with hideous face, hair of bronze or intertwined with serpents, mighty wings, and clad in black. Gorgo or Medusa (Μέδουσα, the Queen) is mortal, but her two sisters, Σθενώ (the Strong) and Εὐρύπλη (the Far Leaper), are immortal. Medusa is the most terrible; one glance from her eyes turns any human being to stone. Though she was hated by the other gods, Poseidon loved her. These Gorgons lived in the Far West, near the garden of the gods and the realm of the dead. Medusa was beheaded by Perseus and from her trunk sprang the fruit of Poseidon's love, Chrysaor, of the golden sword, and the winged horse, Pegasus. The head, with its petrifying power, was used by Perseus against his enemies and was later taken by Athena and placed upon her aegis. Attic legend knew of but one Gorgon, produced by Gaia to aid the giants against the gods, and slain by Athena, while the later poets explained Poseidon's love by telling of the maiden Medusa, who won the love of the god, but inspired the jealousy of Athena, who transformed her into the hideous monster and guided Perseus to her destruction. Roscher (see below) held that the Gorgons are a personification of destructive and terrifying thunderstorms, which come with speed from the western ocean. Hence the golden sword of the lightning and the bearer of thunderbolts, Pegasus, spring from her dead body. Hence, too, the appearance of the Gorgoneion on the aegis of Zeus and Athena, who are armed with the thunderbolt. The head of the Gorgo was used by the Greeks for apotropaic purposes, i.e., to ward off the evil eye or other evil influences. Another view, noting that the power of Medusa was in her head, explains the whole story of the Gorgon as derived from the ritual mask common to primitive cults. In Greek art the Gorgoneion does not appear much before the seventh century B.C. Its earliest form is certainly the hideous mask, with round face, snaky hair, huge staring eyes, and wide mouth, with projecting tongue and tusklke teeth, which was used to keep off the evil spirits, and from which the later figure of the Gorgon develops. There was a later conception of the Gorgon as beautiful, best seen in the "Medusa Rondanini" at Munich. Consult: Roscher, *Die Gorgonen und Verwandtes* (Leipzig, 1890); Six, *De Gorgone* (Amsterdam, 1880), especially for the coin types. Particularly good are the article by Roscher and Furtwängler in Roscher's *Lexikon der griechischen und römischen Mythologie* (Leipzig, 1886-90) and that by Glotz, in Daremberg and Saglio, *Dictionnaire des antiquités* (Paris, 1896). Consult also Harrison, *Prolegomena to the Study of Greek Religion* (Cambridge, 1903).

GORGONIA-CEA (Neo-Lat., from *Gorgonia*, from Lat. *gorgonius*, relating to the Gorgon, from *Gorgo*, Gorgon; so called from hardening in the air). An order of alcyonarian corals (Octocoralla), in which the colony has a branching or fan-shaped structure. See SEA FAN, and Plate with CORAL.

GOR'GONZO'LA. A town in the Province of Milan, north Italy, 11 miles northeast of the city of Milan, famous for its cheese. Pop. (commune), 1901, 4895; 1911, 5198.

GOR'HAM. A town in Cumberland Co., Me., 10 miles northwest of Portland, on the Presumpscot River, and on the Boston and Maine Railroad (Map: Maine, B 5). It is in an agricultural region, has a tannery, and contains a State normal school, public library, and an historical museum. Pop., 1900, 2540; 1910, 2822.

GOR'HAM, GEORGE CORNELIUS (1787-1857). An English theologian, who became known as the principal figure in the "Gorham case." He was born at St. Neots, Huntingdonshire, was educated at Queen's College, Cambridge, received the degree of B.A. in 1808, was elected a fellow of his college in 1810, and held that appointment until 1827. Even before his ordination (1811) there, his views on baptismal regeneration had caused comment, and particularly his contention that by baptism infants do not become members of Christ and the children of God; but the discussion did not become crucial until the question of his appointment to the vicarage of Bramford Speke came up before Dr. Phillpotts, Bishop of Exeter. (See GORHAM CONTROVERSY.) Gorham obtained his vicarage in 1851, and the question of the views on baptismal regeneration allowed in the Church of England was left unsettled. He was an antiquary of some reputation and the author of a number of pamphlets.

GORHAM CONTROVERSY. A theological controversy within the Church of England as to the teaching of this church with reference to the sacramental grace of baptism. The occasion was a suit by the Rev. George C. Gorham against the Bishop of Exeter for induction into the vicarage of Bramford Speke, in spite of his denial of baptismal regeneration. The Archbishops Court of Canterbury decided in 1845 against Mr. Gorham, maintaining that baptismal regeneration is the doctrine of the Church of England, while on appeal the judicial committee of the Privy Council reversed the judgment of the lower court, without, however, expressing any opinion as to the theological accuracy of Mr. Gorham's opinions. The decision and the attitude of the high dignitaries of the Church of England, amid the fierce controversy which arose in regard to it, were the main determining factors in Manning's decision to submit to the Roman obedience. Consult Purcell, *Life of Cardinal Manning* (London, 1897).

GORI, gǝ'rě. The capital of a district in the Russian Government of Tiflis, Caucasus, 48 miles west-northwest of Tiflis, on the Poti-Tiflis Railway (Map: Russia, F 6). It is picturesquely situated at an elevation of 2000 feet and at the foot of a mountain crowned with the ruins of the ancient fortress of Goris-Tsikhe. In one of its churches is kept an ancient icon, believed to have been presented in the sixth century to a member of the family of the Bagratides by one of the Byzantine emperors. Gardening, vine growing, wine making, and trading

are the principal occupations. Pop., 1891, 7200; 1897, 10,450. Founded, probably, in the seventh century.

GORI, gǝ'rě, ANTONIO FRANCESCO (1691-1757). An Italian antiquary. He was born at Florence, where he was ordained a priest in 1717. Through the influence of Archbishop Fontanini he was enabled to devote himself extensively to antiquarian and archaeological studies. He succeeded Corsotti in the chair of history at the University of Florence, founded the *Accademia Columbaria* in 1735, and continued the catalogue, begun by Assemani, of the Oriental books and manuscripts at Florence. Among his writings, which had a very considerable influence on the progress of archaeological science, are: *Inscriptiones Antiquæ Græcæ et Romanæ quæ Extant in Hetruriæ Urbibus* (1726-44); *Monumentum Columbarium Libertorum et Servorum Livie Augustæ et Caesarum* (1729); *Museum Florentinum* (1731-43); *Museum Etruscum* (3 vols., 1737-43); *Symbolæ Litte-rariæ* (1748-58); *Vita di Mich. Angelo Buonarroti* (1746); *Thesaurus Diptychorum, cum Notis Passerii* (3 vols., 1759), probably his most valuable work.

GORIL'LA. The greatest of the anthropoid apes (*Gorilla gorilla*), a native of the western equatorial coast of Africa. Its name recalls a curious history. When Hanno, the Carthaginian, returned from his voyage of exploration down the west coast of Africa, about 500 B.C., he reported that he had seen hairy women whom the natives called gorillas (Gk. γορῖλαι); but as he went only to the Bight of Benin, and gorillas, so far as we know, never lived north of the Kameruns, the creatures Hanno saw, if any, were either chimpanzees, or, more probably, dog-faced baboons. The next mention of the animal is in an account printed in 1613 in *Purchas, His Pilgrims*, of the experiences of an English sailor named Battel on the Guinea coast, in which he tells of a great ape which the natives knew by various names, and the Europeans called gorilla. Such an ape was described again by Bowdich in his *Mission from Cape Coast Castle to Ashantee* (London, 1819). Finally, in 1847, Prof. Richard Owen, of London, obtained from Dr. Savage, a missionary at the Gabun, drawings of the skull of the mysterious ape, and a few months later Professor Owen received two skulls, which he described as "*Troglodytes savagei*," considering the animal to be of the same genus as the chimpanzee. That an American missionary, Rev. Leighton Wilson, is entitled to credit for early investigation of the animal, appears from his book, *Western Africa* (New York, 1856), in which he gives an extended account of the "recently discovered" gorilla, and says that he was "the first to call the attention of naturalists to the animal." He found a skull towards the close of 1846 and sent it to the Boston Society of Natural History, where it became the subject of immediate study and writings. Indeed, Wyman's description of this ape as *Troglodytes gorilla* in the *Journal of the Society* antedated that of Owen, so his specific name takes precedence. Wilson's book contains much interesting information.

In 1852 a migration of these apes was made to the coast (probably due to an extraordinary failure of food in the interior, for one has never been seen there since), and several were killed whose skeletons reached both Europe and America. This new material showed such de-

partures from the structure of the chimpanzee that a French naturalist, I. Geoffroy Saint-Hilaire (consult *Comptes Rendus*, vol. xxxiv, Paris, 1852), erected for it a new genus, *Gorilla*, based upon such peculiarities as the great cranial ridges, the shape of the teeth, the disparity in size between the sexes, etc.; and this has received scientific approval. Owen's classic anatomical studies were in the *Transactions* of the Zoölogical Society of London for 1848, and in the *Proceedings* of the Royal Institution, for 1855, part ii.

The gorilla is not only the largest anthropoid ape, but the males are on the average larger than man himself, usually exceeding 6 feet in height when they stand upright. The females, however, unlike any other kind of ape, are always much smaller, usually $4\frac{1}{2}$ feet tall, nor do they have great protuberances above the orbits of the eyes, and the long, exposed canine teeth, which give their mates so ferocious an appearance. The shoulders of a male gorilla are extraordinarily broad and massive, supporting a somewhat conical head on a thick "bull" neck, and giving attachments and leverage necessary for the powerful muscles of arms that, when they hang by his side, reach nearly to the calf of the leg. The hands are very broad, and the fingers short, thick, and united by webs nearly to the first joint. The legs are shorter in proportion than man's, have fairly developed calves, and the feet, like the hands, are broad and blunt, the toes being very large and short, and the great toe set out at an angle like a thumb; and the whole foot is nearly straight. The body is covered in most parts with long, coarse hair, blackish below but whitish at the tips, giving a brownish-gray aspect; but individuals vary greatly in color, and all grow grizzled with age. This hair becomes very long on the shoulders, back, and thighs, and on the top of the head and nape is stiff and erectile, rising like a dog's hackles when the gorilla is angry. There is a distinct beard or ruff under the chin. Beneath the outer coarse hairs grows a coat of short curly hairs, approximating to a wool. "The whole skin of the face is of a deep-black color, of a glossy appearance, and sparsely sprinkled with coarse hairs. The ears are comparatively small, with their hinder border sharply angulated in the middle, . . . and of a deep-black hue."

The gorilla is a denizen of mountainous forests, and its habitat is confined to a narrow coast region of the French Congo, extending 3° or 4° north and south of the equator, drained by the Ogove, Gabun, and upper Benito rivers—probably less than 1000 square miles of territory. This is a hilly region of comparatively open, yet damp and shady forest, with thickets of scitamines and tree ferns, which abounds in trees bearing fruits that ripen at various times, affording the animals food the year round; in addition to which the gorillas occasionally raid the plantations of sugar cane, rice, etc., cultivated about the native villages.

It appears that these animals remain in the forest and are most common in the Sierra de Cristal, between the Ogove and Muni rivers. They spend most of their time in the trees, where they move about with surprising agility, considering their bulk, and swing and leap like the huge monkeys they are. They wander during the day in search of food in family parties consisting of two mates and offspring of various ages, but at night are wholly stationary. Sev-

eral writers assert they make nests only for the lying-in of pregnant females; but Herr Koppensfels declares that each night the female plait the branches of a tree top into a platform, and adds to this sticks and leaves, or moss, until she has a comfortable sleeping place for herself and her young ones; and that this is sometimes returned to for three or four nights in succession, but not longer. The male is said to sleep curled up at the foot of the tree, prepared to guard his family against leopards—almost the only foe he need fear. The gorilla's food consists mainly of fruits, especially the undeveloped spathe or "cabbage" of the oil palm, bananas, pawpaws, several plumlike fruits, and nuts, the hardest of which, allied to the kola nut, he cracks with a stone; but his great back teeth are well adapted to nut cracking and to crushing tough rinds. The gorilla also eats insects, honey, birds' eggs, and fledglings, and he is said to take flesh when he can get it, though he is not known to seek to kill other animals for the sake of eating them.

These animals are mainly arboreal, and when they go upon the ground usually walk on all fours, as their tracks constantly show, always turning the fingers of the hands under, and sometimes also the toes of the hind limbs. They walk erect with some difficulty, unless they can steady themselves by grasping something. They are shy, and even timid, usually retreating from man, and are rarely seen, even by the silent and stealthy natives of the forest, except by accident. When surprised, they run away screaming with fright, but if wounded or cornered make a terrible fight, using much the tactics of a bear, by rearing up and endeavoring to seize and pull the enemy near enough to tear it with their great teeth. Little is known of the exact range of these apes. Elliot recognizes two species which are divided into six forms.

Young gorillas are occasionally captured by the negroes, and several have reached Europe and America—the first as early as 1860, when it was carried about Great Britain for several months, no one regarding it as anything but a chimpanzee until after its death. Up to the year 1914 four or five have been seen in Berlin, London, and New York; but, in spite of the greatest care, only one survived more than 18 months before succumbing to lung disease. At that time a young specimen, two years old, in perfect health, was living in the New York Zoölogical Park. All of the gorillas which have been in captivity have been of a gentle, docile disposition, showing traits and an ability to learn very similar to those of the chimpanzee, eating all sorts of food, and having a childish fondness for their friends and for noise making and amusements.

Bibliography. The books already mentioned, and such general works as *Standard Natural History* (6 vols., Boston, 1885) and the *Royal Natural History* (6 vols., London, 1895), contain much of what is known of the subject. Consult also Hartmann, *Anthropoid Apes* (New York, 1886), which also furnishes a complete comparative account of the animal's structure and an extensive bibliography, and Elliot, *A Review of the Primates* (ib., 1913). See Plate of ANTHROPOID APES, under APE.

GORINCHEM, gô-rên-kêm. See GORKUM.

GORING, GEORGE, EARL OF NORWICH (c.1583–1663). See NORWICH, GEORGE GOBING, EARL OF. GORING, GEORGE, LORD (1608–67). An English soldier, son of George, Earl of Norwich.

(See NORWICH.) He married Lettice, daughter of the Earl of Cork, by whose influence he received a post in the Dutch service. He was wounded at Breda (1637), was appointed Governor of Portsmouth (1639), and served in both Scottish wars. He took part in the first army plot, hoping to become lieutenant general, but played the conspirators false as soon as he saw that his advancement was not certain. But he was never really allied with Parliament and in 1641 had made his peace with the King. He tried to get money both from the King and from Parliament, but in the fall of 1642 declared openly for the King. A month later Portsmouth was captured, and Goring fled to Holland and there tried to advance the King's interest. In 1643 he was again in England and after defeating Fairfax at Seacroft Moor was captured by him at Wakefield and sent to the Tower, but was finally exchanged. In 1644 he commanded the left wing at Marston Moor and was in the second battle of Newbury. His intrigues against Rupert, to win himself a command and to make himself indispensable, were grave factors in the defeat of the Royalist cause. He went so far as to quarrel openly with Prince Charles's counsel when the Prince came to take command in the West. He was forced to leave the siege of Taunton to meet Fairfax, after Naseby, and was defeated by him again at Langport (1645). Goring retreated to the north and left the Parliamentary army without opposition. Soon after he went to France on a plea of ill health. He served in the English regiments in the Netherlands.

GORITZ, gē'rits. See GÖRZ.

GORKUM, GOR'KUM, or GORINCHEM, gō'rēn-kēm (Lat. *Gorcomium*). A town in the Netherlands, situated on the Merwede, 28 miles east-southeast of Rotterdam. The town has fortified gateways of the seventeenth century and interesting specimens of Dutch brick and tile mosaic architecture. It is famous for its salmon fisheries and carries on a trade in grain, hemp, and cattle. The town is the terminus of the Merwede Canal to Amsterdam. Gorkum is historically important as being the first city taken from the Spaniards by the Water Gueux in 1572. Pop., 1911, 12,053.

GORKY, gōr'kē, MAXIM. The pseudonym of ALEXEI MAXIMOVITCH PESHKOV (1868-). A modern Russian writer, born at Nizhni Novgorod. Left a double orphan in early childhood, he was apprenticed to a shoemaker at nine. He then worked at the manufacture of ikons, as cook's helper, baker, public porter, and fruit vender, finally becoming a lawyer's clerk. It was from the cook on board a Volga steamer that Gorky acquired his literary passion and a thirst for knowledge. He was only 12 at the time, but four years later he set out for the University of Kazan in a vain effort to secure a free education. Disappointed and disgusted, he resumed his desultory pursuits. At 19 he attempted suicide and a few years later, in the company of outcasts and vagabonds, went tramp-ing through south Russia. He was twice arrested for his revolutionary sympathies. In 1906, at the height of his popularity, he traveled in Europe and visited the United States in search of funds for the cause of Russian freedom. In America the intrusion of a moral issue of a personal nature—the legal status of a woman whom Gorky considered as his wife—ruined his mission and caused a revulsion of feeling against him which culminated in social

ostracism. He then sailed for Italy, where he lived thereafter.

Gorky's first sketch, *Makar Chudra*, appeared in 1892, but attracted little attention. His second striking tale, *Chelkash*, appearing in 1895 in *Russkoye Boyat'sio*, started the writer on the road to fame. In five years he became so popular in Russia that the first collection of his stories (1900) quickly sold out a large edition, and subsequent editions were equally successful. Beyond Russia Gorky's fame spread with amazing rapidity after 1901, when his first two tales appeared in English. Since then his works have been translated into every European language. Space forbids mentioning his short stories available in English. The following collections contain some of the better known: *Orloff and his Wife* (containing seven other tales, 1901); *Twenty-Six and One* (with two other tales, 1901); *The Outcasts and Other Stories* (1902); *Tales from Gorky* (nine in all, 1902); *Heartache*, and *The Old Woman Izerofel* (1905); and *The Individualists* (containing two other tales, 1906). His longer works in English include *Foma Gordyev* (1901), *Three Men* (1902), *Mother* (1907), *The Spy* (1908), *A Confession* (1910), and the following dramas, which appeared in *Poet Lore: Summer Folk* (1905), *A Night's Lodging* (1905), *The Children of the Sun* (1906), *The Smug Citizen* (1906), and *The Lower Depths* (1912).

Gorky's most congenial field is the tale of the underworld he knows so well. When he leaves this realm, or when he attempts anything beyond the short story, he is far less successful. His plays, too, though full of color and interesting situations, lack dramatic inspiration. In his idealization of the underworld he has undoubtedly sounded a strong new note in Russian literature, yet he will hardly rank high in its annals, unless his best work is still to come. Admirable brief studies of Gorky will be found in Kropotkin, *Russian Literature* (London, 1905); Phelps, *Essays on Russian Novelists* (New York, 1911); and Persky, *Contemporary Russian Novelists* (Boston, 1913). Consult also Ossip Lourié, *La psychologie des romanciers russes* (Paris, 1905).

GÖRLITZ, gēr'lits. A town in the Prussian Province of Silesia, capital of the circle of Görlitz, situated on the Neisse, 62 miles by rail east of Dresden (Map: Germany, F 3). It has still retained in part its old buildings and fortifications, though the old walls have been demolished and their places taken by modern walks and driveways. There are extensive modern quarters. Chief among the ecclesiastical buildings of Görlitz is the large Protestant church of St. Peter and St. Paul, originally built in the thirteenth century, rebuilt in the fifteenth century, and partly renovated after a fire at the end of the seventeenth. The church is a good specimen of late Gothic style and has a fine crypt and two modern towers. The chapel of the Holy Cross contains a model of the Holy Sepulchre at Jerusalem, made during the fifteenth century. Other noteworthy churches are the late Gothic Frauenkirche, dating from the fifteenth century; the Trinity, or Abbey, Church, dating from 1245 and restored in 1808; and the new Protestant Church, consecrated in 1901. The slightly Rathaus, built in the Gothic and early Renaissance styles, has a remarkable staircase and fine examples of wood carving. A massive bastion of the fifteenth century, well worthy of attention,

is now used as a guardhouse. Many fine examples of Renaissance architecture are also found among the private dwellings, and there are numerous monuments and fountains. The attractive municipal park contains a botanical garden and several statues, including one of Jakob Böhme, the mystic, who was born near Görlitz in 1575 and passed most of his life in this place. The municipality owns about 70,000 acres of forests and is accounted one of the wealthiest towns of Germany.

Among the educational institutions the most prominent are the two Realgymnasien and one classical Gymnasium, the seminary for female teachers, the municipal museum of antiquities, the municipal theatre, the municipal library, containing many valuable manuscripts and incunabula, and the library of the Upper Lusatian Scientific Society. The city is well provided with benevolent institutions as well as with art and scientific organizations. It is one of the most important industrial points of Silesia. The leading manufactures are cloth goods. There are also produced railway supplies, leather and leather manufactures, glass, tobacco, cars, chemicals, machinery, gold and silver wares, toys, cigars, and sausages. The retail trade is carried on to a large extent by cooperative stores. Pop., 1890, 62,135; 1900, 80,931; 1910, 85,806, mostly Protestants.

Görlitz, which bears the name of a Slavic village near which it rose, was founded about 1200. It received Magdeburg rights in 1303 and joined the league of the six towns of Upper Lusatia in 1346. From 1377 to 1396 it was the capital of the Duchy of Görlitz. In 1635 it passed to Saxony and was annexed to Prussia in 1815. Consult M. Kwiecinski, *Görlitz und seine Umgegend* (6th ed., Görlitz, 1899), and R. Jeclit, *Innen zur Geschichte der Stadt Görlitz bis 1600* (ib., 1909).

GÖRLITZ TRIAL, THE. A famous trial held in 1850 at Darmstadt, Germany, and pertaining to the mysterious death of a Countess Görlitz. It was asserted that her death was due to spontaneous combustion. Liebig and Bischoff declared that under no circumstances could a body in which the blood is circulating take fire. Consult Graff, "Ueber die Todesart der Gräfin Görlitz, nebst Gegenbeweis von Bischoff," in Henkes, *Zeitschrift für die Staatsarzneikunde* (Erlangen, 1850).

GORMAN, ARTHUR PUE (1839-1906). An American Democratic politician, born in Howard Co., Md., March 11, 1839. He was educated in the public schools and at 13 became a page in the United States Senate, which post he held for 14 years. He was collector of internal revenue in the Fifth District of Maryland in 1866-69. He was made general superintendent of the Chesapeake and Ohio Canal Company, and in 1872 its president. In the meantime he had been elected to the House of Delegates in Maryland in 1870; he held office until 1875, during the last part of his term serving as the Speaker. In 1875 he was elected State Senator and in 1881 United States Senator. By the grasp on parliamentary law which he had attained as a page, and his relentless methods, he quickly rose to a prominent position in his party. In 1884, as chairman of the Democratic National Committee, he was largely instrumental in electing Grover Cleveland President. He led the opposition to the Force Bill in 1889 and opposed the second nomination of Cleveland in

1892. Always an advocate of moderate protection, he became recognized as the leader of those among his party who favored that policy, and after the nomination of Bryan in 1896 an attempt was made to throw Gorman out of the party councils. This led to his defeat for reelection in 1899, but after a lapse of three years he was again in the Senate for a fourth term, and in absolute control of the Democratic organization as chairman of the caucus. He attempted to disfranchise the Maryland negroes in 1904, and was prominently mentioned as a candidate for President. He died June 4, 1906.

GORMAN, WILLIS ARNOLD (1814-76). An American politician and soldier, born near Flemingsburg, Ky. He was educated in law at the University of Indiana, was admitted to the bar in 1825, practiced law for a number of years, served first as a major (1846) and then as a colonel (1847) in the Mexican War, commanding a battalion in the battle of Buena Vista. He was a Democratic member of the House of Representatives from Indiana in 1849-53, was Territorial Governor of Minnesota from 1853 to 1857, and practiced law at St. Paul from 1857 to 1861. On the outbreak of the Civil War he entered the Federal army as a colonel of Minnesota volunteers and became a brigadier general of volunteers in September, 1861. He left the service in 1864 and subsequently lived in St. Paul, serving as city attorney from 1869 until his death.

GORMAS, COUNT DE. See LUNA, A. DE.

GORNER GLACIER. A large glacier in the Pennine Alps, lying on the north slope of Monte Rosa. It has a length of 9.4 miles and covers an area of 26.6 square miles, including the snow fields. The ice sheet averages about a mile in width. A fine view of the glacier is obtained from the Gorner Grat, a ridge rising from the right bank to a height of 10,290 feet.

GOROSTIZA, GORÓ-STÉSA, MANUEL EDUARDO DE (1789-1851). A Mexican statesman and playwright. He was born at Vera Cruz, of which city his father was Governor, and early acquired fame through his comedies, the first of which is said to have been written by him at the age of 12. Entering the Spanish army, he fought in the war against Napoleon and reached the rank of lieutenant colonel. Banished on account of his liberal ideas, he agitated in favor of Mexican independence in London. After the establishment of the Mexican Republic he served as Minister to England, France, and the United States, where he concluded several important political and commercial treaties. In Mexico he filled the posts of Minister of Treasury and Foreign Relations, and director of the National Library. A list of his works was published in the *Catálogo de autoridades de la lengua* of the Spanish Academy. They include: *Don Dieguito* (1820); *Indulgencia para todos* (1818); *El Jugador* (1820); *Contra pan y cebolla* (1833).

GÖRRES, GÉRÈS, JOHANN JOSEF (1776-1848). A German scholar and publicist. He was born at Coblenz, Jan. 25, 1776, studied at the University of Bonn, and, being of a very ardent temperament, threw himself into the revolutionary movement which then agitated Rhenish Prussia. He first dreamed of uniting the Rhenish provinces with France in pursuance of his ideal of a union of all civilized countries and advocated these ideas in two ephemeral newspapers. He, however, soon learned to detest Napoleon and, despairing of the cause of liberty,

from 1800 to 1806 taught physics at Coblenz, then was tutor at Heidelberg very successfully, lecturing first on æsthetics and then on older German literature. In 1808 he returned to Coblenz and for two years (1814-16) edited another newspaper, the *Rheinischer Merkur*, the most important political journal published in Germany at that time, which breathed the most ardent German patriotism. But before long his opinions underwent another radical change, and, compelled to flee because his political views were not acceptable to the government, he took up a mystic and symbolic kind of religion in the same enthusiastic way. Always a Roman Catholic, he now became the church's aggressive champion. In 1826 he was called from exile in Switzerland to be professor of history in the University of Munich, and the next 20 years were the most productive of his life, during which he poured forth a mass of brilliant polemic papers on questions of the day. He died at Munich, Jan. 27, 1848. His principal publication is *Die christliche Mystik* (1836-42), which, though doubtless intended to set forth only views acceptable to the Roman Catholic church, as a matter of fact was regarded with so much aversion that it required all the King of Bavaria's influence to prevent its being put on the Index. His numerous political writings were collected (1854-60), and also his letters (1858-74). In English have appeared *Germany and the Revolution* (1820) and *The Stigmata: A History of Various Cases* (a part of his *Mystik*, 1883). Consult his biography by Galland (2d ed., Freiburg, 1876), and Franz Schultz, *Joseph Görres, als Herausgeber, Literaturhistoriker, Kritiker* (Berlin, 1902).

GORRESIO, gôr-râ'zâ-ô, GASPARE (1808-91). An Italian Sanskrit scholar, born at Bagnasco, Piedmont, and educated at Turin and Vienna. He was professor in the military school at Turin from 1832 to 1838 and then went to Paris to study Sanskrit under Burnouf and later continued his linguistic studies in London. In 1852 the first chair of Sanskrit in Italy was established for him at Turin, and in 1859 he became librarian of the National Library in that city. His principal work, upon which he was engaged for nearly 30 years, is an excellent Italian translation of the *Râmâyana* (10 vols., 1843-58). He published also the *Uttarakanda, testo con note secondo i codici della recensione Gaudana* (1867). For a brief biography, consult the article of Pizzi in the *Atti della Reale Accademia di Scienze*, vol. xlii (Turin, 1907).

GORRINGE, gôr-rînj, HENRY HONEYCHURCH (1841-85). An American naval officer. He was born in the island of Tobago, West Indies, the son of an English clergyman, and emigrated to New York in 1858, where he entered the merchant-marine service and by 1862 was master of a sailing vessel. In that year he entered the United States navy as master's mate. He was attached to the Mississippi squadron under Commodore Porter, and by 1865, through successive promotions for bravery and good service, attained the rank of acting volunteer lieutenant commander. In 1868 he was commissioned lieutenant commander in the regular service. He commanded the *Portsmouth* in the South Atlantic squadron from 1869 to 1871 and was engaged at the Hydrographic Office in Washington from 1871 to 1876, when he was sent with the *Gettysburg* to the Mediterranean Sea. In 1879 he was assigned the task of transporting from Alexan-

dria, Egypt, to New York the obelisk popularly known as "Cleopatra's Needle," which the Khedive Ismail Pasha had presented to the United States. Gorrington accomplished the task with complete success, surmounting great engineering difficulties and showing considerable ingenuity in the contrivances he invented for moving the monolith. He resigned his commission soon afterward in consequence of a reprimand received from the Secretary of the Navy for too free criticism of naval matters and during the remainder of his life was engaged in extensive shipbuilding projects. He published *Egyptian Obelisks* (1882).

GORSE. See FURZE.

GORST, SIR JOHN ELDON (1835-1916). An English legislator, born at Preston and educated at St. John's College, Cambridge. He was civil commissioner of Waikato, New Zealand, from 1861 to 1863. In 1866-68 he was in Parliament as Conservative member for Cambridge University, from 1875 to 1892 represented Chatham, and from 1892 to 1906 sat again for Cambridge. He failed of reelection in the latter year. He was appointed Solicitor General in 1885, and afterward was successively Undersecretary of State for India (1886-91); Deputy Chairman of Committees, House of Commons (1888-91); Financial Secretary to the Treasury (1891-92); rector of Glasgow University (1893-94); and vice president of the committee of the Council on Education from 1895 to 1902. After 1903 he actively opposed Mr. Chamberlain's tariff-reform proposals. He wrote *The Children of the Nation: How their Health and Vigor should be Promoted by the State* (1907) and *New Zealand Revisited* (1908).—His son, SIR ELDON GORST (1861-1911), was educated at Eton and at Trinity College, Cambridge. After filling various posts he was appointed Secretary of Legation (1901), while acting as financial adviser to the Egyptian government (1898-1904), and subsequently he was Assistant Undersecretary of State for Foreign Affairs (1904-07), and British Agent and Consul General in Egypt (1907-11).

GORTCHAKOFF, gôr'châ-kôf'. A Russian family, tracing its ancestry to Vladimir the Great and Rurik.—Prince PETER GORTCHAKOFF, Governor of Smolensk, defended that town for two years (1609-11) against Sigismund III of Poland, until it was taken by storm.—Prince DMITRI GORTCHAKOFF (1756-1824) was a celebrated Russian poet and wrote odes, satires, and epistles.—Prince ALEXANDER GORTCHAKOFF (1764-1825) served under his uncle Suvaroff in Turkey and Poland, displayed great courage at the capture of Praga, a suburb of Warsaw, and was made lieutenant general in 1798. In the campaign of 1799 he commanded under Korsakoff at Zurich. He was made military governor of Viborg, repulsed Marshal Lannes at Heilsberg, and commanded the right wing of the Russian army at the battle of Friedland (1807). Appointed Minister of War in 1812, he filled this post to the end of the French War, when he was made general of infantry and member of the Imperial Council.—Prince ANDREI GORTCHAKOFF (1768-1855) served in 1799 as major general under Suvaroff in Italy and commanded in 1812 a division of grenadiers at Borodino, where he was wounded. In the campaign of 1813-14 he commanded the First Corps of Russian infantry and distinguished himself at Leipzig and Paris. He was made general of infan-

try in 1819 and in 1828 retired from active service.—Prince PETER GORTCHAKOFF (1790–1868) fought against Napoleon in 1807 and 1817, later served in the campaigns of 1813 and 1814 in Caucasia under General Yermoloff. He took part in the Russo-Turkish War of 1828–29 and was one of the signers of the preliminaries to the Treaty of Adrianople. In 1843 he was appointed Governor-General of Western Siberia, and occupied that important post until 1851, when he retired from active life. On the outbreak of the Crimean War, however, he returned to service, and at the battle of the Alma commanded the left wing of the Russians. He also took part in the battle of Inkerman.—Prince MIKHAIL GORTCHAKOFF (1795–1861), brother of Peter, began his military career as an officer of artillery and distinguished himself in 1828 at the siege of Silistria and at Shumla. In 1831 he gave proofs of extraordinary valor in the battle of Ostrolenka and at the taking of Warsaw. He was appointed general of artillery in 1843 and military governor of Warsaw in 1846. In 1853 he commanded the Russian forces in the Danubian Provinces, crossed the Danube at Braila, March 23, 1854, occupied the frontier region of Bessarabia, and in 1855 directed the defense of Sebastopol. As a reward for his services in this unsuccessful but still brilliant defense, Prince Gortchakoff was appointed by the Emperor Alexander II Governor of the Kingdom of Poland and was for several years a wise and conciliatory representative of his youthful Emperor at Warsaw. He died May 30, 1861.

Prince ALEXANDER MIKHAILOVITCH GORTCHAKOFF (1798–1883), a cousin of the preceding, entered the diplomatic service and became one of the most skillful and influential diplomats in Europe. He was an attaché in the suite of Count Nesselrode at the congresses of Laibach and Verona, Secretary of the Russian Embassy in London in 1824, chargé d'affaires at Florence in 1829, counselor of the Russian Embassy at Vienna in 1832, and in 1841 was sent as Plenipotentiary to Stuttgart, where he negotiated the marriage of the Grand Duchess Olga, daughter of Emperor Nicholas, with Crown Prince Charles of Württemberg. He was accredited Ambassador to the German Bundestag at Frankfurt in 1850, and there first met Bismarck. He represented Russia at Vienna from 1854 to 1856, and so conducted affairs that Alexander II made him Minister of Foreign Affairs on the retirement of Nesselrode, April 15, 1856. At the very outset hostility to Austria seemed to be the impelling motive of his policy. "Austria," he declared, "is no state, only a government," and he shaped his policy in accordance with his dictum, after the disastrous issue of the Crimean War, "La Russie ne boude pas, elle se recueille" (Russia bears no grudge; she collects herself). He was unquestionably successful in restoring the prestige of Russia. In 1863 he was made Chancellor of the Empire. During the Civil War in the United States he maintained a friendly attitude towards the North, a fact which restrained France and England from open countenance of the Confederacy. By bringing Russia into accord with Prussia in 1863 he was able to resist the attempted interferences of foreign powers in behalf of the Polish insurgents. He cultivated friendly relations with Bismarck while the latter was Prussian Ambassador at St. Petersburg, and the good understanding between the two governments made

possible the attainment of German unity through Prussia's drastic course, while Russia reaped her reward by being enabled to break the terms of the Peace of Paris, extorted from Russia at the close of the Crimean War in 1856, to the extent of gaining control of the mouths of the Danube and admitting the Russian war fleet to the Black Sea. After 1873 Gortchakoff ceased to view with favor the much talked of alliance of the three emperors, because of the increasing power of Germany. He was the guiding spirit of Russian policy in the war with Turkey in 1877–78, and the diplomatic consequences of that war widened the breach between the two great chancellors and their governments. Gortchakoff felt that Russia had been deserted by Germany in the negotiations at Berlin, and he never forgot it. He was the author of the Franco-Russian *entente*, to which Bismarck responded by the Triple Alliance. De Giers succeeded Gortchakoff as Minister of Foreign Affairs in 1882, but the latter remained Chancellor until his death at Baden-Baden, March 11, 1883. Prince Gortchakoff's biography, by Charles Marvin, was published in London (1887). Some interesting observations on Gortchakoff and his diplomatic methods are to be found in Bismarck's *Autobiography*, trans. by Butler (New York, 1899). Consult also Klaczko, *The Two Chancellors*, trans. by Tait (New York, 1876), and Alfred Rambaud, *A Popular History of Russia*, vol. iii (Boston, 1882). See RUSSIA; RUSSO-TURKISH WAR.

GORTON. A suburban municipality of Manchester (q.v.), Lancashire, England. Pop., 1901, 26,550; 1911, 40,578.

GORTON, SAMUEL (1592–1677). One of the founders of Rhode Island, born at Gorton, England. For a time he was a clothier in London; but having adopted radical religious opinions, he left in 1636 for Boston, Mass. There his participation in religious discussions led to trouble; so he went to Plymouth and began to preach; but in 1638, leading the opposition to certain political measures of Governor Prence, he was banished from Plymouth. He then removed to Pocasset (now Portsmouth), Aquidneck (now Rhode Island). When William Codrington became Governor, Gorton was denied the island, but he found protection at Providence with Roger Williams (1640). Thence in 1642 he went to the other side of Narragansett Bay and bought the lands owned by the Indian chief Miantonomi at Shawomet, now Old Warwick. His claim was disputed by other Indian chiefs, and, the dispute being referred to the Boston authorities, 40 soldiers were sent, who took Gorton and eight of his people prisoners. They were tried at Boston on a heresy charge and sentenced to hard labor in chains (1643). Five months afterward (March, 1644) they were released and at once left the Colony. Gorton then returned to England and obtained from the Parliament Commissioners a mandate protecting his land claim. He returned in 1648, named the place Warwick, and thenceforward lived in peaceful possession. In 1651–52 he was president of Providence and Warwick, and he held numerous other offices. He was an author and published *Simplicio's Defense Against Seven-Headed Policy* (1646; reprinted in Peter Force, *Collection of Historical Tracts*, Washington, 1846); *An Incorruptible Key Composed of the OX. Psalm Wherewith You May Open the Rest of the Holy Scriptures* (1647); *An Antidote Against the Common*

Plague of the World (1657): and other works. He died at Warwick between Nov. 27 and Dec. 10, 1677. A sect of which he was the founder, though few in number, existed for about 100 years. Its distinguishing tenets were contempt for the regular clergy and the outward forms of religion, and the belief that the true believers were so united to God that they shared in His perfection, and for them heaven and hell were practically non-existent. The emphasis laid on negations by Gorton's followers led to their being called the Nothingarians. Consult Janes, *Samuel Gorton* (Providence, 1896), and A. Gorton, *Life and Times of Samuel Gorton* (Philadelphia, 1907).

GORTYNA (Lat., from Gk. Γόρτυνα). An ancient city of importance on the southern side of the island of Crete, now called Gortyn. It stood on the banks of the small river Lethæus (Mitropolipotamo), at a short distance from the sea, with which it communicated by means of its two harbors, Metallum and Lebena. It possessed temples of Apollo Pythius, Artemis, and Zeus. Near the town was the famous fountain of Sauros, inclosed by fruit-bearing poplars; and not far from this was another spring, overhung with an evergreen plane tree which in popular belief marked the scene of the amours of Jupiter and Europa. Gortyna was the second city in Crete, next to Cnosus in importance. According to tradition, Cnosus and Gortyna combined to subdue the island and then quarreled with each other. Neither plays a conspicuous part in the history of Greece. Under the Romans Gortyna became the metropolis of Crete. Some ruins may still be traced at the modern village of Hagii Deka. An important inscription (Greek) was discovered here in 1884, by Halbherr and Fabricius, in the bed of a mill stream. The main body of the inscription was on a wall 27 feet long and 5 feet high. Taken with two fragments previously discovered in 1857 and 1859, by French archaeologists, and 80 others which came to light in 1885, the inscription forms a practically complete code of laws, bearing on the family relations in regard to such matters as inheritance, marriage, divorce, and adoption, and on matters of bargain and sale. The inscription is written alternately from right to left and left to right (*boustrophedon*) in a peculiar local alphabet and in the local dialect. In spite of these marks of antiquity it is not likely that the main inscription can be dated much earlier than 400 B.C.; the fragments discovered in 1885 may belong to the seventh century B.C. There is a cast of the main inscription in the Cambridge (England) Museum of Classical Archaeology. Consult: Bücheler and Zitelmann, *Das Recht von Gortyn* (Frankfurt, 1885); Baunack, *Inscript von Gortyn* (Leipzig, 1886); Merriam, in *American Journal of Archaeology*, vols. i and ii (Baltimore, 1885-86), with translation and notes; Gardner-Jevons, *Manual of Greek Antiquities* (2d ed., London, 1898); Wyse, in *Whibley's Companion to Greek Studies* (Oxford, 1905); Lipsius, *Zum Recht von Gortyna* (Leipzig, 1909); Kohler and Ziebarth, *Das Stadtrecht von Gortyn und seine Beziehungen zum gemeingriechischen Recht* (Göttingen, 1912). For excavations at Gortyna in 1912 which yielded two more blocks of the great inscription, consult Tonks, "Archæology," in *The New International Year Book* (1912). See COMPARETTI.

GORTYNIAN LAW CODE. See GORTYNA.

GÖRTZ, gërts, GEORG HEINRICH VON. See SCHLITZ.

GORUP-BESANEZ, gō'rup bâ-ză'něts, BARON EUGEN (1817-78). A German chemist, born at Graz and educated in that city and at Vienna, Padua, Munich, and Göttingen. He was appointed assistant in 1849 and regular professor of chemistry at Erlangen in 1855. His researches on zoöchemical analysis are important, and his work entitled *Anleitung zur qualitativen und quantitativen zoöchemischen Analyse* (3d ed., 1871) is very valuable. His principal publication is the *Lehrbuch der Chemie* (vol. i, 7th ed., 1885; vol. ii, 6th ed., 1881; vol. iii, 4th ed., 1878), which has been translated into French and several other languages.

GÖRZ, gërts, or **GÖRITZ**, gë'rits. The capital of the Austrian Crownland of Görz and Gradisca, one of the coast districts, charmingly situated in a fruitful plain on the left bank of the Isonzo, about 35 miles north-northwest of Trieste (Map: Austria, C 4). It is the seat of an archbishop. Among its principal buildings are the cathedral of the seventeenth century, with a beautiful sacarium; the church of St. Ignatius and college of the Jesuits, the latter used as barracks; the Archbishop's palace; and government buildings. Above the town rises the dilapidated old castle of the former counts of Görz, now used as barracks; and to the north lies the Franciscan monastery of Castagnavizza, with the graves of Charles X of France, who died in Görz in 1836, of the Duc d'Angoulême, and of the Comte de Chambord. Owing to its fine climate, it has become a favorite health resort, and is now called "the Nice of Austria." Its institutions include a gymnasium, a theological school, a teachers' seminary, an agricultural school, an agricultural-chemistry experiment station, and a public library. Görz has manufactures of silks, cotton, thread, dyed goods, breadstuffs, pottery, candles, kindling wood, leather, matches, candles, paper, and soap, and a thriving trade in vegetables, candied fruits, and wine. Pop., 1900, 25,432; 1910, 30,995.

GÖRZ AND GRADISCA, gră-dis'kă. A crownland and princely earldom of the Austrian portion of Austria-Hungary, bounded on the north by Carinthia, east by Carniola, south by the Adriatic and the districts of Trieste and Istria, and west by Italy. Area, 1140 square miles. It is mostly a mountainous region. The southwestern part, on the Adriatic, is wholly arable and very fertile, but has no good harbors. In the north the Julian Alps cross in a southeasterly direction, with the Triglav group (9394 feet) rising on the east boundary; in the west the Venetian Alps extend southward, forming most of the west boundary, with Monte Canin (8469 feet) as the highest peak. The two important rivers are the Isonzo, which empties into the Adriatic, and the Timavo, which flows into the Gulf of Trieste. Agriculture and culture of the vine are the leading industries. Silk is also produced in the south. Wheat, barley, maize, rice, buckwheat, and hay are raised. Capital, Görz. The local diet has 22 members. The crownland sends five members to the Lower House of Austria. Pop., 1900, 232,897; 1910, 261,721. The inhabitants are almost wholly Roman Catholics. The district came into the possession of Austria in 1600, on the extinction of a line of counts of Görz and Gradisca, who had ruled for some centuries.

GÖSCHEL, gë'shel, KARL FRIEDRICH (1784-

1862). A German jurist and philosopher. He was born at Languensalza and was educated for the bar at Leipzig. In 1845 he was appointed president of the consistory for the Province of Saxony, Prussia, but was compelled to resign that position after the revolution of 1848. He was not only a scholar and theorist, but also a practical legislator, both in ecclesiastical and secular matters. Conservative in his religious views, Göschel exerted considerable influence upon the Protestant church in his day and, above all, was instrumental in establishing the relation between theology and the Hegelian philosophy. His works include: *Aphorismen über Nichtwissen und absolutes Wissen* (1820); *Der Monismus des Gedankens* (1832); *Von den Beweisen für die Unsterblichkeit der menschlichen Seele* (1835); *Vorträge und Studien über Dante* (1863).

GOSCHEN, gö'shen, GEORGE JOACHIM GOSCHEN, first Viscount (1831-1907). An English statesman. He was educated at Rugby and Oriel College, Oxford. Entering the mercantile firm of Fröhling and Goschen, he paid especial attention to finance and in 1856 became a director of the Bank of England. A Liberal member of Parliament for London from 1863, he took an active share in throwing open the universities to dissenters and in bringing about the abolition of religious tests. He was reelected in 1865. He became a privy councillor and vice president of the Board of Trade in 1865, and in the following year Chancellor of the Duchy of Lancaster and Cabinet Minister, but retired with the Russell ministry in June of that year. On Gladstone's accession to power in 1868, Goschen was appointed president of the Poor Law Board and in 1871 First Lord of the Admiralty. He retired from office with his party in 1874, and in the election of this year he was the only Liberal candidate returned from the city of London. In the same year he became lord rector of Aberdeen University. Two years later he and M. Joubert went as delegates to Cairo, where they planned with the Khedive the conversion of the Egyptian debt. In 1880 and 1881, as special Ambassador to the Porte, Goschen lent his services to the settlement of the Græco-Montenegrin boundary. Because of his opposition to Gladstone on the extension of the franchise and on home rule for Ireland, he abandoned the Liberal party for that of the Liberal Unionists (q.v.) in 1886 and accepted the office of Chancellor of the Exchequer in Lord Salisbury's government after the resignation of Lord Randolph Churchill. In 1895 he again became First Lord of the Admiralty; he resigned in 1900, was created Viscount, and entered the House of Lords. He became rector of Edinburgh University in 1890 and chancellor of Oxford University in 1903. He published *The Theory of Foreign Exchange* and a life of his grandfather, G. J. Göschen, the noted German publisher (1903).

GOSCHEN, SIR WILLIAM EDWARD (1847-1924). An English diplomat, brother of the first Viscount Goschen. He was born in London, was educated at Rugby and Oxford, and entered the diplomatic service as attaché in 1869. He was Third Secretary at Buenos Aires (1873) and Paris (1875) and Second Secretary at Rio de Janeiro (1877), accompanied his brother to Constantinople in 1880, and served as Secretary of Legation in Peking (1885), Copenhagen (1888), Lisbon (1890), Washington (1893), and St. Petersburg (1894). He was Ambassador at

Belgrade in 1898-1900, at Copenhagen in 1900-05, and, after three years in Vienna, was in 1908 promoted to the even more important post of Berlin. At the opening of the great European conflict of 1914 he returned to England.

GOS/HAWK (AS. *gōshafoc*, goose hawk, from *gōs*, goose + *hafoc*, *heafoc*, hawk). A genus of falcons (*Astur*) containing five or six species, distinguished from the true falcons by a lobe or festoon instead of a sharp tooth, on the edge of the upper mandible, and by the shortness of the wing, which reaches only to the middle of the tail. It is more closely allied to the sparrow hawks. The species to which the name "goshawk" originally belonged (*Accipiter palumbarius*, or *gentilis*) is very widely diffused over Europe, Asia, and the north of Africa, chiefly inhabiting hilly and wooded regions. It is now very rare in Great Britain, particularly in England. Although one of those that were called ignoble birds of prey, it was much used for falconry, being easily trained, and very successful in catching such game as is confined to the ground. The goshawk was thus flown at hares, rabbits, pheasants, partridges, etc. It was also flown at geese, whence the name "goose hawk." It ordinarily seeks its prey by flying near the ground and can remain a very long time on the wing. It follows its prey in a straight line, not rising in the air to descend upon it, like the falcons; and when baffled by the object of pursuit entering a wood and hiding itself in some covert, will perch on a bough and await its reappearance with wonderful patience for many hours. Its flight is very rapid. The goshawk builds a large nest in trees. The female, much larger than the male, is about 2 feet in entire length.

The American goshawk (*Astur atricapillus*) differs from that of the Old World, being altogether a larger and handsomer hawk. The upper parts are dark bluish-slate color, while underneath it is whitish, closely barred, or vermiculated with fine zigzag lines of brown. The young birds have a much less handsome plumage. The goshawk is chiefly a winter visitor in the northern United States, but breeds in the Rocky Mountains from Colorado northward. It is the most abundant of the birds of prey in Alaska, where many remain through the winter, and subsists partly by robbing the Eskimo hunters' snares, though mainly by capturing ptarmigan for itself. See PLATE OF FALCONS and FALCONRY.

GO'SHEN. The name of a land given by Pharaoh to Jacob and his family when they came to Egypt, and occupied by their descendants until the Exodus (Gen. xlv. 10, xlv. 28, 34, xlvii. 27, l. 8; Ex. ix. 26). According to Gen. xlv. 34, Goshen was outside of Egypt. This is also suggested by Josh. x. 41, xi. 16, where the land of Goshen is spoken of in connection with the Negeb (q.v.) and the Philistine Shephelah as a part of the conquests of Joshua. The Greek version rendered the name *Péreu*, *Gesem*, evidently identifying it with the Kesem, or Kes, of Ptolemaic times, also called the Arabian nome, with its capital at Phakusa, the Egyptian pa-Sept, the modern Saft el Henneh. Naville, Müller, and Wiedemann accept this view and look for the land of Goshen in the district around Saft el Henneh, east of the canal Abu'l Menagge and extending north of the Wadi Tumilat so as to include both the twentieth and the eighth nome with Bubastis, Belbeis, and Abasseh. It is not improbable, however, that this district,

which in the time of Seti I (1319-10 B.C.) was a marshland, formed only the part of Goshen that was nearest to Egypt, and that the name was used by the Hebrews to designate the whole country between the Brook of Egypt (Wadi el 'Arish) and the Nile delta. As the name "Mizraim" (Egypt) was also employed so as to include this region, Goshen might be said to be in Egypt in the wider sense as well as outside of Egypt in a narrower sense. When it is described as "the best of the land" (Gen. xlvii. 6, 11), this is to be understood as referring to the needs of a pastoral or seminomadic people. Consult W. Max Müller, *Asien und Europa nach den ägyptischen Inschriften* (Leipzig, 1893); id., art. "Goshen," *Encyclopædia Biblica* (New York, 1901); Naville, *The Shrine of Sift el Henneh and the Land of Goshen* (London, 1888); Wiedemann, in *Guth's Kurzes Bibelwörterbuch* (Tübingen, 1903); J. G. Duncan, *Exploration of Egypt and the Old Testament* (New York, 1909); H. Brown, *The Land of Goshen and the Exodus* (2d ed., London, 1912).

GOSHEN. A city and the county seat of Elkhart Co., Ind., 110 miles east of Chicago, Ill., on the Lake Shore and Michigan Southern and the Cleveland, Cincinnati, Chicago, and St. Louis railroads, and on the Elkhart River (Map: Indiana, F 1). The city contains Goshen College, a Carnegie library, city hospital, and a fine high-school building. It has important agricultural and lumber interests and extensive manufactures, which include flour, rubber goods, ladders, iron, condensed milk, buggies and wagons, steel tanks, underwear, machinery, sash and doors, veneering, furniture, and farm implements. Goshen is governed by a mayor, elected every four years, and a unicameral council. The water works and an electric-light plant are owned and operated by the city. Pop., 1900, 7810; 1910, 8514; 1914 (U. S. est.), 8813.

GOSHEN. A village and the county seat of Orange Co., N. Y., 60 miles northwest of New York, on the Erie and the Lehigh and New England railroads (Map: New York, A 1). The centre of an agricultural region, it has a large trade in milk and cheese. There are cut-glass works, foundries, a road-cart factory, and a cider mill. The village contains a public library, a hospital, and a sanitarium. Goshen was settled in 1714 and first incorporated in 1809. The government, under a general Act of 1897, is vested in a president and board of four trustees, who are elected at the annual corporation meeting. The village owns and operates its water works. Pop., 1900, 2826; 1910, 3081.

GOSIUTE, gó'shl-oot (from *Gossip*, their chief + *Ute*). A Shoshonean tribe, formerly ranging west of Great Salt Lake, Utah, and later assimilated by the Piute (q.v.).

GOSLAR, gó'slár. An ancient Imperial city of Germany, in the Prussian Province of Hanover, situated on the Gose at the foot of the Rammelsberg, about 35 miles south of Brunswick (Map: Prussia, D 3). Its ancient buildings give it a very mediæval appearance. These include the Zwinger, a tower with walls 20 feet thick; the Gothic Rathaus, with a valuable collection of old books, paintings, and other antiquities; the tailors', butchers', and bakers' guild houses, the Romanesque twelfth-century church of the Neuwerk Monastery, with good mural paintings; the Frankenberg Church, built at the beginning of the twelfth century and restored in 1873, with tombstones and

sculptures; and the cathedral chapel, with a splendid altar. It was formerly the vestibule of the historical cathedral of St. Simon and St. Jude, founded in 1045 and destroyed in 1820, and contains many relics of interest to the antiquary. The Kaiserhaus, the most ancient secular building in Germany, built in 1030, is a restored palace founded by Henry III. Its large Imperial hall is enriched with historical frescoes by Wislicenus and contains an ancient Imperial throne dating from the twelfth century. The double chapel of St. Ulrich, a portion of the original building, holds the tomb of Henry III, with his heart. Among its institutions are a gymnasium, a teachers' institute, and several sanitariums.

The chief industry of Goslar is mining. It manufactures polished marble, matches, chemicals, starch, playing cards, cigars, hats, dyes, cut glass, brandy, and beer. In the vicinity are situated a number of ponds from which ochre dye is obtained. The Rammelsberg Mountain (2040 feet) has been mined for centuries, produces silver, copper, lead, zinc, and gold ores, and is a source of much interest to tourists. Pop., 1000, 16,403; 1910, 18,909, chiefly Protestants. Goslar was founded probably early in the tenth century and soon became important on account of its rich mineral deposits. It was a favorite place with the Saxon and Franconian emperors and the seat of many diets. For its adherence to the Hohenstaufen it was destroyed by Otho IV in 1204, but it recovered its prosperity after joining the Hanseatic League. It suffered during the Thirty Years' War and was burned in 1728 and 1780. Attached to Hanover in 1816, it finally became Prussian in 1866.

GOSLAWSKI, gó'sláv'ské, MAURYCY (1802-34). A Polish poet, born in Podolia. He was educated at Kremenetz and composed his famous war songs as a soldier during the revolution of 1830. These were subsequently collected and published under the title *Poczyta Ułana polskiego poswieconą Polkom M. Goslawski* (Poems of a Polish Uhlán, 1833). Sent as an emissary to Galicia from Paris, whither he had fled in 1833, he was arrested by the Russian authorities and imprisoned at Stanislaw, where he died, and where a monument was erected to his memory in 1875. His complete works were published by Brockhaus in 1864 under the title of *Poczyte*.

GOSNELL, R. EDWARD (1800-). A Canadian archivist and author. He was born at Lake Beauport, Province of Quebec, was early a public-school teacher and in newspaper work, and went in 1888 to British Columbia, where, after two years on the staff of the Vancouver *News-Advertiser*, he was appointed a commissioner to exhibit the products of the province. In 1893 he became librarian and secretary of the provincial bureau of statistics, and later he edited the *Victoria Colonist* for some years. He was made provincial archivist and secretary of the British Columbia Forestry Commission, was actively interested in the cause of Imperial federation, becoming a member of the British Empire League in British Columbia, and in 1907 was a delegate to the Conference on Education in London, England. He edited the *British Columbia Year Book*. His publications include *Some Practical Phases of a Great Question* (1901) and, with R. H. Coats, *The Life of Sir James Douglas* (1905), in the "Makers of Canada Series."

GOSNOLD, BARTHOLOMEW (?-1607). An English navigator and one of the earliest explorers of New England. He sailed for America in March, 1602, with a party of colonists in the *Concord*. The expedition seems to have been supported by Sir Walter Raleigh. Gosnold made land somewhere on the coast of Maine, sailed south along the coast, and discovered and named Cape Cod, Martha's Vineyard, and Elizabeth Island. This last, now known as Cuttyhunk, was made a base for trading operations, which were carried on in Buzzard's Bay for a few weeks. The idea of a permanent settlement, to found which was one of the objects of the voyage, was soon abandoned, and in July the *Concord* was once more in England with a cargo of cedar, furs, and sassafras. In 1606—largely through Gosnold's efforts—an association of London and West of England merchants obtained a charter from James I for colonizing Virginia. Three ships sailed under Capt. Christopher Newport (1607). The expedition discovered and named Cape Charles and Cape Henry and founded the settlement of Jamestown. Gosnold was among those appointed by the King to the council of the Colony, and he was one of the many who succumbed to illness in the early months of the experiment. He died on Aug. 22, 1607. For the contemporary account of Gosnold's voyages and the settlement of Virginia, consult Arber's edition of the *Works of John Smith*, in the "Scholar's Library" (London, 1884), and Stevens's reprint of Brereton, *Brief and True Relation of Gosnold's Voyage* (ib., 1901). See CUTTYHUNK.

GOSPEL (AS. *godspel*, *godspell*, OS. *god-spell*, OHG. *gotspel*, the *o* being originally long, and meaning thus *gûd*, good + *spel*, tidings, a translation of Gk. εὐαγγέλιον, *evangelion*, good tidings, from εὖ, *eu*, well + ἀγγέλλειν, *angellein*, to announce. Through the shortening of the *o*, in popular speech, before the three consonants, the word took the form *gûdspel*, God story, the story of Christ. To this form the OS. and OHG. belong). The word used to denote (1) the message of salvation given to the world by Jesus Christ, and (2) the historical record of this message as contained in the first four books of the New Testament, so that each of these books is designated a Gospel, and the collection is known as the Gospels. The term, as used in the earlier books of the New Testament, has an active sense, best expressed by the phrase "the preached gospel." This was due to the missionary character of the initial proclamation which was given by the Apostles to the message of salvation. It is frequently so used in Paul's Epistles (e.g., 1 Thess. iii. 2; Rom. i. 1-3, 9, 16; Phil. i. 5, 12, ii. 22, iv. 3). In the later books the term is used sometimes in a technical sense, denoting the historical record of this salvation message (e.g., Mark i. 1), or even the message itself as an article of faith and confession (e.g., Rev. xiv. 6). This technical sense was fully acquired by the end of the second century. Its primary sense is seen in such passages as Mark i. 14, 15, xiii. 10, xiv. 9; Matt. iv. 23, ix. 35, xxiv. 14, xxvi. 13; Gal. i. 11, ii. 2; 1 Cor. xv. 1; 2 Cor. xi. 7; Rom. x. 16.

The following article naturally confines itself to the term as denoting the historical records of the Gospel message, the New Testament books commonly known as the Gospels. Of these Gospels, the first three (Matthew, Mark, Luke)

cover practically the early portion of Jesus' life, i.e., His ministry in Galilee and the north, together with the close of His life in Jerusalem, recording largely the same events and reproducing largely the same teachings. For this reason they are technically known as the *Synoptic Gospels*, and the question of their literary relation to one another and to common and specific sources is known as the *Synoptic Problem*. Their origin dates within generally the same period, say from 65 to 80 A.D. The Fourth Gospel (John) covers the later portion of Jesus' life—i.e., His ministry in Judaea and Jerusalem, not only on the occasion of His visits to the city before and at the close of His Galilean ministry, but especially during His closing ministry in that city and region—recording events and reproducing teachings largely different from those given in the Synoptic Gospels. For this reason the literary relation of the Fourth Gospel to the Synoptic Gospels constitutes in itself a specific problem known as the *Johannine Problem*, or the Problem of the Fourth Gospel. The origin of the Fourth Gospel dates from a period much later than those of the Synoptists, say about 90 A.D. The discussion of these two problems has enlisted the interest of most New Testament scholars and has really gathered around itself the most significant New Testament work which has been done in the last 50 years. More definitely stated, these problems are as follows:

I. Synoptic Problem. Our first three Gospels present such striking identities in their order of narrative and in their use of word, phrase, and continued statement, and at the same time such striking differences in these respects, that we are compelled to ask what theory of their origin will account for these phenomena. The following theories have been propounded: (a) the *Successive Dependence Theory*, viz., that the evangelists made use of one or more of the Gospels already written, so that one of the Gospels is the first and original Gospel—a second writer using the first, and the third using one or both of his predecessors. This is the oldest view, having practically originated with Augustine, and has been worked out into every possible modification. (b) the *Documentary Theory*, viz., that all three Gospels to some extent made use of a preëxisting written source. This theory came from ideas suggested by Le Clerc (1716) and was later taken up by Priestly (1777) and finally definitely formulated by Lessing (1778). This also has received many modifications, according to the view held as to the character of the original document and also according to the way this theory was combined with the first. (c) the *Oral Theory*, viz., that all three Gospels made use of the common oral tradition, which had become fixed by use. This was first suggested by Herder (1797) and Eckermann (1806), but fully formulated by Gieseler (1818). It has also been variously modified, according as there have been held to enter into the oral sources written sources as well, or as the Gospels have been held to have undergone various recensions which the evangelists have used in varied combinations.

The conclusions most generally accepted by critics to-day lie within the general sphere of the Documentary Theory, though they involve elements of each of the others. In substance they are, that behind our present canonical

Gospels lay two fundamental written sources: one a collection of sayings of Jesus, known as the *Logia* of Matthew—referred to to-day by the more general term *Quelle* (Source), represented by the symbol *Q*—and present most conspicuously, if not exclusively, in our first and third Gospels; the other a narrative of the events of Jesus' ministry, which is practically, if not absolutely, identical with our second Gospel. Besides these main sources, it is held that the writers of the individual Gospels had access to special sources peculiar to themselves; while the writer of the third Gospel is held by some to have made use of the first as well as the second, though there are others who account for the material common to the first and third Gospels on the theory that they made use of common documents apart from *Q* and not accessible to the second Gospel. Recently the theory has been advanced in Germany that the two main documents referred to above are not primary in character, but composite results of multiple sources whose origin is often, if not always, impossible to trace.

II. *The Problem of the Fourth Gospel.* Generally the problem has been centred on the contrasts disclosed between the Fourth Gospel and the Synoptics. The narrative scheme of the Fourth Gospel differs from that of the Synoptics, not only in the portion of the ministry which it specially covers, but in the shifting of incidents common to both schemes; while incidents are introduced in the Fourth Gospel the omission of which on the part of the Synoptics is difficult to understand, and others are omitted which would be reasonably expected on the part of the Fourth Gospel. In the discourses of Jesus there is an even more radical difference. (a) The Synoptics present the discourses as simple talks on the level of everyday speech; the Fourth Gospel as involved discourses beyond the range of ordinary speech. (b) The Synoptics give the discourses largely in the form of parable—as the Sower, the Lost Sheep, the Prodigal Son; the Fourth Gospel gives them largely in the form of allegory—as the Water of Life, the Light of the World, the Good Shepherd. (c) In the Synoptics the subject of the discourses is, generally speaking, the varied and practical topics of religious living—as in the Sermon on the Mount, the qualities of the Christian life and character; or, as in the great Parable Discourse, the nature and growth of the Kingdom of God. In the Fourth Gospel, to an almost exclusive extent, Jesus Himself is made the subject of the discourses, and this self-subject is treated almost wholly from the point of Jesus' transcendental relations to the Godhead. The problem so presented has been sought to be solved, on the one hand by harmonizing the contrasts between the Fourth Gospel and the Synoptics, as both of first-century origin; on the other hand by accepting them as evidence of a second-century origin of the Fourth Gospel. Recently, however, it has come to be recognized that the problem is too complicated to be settled on the basis of the contrasts between the Fourth Gospel and the Synoptics. The Synoptic narrative cannot be accepted as a standard of completeness or accuracy as to Jesus' ministry, or the Synoptic discourses as the only form of address possible on Jesus' part. The problem thus resolves itself into the question, not only as to the extent to which the Fourth Gospel dis-

courses are supposable on the part of Jesus, but also as to how far reliable historical tradition underlies the framework of facts which the Fourth Gospel presents.

In addition to these main problems of the Gospels, there are the following minor ones:

A. *The Problem of the Contents.* Involved in this problem are the following principal points of present-day criticism:

(a) *The Nativity.*—This is given in but two of the four Gospels, Matthew (i. 18-ii) and Luke (i. 5-ii. 39), and is presented by them in narratives differing largely from each other. The one in Luke is the fuller and gives every evidence of having been derived from written Aramaic sources; the one in Matthew gives the impression of having come from oral sources. The chief question of debate is whether these sources rest upon historical fact or are the product of idealizing tradition. Against their acceptance as historical is the difficulty that during the period of the Gospel history there seems to have been no popular, nor even disciple, knowledge of them, the significance of which fact is heightened by the absence of all reference to them in the New Testament epistolary literature. In addition to this, are difficulties in the narratives as they stand—particularly the lack of full harmony in their record of events, as seen in the return of the family to Nazareth; the singular agreement which they bear at points to the national Messianic expectations which were never realized—as seen in the angel announcement that the Child was to ascend the throne of David and reign over the house of Jacob forever; and the poetic elaboration of certain parts—as seen in the songs of Mary and Zacharias. On the other hand, against the interpretation of the narratives as idealizations, there is the difficulty of the necessary assumption of a remarkably early date for the process. Neither Matthew nor Luke was written much, if at all, later than 75 A.D.; and yet at the time of their writing this tradition was not only popularly received, but had come into the elaborated documentary form represented in Luke. Such idealization further must have been of a distinctively Gentile origin. With his high conception of the holiness of the married state, the Jew would not consider supernatural birth necessary for an ideal—in fact, did not so interpret the prophecy of the virgin birth (Isa. vii. 14)—while his severely monotheistic idea of God would render a birth brought about by divine paternity hopelessly foreign to his mind; and yet, on the part of the Gentile, the crude sensuality of supernatural birth in pagan mythologies would make the creation and acceptance of such a tradition regarding Jesus within the Christian Church most difficult of accomplishment; while the origin of the narratives in Oriental myths is critically improbable, in view of the fact that these myths present no analogy to the virgin element in the narratives and that there is absolutely no trace of any process of a pre-Christian development of them which would render possible their final incorporation in the Gospels. Of the problem thus presented there may be no complete solution, though there is nothing in it which renders impossible the acceptance of the essential fact of a miraculous birth. On the contrary, the difficulty of the Gospel and Epistle silence regarding the event, and the difficulty gathering around the presence in the narratives of unfulfilled Jewish ideals,

favor the historical character of the record; since, not only in proportion as the peculiar privacy of the event and the singular suspicion likely to attach to it in the popular mind are appreciated does the lack of publicity given become intelligible, but in proportion as the narratives record a form of announcement which agrees with the stage of Messianic expectations belonging to that beginning time of Gospel history, they show their primitive character, whatever poetic elaborations or harmonistic difficulties they present; while in proportion as the main idea of the supernatural conception which the narratives contain was unnatural to Jewish thought and unlikely of Gentile production or of Oriental derivation, they show an element accounted for only on the assumption of actual fact.

(b) *The Lord's Supper.*—This is recorded by each of the Synoptists, all of whom agree in placing it at the time of, and in connection with, the regular Passover meal. Mark and Matthew, however, agree as against Luke at two points: (1) as to the sequence of the bread and the cup—Mark and Matthew placing the bread first, Luke placing the cup both first and last; and (2) as to the permanence intended in the observance of the meal. Luke making Jesus purpose it as a subsequent memorial of Himself, Matthew and Mark recording no such intention on Jesus' part. At the same time the Synoptists come into definite relation to the narrative of the Passion Week as given by the Fourth Gospel, involving the time of the Supper and its relation to the regular Paschal meal. The Synoptists placing the Supper on the Feast day and making it identical with the Paschal meal, the Fourth Gospel placing the Supper before the Feast day and out of all association with the meal. In addition, account must be taken of the fact that Paul has given us, in 1 Cor. xi. 23-26, a definite statement of the institution of the Supper, which, in proportion as it is earlier than the Gospel narratives could be, takes precedence of the Synoptic records. This Pauline statement agrees with Luke—though only to a very slight degree when the text of the Gospel is relieved of its errors and thus diverges from Mark and Matthew in its distinct mention of the cup being after the Supper, and of Jesus' purpose that the observance of the meal should be a permanent one with His disciples. In fact, it is quite clear from the character of the account of Luke that, in its statement of the after cup and of Jesus' purpose, it is derived from Paul, who in his statement further diverges from all the Gospels in evidently associating together the Supper and the ordinary religious meal of the Church—the Agape—if he does not actually identify them.

The problem presented is consequently twofold: (1) Was the Supper observed before the regular Passover feast and as a meal distinctly different from it, or at the close of the feast and as a meal definitely associated with it? and (2) Was its observance intended by Jesus to be a permanent one or to be exhausted in the event of that night? As to the first point, in case the dating of the Fourth Gospel is to be taken as correct, that part of the Synoptic narrative which connects the supper with the Passover feast (Mark xiv. 12-16 and parallels, including Luke xxii. 15) must be regarded as a modification of the original tradition, due to

the Church's early identification of the two meals, while the Supper itself must be understood as an ordinary Jewish meal, the bread and wine of which Jesus symbolically refers to Himself. It has been held that in case the dating of the Synoptics is to be accepted, the Fourth Gospel's chronology is to be regarded as distorted by its author, either through ignorance or for partisan reasons, and the Supper itself understood as identified in time and meaning with the regular Passover feast. But it is now recognized that the record of the Synoptics is not consistent with their placing of the meal, but betrays the fact that it could not have occurred on the Feast day, as it must have done if it was identical with the Paschal feast. In either case, however, it is to be noted that all four Gospels agree in placing Jesus' death on Friday, and that the significance recorded by the Synoptists and Paul as attached by Jesus to the bread and wine of the meal is one which refers them to His death as a sacrifice. As to the second point, the fact that Luke's mention of Jesus' purpose of a permanent observance of the Supper is practically derived from Paul confines the authority for this item in the narrative wholly to the Apostle. In regard to the worth of his testimony, it is evident, on the one hand, that the earliness of his account, in comparison with the Gospel records, gives it a relative value beyond theirs. This is confirmed by the almost necessary assumption that, even if the peculiar way in which he introduces his account (verse 23 a) was not intended by him to refer his knowledge of the facts to divine revelation, it was intended to place it on a high plane of authority. On the other hand, the fact that Paul is writing to the disorderly church at Corinth, and has in mind at this particular point in his Epistle their shameful conduct of the Lord's Supper, might lead Paul to read this purpose into the narrative of the event by way of emphasizing to his readers the continual authority of the Supper. It would be manifestly unwarranted, however, to hold that such action on Paul's part disposed of the question, since the portrayal of the Supper by Mark and Matthew as, in the mind of Jesus, a covenant between Himself and His disciples, implies an intended permanence in the observance of the event, which practically involves the command, "This do in remembrance of Me," whether it was actually uttered or not. It would seem, therefore, that whatever difficulties lie in the way of a complete solution of the problem, the following essential facts are clear: that Christ, in a final supper with His disciples, symbolically referred the bread and wine of the meal to His approaching death as a sacrificial act on His part, in their partaking of which symbols they entered into a covenant realization of its benefits and recognition of its obligations.

(c) *The Resurrection.* While none of the Gospels record the act itself, they all record the fact of the Resurrection, though in narratives which differ widely from one another. (The concluding verses of the last chapter of Mark, xvi. 9-20, are recognized as a later substitute for the ending of the Gospel, and John xxi as a probable supplement to the original Gospel.) The most significant divergence is regarding the scene of the chief appearances of Jesus—Matthew (xxviii. 16-20) and, by implication, Mark (xvi. 7) placing it in Galilee, Luke (xxiv) and John (xx) in Jerusalem. The minor

divergences relate to individualities in the narration of events, involved in which are some notable peculiarities, such as Matthew's reference to the accompanying natural and angelic events (xxviii. 2-4), and the gathering of the eleven at a mountain in Galilee (verses 16-20); Luke's story of the two disciples on the way to Emmaus (xxiv. 13-15), and his account of Jesus' final blessing of the disciple band and His ascension from them at Bethany (verses 50-53); John's record of the curing of Thomas's doubt (xx. 24-29). Further involved in these individualities of narration are some striking difficulties of detail, such as the statement by Luke (xxiv. 9) that the women told their experience at the sepulchre to the eleven and to all the rest, while Mark says that they said nothing to any man (xvi. 8); John's statement that Jesus forbade Mary to touch Him (xx. 17), while Matthew recounts that the women, including Mary, were allowed to clasp His feet (xxviii. 9). Apart from these divergences, however, there manifest themselves the following whole and partial agreements: (1) As to the visit of the women to the sepulchre. All the Synoptists unite in saying that they made their visit early in the morning, finding the tomb empty and returning to the city with the fact impressed upon their minds (Mark xvi. 2-4, 6; Matt. xxviii. 2, 3, 5, 6; Luke xxiv. 4-6 a). John confines his account to the experience of Mary Magdalene, but states also on her part an early-morning visit, implying the finding of an empty tomb, and the announcement of the fact to Peter and John, who themselves go to the sepulchre and confirm the story by their personal observation and then return to their homes (xx. 1-10; cf. Luke xxiv. 12). (2) As to the angelic appearances. All the Synoptists unite in relating a vision of angels at the tomb (Mark and Matthew one angel, Luke two), and a message from the angels, through the women, to the disciples, to the effect that Jesus was risen (Mark xvi. 5, 6; Matt. xxviii. 2, 3, 5, 6; Luke xxiv. 4-6 a), Mark and Matthew adding an announcement that Jesus would meet with His disciples in Galilee (Mark xvi. 7; Matt. xxviii. 7); Luke, merely a reminder of what Jesus had said to His disciples concerning His death and resurrection while He had been with them in Galilee (xxiv. 6-8). (3) As to the appearances of Jesus Himself. (a) Matthew and John unite in relating an appearance to the women after leaving the tomb (Matthew to the group, John to Mary Magdalene). On this occasion a message is given them by Jesus Himself to His disciples (Matthew, that He would precede them into Galilee; John, that He would ascend into heaven) (Matt. xxviii. 10; John xx. 17). (b) Luke and John unite in relating an appearance to certain of His disciples during the evening of this same day, in which Jesus convinced their unbelief by displaying to them the marks of His crucifixion; Luke adding the items of the disciples' fear at the appearance and the material proof given by Jesus of His bodily existence, together with His instruction of them in the Scriptures' reference to Himself and His work; John, the items of the appearance being accomplished in spite of closed doors, Jesus' impartation to them of the Holy Spirit, and His recognition of them as His representatives in the world (Luke xxiv. 36-49; John xx. 18-23). In our study of the Gospel narratives,

however, account must be taken of the definite statement made by Paul in his First Epistle to the Corinthians (xv. 4-8), where he gives a list of six appearances of Jesus—first to Peter, then to the twelve, then to a company of more than 500 disciples, after that to James, then to all the Apostles, adding finally the appearance to himself. This statement, like that regarding the Lord's Supper, has priority over the earliest Gospel account and is placed by the Apostle on a high plane of reliability of source. In view of these facts it is significant that its only divergence from the Gospel accounts is by way of supplementation to what they narrate. From all this, then, it would seem quite possible for Jesus to have appeared to certain individuals among His disciples in Jerusalem and its neighborhood within eight days after His resurrection; later to have appeared to larger numbers of His followers in Galilee; and finally, before His ascension, to have appeared to the apostolic circle in Jerusalem, leading them out to Bethany, where He was parted from them. The only question would be the time taken for the disciples' journey from Jerusalem to Galilee and return, and this is not a serious one. As to the general sequence of events, however, it is quite impossible to construct any narrative which will include all the items of the independent accounts as given us in the four Gospels. It is most likely that the four statements (Matt. xxviii. 1; John xx. 1; Luke xxiv. 4, 10) regarding the visits by the women are merely variants of fragmentary accounts of a single visit early in the morning, for the purpose of completing the burial.

It is quite natural that, when Peter and John were informed as to what had taken place, they should have proceeded at once to the sepulchre in order to verify the facts and, upon arriving at the place, that it should be John who rose to a believing idea as to what might be behind the facts (John xx. 3-10; cf. Luke xxiv. 12). Mary Magdalene may have returned to the sepulchre at the same time as Peter and John, and while there the Master may have appeared to her (John xx. 14-18; cf. Mark xvi. 9)—the vision of angels given in John xx. 11-13 being a confusion of the Synoptic account.

The appearances to the disciples recorded in Luke xxiv. 13 ff., cf. Mark xvi. 12; Luke xxiv. 34, cf. 1 Cor. xv. 5; Luke xxiv. 36 ff.; John xx. 19 ff., cf. Mark xvi. 14, most likely followed in the Jerusalem region; while the appearances in Galilee (as recorded in John xxi. 1-23; Matt. xxviii. 16 f., cf. 1 Cor. xv. 6 f.) were probably later.

The appearance to the 500 (1 Cor. xv. 6) was in all likelihood the same as that recorded by Matthew (xxviii. 16 f.), following the meeting at the lake referred to by John (xxi. 1-23). The appearance to James (1 Cor. xv. 7) may naturally have been the last before the ascension, which latter event is referred to by Paul as the appearance to "all the apostles," at which time the commission was most fittingly given—Matthew inaccurately connecting it with the appearance to the disciples in Galilee (xxviii. 18-20), and Luke compressing it into connection with the appearance to the eleven in Jerusalem in his desire to prepare the closing of the Gospel narrative for the beginning of that of his Second Book.

As a general result, the problem presents itself, not as one of mutually exclusive records,

since, admitting all the minor contradictions, the agreement among the narratives as to the essential facts is clear. The problem reduces itself in reality to the question whether the source of these narratives is more likely to have been the actual fact of the resurrection, evidenced to the disciples, or a self-persuasion of it on their part, through a desire to believe it to have occurred, though it had not. The decision between these alternatives will be determined by the inference which must inevitably be drawn from the facts (1) that the disciples did not reach their belief by any slow process of reasoning, but by an almost immediate conviction of the event, in spite of their deep dependency over Calvary; and (2) that it has been on the proclamation of this event, as the basal ground of its faith in Jesus, that Christianity has reached its stupendous results in the world.

B. The Problem of the Chronology. This concerns itself chiefly with the question as to the length of Jesus' ministry; and this question turns largely upon the character of the feast mentioned in John v. 1. If this is held to be a Passover, the duration of His active work is extended to at least three years; if it is not so held, the limit is reduced to perhaps two years. For full discussion of this and minor points, see NEW TESTAMENT CHRONOLOGY. See also the articles on the individual Gospels.

Bibliography. Besides the usual *New Testament Introductions and Lives of Christ*, which are useful for the general subject, consult the following more important recent books in addition to those mentioned above: (1) For the Synoptic Problem (*a*) as helps in investigation: Rushbrooke, *Synopticon* (London, 1880-81); Hawkins, *Howe Synoptics* (2d ed., ib., 1910); Vell, *Die Synoptischen Parabeln* (Gütersloh, 1897); Hueck, *Synopsis der drei ersten Evangelien* (4te Aufl., Tübingen, 1910); Heinicke, *Synopsis der drei ersten kanonischen Evangelien* (Leipzig, 1898); Wright, *Synopsis of the Gospels in Greek* (London, 1903); id., *St. Luke in Greek* (ib., 1900). GOSPEL. In the liturgical sense, the short selection from the Gospels which is read or sung in the mass and in the Anglican communion service between the epistle and the creed. It formed a regular part of the service as early as the second century. For 200 years the reading was continuous, taken up each day where the previous one had stopped; but when the calendar was fully developed under Pope Damasus the selections were chosen to correspond with it. The liturgical gospels were not originally included in the same book with the rest of the service, which allowed special ceremonial veneration to be paid to the book containing them. Thus, in the fifth century it was brought in solemn procession and laid upon the altar at

the beginning of the service; a relic of this practice is the present custom of having the deacon deposit it for a while upon the altar immediately before singing the gospel. The bearing of lights in connection with it was known to St. Jerome and signifies the illumination of the world by the gospel message. The reading is prefaced by the response (*Gloria tibi, Domine* (Glory be to thee, O Lord!)), and followed by *Laus tibi, Christe* (Praise be to thee, O Christ!), after which the book is kissed by the celebrant. All present have always stood during the reading with uncovered heads, even kings laying aside their crowns. The recitation of the "last gospel" (commonly the first 14 verses of John, unless commemoration is made of a superseded office by the use of its gospel) is of later introduction. In the thirteenth century the priest recited it on the way to the sacristy, as the bishop does to-day on the way from the altar to his throne. Pius V in his revised missal gave it its present place. See MASS; EPISTLE.

GOSPELER. A name applied to the minister in the Church of England who reads the gospel in the communion service, analogous to the deacon in the mass. (See EPISTOLER.) It was also used as a nickname for Wiclif and his followers when they devoted themselves to the circulation of the Scriptures in the vernacular.

GOSPORT. A fortified seaport and market town in Hampshire, England, 81 miles southwest of London, on Portsmouth harbor (the English Channel), directly opposite Portsmouth, with which it is connected by a floating bridge (Map: England, E 6). It is the chief manufacturing seat and depot of stores for the equipment of the British navy. The inhabitants are mostly engaged in government establishments, which comprise powder magazines, fusee and rocket laboratories, and the Royal Clarence Victualling Yard, with its various important departments. Among the industries are the manufacturing of anchors and chain cables, yacht building, and sailmaking. The town is inclosed within ramparts with an outer circle of forts, which merge in the continuous barrier that surrounds Portsmouth and Portsmouth. On the southeast is Haslar Hospital, the celebrated national institution for disabled sailors, accommodating 2000 patients. Bishop Henry de Blois is said to have bestowed the name of God's port—hence Gosport—when he found safety here during a storm in 1158. The large suburban district of Alverstoke is included in the census of Gosport. Pop., 1901, 28,900; 1911, 33,300.

GOSS, CHARLES FREDERICK (1852–). An American Presbyterian clergyman and writer, born at Meridian, N. Y. He graduated from Hamilton College in 1873 and from Auburn Theological Seminary in 1876. Ordained in 1876, he held various pastorates until 1885, when he was called to the Moody Church in Chicago. In 1892–94 he was assistant pastor of the Madison Avenue Church, New York, and after 1894 pastor of the Avondale Presbyterian Church, Cincinnati, Ohio. He is author of *The Optimist* (1897; 4th ed., rev., 1905); *The Philoplist* (1898); *Hits and Misses* (1899); *The Redemption of David Corson* (1900), his best-known book; *The Loom of Life* (1902); *Little Saint Sunshine* (1902); *Just a Minute* (1904); *Husband, Wife, and Home* (1905); *That Other Hand upon the Helm* (1910); *Cincinnati, the Queen City, 1788–1912* (4 vols., 1912).

GOSS, WILLIAM FREEMAN MYRICK (1850–

). An American mechanical engineer, born at Barnstable, Mass. He studied at Massachusetts Institute of Technology in 1877–79; organized the department of practical mechanics at Purdue University, where he was dean of the School of Engineering and director of the engineering laboratory from 1890 to 1907; and thereafter was dean of the College of Engineering at the University of Illinois. In 1913 he was engineer for the committee of investigation of the smoke nuisance in Chicago. He also served as president of the American Society of Mechanical Engineers in 1913. Besides various papers and reports on locomotive service, he is author of *Bench Work in Wood* (1887; rev. ed., 1905); *Locomotive Sparks* (1902); *Locomotive Performance* (1907); *Superheated Steam in Locomotive Service* (1910); *Tests of a Jacobs-Shupert Boiler* (1912).

GOSSART, GOSMART, JAN. See MABUSE, JAN.

GOS'SAMER (ME. *gossomer, goscomer, goose summer, from gos, goose + samer, summer*; so called on account of the downy appearance and the time of coming). A light filamentous substance, which often fills the atmosphere to a remarkable degree during fine weather in autumn, or is spread over the ground, stretching from leaf to leaf and from plant to plant, loaded with dewdrops, which glisten and sparkle in the sunshine. It is produced by small spiders of many species and is said to be produced by young and not by mature spiders—a circumstance which, if placed beyond doubt, would help to account for its appearance at a particular season of the year. The threads of gossamer are so delicate that a single one cannot be seen unless the sun shines on it; but being driven about by the wind, they are often beaten together into thicker threads and flakes. They are often to be felt on the face when they are scarcely visible. The spiders which produce these threads shoot them out from their spinnerets—a viscid fluid being ejected with great force, which becomes a thread; sometimes several such threads are produced at once in a radiating form, and these, being caught by the ascending current of heated air, are borne up, and the spider along with them. See SPIDER.

GOSSE, GOS, EDMUND WILLIAM (1849–). An English poet, critic, and biographer. He was born in London, the son of Philip Henry Gosse. Though he did not have a university education, he received, in recognition of his services to letters, the degree M.A. (1885) from Cambridge and the degree LL.D. (1899) from St. Andrews. In 1867 he was appointed assistant librarian in the British Museum; in 1875, translator to the Board of Trade; in 1884, Clark lecturer in English literature at Trinity College, Cambridge; and in 1904, Librarian to the House of Lords. In 1884 he visited the United States, lecturing at Harvard, Yale, Johns Hopkins, and other colleges. His chief works are: *Madrigals, Songs, and Sonnets* (1870); *On Viol and Flute* (1873); *Northern Studies* (1879); *Thomas Gray* (1882); *Nineteenth Century Studies* (1883); *Congreve* (1888); *History of Eighteenth Century Literature* (1889); *The Secret of Narcissa* (1892); *In Russet and Silver* (1894); *The Jacobean Poets* (1894); *Critical Kil-Kats* (1896); *Short History of English Literature* (1897); *Life and Letters of Dr. John Donne* (1899); *An Illustrated History of English Literature*, with Garnett (1902); *Jeremy Taylor* (1904); *French Profiles* (1905);

Coventry Patmore (1905); *Sir Thomas Browne* (1905); *Father and Son* (1907), crowned by the French Academy in 1913, an autobiographic work; *Henrik Ibsen* (1908); *Portraits and Sketches* (1912); *Two Visits to Denmark, 1872, 1874* (1912); *Collected Essays* (5 vols., 1913).

GOSSÉ, NICOLAS LOUIS FRANÇOIS (1787-1878). A French historical painter, born in Paris, where he studied at the Ecole des Beaux-Arts and under Vincent and became a skilled representative of the classic academic style. His principal works include: "Napoleon I and Queen Louise at Tilsit," "Meeting of Napoleon and Alexander of Russia at Erfurt," and "Louis Philippe Declining the Crown of Belgium Offered to his Son," all in the Historical Museum at Versailles; and "Entry of the Duke of Angoulême into Madrid," a wall painting in the Hôtel de Ville, Paris.

GOSSÉ, PHILIP HENRY (1810-88). An English naturalist, born at Worcester, England. From 1827 to 1835 he lived in Newfoundland as a merchant, from 1835 to 1838 in Canada as a farmer, and from 1838 to 1839 in Alabama as a teacher. In 1844 he visited Jamaica to study the birds there. He was an accurate observer of animal life and a voluminous and most agreeable writer. In 1856 he was made F.R.S. Gosse did a great work in advancing and popularizing marine zoölogy, and the influence he exerted was widespread and lasting. Among his publications are: *The Canadian Naturalist* (1840); *Birds of Jamaica* (1851); *Natural History* (1848-51); *A Naturalist's Rambles on the Devonshire Coast* (1853); *The Aquarium* (1854); *Marine Zoölogy* (1856); *Evenings with the Microscope* (1859); *Letters from Alabama* (1859); *Land and Sea* (1865); *Life in its Lower Forms* (1875); *A Year at the Shore* (1877).

GOSSÉ, gô'sèk', FRANÇOIS-JOSEPH (1734-1829). A French composer, born at Vergnies in Hainaut. He was a choir boy in the Antwerp Cathedral and then went to Paris, where, through the influence of Rameau, he was employed by a rich amateur, La Popelinère, to direct his private orchestra. Gossec has been called "the father of the symphony in France." He found all instrumental music neglected and made it his ambition to revivify it. His first symphonies were published in 1754, five years before Haydn wrote his. While orchestra conductor to the Prince of Conti, he wrote several operas. To him belongs the honor of having started the Ecole Royale de Chant (1784), which was the prototype of the Conservatory, and when that institution itself was founded (1795), he was one of the three inspectors, the others being Méhul and Cherubini. During the Revolution he was the conductor of the band of the Garde Nationale and composed a good deal of national music for fêtes. A critic sums up Gossec as "not one of those geniuses who defy time," and he had the misfortune to see his ideas improved upon by some of his contemporaries; but his influence on the development of instrumental music in France can hardly be overestimated. His works include: *Le faux lord* (1764); *Les pêcheurs* (1766); *Alexis et Daphné* (1775); *Phlémon et Baucis* (1775); *La fête du village* (1778); *Thésée* (1782); *Rosine* (1786); *Chant du 14 Juillet*, *Hymne à l'humanité*, *Hymne à l'Etre suprême*, *Chœurs et chants pour l'apothéose de Voltaire et de*

Rousseau; some oratorios and a good deal of instrumental music. Consult F. Hellouin, *Gossec et la musique française à la fin du dix-huitième siècle* (Paris, 1903).

GOSELIN, gô'slân', AUGUSTE HONORÉ (1843-). A Canadian historian and biographer. Born at St. Charles de Bellechasse, Province of Quebec, educated at the Quebec Seminary and Laval University, and ordained a Roman Catholic priest in 1866, he was secretary to the Archbishop of Quebec for two years, vicar at the Quebec Basilica in 1868-69, pastor of Ste. Jeanne de Neuville, Pont Rouge, in 1869-86, and pastor of St. Féréol until 1893, when he turned to literary work. In 1892 he was elected a fellow of the Royal Society of Canada and later a corresponding member of the Society of Antiquities of Normandy. In 1907 he was appointed a member of the Canadian Historical Manuscript Commission. He published: *La vie de Mgr. Laval, premier évêque de Québec et apôtre du Canada* (2 vols., 1890); *Les Normands au Canada* (3 vols., 1892-94); *Observations à propos du P. le Jeune et de M. de Queylus* (1896); *La vie de Henri de Bernières* (1897); *Un bon patriote d'autrefois, le Dr. Labrie* (1898); *Mgr. de Saint Valier et son temps* (1900); *Jean Nicolet et le Canada de son temps* (1905); *L'abbé Holmes et l'instruction publique* (1908); *Le vrai monument de Champlain* (1909); *Au pays de Mgr. de Laval* (1910); *L'Eglise du Canada depuis monseigneur de Laval jusqu'à la conquête* (1911).

GOSELIN, PASCAL FRANÇOIS JOSEPH (1751-1830). A French archaeologist, born at Lille, France. After acting as a deputy to the National Assembly (1789), he became a member of the central administration of commerce (1791), and was employed in making maps for the War Department (1794). He was employed by Napoleon to assist in the translation of Strabo, was one of the chief editors of the *Journal des Savants* after 1816, and published, among other works, *Géographie des Grecs analysée* (1790) and *Recherches sur la géographie systématique et positive des anciens* (1798-1813).

GOSSLER, gô'slér, GUSTAV VON (1838-1902). A Prussian statesman, born at Naumburg. He studied law at Berlin, Heidelberg, and Königsberg, and, after having held a number of government posts, was an assistant in the Ministry of the Interior from 1874 to 1878, and in 1879 was appointed Undersecretary of State in the Ministry of Ecclesiastical Affairs and Public Instruction. In 1881 he succeeded Puttkamer in the ministry. The troubles attending the Kulturkampf were still active, but he ended them by a practical scheme of informal concession to the Roman church. Thus, he did away with several provisions of the so-called "May Laws," such, e.g., as the examination of the clergy and appointment of priests by the state. Other measures of conciliation were also devised by him, sometimes not without the opposition of the Prussian government. He very vigorously opposed the Polish nationalistic movement in Posen, and in 1887 struck a decisive blow by abolishing instruction in the Polish language in the public schools, and thus did much to bring about the acute Polish situation which exists to-day. In 1890 he formulated a school law which gave offense to the Poles, and of whose immediate passage there was little hope, since the government at that time required Polish assistance in the Reichstag in support of its

commercial projects. He therefore resigned in 1891 and soon afterward was appointed Lord Lieutenant of West Prussia. Consult his *Ansprachen und Reden* (Berlin, 1890).

GOSSNER, gōs'nēr, JOHANNES EVANGELISTA (1773-1858). Founder of the Gossner Foreign Missionary Society. He was born at Hausen, near Augsburg, Dec. 14, 1773, educated at Dillingen and Ingolstadt, and from 1796 to 1826 served in the ministry of the Roman Catholic church. During 1820-24 he was preacher in St. Petersburg. As early as 1802 he was suspected of leanings towards Protestantism, and in 1826 he openly joined the Evangelical church. From 1829 till 1846 he preached in Berlin and labored zealously for missions, education, and philanthropic undertakings. He became a director of the Berlin Missionary Society when it was founded in 1831, but left it in 1836 because he wished missionaries to have greater liberty of action. Assisted by voluntary contribution, he continued to send forth missionaries, and in 1842 his missionary society was formally organized. It still exists, and labors chiefly in the East Indies. Gossner died March 30, 1858. Among other works he published: *Geist des Lebens und der Lehre Jesu* (1823); *Die Heiligen Schriften des Neuen Testaments mit Erklärungen und Betrachtungen* (new ed., 1888-94); *Goldkörner* (6th ed., Berlin, 1893). Consult his life by Dalton (Berlin, 1878).

GOS'SON, STEPHEN (1554-1624). An English author, born in Kent. Entering Corpus Christi College, Oxford, he was graduated B.A. in 1576 and wrote several plays, of which none are extant. Later he attacked the stage violently and took orders. In his *Schools of Abuse* (1579; reprinted by E. A. Arber, 1868) he began a lively controversy about the stage, which led to many pamphlets and ultimately to Sidney's *Apologie for Poetrie* (1595).

GOSSYPUM. See COTTON.

GOSZCZYŃSKI, gōsh-chun'skē, SEWERYN (1803-76). A Polish poet, born in the Government of Kiev, Russia. He was educated at Warsaw and was one of the foremost leaders of the revolution of 1830. He was one of the band of fugitives who subsequently assembled in Paris, and they exercised a very powerful influence upon him. In 1872 he returned to Lemberg, where he died. His works are lyrical in character, and many of them are devoted to a description of life in the Carpathians and in the Ukraine. Most of them are characterized by a vein of sadness due probably to the political conditions which have weighed so heavily upon the patriotic poets and authors of Poland. During the latter part of his life he fell under the influence of the mystic Towianski (q.v.). His principal poetic productions include: *Zamek Kaniowski* (The Kaniow Castle, a gruesome epic betraying Byron's influence; trans. into German and French); *Król Zamczyska* (The King of the Ruined Castle, 1842); *Oda; Powieść z czasów Bolesława Chrobrego* (1852); *Posłanie do Polaci* (Message to the Poles, 1869). He also prepared an excellent translation of Ossian. The latest edition of his *Works* is that of Lemberg (2 vols., 1904).

GOT, gō, FRANÇOIS EDMOND (1822-1901). An actor of the Comédie Française, where he made his appearance in 1844. He was born at Lignerolles (Orne) and educated at the Lycée Charlemagne. After a short time spent as a government clerk he entered the Conservatoire in 1841,

where in the two following years he carried off successively the second and first prizes. He made his début at the Comédie Française in 1844 as Alexis in *Les héritiers* and *Mascarille* in *Les précieuses ridicules*. He speedily rose to the highest rank as a comic actor, and was elected a member of the company six years later. His subsequent career was spent chiefly at the "House of Molière," but in 1866 by special arrangement he played in Emile Augier's *Contagion* at the Odéon and afterward "starred" in this piece in various provincial cities. One of his most popular creations was Giboyer in *Les effrontés* and *Le fils de Giboyer*, a part to which he devoted himself for two years. M. Got was the author of the libretto of *François Villon*, which was rendered at the Opéra in 1837, and of *L'Esclave* (1874). His golden jubilee at the Théâtre Français was celebrated in 1894, and he made his farewell appearance in 1895. He died in Passy.

GÖTA-ELF, yō'tā-ēlv' (elf, Dano-Norwegian *elv*, river). The outlet of Lake Venern (q.v.) in Sweden, forming, with its upper course, the Klar-Elf, the largest river system of the Scandinavian peninsula. The Klar-Elf rises among the Kjölen Mountains a short distance from the Norwegian boundary, and on the boundary between Svearike and Norrland, and flows south-east as a violent mountain torrent, first through a part of Norway, where it widens into the Fälmund-Elf, and then through the Swedish Län of Vermland, where it empties into Lake Venern at Karlstad. Leaving Lake Venern at its south-west corner, the Göta-Elf proper flows in a nearly southerly direction and empties by two arms into the Cättegat at the city of Göteborg, situated on the south arm. The length of the Göta-Elf is 68 miles, but the whole length of the river, including the Klar-Elf, is 440 miles. The river forms a number of falls or rapids, of which the famous Trollhättan (Witch's Cap) in the Göta-Elf proper, a few miles below Venern, is the largest and is one of the most picturesque rapids in the world. Navigation has been made possible past the Trollhättan by means of a canal, which through Lake Venern connects with the Göta Canal, constructed in 1810-32 at a cost of over 14,000,000 kroner (about \$4,000,000) and which opens up a continuous waterway by way of Lake Vettern from the Cättegat to the Baltic Sea through the heart of Sweden.

GOTAMA, gō'tā-mā. An early Hindu philosopher and logician. He is the reputed author of the *Nyāya-Sūtras*, or aphorisms of logic, which form the basis of the Nyaya system of philosophy (q.v.). As an appellation, Gotama is a very old name in India; one of the Vedic seers was called Gotama and bore the patronymic Rahugana. From Gotama descended the family of the Gautamas. Buddha also was known as Gautama Buddha (q.v.), or in the Pali form as Gotama Buddha.

GÖTARIKE, yē'tā-rē'ke, or **GOTHLAND** (Swed., Kingdom of the Goths) (Map: Sweden, E 8). One of the three historical divisions of Sweden, occupying the southern part of the country and divided into 12 läns.

GOTCH, FRANÇOIS (1853-1913). An English physiologist, born in Liverpool and educated at Cambridge. He was appointed demonstrator in physiology at Oxford University in 1883, accepted the chair of physiology at Liverpool in

1891, and returned in 1895 to Oxford, where he held the Waynflete professorship until his death. His researches concerned particularly the excitable tissues of the muscles and nerves. He was elected a fellow of the Royal Society in 1892. He published *Two Oxford Physiologists: Richard Lower, 1631 to 1691, John Mayow, 1613 to 1679* (1908).

GÖTEBORG, yē'te-bōr'y', **GOTH'ENBURG**, or **GOTTENBURG**. Capital of the Län of Göteborg and Bohus, and, next to Stockholm, the most important city of Sweden, situated on the river Göta, 4 miles from its mouth (Map: Sweden, D 8). The town is semicircular in form and lies in a plain surrounded by hills. The newer sections are built on the hills; the lower portion along the river has broad streets, partly formed by canals and lined with trees. In the centre of the town are the Gustav Adolfs Torg, or market place (containing statues of Gustavus Adolphus, Oscar I, and Odin), the exchange, and the town hall. Other noteworthy buildings are the cathedral, the Governor's palace, and the arsenal. The educational institutions comprise a university supported from private funds, with 2051 students, mostly auditors, in 1913; a Gymnasium; technical, commercial, and nautical schools; a municipal library of 125,000 volumes; a museum with fine archaeological, zoological, and industrial collections; and a scientific society, founded in 1778. The water supply is good; the streets are lighted by gas and electricity. Street railways and omnibuses traverse the town.

Cotton spinning, saw milling, shipbuilding, iron and steel milling, are among the manufacturing industries. Other important products are sugar, porter, paper, sailcloth, and leather; the town stands preëminent in Sweden on account of its commerce. Its harbor which has 3 miles of quays approachable by vessels of 20-foot draft, is rarely blocked by ice and affords a shelter for a large number of vessels from all parts of the world. The largest exports are pig and wrought iron, steel, zinc, manganese, lumber, matches, oats, fish, and pork. Among the imports are sugar, coffee, grain, cotton and cotton goods, and coal. Göteborg receives about one-fourth of the total foreign commerce of Sweden. The United States is represented by a consul. Pop., 1840, 26,084; 1900, 130,619; 1912, 173,875. Göteborg was founded on its present site in 1619 by Gustavus Adolphus and is world-famous for its plan of municipal licensing known as the Gothenburg System (q.v.).

GOTHA, gō'tā. The capital of the Duchy of Gotha and, alternately with Coburg, the residence of the dukes of Saxe-Coburg-Gotha. It is situated on the Leina Canal, 17 miles by rail southwest of Erfurt (Map: Germany, D 3). Gotha is a well-built, pleasant city, near the north edge of the Thuringian Forest. It is composed of the old inner town and four modern suburbs separated from it by promenades. The finest building is the ducal palace of Friedenstein, situated on an eminence south of the old town. It is an extensive building, with two massive towers, erected in 1643 by Ernest the Pious, and occupies the site of the old fortress of Grimmenstein. It is surrounded by promenades and a park and contains a library of about 200,000 volumes, 1900 incunabula, as well as 7000 manuscripts, including many in Arabic, and one of the best collections of coins in Germany. The public park is worthy of note.

The well-known museum was constructed in an ornate Renaissance style in 1864-77. It contains an extensive collection of ancient pottery, gold, ornaments, weapons, embroideries; an ethnographical collection; a splendid gallery of paintings, rich in old masters; a collection of sculptures, engravings, and casts; a natural-history cabinet; and a variety of miscellaneous treasures. Other noteworthy buildings are the fine sixteenth-century Renaissance Rathaus, the Augustinian Church with a large altarpiece, the theatre, and the Friedrichsthal Palace (now occupied by the government offices), the Masonic lodge, and the post office. The town is lighted by electricity and has an electric street railway. Educational and benevolent institutions are numerous, including art and medical schools. There are also many active unions and associations, scientific, historical, etc. It is noted for the number and activity of its insurance societies. The city is an important centre in the publishing and art trade of Germany. The famous *Almanach de Gotha* and *Petermann's Mitteilungen* are published here, being issued by the firm of Justus Perthes, the foremost geographical establishment in Germany. Industrially and commercially Gotha is one of the most important cities of Thuringia. The chief products are porcelain ware, meat, footwear, tobacco, machinery, soap, sugar, woollens, stoves, and brick. There are also large railway repair shops and numerous engraving and printing establishments. Pop., 1890, 23,134; 1900, 34,651; 1910, 39,553, composed almost exclusively of Protestants.

Gotha probably was a village at the time of Charlemagne. It is first mentioned as a town at the beginning of the twelfth century, when it belonged to the landgraves of Thuringia. In 1440 it passed to the electors of Saxony. In the partition of the Saxon dominions in 1485 it became part of the possessions of the Ernestine line, and since 1640 has been the capital of the Duchy of Gotha. See **SAXE-COBURG-GOTHA**.

GOTHA, ALMANACH DE. A universal political register, printed in German from 1764 to 1804, in French from 1805 to 1871, and since in both languages. See **ALMANAC**.

GOTHA, DUCHY OF. See **SAXE-COBURG-GOTHA**.

GOTHAM, gō't'am or gōth'am or gōth'am. A parish in Nottinghamshire, England, the name of which is suggestive of simple or foolish people. Tradition states that King John proposed making a progress through the town with the intention of purchasing a castle, but the people (the traditional "Wise Men of Gotham"), averse to the expense of maintaining royalty, turned him away by engaging in idiotic pursuits. Gotham, however, is only one of the many European localities to which a similar tradition is applied. Irving in his *Salmagundi* applied the name "Gothamite" to the inhabitants of New York. Consult Cunningham, *Amusing Prose Chap-Book* (Glasgow, 1888).

GOTHAM ELECTION, A. A farce by Mrs. Centlivre, published in 1715, but never acted.

GOTHAMITE, gō'tham-it or gōth'am-it. A New Yorker; a designation first applied by Washington Irving in *Salmagundi* in 1807.

GOTHENBURG, gō'ten-burk. See **GÖTEBORG**.

GOTHENBURG SYSTEM. The system of regulating the liquor traffic at Gothenburg, or Göteborg, in Sweden, put in operation in 1865. In 1864 a committee on pauperism proposed as

a remedy that the sale of the national drink (brandy) should, under the Law of 1855, be bonded over to a company to carry on the trade for the benefit of the working classes. The general features of the system are as follows: The company is granted a monopoly for which it pays a tax; the shareholders, who are usually prominent citizens, cannot receive a dividend beyond 6 per cent (5 per cent in Norway); the additional profits of the company are shared between the town, the agricultural society of the province, and the general government (in Norway by educational and charitable institutions); the well-kept bars are placed in the hands of managers who receive a salary, who maintain eating houses with cheap, well-cooked food, and who can sell coffee, mineral waters, and cigars for their own profit. The policy of the company has been that of strict control, a reduction of the number of drinking places, and the raising of the price of brandy. Some of the results, it has been claimed, are the diminishing of the temptation to drink, the divorce of liquor from politics, the sale of pure spirits, and better rules as to minors and hours. The system with variations has been widely adopted in Sweden and Norway and also in Finland. While the system has been the subject of numerous encomiums, from both native and foreign observers, there have not been wanting students who have pointed out abuses connected with it. Since profits from the bars are in many cases a significant form of public revenue, the municipal officers have had an inducement to encourage drinking. Further, other spirituous liquors, not controlled by the system, have gained in popularity; and sale in bulk, which is likewise free from control, has gained relatively to trade at the bar.

A modified form of the Gothenburg system was adopted by South Carolina in 1892 under the name of the dispensary system. The sale of all forms of intoxicating liquors was monopolized by the State. The system gave rise to much popular dissatisfaction; charges of corruption were freely made, and in 1907 the system was abandoned. Consult: *Report of Massachusetts Committee on Gothenburg System* (1893); Rowntree and Sherwell, *Gothenburg Experiments and Public-House Trusts* (London, 1901); Thompson, "The Gothenburg Method," in *Transactions of Wisconsin Academy of Science, Arts, and Letters*, vol. xiii (Madison, 1901); Pratt, *Licensing and Temperance in Sweden, Norway, and Denmark* (London, 1907); Gordon, *The Breakdown of the Gothenburg System* (New York, 1911). See TEMPERANCE.

GOTHIC ARCHITECTURE. Common usage has, ever since the Renaissance, employed this name to designate collectively and without discrimination the styles which were developed by the ecclesiastical builders of the Middle Ages in western Europe between 1150 and 1500, of which the most obvious common characteristics were the pointed arch, the traceried window, the flying buttress, spires and pinnacles, and internally the ribbed groined vault. The name "Gothic" is an obvious misnomer, for the Goths as a nation had disappeared long before the beginnings of this architecture, which was a logical outgrowth from the Romanesque of the twelfth century. (See ARCHITECTURE.) The Romanesque builders of France had evolved, especially in their monastic architecture, a type of cruciform church with three (rarely five)

aisles, having stone-vaulted side aisles flanking a loftier central aisle lighted by a clearstory (q.v.), and usually vaulted in stone, though sometimes the ceiling was of wood.

During the first half of the twelfth century groined vaulting upon a framework of ribs had come into quite general use for the vaulting of all three aisles, allowing the clearstory windows to be carried much higher than was possible with a barrel vault, and furthermore concentrating the loads and thrusts of the heavy vaults at distinct isolated points instead of distributing them equally along the entire length of the structure. To resist these separate concentrated strains rudimentary forms of buttress (q.v.) and flying buttress had been devised.

These structural features the Gothic architects made the basis of a remarkable system of architecture in which structural requirements were met by practical devices frankly expressed in the design and made to contribute to the general decorative effect, with a constant progressive striving towards economy of material and loftiness and lightness of interior design. The decorative details were derived from nature, and sculpture, painting, and stained glass made to serve religious-didactic purposes, always subservient to the architectural ensemble. This development, which produced in time the most perfectly logical and structurally expressive of all architectural styles, was greatly stimulated by the rise of the episcopal power as against the monastic orders in France and was thus in an especial sense a cathedral-building movement, though by no means confined to cathedral buildings. The forms and principles it developed were applied to all sorts of buildings. The style spread from France to England, later to Germany and Spain and the Low Countries, and in greatly modified fashion to Italy. It made no impression on the Byzantine East. In the nineteenth century a persistent effort was made in England and to some extent in Germany and France to revive Gothic architecture modified to meet modern requirements (see VICTORIAN GOTHIC); it was only partially successful, though it has exerted some influence on modern design. Concurrently with the development of this remarkable ecclesiastical and civic architecture, the feudal lords and military chieftains of Europe were developing on quite different lines the military or feudal architecture (q.v.) of their castles, city walls, and fortresses. But though totally different in form from the Gothic church architecture, it displays the same logical directness of design, the same frankness of structural expression, whether in gate, tower, wall, or donjon. See FEUDAL ARCHITECTURE; CASTLE; DONJON.

France. The transition from the heavy, round-arched Romanesque style, with its massive walls, small windows, and moderate height, to the Gothic style, with its light and lofty proportions, great traceried windows of stained glass, its pointed arches, slender clustered piers, ribbed groined vaults, flying buttresses, pinnacles, and wealth of floral carving and of sculpture, appears to have first begun, and can best be traced, in the region about Paris, the ancient "Île-de-France," or Royal Domain, where the free communes were most numerous, and where the royal power seconded the rising of the bishops against the arrogance of the abbots and monastic orders. The germs of the transition are discoverable at Morienval, Saint-Germer-

de-Fly, Saint-Etienne at Beauvais, and other churches erected previous to 1140. The pointed arch, employed both because it exerts less thrust than the round and because it can be made to reach any desired height with a given span, began to be applied to the vault ribs (see VAULTING) in these churches, and perhaps earlier in the porch of Vézelay Abbey in Burgundy. The original construction of the abbey of Saint-Denis (1140) embodied systematically many of the Gothic features. The cathedrals of Senlis, Noyon, and Laon, begun somewhat later, showed further progress; but it was the great cathedral of Notre Dame (q.v.) at Paris, begun in 1163, that first displayed the results of these developments in their completeness. The cathedral of Chartres, begun in its present form about 1190; of Rheims, dating from 1208; of Amiens, the greatest of all French cathedrals, begun in 1220; of Rouen, Bourges, Troyes, Tours, Le Mans (choir), and Soissons, represent the style in its maturity, attained by the middle of the thirteenth century, when the effort after lightness and loftiness reached its culmination. While the vault of Notre Dame is but 108 feet high, that of Amiens is 142 feet high. At Beauvais, begun about 1247, this effort overreached itself; the vault, 156 feet high, collapsed in 1275, and though the choir and transepts were rebuilt, the nave was never added.

The style spread rapidly from the Royal Domain through Normandy, Champagne, Picardy, and Burgundy, but made little impression on Brittany and southern France until the latter part of the fourteenth century, by which time the cathedral-building movement had nearly ceased. This decline was partly due to war and political confusion, partly to the fact that by that date the strong and rich dioceses were already provided with cathedrals. The grandest of the later cathedrals is that of Albi, dating from about 1300; it is unique in the vast space of its one-aisled nave, measuring 65 feet in width and flanked by side chapels; it has no transepts. But while the building of cathedrals declined and then ceased, that of churches and chapels continued, in a new and increasingly ornate style of design, in which structural expression was subordinated to decorative elaboration. At Rouen the church of Saint-Ouen marks the early stages, that of Saint-Maclou the culmination, of this later phase of the Gothic style; while the long-unfinished façade of the cathedral displays it in its utmost extravagance of minute elaboration. This last development was most successful in minor works like choir screens, pulpits, and tombs. It is thus possible to trace in French Gothic work three well-marked stages. The first, or *Early French*, extending from 1160 to about 1220, is the period of development, marked by a certain severity and high purity of detail and great simplicity of tracery, as in Notre Dame at Paris. The second is that of culmination, commonly called the *Rayonnant* on account of its superb radiating or rose windows; it is characterized by elaborate geometric tracery and richer moldings and carving than the first period (Amiens; Sainte Chapelle at Paris; transept fronts of Notre Dame, Paris), and extends to about the middle of the fourteenth century. The last period, from 1350 or 1375 to 1525, is called the *Flamboyant*, from the flame-like patterns of its tracery; its principal characteristics have already been described. To those already men-

tioned should however be added the general omission of capitals on the piers, a certain wire-drawn thinness of moldings, and the carrying up of oggee dripstones over the exterior arches, terminating in exaggerated finials. Notable examples, besides those already mentioned, are the churches of Saint-Jacques at Dieppe, Saint-Wolfren at Abbeville, the front of Notre Dame de l'Épine at Châlons, the Saint-Esprit Chapel at Rue, the church at Louviers, and the exquisite north spire of Chartres Cathedral (1525).

The perfected type of Gothic architecture, best illustrated by the cathedral of Amiens, displays, in plan, an enlarged choir with aisle

AMIENS CATHEDRAL — INTERIOR.

and radiating chapels, no crypt, a short transept, three or five aisles, and sometimes a continuous line of aisle chapels; in front elevation, a western façade with two flanking towers, three prominent portals richly adorned with carving and figure sculpture, and a wheel or rose window in the centre above them. In side elevation but little wall surface appears except a row of pinnacled buttresses, the space between them being occupied by windows filled with tracery and stained glass. The interior was divided into bays by strongly marked vertical lines of support from the piers upward, presenting as if in three stories the piers and arches opening into the side aisles, the triforium passage above them, and the great traceried clearstory windows reaching

up to the groined vaulting overhead. In the rich decoration the characteristic feature is the abandonment of classic and, indeed, of all traditional design, and the direct recourse to natural fauna and flora for models, which were of the greatest variety and truth. No period has so beautifully reproduced foliage and flowers in stone. But though there was a dominant type, there were wide differences; e.g., the façade towers terminate in spires at Chartres Cathedral, while at Notre Dame, Laon, Amiens, and elsewhere, they have square terminations. Other differences, though not fundamental, mark

AMIENS CATHEDRAL.

special schools of Gothic in Burgundy (Notre Dame at Dijon, Cathedral Auxerre) and in Normandy (cathedrals of Coutances, Bayeux, Lisieux, and Séz), while the Ile-de-France, Picardy, and Champagne are practically one school. If a single building were selected to typify perfect Gothic, it would be Amiens Cathedral, for both internal and external effects. The exaggeration of delicacy and height next attempted at Beauvais Cathedral was both constructively and æsthetically a failure as already explained.

There is, however, no perfect west façade of this best period, for the façade of Amiens was not completed until 1288; that of Rheims not till

1380; while many other west fronts belong to the Flamboyant period, e.g., Rouen, Tours, Troyes. With the later Flamboyant works Gothic architecture expired in France, overborne and supplanted by the tide of the Renaissance (q.v.).

Consult the various histories of architecture; also Moore, *Decompment and Character of Gothic Architecture* (New York, 1890); Viollet-le-Duc, *Dictionnaire raisonné de l'architecture française* (Paris, 1854-68); Lassus, *Notre Dame de Paris* (ib., n. d.); Ducloux and Doury, *La Sainte Chapelle de Paris* (ib., n. d.); Enlart, *Archéologie française*, vol. i (ib., 1902-04); Hasak, *Die gotische Baukunst: der Kirchenbau in Handbuch der Architektur* (Stuttgart, 1887-1904); Dehio and Bezold, *Kirchliche Baukunst des Abendlandes* (ib., 1887-1901); Corroyer, *L'Architecture gothique* (Paris, 1891); *Archives of the Commission des monuments historiques* (ib., 1855-72); Durand, *Monographie de l'église Notre-Dame Cathédrale d'Amiens* (Amiens, 1901-03); Gurlitt, *Die Baukunst Frankreichs* (Dresden, 1900).

Great Britain. As the Gothic style in France developed out of the Romanesque, so in England it developed out of the Anglo-Norman, but along strictly national lines, although the initial step in this development was taken by a French architect, William of Sens, summoned in 1174 to rebuild the choir of Canterbury Cathedral after the disastrous fire of that year. The ribbed groined vault had already (as is now believed) been used over the nave of Durham Cathedral, but at Canterbury we have a nearly complete Gothic system. Lincoln Cathedral choir and transepts, begun in 1190, display the system applied in a distinctly English fashion, and from that time on all trace of French influence disappears, except in Westminster Abbey (1245-1490), whose plan and proportions are French, though its details are absolutely English. The English Gothic churches of the first rank—abbeys and cathedrals—differ from the French in fundamental ways. In plan they are longer, narrower, with square instead of apsidal east ends (q.v.), with longer transept arms having sometimes one side aisle, sometimes two, sometimes none, and sometimes with secondary transepts near the west front. They are much lower than the French; the Wells vault is but 63 feet high, Salisbury's 85, and Westminster Abbey's, the highest of all, is less lofty than that of Notre Dame at Paris—it measures 103 feet in height.

The English churches are in internal architecture far richer decoratively than the French—the piers more richly clustered, with shafts of black Purbeck marble; the moldings finer and more complicated, and the vaulting built with multiple ribs, producing highly decorative effects. On the other hand, the exteriors were less ornate than the French not only in having fewer pinnacles and flying buttresses, but in their lack of tabernacles and figure sculpture and in the insignificance of their portals. There was no fixed type of west front; York, Lincoln, Wells, Canterbury, Westminster, and Beverley have twin square western towers; Lichfield and Chichester, twin spires; Peterborough, Salisbury, Winchester, Exeter, and others have no western towers. Some of the fronts are mere screens; others, more logically designed, are uninteresting (Winchester). The finest external feature is the central crossing tower, replacing the French lantern, or *flèche*; these towers, mostly built after

1350, were usually square (Lincoln, Gloucester, Canterbury, York, etc.), but capped with a spire at Chichester, Lichfield, and Salisbury—the last named, 424 feet high, one of the most beautiful of all Gothic spires. English window tracery was developed more systematically and is on the whole more interesting than the French; the great east and west windows of the cathedrals are especially notable. (See TRACERY.)

English Gothic architecture, like the French, passed through three well-marked periods. In the first, called the *Early English* (q.v.), from 1175 to about 1250, we observe (as Professor Moore has well pointed out) what is structurally a transitional Romanesque with pointed arches and Gothic details; the lancet windows are still small, the walls thick, the piers massive. In the second, or *Decorated* (q.v.), the Romanesque or Anglo-Norman characteristics tend to disappear; the windows, greatly enlarged, have superbly decorative geometric tracery; and the decorative elements of the interior are greatly multiplied and enriched. The French structural device of the vault rib is logically extended and elaborated by multiplying the ribs (tiercerons and liernes; see VAULTING). The third, or *Perpendicular*, period (1360 or 1375 to 1525) was marked by the building of many fine parish churches and by the superb chapels of St. George at Windsor, King's College at Cambridge, and Henry VII at Westminster Abbey. It is the most logical, structurally, of the three English styles, in the French sense, i.e., in the suppression of wall surfaces and the external expression of plan and structure. It was, however, during this period that fan vaulting (q.v.) was developed, in which the multiplied tiercerons and liernes were converted into a purely decorative apparel of carved paneling, their structural origin and use thus being wholly lost. (See VAULTING.) Its name is derived from the character of its tracery—the least decorative of all the historic types. The naves of Canterbury and Winchester were rebuilt in this period. To the first period belong, in the main, Lincoln, Salisbury, and Wells cathedrals and Canterbury choir; to the second, the naves of York, Lichfield, and Beverley cathedrals, and the greater part of Westminster Abbey. But hardly any cathedral or great church in England was built originally in one period in its present form; many show all the styles, from the Anglo-Norman to the Perpendicular. Particularly worthy of notice are many of the great parish churches with fine central west towers, as at Boston; or spires, as St. Mary Redcliffe at Bristol.

Special and interesting developments are seen in the semiecclesiastical academic and collegiate architecture of the universities and great mansions, especially of the fifteenth century; and in the superb "open-timber" ceilings of many late halls and churches, in which the hammer-beam (q.v.) truss is used with as clear logic and artistic skill as the French vaults of stone display. Mention must also be made of another exclusively English development, in the polygonal chapter houses of York, Wells, Salisbury, Lincoln, and Westminster. All but that of York have superb stone vaults springing from a central clustered shaft, and in design and construction they represent a remarkable achievement in the combination of structural logic with artistic purpose.

in England (ib., 1900); Bond, *Gothic Architecture in England* (ib., 1906); id., *Cathedrals of England and Wales* (ib., 1908) and *An Introduction to English Church Architecture* (ib., 1913); Fairbairns, *Cathedrals of England and Wales* (4 vols., ib., 1907); Moore, *Medieval Church Architecture in England* (New York, 1912); Van Rensselaer, *English Cathedrals* (ib., 1892). See authorities under ROMANESQUE ART; EARLY ENGLISH STYLE; PERPENDICULAR STYLE.

Germany. It is difficult to find a consistent character in German Gothic. It never became a national style, as in France and England. The Romanesque style had had so superb a development in Germany that it was difficult to introduce a new style, and not until French Gothic had reached its fullest expression in France did it find a foothold. The cathedral at Limburg copies Noyon and is still plain and heavy (1235). The singular Liebfrauenkirche at Treves (1227), on a circular plan with 12 foils, in architectural style a copy of the French church of Saint-Yved at Braine, is the first purely Gothic church. It was natural that the Rhineland should first adopt the new style, not only from its proximity, but because it excelled other provinces artistically. On the other hand, the Germans evolved a distinctly national type in their "hall churches," with nave and aisles of equal height, of which St. Elisabeth at Marburg is an early example; later ones are at Nuremberg (St. Sebald) and Breslau (Kreuzkirche). The supremacy of the Rhineland is emphasized in the second half of the thirteenth century in three great churches—the cathedrals of Strassburg, of Freiburg, and of Cologne, where French influence is almost unmingled with German peculiarities; purest of all is the choir of Cologne (finished 1320), built long before the nave, which was not completed until late in the nineteenth century. In these Rhenish cathedrals there is much figured sculpture, which in the west portals at Strassburg equals the finest French work. Peculiarly German is the use of tracery as a purely external decoration, as embodied in the façade and spire of Strassburg and the spire at Freiburg, like delicate lace openwork. The cathedral of Halberstadt and the abbey churches of Altenberg and Xanten belong to the same style. The great cathedrals influenced a multitude of construction, especially throughout the Rhineland, and led to the formation of a German version of Gothic, much less pure, much less artistic, but interesting as a national expression, though varying in detail in local schools, as in the upper Rhine (Oppenheim), in Swabia, and Bavaria. With the middle of the fourteenth century the territory occupied by Gothic architecture had immensely increased. Nuremberg had become a great centre (St. Lawrence, St. Sebald, Frauenkirche). Great cathedrals and minsters were undertaken at Regensburg and at Ulm; also in Austria (St. Stephen, Vienna). Although great pains were taken with the decorative work, it was often lacking in artistic quality, showing in its place the German fondness for the fantastic and for ingenious mechanical intricacy of execution. The decorative vaulting ribs are not so pleasing nor so appropriate structurally as the English; the foliage work on capitals, friezes, etc., is stiff and unnatural; the proportions are not happy. One of the least happy phases was the brick architecture of the north in the Baltic Provinces and north Prussia. Consult the au-

thorities referred to under ROMANESQUE ART; also Moore, *Gothic Architecture: Its Development and Character* (London, 1899); Dehio and Bezold, *Die kirchliche Baukunst des Abendlandes* (Stuttgart, 1887-1901); Lübke, *Eccelesiastical Art in Germany during the Middle Ages*, trans. by Wheatley (Edinburgh, 1873); Hasak, *Die gotische Baukunst der Kirchenbau*, in Stuttgart series *Handbuch der Architektur* (Stuttgart, 1887-1904).

Belgium and Holland. The Gothic of Flemish towns partook of both French and German characteristics; the German being paramount in Holland, as in churches at Utrecht, Leyden, Haarlem, etc.; the French in Belgium, as at Sainte-Gudule in Brussels and at Tournai. In the fourteenth century by the side of such great cathedrals as Antwerp, with its seven aisles and its magnificent spire, Malines, and Louvain, already corrupt in taste, are the Flemish guild-halls and town halls of Ypres, Bruges, Louvain, Mechlin, Ghent, Brussels, and Oudenarde. Consult Van Ysendyck, *Documents classés de l'art dans les Pays-Bas* (Antwerp, 1880-91).

Spain. The hybrid Byzantine-Moresco-Basilical architecture current in the Christian parts of Spain during the Moorish supremacy was beginning to be superseded by a Romanesque style of great dignity, borrowed from the south and west of France, when the French architects who were introducing it felt the first inroads of the early Gothic style—that of Saint-Germer, tempered by the Cistercian simplicity. The old cathedral of Salamanca (close of twelfth century), with its heavy proportions but genuine Gothic vaulting, shows in certain features, especially in its interesting ribbed dome, an original interpretation of Gothic principles. San Vincente at Avila, the abbey church at Veruela, and the cathedrals of Lérida, Tudela, and especially Tarragona, belong to the same period and style of heavy transition from Romanesque to Gothic. This group is as effective, well composed, and imposing as any in Europe of this time. But we do not see the links that connect it with the developed Gothic of Burgos, Toledo, León, Valencia, and Barcelona cathedrals, built in the thirteenth century, because this style was not an indigenous outcome of the older buildings, but was brought straight from France. These and other buildings of less importance are in great measure reproductions of the best French models—especially of the types of Amiens and Rheims—so that the Spanish Gothic of this middle period is second only to the French in its purity and consistency. Toledo is the most purely French of the five, León next to it. Burgos departs furthest from French types in its late Gothic *cambrorio*, or lantern, and its very German traceried spires. Figure sculpture is much less important than in the French models, and these Spanish churches are more massive and less lofty than the French. The Romanesque love of heavy wall masonry persists, and the round arch is retained quite late in the main portals. Perhaps Burgos presents, on the whole, the richest and most artistic exterior, as to towers, façade, and general composition. The unity of style was sadly disturbed in the fourteenth and succeeding centuries. English, German, southern French, Italian, and Flemish elements were introduced, all more or less deviating from true Gothic design, and the national passion for rich decoration led to much extravagance in ornament and

details. Of this late and surcharged phase of Gothic architecture the monastery of Belem and the mausoleum of Manoel II at Batalha in Portugal are the finest examples. But during the fifteenth century and even in the sixteenth, notable examples of Gothic design were erected, mainly free from faults of overcharged ornament, though somewhat thin and wiredrawn in detail. The nave of Seville, the entire new cathedral at Salamanca, and the fine cathedral of Segovia belong to this period. Some of the Spanish churches are immense. The Toledo Cathedral was already one of the largest in Europe, but Seville Cathedral, begun in 1401, is the largest of all mediæval structures, measuring 415 X 298 feet, or nearly 120,000 square feet.

Consult: Street, *Gothic Architecture in Spain* (London, 1865; new ed., 1914); Junghündel and Gurlitt, *Die Baukunst Spaniens* (Dresden, 1891-93), with photographic illustrations; Gade, *Cathedrals of Spain* (New York, 1911); *Monumentos arquitectónicos de España*, in course of publication by the Spanish government.

Italy. We can speak of a Gothic age but not of a Gothic style, in Italy, if by "Gothic" we mean the embodiment of the structural logic which to greater or less degree dominated the mediæval architecture of the countries so far discussed; for the Italians never mastered, nor cared to master, the principles underlying Western Gothic construction, but adopted at their good pleasure, and with modifications to suit their genius, a good proportion of western Gothic forms. The first Gothic inroads naturally appear to be by the hand of Frenchmen, such as the Cistercian monasteries of Fossanova, Casamari, San Galgano, and San Martino, as well as the gem Sant' Andrea at Vercelli, all belonging to the primitive transitional style. Then, at the mother church of the Franciscan Order, San Francesco at Assisi, the Gothic type was accepted by these monks as it was by the Dominicans. These two orders were the main agents for diffusing Gothic forms throughout Italy; for, strange to say, while northern Europe was replacing monastic architects by lay guilds in imitation of what Italy had done earlier, Italy meanwhile veered about, and nearly all her architects during the thirteenth and fourteenth centuries were monks. It is in the churches of these two orders at Bologna (San Francesco, San Domenico), Florence (Santa Maria Novella, Santa Croce), Venice (Santi Giovanni e Paolo, Santa Maria dei Frari), Rome (Santa Maria sopra Minerva), Treviso, etc., that the Italian Gothic type of church was developed, and the requirement insisted on by these preaching orders, of an interior suitable as an auditorium, determined largely their artistic character. Nowhere else are there so many churches of a single nave or with aisles nearly as lofty as the nave.

But in all these both the structural logic and the general aspect of the Western Gothic is wanting; the hold of classic tradition on the Italian taste was still strong; large wall surfaces, small windows, and large units of design were preferred to the small scale of parts, the broken surfaces, the suppression of the wall, characteristic of the French Gothic. The Italians built well, but they were decorators first of all; a church interior must offer surfaces for painting; the exterior, surfaces for marble veneer and mosaic; the west front, a screen of any desired outline, to receive carving, sculpture, and

inlay. The frank resistance to vault thrusts by flying buttresses was repugnant to Italian taste; they preferred internal tie-rods of iron. Tracery was, of course, but little developed in the small Italian windows, though there are a few good examples in Florence, Pisa, and Milan.

Many so-called Gothic buildings, such as the cathedrals of Orvieto, Siena, and Lucca, are round-arched or wooden-roofed, or have columns in place of grouped piers, so that we miss every Gothic element. Even where groin vaulting is used—as at Santa Maria Novella at Florence, and Sant' Anastasia at Verona, two of the most beautiful examples in Italy—one misses the moldings of the grouped piers connecting structurally with the arcades and vaults. The wide spacing of the piers, the height of the aisles, and the lack of detail make the interiors look much smaller than they are. The rich polygonal choir with radiating chapels is almost unknown. In most parts of Italy the thirteenth century was a sterile period. There was little building in Sicily and the south. Rome suffered from the papal exile. The Lombard cities lost their freedom under tyrants. Only Venice, Florence, Siena, and neighboring cities produced much that was notable. By the end of the fourteenth century cathedral architecture had adopted Gothic features, as in the duomo (cathedral) of Florence, and in the most pretentious and un-Italian of cathedrals, that of Milan, in which German architects were employed, as well as in the huge parish church of San Petronio at Bologna. The bareness of the Italian interiors was occasionally redeemed by fresco paintings, as in San Francesco at Assisi. It was in civil architecture that the Italians excelled. The private palace of Venice, beginning as a Byzantine and Romanesque type, developed during the Gothic period into a beautiful creation, whose climax is the Cà d'Oro and the Doge's Palace. The type spread to the mainland at Padua, Vicenza, Udine, and elsewhere. The fortress palace is a different type, especially well developed at Florence, with its heavy bossed work and stern aspect. The communal palaces were monuments rivaling the cathedrals; those at Florence (Palazzo Vecchio, Bargello, etc.), Siena, Perugia, Gubbio, and those farther north at Brescia, Bergamo, Cremona, Milan, Padua, etc., are superb compositions. Consult: Mothes, *Die Baukunst des Mittelalters in Italien* (Jena, 1884); Street, *Brick and Marble Architecture of North Italy* (London, 1874); Fleury, *La Toscane au moyen âge* (Paris, 1874); Cummings, *A History of Italian Architecture* (2 vols., Boston, 1901).

GOTHIC ART. The term was originally applied by the Italians to the pointed architecture which preceded the Renaissance in derision of its supposed barbaric character. The general adoption of this term was promoted by the erroneous idea that there was something essentially Germanic in the style, and the term, though unscientific, has been too long in general use to be discarded. The Gothic period extends, roughly speaking, from the twelfth to the fifteenth century. It was a period of French ascendancy, during which artistic influences radiated from France over the rest of Europe. The control of art passed from the hands of the clergy into that of lay guilds. Gothic art had its root in the life of the cities. Nevertheless, it bore the impress of chivalry, being marked

by a gentleness and charm which sometimes degenerated into sentimentality. It possessed a keen sense of humor and mockery, as is especially shown in its grotesque sculptures, and at the end of the period there was a decided tendency towards realism. During this time sculpture and painting, though highly developed, were decorative in character and strictly subordinated to architecture, to which, therefore, a separate article has been given. See **GOTHIC ARCHITECTURE**.

SCULPTURE

France. The School of the Ile-de-France, where Gothic architecture originated, also began the use in the lower portals of statues, at first severely stiff. About 1210-20 statues of this character became freer and more artistic, though remaining part of the architecture. Among the best early examples are the portals of the cathedral of Laon and the western portal of Notre Dame (q.v.) at Paris (1225). During the thirteenth century the use of statuary grew to an extent never before nor since practiced. It was concentrated upon the exterior of the buildings, centred about the portals, both of those of the façade, which usually terminated in three great pointed arches, and those of the side, which were often double. In order to accommodate the multitude of statues the portals were extended into porches. They were lined by rows of statues, and the tympanums were filled with reliefs. Great cathedrals of the thirteenth century were decorated with thousands of statues—like the façade of Notre Dame; the porches of Chartres, the portals, both façade and lateral, of Rheims, called the Parthenon of the Middle Ages because of the beauty and delicacy of the statuary; and Amiens, where the majestic statue of Christ, "Le bon Dieu," is eminent among many of high excellence. The subjects represented were usually biblical and allegorical cycles, like the "Creation" and "Fall of Man"; Old and New Testament history, usually terminating in the "Last Judgment," a favorite subject; allegorical figures of the trades and industries, of virtues and vices. They were, in fact, the translation into stone of the religious and philosophical ideas of the day—Bibles and sermons in stone. Occasionally the figures were executed after nature, but more usually in accordance with geometrical canons, so comprehensive that even mediocre artists could do good work. The treatment of the nude was crude, but high success was attained in draperies, which will even bear comparison with the products of Greek art. Though realistic, the figures are always of a deep religious feeling and full of dignity. This, however, is lost in the late thirteenth and fourteenth centuries, when French sculpture aims increasingly at realism, becoming naïve and humorous. The centre of artistic activity shifts to Flanders and northern Burgundy, where there was great activity at Dijon, under patronage of the Burgundian dukes. The surviving masterpiece of the school is Claus Sluter's (q.v.) "Fountain of Moses." An admirable collection of French sculpture of the late Gothic period in all its forms is on exhibition in the J. Pierpont Morgan collection and the Wing of Decorative Arts in the Metropolitan Museum of Art, New York. The English Gothic, with few exceptions, like the façade of the cathedral of Wells, was not adapted to sculptural decorations. The most important manifes-

tation of sculpture here is in sepulchral monuments, funeral slabs and brasses, in which much realism is manifest. In northern Spain Gothic sculpture was at first influenced by French models. The façade of the cathedral of Santiago de Compostela is decorated with a wealth of statuary hardly second to that of the great French cathedrals. In the fifteenth century the French was supplemented by a German influence. The final development of Gothic sculpture in Spain was a decorative art rich to the point of profusion, as may be seen in such works as the church and cloisters of San Juan de los Reyes at Toledo, the façade of San Juan at Valladolid, and the tomb of King John II at Miraflores (near Burgos).

Germany. The thirteenth century was the golden age of German mediæval sculpture, which was doubtless influenced by contemporary French art. As the Germans still built in the Romanesque style, their churches did not afford opportunity for great cycles of plastic art, as did those of France. Their activity was confined to the interior of the church between the arches, the walls of the choir, the altar, and the pulpit; exterior decoration was rare and only practiced at the end of the epoch. The figures were full of life and dignity, less realistic than the French, and representing a calmer, higher ideal. As in the Romanesque epoch, the Saxon and Franconian schools lead. The early work of the Saxon school is best represented by the apostles and angels in the choir of the church of St. Michael, Hildesheim, and its highest development in the church of Halberstadt. Heavier and more impassioned are the figures of the South Saxon school, as exemplified in the reliefs of the pulpit and the "Crucifixion" at Wechsellberg; the famous "Golden Portal" at Freiburg, the sculptures of which represent, in a grandiose manner, the "Revelation of the Kingdom of God to Man by Christ"; and that most beautiful of German sepulchral monuments, the tomb of Henry the Lion and his wife Matilda in the cathedral of Brunswick. The school reached its culmination in the latter part of the thirteenth century in the statues of the benefactors of the Church in the cathedral of Naumburg—simple, realistic, and dignified, and superb in treatment of drapery. Of equal excellence are the contemporary statues by the Franconian school in the cathedral of Bamberg, of which the "Ancient Sibyl" is the best known. The Rhenish school followed the French more closely, as is evident in the church of the Virgin at Treves and in the minsters of Freiburg and Strassburg. More characteristically German are the sculptors of the Nuremberg churches, chiefly reliefs with small figures. In the fifteenth century sculptures in wood took the place of stone, with a change of style, though not of ideals, corresponding to the new material. The figures were treated with sharper lines, and the draperies in wrinkles instead of folds; both figures and draperies were colored. From this period date the finest Gothic altars and other ecclesiastical furniture of wood. The two chief schools were the Franconian, with Nuremberg as a centre, and the Swabian at Ulm. The chief artist of the latter was Joerg Syrlin the elder, whose chief work is the choir stalls in the minister of Ulm (1469-74). The Germanic Museum and the churches of Nuremberg contain fine examples of the wood carving of that school. The chief artists were Michael Wohlgemuth

(q.v.) and Veit Stoss (q.v.), who transplanted the art to Cracow, Poland. His latest and best work, however, falls in the Renaissance period.

Italy. The school of Pisa was the first to achieve the revival of sculpture in Italy, in the person of Niccolò Pisano (c.1206-78). Though belonging to the Gothic epoch, his sculptures owe all their inspiration to the antique, forming a sort of Proto-Renaissance. (See *SCULPTURE, History*.) His son Giovanni (c.1250-c.1320), however, accepted the dramatic and naturalistic elements of Gothic art, and under Andrea Pisano, who was chiefly active in Florence, Gothic sculpture reached its highest development between 1310 and 1335. (See *PISANO*.) Its chief monuments in Tuscany are the sculptures of the façade of the cathedral of Orvieto, the marble reliefs on the campanile, and the bronze doors of the baptistery of Florence. The style was further developed by the Florentine Andrea Orcagno (c.1320-68) (q.v.), whose masterpiece is the tabernacle of Or San Michele. The most important school outside of Florence was that of Siena, whence the art was transplanted to Naples and Lombardy, with Verona as a centre. In Lombardy the school developed a series of sepulchral monuments of great magnificence and originality, the most important of which are those of the Scaliger family. The Roman school of sculpture, which came to an end c.1300, was not properly Gothic, but found all its inspiration in antiquity. (See *COSMATTI*.) In like manner the admirable South Italian school, which developed in the early thirteenth century under the patronage of the Emperor Frederic II, found its inspiration in Greek originals. (See *ROMANESQUE ART*.) As elsewhere, marble and stone were the chief materials used, though bronze casting was brought to high perfection by Andrea Pisano. Italian sculptors lacked the imagination of the French, their subjects being the traditional ones of the Old and New Testaments.

PAINTING AND ALLIED ARTS

The breaking up of the wall surfaces in Gothic art left little opportunity for painting. There was, however, an increased opportunity for stained glasses (see *STAINED GLASS*), which during this epoch attained their highest development. The windows of the great French cathedrals were treated so as to form cycles of biblical stories and Christian legends, showing the substance of the Christian doctrine. Most of these cycles have perished, but remains survive in the chief cathedrals. The most perfect thirteenth-century example is the cathedral of Chartres, with its 146 windows; the glasses of the Sainte Chapelle in Paris have been so perfectly restored as to give an excellent idea of the best period. Good English examples are to be found in the cathedrals of Salisbury, Lincoln, and York. In the fourteenth century came a decisive change with the introduction of architectural forms in stained glasses, which had heretofore been in patterns more like tapestry. In France such windows are most frequent in the cathedrals of the south and in private houses; but the finest examples are in Germany, especially in the cathedrals of Cologne and Strassburg.

In Germany the buildings of the transitional style afforded more opportunity for mural paintings. On the Rhine a school arose at Cologne, in the fourteenth century, the mystic and sen-

timental inclinations of which show French influence. A Bohemian school flourished near Prague under the patronage of the Emperor Charles IV, the chief characteristic of which was a harsh realism. Midway between the two were the Franconian school, with a centre at Nuremberg, and the Swabian, the beginnings of which both fall in the fourteenth century. But towards the end of the fourteenth century painting in northern Europe began to lose its decorative character. The panel replaced fresco (q.v.), and with its use painting became an independent art. This change, which occurred first in the Netherlands in the works of the brothers Van Eyck (q.v.), emancipated painting from the bonds of the Gothic. It is more fully treated under PAINTING.

In Italy the large wall spaces of Gothic architecture afforded ample opportunity for mural painting, with the result that the later thirteenth century saw the rise of an important school of fresco painting, which culminated in Giotto (q.v.), the Florentine, and flourished throughout the fourteenth century. A little earlier the Siennese, beginning with Duccio (q.v.), who followed Byzantine models, developed an important school of panel painting. Although both the Florentine and the Siennese schools belong in time and in spirit to the Gothic epoch, their importance in the development of painting is such as to merit fuller treatment in the article PAINTING.

The Decorative Arts. The Gothic is one of the most important of all epochs in the decorative arts. Its principles were applied to all articles of ecclesiastical and worldly use with a consistency and purity comparable to the Greek and Byzantine epochs. The general subject is treated under the caption DECORATIVE ART; with more detailed treatment under such subjects as INTERIOR DECORATION; FURNITURE; TAPESTRIES; COSTUME; JEWELRY; PLATE; and the like. Especial mention should be made of the innumerable articles of ecclesiastical usage treated under such general heads as ENAMEL and IVORY CARVING, and such individual titles as ALTAR; CRUCIFIX; SHRINE; MONSTRANCE; etc.

Bibliography. A good general treatment of Gothic art is found in the excellent, compendious histories of art recently published, the titles of which are enumerated in the bibliography of art: especially in the histories by Woermann, Springer, and Michel. For a still briefer treatment, see such manuals as Reber, *History of Medieval Art* (New York, 1887), and Lethaby, *Medieval Art* (London, 1904). SCULPTURE. France: Emeric-David, *Histoire de la sculpture française* (Paris, 1872); Baudot, *La sculpture française au moyen âge et à la renaissance* (ib., 1884); Frothingham, in *American Journal of Archaeology* (New York, 1885); Pillion, *Les sculpteurs français du XIII^e siècle* (Paris, 1912); Humbert, *La sculpture sous les ducs de la Bourgogne* (ib., 1913). (New York, 1883); Venturi, *Storia dell' arte italiana*, vols. iii, iv, v (Milan, 1902), the most scholarly account; Zimmermann, *Oberitalische Plastik im frühen und hohen Mittelalter* (Leipzig, 1897); Waters, *Five Italian Shrines* (London, 1906); and the manuals of Italian sculptors by Evelyn and Walters cited in the bibliography of SCULPTURE.

GOTHIC JURISPRUDENCE. The law of the Gothic invaders who established themselves on the ruins of the Roman Empire in western Europe. The Goths had originally the same law as the other Germanic races, it being administered on the whole by the family, and only very grave criminal offenses being dealt with by the state. What makes Gothic jurisprudence especially interesting is the adoption of the Roman law and its codification. This is true of the Visigoths rather than of the Ostrogoths, who merely used the Byzantine law as it existed in Italy upon their invasion. Side by side with this, their own native law continued in force. In Spain, however, Alaric II, King of the Visigoths, in 506 issued a codification of the Roman law, the *Lex Romana Visigothorum*, better known as the *Breriarium Alaricianum*. It was revised by King Egica (687-701) and until the thirteenth century remained the chief source of Roman law for western Europe. As such, it exerted a great influence on the development of law, especially in Spain, where Ferdinand III (1217-52) introduced it under the title of *Fuero juro* (Lat. *forum judiciale*). Consult: Pollock and Maitland, *History of English Law*, vol. i (2d ed., Oxford, 1899); Zeumer, "Lex Visigothorum," in *Monumenta Germaniæ historica, Leges, sectio I* (Hanover, 1894). See CIVIL LAW.

GOTHIC LANGUAGE (Lat. *Gothicus*, from *Gothus*, Gk. *Γόθος*, *Gothos*, *Γόθων*, *Gythōn*, from Goth. *Gut-biuda*, Goth-people, AS. *Gōtan*, OSwed. *Gutar*, *Gotar*, Goths; cf. dialectic Norw. *gut*, boy). The language spoken by the Goths (q.v.). Excepting the Old Icelandic runic inscriptions (see RUNES) and a few Germanic glosses and proper names preserved in classical authors, such as Cæsar and Tacitus, Gothic is the oldest monument of all the dialects of the Germanic group of Indo-Germanic languages. Like Anglo-Saxon, Frisian, and Old Icelandic, it has undergone only the first sound shifting, or ablaut, and is consequently one of the Low Germanic languages, as contrasted with Old High German, where the second sound shifting has been carried through. (See GRIMM'S LAW.) Within this Low Germanic subgroup it is most closely akin to the Scandinavian (Old Icelandic, Old Norwegian, Old Swedish, Old Danish, and their modern representatives), so that some scholars class Gothic and Old Scandinavian together as East Germanic, contrasting this group with the Anglo-Frisian and High Germanic languages, which are then termed West Germanic. The most important points of coincidence between Gothic and Icelandic are the development of Germanic *gy* to *ggw* (as Goth. *triggws*, OEcl. *tryggw*, true, but AS. *trēowe*, OHG. *triuwi*), and the retention of final *z* (Goth. *s*, OEcl. *r*), which is lost in West Germanic (as Goth. *dags*, OEcl. *dagr*, day, but AS. *dæg*, OHG. *tag*). On the other hand, Gothic and Scandinavian diverge in many respects, especially in declension and conjugation (as runic Norse *þótrikr*, daughters, but Goth. *dohtrijus*; runic Norse *tawíþo*, I did, but Goth. *tawida*). It therefore seems better, on

the whole, to regard Gothic and Scandinavian as belonging to different groups, which may be termed East and North Germanic respectively.

The sources of our knowledge of Gothic are limited. The earliest gloss preserved is in Isidor of Seville, who cites the words *medus*, mead, and *reptus*, garment. The *Lex Visigothorum* also contains a few Gothic words, as *leudes*, people, and *saio* (whence the Sp. *sayon*), beadle. The most important and extensive remnant of the language is the fragments of the translation of the Bible by Ulfilas (q.v.), contained in the *Codex argenteus*, now in Upsala. There are also a few words, chiefly proper names, in two documents found at Naples and Arezzo, and a fragment of a calendar.

In phonology and inflection Gothic is the most primitive of all the Germanic languages. Its pronunciation is fixed by our knowledge of that of Greek in the fourth century. Thus, as *ei* in Greek then had the itacistic value of *i*, *i* is represented in Gothic by *ei*. Similarly *ng* is written *gg* in Gothic in conformity with the Greek use of *γγ* instead of *γγ*. The vowels and consonants correspond in general to the pre-Germanic phonology. Short *e*, however, does not occur, being changed to *i* (as OHG. *neman*, to take, but Goth. *niman*), which is written *ai* before *h* and *r* (as Goth. *airpa*, earth, *raihts*, right, but OHG. *erda*, *reht*), exactly as *u* is written *au* in a similar position (as Goth. *waürms*, worm, *saühts*, sickness, but OHG. *uurm*, *suht*). Pre-Germanic *z*, which became *r* in the other Germanic languages, remained *z* in Gothic, but sometimes, for reasons not yet altogether clear, it was changed to *s* (as Goth. *ausō*, ear, but OHG. *ōra*). The declension does not differ materially from the Germanic type. The pronouns of the first and second persons have, as in Old Icelandic, Anglo-Saxon, and Old Saxon, a dual. The conjugation of the verb, while harmonizing in general with the Germanic type, is marked by a number of important features. Gothic is the only Germanic language in which the verb retains the dual number (as Goth. *we two bear*, *baírats*, ye two bear, Skt. *bharūvas*, *bharathas*; *baíraiwa*, we two bore, Skt. *abharāva*), and the third person of the imperative (*baíradau*, let him bear, *baírandau*, let them bear, Skt. *bharatu*, *bharantu*). The reduplicated preterit, which is very rare in other Germanic languages, is frequent in Gothic, 11 preterits of this type being found in the scanty remnants of the literature. As examples may be cited: *faiñh*, from *fāhan*, to seize, *haiñait*, from *haitan*, to call, *rairōp*, from *ređan*, to counsel, *saisō*, from *saian*, to sow. For all these preterits the Anglo-Saxon, e.g., has as corresponding forms, *fēng*, *heht*, *reord*, *sēow*. Most noteworthy of all, however, is the fact that Gothic, unlike any other member of the Germanic group, possesses a middle voice in other verbs than *hātan*, to call. Thus, Goth. *baíraza*, thou bearest thyself, *baírada*, he bears himself, *baírandā*, they bear themselves, correspond to Sanskrit *bharasē*, *bharatē*, *bharantē*.

In its vocabulary Gothic has a number of Indo-Germanic words which are not found in the other Germanic languages, as *us-anan*, to breathe forth, Lat. *animus*, breath; *aljis*, other, Lat. *alius*. On the other hand, it has no etymological representation of such common Germanic words as *do*, *say*, *fall*, *mother*, for which it substitutes *taujan*, *qipan*, *drisusan*, *aipei*. As might be expected in a translation of the Bible, Greek and Latin loan words are quite numerous. It has

likewise borrowed a few Celtic words, as *kēlikn*, tower, from Gallic *cellicon*, *reiks*, Ger. *Reich*, from Gallic *rix*, and two from the Slavic *plinsjan*, to dance, and *smakka*, fig (cf. OChurch Slav. *plešati*, smoky).

Literary Gothic is sometimes termed West Gothic, to distinguish it from East, or Krim, Gothic. The Crimean Goths preserved their identity until the sixteenth century. A collection of 86 Krim Gothic words was made in 1595 by a Fleming named Busbeck. The list, which is of great value as being the only remnant of this dialect of Gothic, is in general accurate, although some errors naturally crept in, as *hazer*, thousand, which is a loan word from Persian *hazār*. It adds a number of words to the Gothic vocabulary, as *miera*, ant, *rinck*, ring, *ada*, egg, *waghen*, wagon. In phonology Krim Gothic seems to have differed from the language of Ulfilas. The vocabulary of Busbeck contains little information on inflection. If we may judge, however, from such hints as Krim *oeghene* beside Goth. *augōna*, eyes, Krim *ahte*, eight, beside Goth. *ahidu*, Krim *singhen*, to sing, beside Goth. *siggican*, Krim *tag* (for **dag*), day, beside Goth. *dags*, it would seem that a change had taken place within the 12 centuries between Ulfilas and Busbeck, which was, roughly speaking, analogous to the transition from Old to Middle High German.

To the same East Germanic group as the Gothic belong the Vandal and Burgundian languages, of which only scanty fragments, chiefly proper names, survive.

The Gothic alphabet was invented by Ulfilas. He took as his basis the Greek letters, adding some Latin characters, and a few signs from the runes which were previously in use among the Goths. The number of letters was 27, of which two, corresponding to the Greek koppa and sampi, had numerical values alone, and a third, the equivalent of the Greek chi, was used only in foreign proper names. The alphabet really consisted, therefore, of 24 letters, which are, in modern editions of Gothic texts, transliterated into the ordinary Roman alphabet with the addition of *þ* and *h*.

GOths. The name of a powerful nation of antiquity, belonging to the Germanic race. By some writers they are thought to have had a Scandinavian origin; this was the belief of their own historian, Jordanes. The earliest notice of them extant among the writers of antiquity is that of Pytheas of Marseilles, who lived about the time of Alexander the Great and wrote a book of travels, some fragments of which have been preserved in the works of other writers. In one of these fragments, quoted by Pliny, we find mention made of a tribe of Guttones bordering upon the Germans, and living round a gulf of the sea called Mentonomon, a day's sail from the island of Abalus, where they used to gather amber and sell it to the neighboring Teutones. This gulf, there is every reason to believe, was the Frisches Haff, situated on the Prussian shore of the Baltic. The next notice of the Goths is in the *Germania* of Tacitus (chap. 44), in which they are called Gothones, and are represented as dwelling beyond the Lygii, in the same direction as the one pointed out by Pytheas, though not on the seacoast. Tacitus also distinguishes them from the Gothini, a tribe east of the Quadi and the Marcomanni, and represented by him as using the Gallic tongue. The Gothones, according to this historian, were under regal government and on that account not quite so free as the other tribes of Germany, but still they enjoyed a considerable amount of liberty. The tribes next beyond them, and dwelling immediately on the seacoast, were the Rugii and the Lemovii, whose form of government was also monarchical; their weapons, also, like those of the Gothones, were round shields and short swords.

We next hear of the Goths as settled on the coast of the Black Sea, about the mouths of the Danube, early in the third century. But at what time or under what circumstances their migration from the Baltic to the Euxine took place, it is impossible to ascertain. In their new home, which was also the country of the Getae (q.v.) (whence, perhaps, the error that confounded them with that people), the Goths increased in both numbers and strength, so that, as early as the reign of Alexander Severus (222-235 A.D.), they made some formidable inroads into the Roman Province of Dacia. In the reign of Philip (244-249 A.D.), they ravaged that province and even advanced to the siege of Marcianopolis in Mœsia Secunda. The inhabitants ransomed their lives and property with a large sum of money, and the invaders withdrew for a time to their own country. Under the Emperor Decius, however, they again entered Mœsia to the number of about 70,000, led by a king named Cniva. Decius himself advanced to meet them and found them before Nicopolis. On his approach they raised the siege and marched away to Philippopolis, a city of Thrace, near the foot of Mount Hæmus. Decius pursued them by forced marches, but the Goths turned with fury upon the Roman legions and utterly defeated them. Philippopolis next fell before them by storm, after a long resistance, during which, and the massacre that followed, 100,000 of its inhabit-

ants are reported to have been slain (250 A.D.). In 251 another tremendous battle took place near an obscure town called Forum Trebonii in Mœsia, in which the Romans were again defeated with great slaughter, the Emperor Decius and his son being in the number of the slain. The succeeding Emperor, Gallus, purchased their retreat by an immediate present of a large sum of money and the promise of an annual tribute for the future. The Goths now set themselves to the acquisition of a fleet, and with this, in 253, advanced to the conquest of Pityus, a Greek town on the northeast coast of the Black Sea, which they completely destroyed. In 258 they besieged and took Trebizond, when a great fleet of ships that were in the port fell into their hands. In these they deposited the booty of the city, which was of immense value, chained the youth of the seacoast to their oars, and returned in triumph to the Kingdom of Bosphorus. In the following year, with a still more powerful force of men and ships, they took Chalcedon, Nicomedia, Nice, Prusa, Apamea, and Cius. In a third expedition, which numbered as many as 500 vessels, they took Cyzicus, then sailed down the Ægean, ravaged the coast of Attica, and in 262 anchored at the Piræus. Athens was now taken and plundered, and many other renowned places in Greece were either partially or wholly destroyed. Even Italy was threatened; but the danger drew the indolent Emperor, Gallienus, from his seclusion. The Emperor appeared in arms, and his presence seems to have checked the ardor and to have divided the strength of the enemy. A portion of the Goths now returned to their own country. But in 269 they again started on a maritime expedition in far greater numbers than ever. After ravaging the coasts of both Europe and Asia, the main armament at length anchored before Thessalonica. In Claudius II, the successor of Gallienus, however, the Goths found a far abler general than any they had yet contended with. This Emperor defeated their host, said to number as many as 300,000 men, in three successive battles, taking or sinking their fleet and, after an immense slaughter of their troops, pursuing such as escaped until they were hemmed in by the passes of Mount Hæmus, where they perished for the most part by famine. This, however, was only a single reverse. Aurelian, the successor of Claudius, was obliged to cede to them, in 272, the large Province of Dacia, after which there was comparative peace between the combatants for about 50 years. In the reign of Constantine, their King, Alaric again provoked hostilities, but was obliged eventually to sue for peace with the master of the Roman Empire. Under Valens they once more encountered the Roman legions, with whom they carried on a war for about three years (367-369) with tolerable success. They now began to be distinguished by the appellations of Ostrogoths and Visigoths, or the Goths of the east and the Goths of the west; the former inhabited the shores of the Black Sea, the latter the Dacian Province and the banks of the Danube. On the irruption of the Huns the Visigoths sought the protection of Valens against those barbarians and in 376 were allowed by him to pass into Mœsia, to the number of about 200,000. Great numbers of them also now took service in the Roman army; but a dispute soon arose between the Goths and their new allies, which led to a decisive battle in 378, near Adrianople, in which the Emperor Valens

lost his life. The Goths now threatened Constantinople, but were not able to take it; and during the reign of Theodosius there was again a period of comparative peace.

Henceforward the history of the Visigoths and that of the Ostrogoths flow in two divergent streams. Before tracing either of these, however, it should be mentioned that the Goths for the most part became converts to Christianity about the middle of the fourth century, adopting the Arian form of belief. Here, also, it may be stated that the term "Moesogoths" was applied to certain of the western Goths, who, having settled in Mesia, devoted themselves to agricultural pursuits under the protection of the Roman emperors.

Visigoths. Upon the death of Theodosius the Great in 395, and the partition of the Empire between Honorius and Arcadius, the renowned Alaric (q.v.), King of the Visigoths, invaded Greece with an army of his countrymen. His retreat was purchased by giving him a commission to govern Illyricum. In 402 he invaded Italy, took and pillaged Rome (410), and was preparing to carry his arms into Sicily and Africa, when his career was arrested by death. Alaric was succeeded in the sovereignty by **ATAULFUS** (q.v.), or **ATHAULF** (410-415), who, having married Placidia, the sister of Honorius, withdrew from Italy into the south of Gaul, and about 412 crossed the Pyrenees into Spain. Athaulf was assassinated at Barcelona (415), at the instigation of a rival faction of the Goths, and his successor, Sigeric, died the same year. The choice of the Goths now fell on Wallia (415-419), who extended his power over a great part of southern Gaul and Spain and made Toulouse his capital. The Goths under this monarch greatly assisted the Romans in their contests with the Vandals and the Alani. Wallia was succeeded by Theodoric I (419-451), son of the great Alaric. He lost his life fighting on the side of the Romans against Attila (q.v.) at Châlons (see **CHÂLONS-SUB-MARNE**), leaving the throne to his son, Thorismund (451-453), who, however, was assassinated by his brother Theodoric II (453-466), who was himself assassinated by his brother Euric (466-483). The reign of Euric was unusually brilliant and successful. He extended the sovereignty of the Visigoths considerably both in France and Spain, introduced the arts of civilization among his subjects, and drew up for their use a code of laws. Under his successors, Alaric II (483-507) and Amalaric (507-531), however, the kingdom of the Visigoths declined before that of the Franks. Alaric II fell by the hands of Clovis (q.v.) in battle, and Amalaric was killed by an assassin. Under the latter's successor, Theudis, the rule of the Visigoths was confined exclusively to Spain. Theudis was in his turn assassinated in his palace at Barcelona in the year 548. It will not be necessary to trace the long line of Visigothic kings that subsequently ruled in Spain from this period down to the year 711. The Visigothic power was completely broken by the Saracen invaders on the battlefield of Jérez de la Frontera. See **SPAIN**.

Ostrogoths. At the coming of the Huns part of the Ostrogoths had been conquered and compelled to lend aid; thus they joined Attila in his renowned expedition against Gaul and fell by thousands under the swords of their kinsmen, the Visigoths, at the battle of Châlons in 451. After this they obtained from the Empire

the right to settle in Pannonia, where they were joined by the other Ostrogoths, who had at the coming of the Huns been admitted within the Roman Empire. In 476 Theodoric (q.v.), the greatest of the Ostrogoth sovereigns, succeeded to the throne upon the death of his father, Theodemir. He directed his arms almost immediately against the Eastern Emperor, Zeno, and, having gained considerable advantages over him, obtained a grant of some of the richest provinces in the Empire. Eventually he was named chief of the Imperial guard and consul for the year 484. In 488, with the consent and advice of Zeno, he planned an immense expedition against Odoacer (q.v.), King in Italy, who had held that position since 476, when he dethroned Romulus Augustulus, the last of the Western emperors. Theodoric utterly defeated Odoacer, slew him, it is said, with his own hand in 493, and reigned undisturbed sovereign of Italy until his death, in 526. The seat of his Empire was at Ravenna, and in 500 he visited Rome, when he convened a meeting of the Senate and declared that it was his intention to rule with evenhanded justice the people committed to his charge. To a great extent he fulfilled this promise and governed his subjects, upon the whole, wisely and to their advantage. The glory of his reign was, however, sullied by the execution of two of the most distinguished men of that age, Boëthius and Symmachus, upon the plea that they were engaged in a conspiracy against him. In the disorders consequent upon the death of Theodoric the Emperor Justinian sought to win back Italy to the allegiance of the emperors of Constantinople; and for this purpose he dispatched Belisarius at the head of an army into that country. In 536 Belisarius entered Rome, which he held for his master, although invited by the Goths to become himself their king; but all his and his successor's efforts to subdue the Goths were at that time utterly fruitless. Totila (541-552), a noble Goth, was elected as successor to Vitiges, the antagonist of Belisarius, but was conquered in the battle of Tagina by the Imperial general Narses in the year 552. In that battle Totila received his death wound and was succeeded by Teias, who did all that a brave man could to repair the misfortunes of his countrymen. It was to no effect, however, for he also was killed in battle in the following year. The Ostrogoths, broken and dispersed by their calamities, henceforward disappear from history as a distinct nation, their throne in Italy being filled by the exarchs of Ravenna; while the nation generally became absorbed in the indiscriminate mass of Alani, Vandals, Burgundians, and Franks, who had from time to time established themselves in the dominions of the old Roman Empire. Consult: Bradley, *The Story of the Goths* (New York, 1888); Hodgkin, *Italy and her Invaders* (Oxford, 1880-99); Bury, *History of the Later Roman Empire* (London, 1889); Gibbon, *Decline and Fall of the Roman Empire* (Bury's ed., 1896-1900); Rappaport, *Die Einfälle der Gothen in das römische Italien* (Leipzig, 1899); Villari, *Le invasioni barbariche in Italia* (Milan, 1901); Martroye, *L'Occident à l'époque byzantine: Goths et Vandales* (Paris, 1903); Cambridge *Medieval History*, vol. i (New York, 1911).

GOTTLAND, göt'land, or **GOTHLAND** (Swed. *Gottland*). The largest island in the Baltic Sea, situated about 44 miles off the east coast of

Sweden, and forming, together with the adjacent islets of Fårön and Gotska Sandön, the Swedish Län of Gotland (Map: Sweden, F 8). Its greatest length is nearly 80 miles, its greatest breadth about 35 miles, and its area 1176 square miles. The surface is level and the soil fertile, while the climate is comparatively mild. A large part of Gotland is under forests, and the arable land constitutes only about one-fifth of the total area. The chief occupations are agriculture and the breeding of live stock. There is a government sheep farm at Roma, in the centre of the island, and the village is the junction for the railroad to the east and west coasts. Sugar beets are extensively grown, and there is a large sugar refinery, while much barley is grown and exported to the breweries on the mainland. There is also some manufacturing of lime, and a number of the inhabitants are engaged in seafaring. There are a number of good harbors, of which Slite Hamn is the most important. Pop. of the län, 1914, 55,488. Chief town Visby (q.v.). The island was in the possession of Sweden as early as the ninth century. In the Middle Ages Visby was an important member of the Hanseatic League. The island was taken several times by Denmark. It came back into the possession of Sweden in 1845. It has strong fortifications.

GOTSKOWSKI, göts-köv'ské, JOHANN ERNST. See GÖTZKOWSKI.

GOTTBUS. See COTTBUS.

GOTTENBURG, göt'en-burk. See GÖTEBORG.

GOTTER, FRIEDRICH WILHELM (1746-97). A German poet and dramatist, born at Gotha. He began the study of law, but was early influenced to write for the theatre. While at Wetzlar he became the friend of Goethe. Gotter wrote dramas, lyrics, elegies, tales, and operas. He was the last representative in Germany of the old French taste. Perhaps his best work is *Medea* (1775), for which Benda wrote the music (1778). His complete works were published in 1787, and a posthumous volume, *Litterarischer Nachlass*, in 1802. Consult Schlösser, *F. W. Gotter: sein Leben und seine Werke* (Hamburg, 1894).

GÖTTERDÄMMERUNG, göt'ër-däm'ër-ung (Ger., Twilight of the Gods). The last of the four divisions of Wagner's music drama, *Der Ring des Nibelungen*. It was first produced on Aug. 17, 1876, at Bayreuth; in the United States Jan. 25, 1888 (New York). Consult W. C. Sawyer, *Teutonic Legends in the Nibelungen Lied and the Nibelungen Ring* (Philadelphia, 1904). See RING OF THE NIBELUNGEN.

GÖTTERDÄMMERUNG. See RAGNARÖK.

GOTTFRIED, göt'frët, JOHANN LUDWIG. See ABELIN.

GOTTFRIED VON STRASSBURG, sträs'-bürk (c.1200). One of the most brilliant of the German court poets of the thirteenth century. Of his personality very little is known except that he was of good but not noble family, was well educated, and is said to have held some important office, perhaps that of city clerk, in Strassburg. His great poem, *Tristan und Isolde*, written about 1215, is based upon a Celtic legend that reached Germany from France; it was given by Gottfried the form that has widely influenced later literature and furnished Richard Wagner a subject for a great opera. This epic, of 19,554 highly polished verses, gives to the story of fateful, sensual love a tragic force that

is lacking in its French prototype by Thomas, and also in the earlier German epic of like name by Hilhart von Oberg (c.1180). Gottfried left the poem unfinished at the moment when Tristan, parted from Isolde by the jealous husband, King Mark, has withdrawn to Normandy and has vainly sought consolation from another Isolde (of the White Hands). Two efforts to complete the poem were made—one by Ulrich von Türheim (1236) and one by Heinrich von Freiburg (1300), both unsuccessful. Gottfried is said to have written some lyric poems also and was one of the most widely imitated poets of his day. His style is brilliant, but somewhat florid. W. Golther's edition of *Tristan* in "Deutsche National-Litteratur," vol. iv (Berlin, 1888), and Bechstein's edition (2 vols., Stuttgart, 1881) are useful. Of the translations into modern German that of W. Hertz (2d ed., ib., 1894) is said to be the best. For Gottfried's life, consult Charles Schmidt, *Ist Gottfried von Strassburg Strassburger Stadtschreiber gewesen?* (Strassburg, 1876). Consult also: K. F. B. Bergemann, *Das höfische Leben nach Gottfried von Strassburg* (Halle, 1876); Max Heidingsfeld, *Gottfried von Strassburg als Schüler Hartmanns von Aue* (Rostock, 1886); Karl Stiebeling, *Stilistische Untersuchungen über Gottfried von Strassburg* (Leipzig, 1905).

GOTTHEIL, göt'hil, RICHARD JAMES HORATIO (1862-). An American Semitic scholar. He was born at Manchester, England, but early went to the United States and graduated in 1881 from Columbia College. He studied also at the universities of Berlin, Tübingen, and Leipzig (Ph.D., 1904), and at Jewish institutions in Berlin. At Columbia he lectured on Syriac languages and literature in 1886-87 and was appointed professor of Semitic languages in 1887. In 1896 he became head of the Oriental department of the New York Public Library, and in 1909-10 had charge of the American School of Oriental Research at Jerusalem. From 1898 to 1904 he was president of the American Federation of Zionists, in 1902-03 president of the Society of Biblical Literature, and after 1904 vice president of the American Jewish Historical Society. He wrote many articles on Oriental and Jewish questions for newspapers and reviews, edited the *Columbia University Oriental Series*, and the *Semitic Study Series*, with Morris Jastrow, Jr., was one of the editors of the *Jewish Encyclopedia* after 1901 and a contributor to the NEW INTERNATIONAL ENCYCLOPEDIA, and is author of *The Syriac Grammar of Mar Elia Zobha* (1887), *Selections from the Syriac Julian Romance* (1906), *Zionism* (1914).

GOTTHELF, göt'helf, JEREMIAS. The pseudonym of the Swiss author Albert Bitzius (q.v.).

GOTTI, göt'te, GIROLAMO MARIA (1834-1916). An Italian prelate and Cardinal of the Roman Catholic church. He was born in Genoa, where his father was a dock laborer. He joined the Carmelite Order in 1854 and, showing an unusual bent towards physical science, was made professor of mathematics and natural philosophy in one of their colleges. He was nominated general in 1881. His diplomatic ability caused him to be selected for various special missions to South American states, which he fulfilled with success, especially in Brazil. In 1895 he was created Cardinal, and later Prefect of the Congregation of Bishops and Regulars. In 1902 he was selected, on the death of Cardinal Ledo-

chowski, as Prefect of the Propaganda (q.v.)—a still more important office, practically second in importance and responsibility to the papacy, for the succession to which his name was frequently mentioned.

GÖTTINGEN, gŏt'ing-en. An old town of the Prussian Province of Hanover, situated on the Leine, 36 miles north by rail east of Cassel (Map: Germany, D 3). A canal separates the old town from the new. With the exception of the fourteenth-century Rathaus, containing frescoes by Schaper, the modern theatre, and the famous Göttingen University (q.v.) with a library of 600,000 volumes, the town has no buildings worthy of mention. Of its many educational institutions, the most noteworthy, aside from the university, are the gymnasium, founded at the end of the sixteenth century, the pedagogical seminary, the trade school, the municipal museum of antiquities, and the Anatomie, with the Blumenbach collection of skulls. The Aula has a picture collection with some good examples of the early Dutch and German schools. The chief manufactures are cloth, woolen goods, sugar, chemicals, leather, scientific and musical instruments, tobacco, and famous Bologna sausages. Book publishing is important. Pop., 1900, 30,234; 1910, 37,594.

The town is first mentioned 950-960. It was given municipal rights by Otho IV at the beginning of the thirteenth century and in 1261 became the residence of the princess of Brunswick-Lüneburg. It was a prominent member of the Hanseatic League and famous for its cloth goods. Its prosperity was interrupted by the Thirty Years' War, when it fell twice into the hands of the Swedes. The establishment of the university in 1737 gave Göttingen new importance, and by the end of the eighteenth century it was a flourishing literary centre.

GÖTTINGEN, UNIVERSITY OF, or **GEORG-AUGUST UNIVERSITY**. A German university, founded by Georg August, Elector of Hanover, better known as George II of England. It was planned as early as 1732, there being no university in Hanover at that time, and lectures were begun two years later; but the formal foundation dates from 1737. Its organization was the work of the statesman Von Münchhausen, a man of marked ability, who remained in control for many years. Noted teachers, a well-chosen library, a large endowment, and the liberal character of the university soon gave it distinction. The Seven Years' War was a time of depression, but between 1770 and 1790 it was again much frequented. The courses in history, philology, and law were preëminent; in the study of history especially broader and more liberal conceptions prevailed. During the French Revolution and the Napoleonic wars there was another period of depression, followed by renewed prosperity. In 1823 the attendance was greater than it was in 1903; but reverses in 1831 and 1837 brought affairs for a third time under a cloud. During the latter half of the nineteenth century, however, there was a slow and steady growth, due mainly to the excellence of the instruction in mathematics and the natural sciences. The number of students has increased with remarkable rapidity during the present century, reaching 2964 in 1913. There are a large number of laboratories, clinics, seminaries, and the like. The library contains 7381 manuscripts and about 600,000 volumes; for modern books it is probably the richest in Germany. Consult Pütter, Saal-

feld, and Oesterley, *Die Georg-August-Universität* (Göttingen, 1838), and *Chronik der Georg-August-Universität* (Hanover, 1890, and annually since that date).

GÖTTLING, gŏt'ling, KARL WILHELM (1793-1869). A German philologist, born at Jena. He studied at Jena and later under Wolf, Büchli, and Buttmann at Berlin, and, after holding various minor professorships, was appointed professor extraordinary of philology at Jena in 1822 and full professor in 1832. In 1826 he was made director of the Philological Seminary and university librarian. His chief works are: *Ueber das Geschichtliche im Nibelungenliede* (1814); *Nibelungen und Ghibellinen* (1817); *Allgemeine Lehre vom Accent in der griechischen Sprache* (5th ed., 1835; the original edition was translated as *Elements of Greek Accentuation*, London, 1831); *Geschichte der römischen Staatsverfassung bis auf Cäsars Tod* (1840); *Gesammelte Abhandlungen aus dem klassischen Altertum* (vol. i, 1851; vol. ii 1864); and editions of Aristotle's *Politica* (1824) and *Economica* (1830) and of Hesiod's *Carmina* (3d ed., 1878). His *Opuscula Academica* (1869) were published and edited after his death by Fischer. Consult: *Der Briefwechsel zwischen Goethe und Götting* (Munich, 1880); Nipperdey, *Memoria C. Göttingii* (Jena, 1869); Lothholz, *Karl Wilhelm Götting* (Stargard, 1876); Fischer, in the preface to the *Opuscula Academica* (Leipzig, 1869).

GOTTSCHALK, gŏt'shălk, or **FULGENTIUS** (c.805-c.868). A prominent figure in a theological controversy of the ninth century. He was the son of Berno, a Saxon count, and was placed by his parents at an early age in the monastery of Fulda. At the approach of manhood he tried to secure release from his vows, but failed owing to the opposition of his abbot, Rabanus Maurus (q.v.). He was permitted to remove to the monastery of Orbais in the diocese of Soissons and there devoted himself to the writings of St. Augustine and became an enthusiastic believer in the doctrine of predestination, even going beyond his master and holding to a predestination to condemnation as well as to salvation. In 837-838 he went to Italy, partly for the purpose of spreading his views. He was so successful that Bishop Noting called upon Rabanus to assist in suppressing the heretical opinions. In 839 Gottschalk became priest and then had the right to preach. This gave him a great advantage. In 845-848 he was again in Italy, and for two years was the guest of Eberhard, Count of Friuli, till Rabanus, now Archbishop of Mainz, protested. Gottschalk then wandered into Germany, preaching everywhere. Rabanus accused him of neglecting the distinction between foreknowledge and foreordination; on the other hand, he himself refused to recognize any difference between predestination to punishment and predestination to sin. At a synod held in Mainz in 848 and presided over by Rabanus, Gottschalk presented a written explanation in defense of his views; he was, however, very summarily found guilty of heresy and handed over to his ecclesiastical superior, Hincmar of Rheims, to be dealt with as his crime might deserve. He was again condemned in an assembly at Quirey in 849—this time not only as a heretic, but also as a despiser of authority and as a disturber of the Church's peace—deposed from the priesthood and sentenced to be whipped and

rigorously imprisoned. The place selected for his captivity was the monastery of Hautvilliers, in the diocese of Rheims, and here he languished throughout the remainder of his life, a period of 20 years, notwithstanding the efforts of influential friends and his own pitiful appeals. He died Oct. 30, 808 or 869, and was buried in unconsecrated ground. Fragments of his works were published by Migne, *Patrol. Lat.*, cxxi (Paris, 1844-80). The Jansenists (q.v.) renewed interest in him. Consult his life by Borrassch (Thorn, 1868) and Gaudard (Saint-Quentin, 1888).

GOTTSCHALK, LOUIS MOREAU (1829-69). A famous American pianist and composer, born at New Orleans, La. At 12 years of age he took up the study of music under Hallé and Stamaty in Paris and from 1845 to 1852 made successful tours of continental Europe. In 1853 he returned to his native land and repeated his foreign successes. He visited most of the important cities and towns from one end of the United States to the other, playing or conducting his own compositions. His success and the hard work entailed undermined his health, and it only needed the fatiguing tour through Cuba and Latin America, commenced in 1865, to hasten his death, which occurred at Rio de Janeiro. His compositions, published and manuscript, covered every branch of music, but his fame as a composer centred in his pianoforte pieces, of which there are about 90. Consult C. Hensel, *Life and Letters of Louis M. Gottschalk* (Boston, 1870).

GOTTSCHALL, göt'shāl, RUDOLPH VON (1823-1909). A German critic and miscellaneous writer. He was born in Breslau and studied at Königsberg, Breslau, and Berlin. His political and social sympathies with the revolutionary movement of 1848 were shown in the dramas *Wiener Immortellen* (1848), *Lambertine von Méricourt* (1850), and *Ferdinand von Schill* (1851), as well as in his first collection of poems, *Gedichte* (1850), and in a lyric epic, *Die Göttin, ein hohes Lied vom Weibe* (1853). From this time on, his work became more serene in temper and style. An epic, *Carlo Zeno* (1854), was followed by a very successful historical comedy (after the style of Scribo), *Pitt und Posa* (1854), and this by literary and historical studies, whose final titles were: *Die deutsche National Literatur des XIX. Jahrhunderts* (1892) and *Poetik: Die Dichtkunst und ihre Formen* (1858). Noteworthy also are: *Neue Gedichte* (1858); *Mazepa* (1850); *Reisebilder aus Italien* (1864); *Maja* (1864); *König Pharao* (1872); *Janus*, poems (1873); *Bunte Blüten*, poems (1891). Gottschall's dramas are collected in 12 volumes (1884); his literary essays in *Portraits und Studien* (1870-71), *Litterarische Totenklänge und Lebensfragen* (1885), *Studien zur neuen deutschen Litteratur* (1892), and *Zur Kritik des modernen Dramas* (1900). Of his many novels, the first, *Im Banne des schwarzen Adlers* (1876), is best. Gottschall was also active as an editor and compiler of anthologies.

GOTTSCHED, göt'shët, JOHANN CHRISTOPH (1700-66). A noted German critic and author, who for about 15 years exercised an almost undisputed literary dictatorship in Germany. He was born near Königsberg, Feb. 2, 1700, studied theology and especially philosophy at the University of Königsberg, and in 1724 went to Leipzig, where his lectures on polite literature made

him speedily known, and where he became professor at the university—first of poetry (1730), then of logic and metaphysics (1734). As editor of the weeklies *Die vernünftigen Tadeln* (1725-26) and *Der Bielermann* (1727), modeled after the English, he entered upon his career of untiring critical activity, continued in other literary journals, all tending towards purification of the language and towards conventional forms. In 1726 he was elected senior of the Poetic Society of Leipzig, which he reorganized, and whose influence was considerably extended by him. Directing his criticism at first chiefly against the bombast and absurd affectations of the Second Silesian school, he proceeded to lay down strict laws for the composition of poetry. He was exclusively a man of reason who sought to reduce all rules of rhetoric and poetry to philosophic principles, confining himself, however, strictly to external perception, evidently incapable of fathoming the intrinsic merit of creative genius. Voiced in all his various periodicals and treatises, this tendency was especially apparent in his *Versuch einer kritischen Dichtkunst vor die Deutschen* (1730 and repeatedly after). Here Horace and Boileau were his models. His main endeavor was directed towards the reformation of the German drama, for which he was bent upon creating a national theatre on the model of the French. Aided by his cultured wife, LUISE ADELGÜNDE VIKTORIE (1713-62), a prolific writer and translator, and with the coöperation of the theatrical manager Neuber and his wife, Caroline, a clever actress, he succeeded indeed in bringing about a considerable improvement in the condition of the German stage by substituting for the prevailing operatic performances translations of French dramas and original plays, and by banishing from it forever the coarse buffoneries of the "Hanswurst" (Jack Pudding). His own tragedy, *Der sterbende Cato* (1732), fashioned after Addison's and Deschamps's work to serve as a model of what a true tragedy should be, and enthusiastically applauded by Gottsched's faithful followers, is a dreary and stilted production, barren of poetry and dramatic action. Growing ever more vain and dictatorial, and carrying his reforms to pedantic excess, he became involved in a violent controversy with the Swiss critics Bodmer (q.v.) and Breitinger, who advocated the introduction to the German public of the great English writers, especially Milton, and when, in 1748, Gottsched went so far as to belittle the rising genius of Klopstock (q.v.), he drew upon himself ridicule and scathing criticism. The new literary spirit inaugurated by Lessing (q.v.) remained a closed book to him. Long before (1741) he had also fallen out with Caroline Neuber regarding practical stage matters and even placed himself in opposition to his wife. Gradually his influence and authority declined, leaving him embittered and isolated, and thus it came to pass that this worthy man, who in his day had done yeoman service for German literature, became a byword for foolish pedantry years before his death, which occurred at Leipzig, Dec. 12, 1766. But his services to the German language and literature, especially to the drama, are now looked upon with more favor. He left at least one important work, *Nötiger Vorrat zur Geschichte der deutschen dramatischen Dichtung* (1757-65), a valuable, though incomplete, repertory of information intended to embrace an account of all dramatic

productions in Germany from 1450 to 1760. Consult: Danzel, *Gottsched und seine Zeit* (Leipzig, 1818); Fischer, *Gottsched und sein Kampf mit den Schweizern* (ib., 1892); Wolff, *Gottscheds Stellung im deutschen Bildungsleben* (Kiel, 1893-97); Gottsched's biography by G. Wanick (Leipzig, 1897).

GÖTZ, gêts, GEORG (1849-). A German classical scholar, born at Gompertshausen and educated at the University of Leipzig. For two years he was a private tutor in St. Petersburg and from 1875 to 1879 taught in the Russian seminary at Leipzig. He then became professor at Jena. His most important work was in early Latin. He was one of the editors of the "triumvirate" edition of Plautus and edited the *Corpus Glossarum Latinarum* (1888-1903) and Varro's *De Lingua Latina*, with Schoell (1910) and *De Re Rustica* (1911).

GÖTZ, HERMANN (1840-76). A gifted German composer, born in Königsberg, Prussia. He did not begin his musical studies until his eighteenth year and from 1860 to 1863 was a pupil at the Stern Conservatory, Berlin, where his teachers were Stern, Von Bülow, and Ulrich. Upon leaving the conservatory he became organist of a church at Winterthur, Switzerland. Götz's place among composers is permanently established by his one opera, *Der Widerspenstigen Zähmung*, first performed at Mannheim on Oct. 11, 1874. In addition to some orchestral and choral compositions he left an unfinished opera, completed by his friend Ernst Frank, called *Francesca von Rimini*. Ill health, brought on by overwork, caused him to retire in 1870 to Hottingen, near Zurich, and he died there, Dec. 3, 1876. Consult A. Steiner, *Herman Götz* (Zurich, 1907).

GÖTZEN, gêts'en, FRIEDRICH, COUNT (1767-1820). A Prussian general, born at Potsdam. He entered the army in 1783 and was appointed major of cavalry on the general staff in 1801. He had the fullest confidence of King Frederick William III, who appointed him his chief adjutant in 1804, and at whose request he was sent to organize the defense of Silesia. As Governor-General (1807-13) of that province, he displayed extraordinary patriotism during the critical period of the Napoleonic invasion and was chiefly instrumental, by his skill and persistent energy, in saving that province to the Prussian crown.

GÖTZEN, GUSTAV ADOLF, COUNT VON (1860-1910). A German traveler, born at the castle of Scharienek, Silesia. He undertook a journey to the Kilimanjaro, which was highly successful, and on his second tour traversed the entire continent of Africa from Pangani, German East Africa, to the mouth of the Congo. The journey, undertaken in association with Drs. von Prittwitz and Kersting, was begun Dec. 21, 1893, and was terminated, after almost incredible difficulties and hardships, Nov. 29, 1894. The interesting discoveries made by Götz on this tour are described by him in the volume entitled *Durch Afrika von Ost nach West* (1895). In 1896 he was sent to Washington as military and naval attaché, in 1900 was appointed Governor of German East Africa, and from 1901 to 1906 major and commander of the defensive forces there stationed. In 1908 he was Prussian Ambassador to the Hanse Towns.

GÖTZENBERGER, gêts'en-bèrg-ër, JAKOB (1802-66). A German historical painter. He

was born in Heidelberg and studied with Cornelius, first at Düsseldorf, then in Munich. With Förster and Hermann he painted (1832), in the aula of the University at Bonn, the frescoes representing the faculties, for which he had made studies in Rome and Naples in 1828. A cycle in fresco in the chapel at Nierstein, Hesse, made his reputation. He was appointed court painter and inspector of the gallery at Mannheim, visited Paris and London with Cornelius, and in 1844 decorated the Trinkhalle at Baden-Baden with illustrations of the legends of the Black Forest. In 1847 he went to England, where he painted many portraits and some frescoes, of which those in Bridgewater House for Lord Ellesmere and four great compositions after an old English ballad in Northumberland House are the most noteworthy.

GÖTZKOWSKI, gêts-köv'skê, or **GOTSKOWSKI**, JOHANN ERNST (1710-75). A Prussian merchant and patriot, born at Konitz. In 1730 he removed to Berlin, where, supported by the patronage of the crown, he introduced the manufacture of porcelain in 1761 at the request, it is said, of Frederick the Great. After the battle of Kunersdorf (1759), so damaging to Prussia, he used his influence with the Russian general who was laying siege to Berlin (1760) to guard the city against plundering and to reduce the heavy tribute levied upon the inhabitants, and then paid a large part of it himself. Consult his *Mémoires d'un négociant patriote* (Berlin, 1769).

GÖTZ VON BERLICHINGEN, or **GÖTZ OF THE IRON HAND**. See BERLICHINGEN. Götz von.

GOUCHER, JOHN FRANKLIN (1845-1922). An American educator, born at Waynesboro, Pa. He graduated from Dickinson College in 1868 (A.M. 1872; LL.D., 1899) and after 1869 held several Methodist Episcopal pastorates in Baltimore. He was president of the Woman's College of Baltimore (now Goucher College) from 1890 to his retirement in 1908. He projected and built several new churches in Baltimore; directed the organization of the Anglo-Japanese College at Tokyo, Japan; helped establish vernacular primary and secondary schools in India; founded the West China and Korean Mission of his church, and made numerous tours of mission and school inspection, especially in the Far East. He was elected president of the board of governors of the West China Union University, Chentu, China, and president of the American Methodist Historical Society. His publications include: *Young People and the World's Evangelization* (1905); *The Sunday School and Missions*; *Christianity and the United States* (1908); *Growth in the Missionary Concept* (1911); *Principles of Stewardship*.

GOUCHER COLLEGE. An institution for the higher education of women in Baltimore, Md. Until March 31, 1910, the institution was known as the Woman's College of Baltimore, and was founded in 1844 under the auspices of the Methodist Episcopal church. The name of the college was changed in recognition of the munificent gifts of the Rev. John Franklin Goucher and of his wife, Mrs. Mary Cecilia Goucher, whereby the founding of the college was made possible, and in further recognition of the distinguished services of Dr. Goucher in the organization of the college and its conduct during the presidency beginning Sept. 1, 1890,

and ending June 30, 1908. The college is situated in the north-central part of Baltimore, more than a mile from the nearest business sections. The principal buildings are Goucher Hall, Bennett Hall, and Catherine Hooper Hall. Bennett Hall contains the gymnasium, baths, and swimming pool. There are three dormitories, and the college is provided with laboratories, libraries, and collections for its work. There are several memorial endowments and scholarships for the benefit of the students. The students in 1913-14 numbered 386, of whom 371 were candidates for the degree of A.B. and 15 were unclassified students. Only one degree is given. The faculty and officials of the college numbered 45. The library contains about 12,000 volumes. The productive funds amount to about \$525,000 and the total income to \$75,000. The president in 1914 was William Westley Guth, Ph.D. John F. Goucher, D.D., LL.D., was president emeritus.

GOUDA, gou'dà (Dutch *Ter Gouw*, on the Gouw). A town of Holland, situated at the confluence of the Gouw and the Yssel, 12½ miles northeast of Rotterdam (Map: Netherlands, C 2). In the market place stand the Late Gothic town hall and the church of St. John, dating from 1485 and restored in 1552, with magnificent stained-glass windows, most of them made by the brothers Crabeth between 1555 and 1577. Gouda has a library located in the church and a museum of antiquities. The chief industries are brick pottery and pipe making, the Gouda pipes having formerly been very famous. Stearin candles are also manufactured here, and an active trade is carried on in dairy products, grain, and especially in the white Gouda cheese, for which the town is famous. The town has also flourishing cigar factories and oil refineries. The canal of Gouda connects Amsterdam with the Lek. Pop., 1880, 19,800; 1910, 29,704.

GOUDIMEL, gō'dé'mél', CLAUDE (c.1505-72). A famous French musician and composer of the sixteenth century. About his life little is known beyond the facts that he was born in Besançon, lived in Paris in 1549, and in Metz from 1557 to 1567. On account of his association with Huguenot circles he was supposed to have been a Huguenot himself, especially because of his composition of the version of the Psalms by Marot and De Bèze (in 8 books, 1551-66). Sometime between 1565 and 1568, during the persecution of the Huguenots, Goudimel left Metz, and lived again at Besançon. Shortly before his death he was in Lyons, where, at the time of the Massacre of St. Bartholomew, he lay seriously ill. As a suspected Huguenot he was murdered and his body thrown into the Saône. Brenet has proved beyond a doubt that Goudimel was not (as has generally been believed) the founder of the great school of Rome. It is even doubtful whether he ever visited Italy. His first compositions (32 chansons) appeared in Paris in 1549. He is best known for his magnificent setting of the above-mentioned Psalms, which passed through many editions. His other compositions include several masses, magnificats, motets, and all the Odes of Horace (1555). Consult M. Brenet, *Claude Goudimel, Essai bio-bibliographique* (Besançon, 1898).

GOUDY, HENRY (1848-). A British jurist. He was born in Ireland and was educated at the universities of Glasgow, Edinburgh, and Königsberg. Upon the establishment of the

Judicial Review he became its editor and conducted that publication until 1893. He was professor of civil law at Edinburgh from 1889 to 1893, when he was called in the same capacity to Oxford. Besides several contributions to the *Encyclopædia Britannica*, he was coeditor of the *Manual of Local Government in Scotland* (1880) and also edited the second edition of Muirhead's *Private Law of Rome* (1898). His *Treatise on the Law of Bankruptcy in Scotland* (1886; 3d ed., 1903) is regarded as a valuable contribution to that subject. He is author also of *Trichotomy in Roman Law* (1910).

GOUFFIER, COMTE DE CHOISEUL. See CHOISEUL-GOUFFIER.

GOUGE, gōōj, THOMAS (1609-81). A non-conformist divine and philanthropist, born in London, Sept. 29, 1609, the son of William Gouge (q.v.). He was educated at Eton and Cambridge, and was vicar of St. Sepulchre's, London (1638-62). Here he won distinction by well-directed efforts to provide work for the able-bodied poor. In 1662 he resigned his living because of the Uniformity Act and retired to Hammersmith. In 1672 he began making semi-annual journeys to Wales for the purpose of establishing schools where English should be taught and circulating religious books. He wrote himself several works and numerous tracts, some of which were translated into Welsh. His collected works were published in London (1706). His *Surest and Safest Way of Thriving* was reprinted, with introduction by Thomas Binney (1856). Consult his biography by Clarke, in *Lives of Eminent Persons* (London, 1833).

GOUGE, WILLIAM (1578-1653). A Puritan divine. He was born at Stratford-le-Bow, Middlesex, Dec. 25, 1578; was educated at Eton and Cambridge; became preacher at St. Anne's, Blackfriars, London, in 1608, and continued there till his death, Dec. 12, 1653. He was one of the leading members of the Presbyterian party in England, sat in the Westminster Assembly, and was prolocutor of the first provincial assembly of London in 1647. At college the strictness of his life gained him the name of the "arch Puritan," and later he was affectionately known as the "Father of the London Ministers." As a writer, he is best known by his elaborate *Commentary on the Epistle to the Hebrews* (1655), to which is prefixed a life by Thomas Gouge.

GOUGES, gōōzh, OLYMPE DE (1748-93). A pioneer of feminism, born at Montauban in the south of France. Louis XV was reputed her father, but this responsibility should probably be laid at the door of the poet and Marquis Le Franc de Pompignan. Married at 17, Olympe soon left her husband and fled with a rich lover to Paris, where her glowing beauty and eccentric personality made her a figure, and where her "affairs" were numerous, open, and flagrant. After a time, however, she "found the trade of gallantry very ignoble," turned literary, and wrote plays, novels, and endless pamphlets. Her claim to fame rests, however, not on these inartistic productions, but upon her championship of the rights of her sex. She was the first to demand of the Revolution the same rights for women that it gave to men. Her feminism, startling in its modernity, embraces most of the ideas for which "advanced" women strive to-day. It reached its best expression in the pamphlet manifesto, *Declara-*

tion des droits de la femme et de la citoyenne (1791), which appeared when Mary Wollstonecraft was in France, and which may have influenced her *Vindication of the Rights of Woman* (1792). Throughout Olympe's career a strain of heroism and idealism blended with frailties and absurdities. A brave offer to defend Louis XVI when his life hung by a thread, followed by attacks she made on men and policies of the hour, brought her to the guillotine in 1793. Consult: Michelet, *Femmes de la Révolution* (Paris, 1854); L. Lacour, *Trois Femmes de la Révolution* (ib., 1900); and for bibliography, J. M. Quérard, *La France littéraire* (12 vols., ib., 1827-64).

GOUGH, gŏf, HUBERT DE LA POER (1870-). An English soldier, educated at Eton and Sandhurst. In 1889 he joined the Sixteenth Lancers, and he saw service in the Tirah expedition in 1897-98 and in South Africa from 1899 to 1902. After commanding the Sixteenth Lancers from 1907 to 1911, he took the command of the Third Cavalry Brigade, with which he was at Curragh, Ireland, in 1914. For services in the European War he was promoted major general in November, 1914.

GOUGH, HUGH, VISCOUNT (1779-1869). An eminent British soldier, born at Woodstown, Ireland. He joined the British army in 1794, served at the Cape of Good Hope in 1795 and in the Peninsular War (1809-13), became a major general in 1830, and in 1837 went to India. He commanded the land forces in the Opium War of 1840-42, compelling the Chinese to sign the Peace of Nanking. In 1843, as commander in chief of the forces in India, he routed the Mahrattas at Maharajpur, and for his brilliant victories at Mudki, Ferozshah, Aliwal, and Solraon in the first Sikh War (1845-46) was given a peerage. In the second Sikh War (1848-49) he was again successful, achieving the victory of Gujarat, following upon an indecisive battle at Chillianwalla; but the heavy losses of the English at Chillianwalla brought criticism upon him, and he was superseded by Sir Charles Napier. Gough was created Viscount and was pensioned in 1849, and in 1862 became field marshal.

GOUGH, gŏf, JOHN BARTHOLOMEW (1817-86). A well-known American temperance lecturer. He was born in Kent, England, but at the age of 12 went to America as an apprentice and worked on a farm in Oneida Co., N. Y. In 1831 he went to New York City, where he was engaged in bookbinding; but he was soon discharged for habitual drunkenness, and was forced to make a living by giving recitations and singing comic songs in bar rooms. He was married in 1839 and established a shop for bookbinding; but his drunken habits reduced him to poverty and delirium tremens and probably caused the death of his wife and child. A benevolent Quaker induced him in 1842 to take the pledge; and he attended temperance meetings and related his experience with such effect as to influence many others. Some time after signing the pledge he had a short relapse into drunkenness; but an eloquent confession restored him to favor, and he lectured in various parts of America with great success. In 1853 he was engaged by the London Temperance League to lecture two years in the United Kingdom, where he drew large crowds by his earnest and, by turns, amusing and pathetic orations. From this time onward until his death he continued to lecture, for the most part on the question of

temperance, and uniformly drew large crowds. He published: *An Autobiography* (1846); *Orations* (1854); *Temperance Addresses* (1870); *Sunlight and Shadow: or, Gleanings from my Life Work* (1880).

GOUGH, gŏf, RICHARD (1735-1809). An English antiquary, born in London and educated at Cambridge. He was director of the Society of Antiquaries of London from 1771 to 1791. As a result of his extensive travels, he published many works, including: *Anecdotes of British Topography* (1768; enlarged, 2 vols., as *British Topography*, 1780); *Sepulchral Monuments in Great Britain* (3 vols., 1786-99); *A Catalogue of the Coins of Canute, with Specimens* (1777); *Collection of all the Wills of the Kings and Queens of England* (1780); *Coins of the Hellenicæ, Kings of Syria* (1803); *Antiquities and Memoirs of the Parish of Uxbridge* (1832). Noteworthy also is his excellent edition of Camden's *Britannia* (3d ed., 3 vols., 1800), which embodies the results of explorations extending over a period of more than 20 years.

GOUIN, gŏŭ'ān', SIR (JEAN) LOMER (1862-). A Canadian lawyer and statesman. He was born at Grondines, Province of Quebec, and was educated at Sorel and Lévis colleges and at Laval University. Called to the bar in 1884, he early became distinguished as a lawyer. In 1891 he was an unsuccessful Liberal candidate for the House of Commons, but he was elected to the Provincial Legislature in 1897; in 1903-04 he was Commissioner of Public Works in the Liberal administration of Simon Napoleon Parent, and after 1905 he was Premier and Attorney-General. He was chairman of the Interprovincial Conference held in Ottawa in 1906 and a delegate to the Interprovincial Conference there in 1910; edited a special edition of the Quebec Municipal Code; in 1907 was made an officer of the Legion of Honor, in 1908 was knighted during the Quebec centenary celebration, and in 1910 was elected *bâtonnier-general* of the provincial bar.

GOUJON, gŏŭ'zhŏn', JEAN (?1520-c.68). The greatest sculptor of the Renaissance in France. He was also an architect, although, as he always worked in conjunction with great architects, it is not possible now to determine how much of the architecture of his works belongs to him. The leading quality of his work is its architectonic quality—the absolute harmony which prevails between it and the architecture which it adorns. But, as sculpture pure and simple, it is of a high order, showing a lofty, but at the same time a free, realization of the antique, coupled with a wholesome naturalism and a fine feeling for style. His figures show a peculiar flavor of preciosity characteristic of the period and his personality.

Goujon's origin is entirely unknown. A contract for two columns supporting the organ of the church of Saint-Maclon at Rouen, dated Aug. 9, 1541, bears his name and points to Normandy as his native country. In the porch of this church are two carved wooden doors of great beauty, which are definitely in the style of Goujon, although there is no proof that they were made by him. A record of 1542 ascribes to him the statue of the Archbishop Georges II d'Amboise on the monument of the Cardinal Georges I d'Amboise in the cathedral of Rouen. When the Archbishop became Cardinal, this statue was replaced by the present one. It has been conjectured that Goujon was also employed

on the monument to Louis de Brézé in the cathedral.

Goujon's long association with the great architect Pierre Lescot begins about 1541, when they accomplished together the restoration of the church of Saint-Germain-l'Auxerrois in Paris. Two of the bas-reliefs have been preserved in the Museum of the Louvre. Goujon was employed in 1545-46 by the Constable de Montmorency in the decoration of his château at Ecouen. The bas-reliefs of the Hôtel Carnavalet are ascribed to the year 1547. Goujon erected an extraordinary loggia with fountains at the corner of the old Cemetery of the Innocents in the Rue aux Fers, Paris. When the cemetery was discontinued (June 19, 1786), this charming work, bas-reliefs of the nymphs of the French rivers, was rearranged in a public square, and is still called the Fountain of the Innocents. Probably about 1550 to 1553 Goujon was employed at the château of Arrêt, under Philibert de l'Orme. The fine group of Diana and a stag which decorated one of the courts of this château is now in the Museum of the Louvre. From 1546 until the end of his life Goujon was associated with Pierre Lescot in the construction and decoration of that portion of the Louvre which was built by Henry II at the southwestern angle of the old Louvre quadrangle. The figures on the sides of the round windows are notable. The most beautiful and important part of his work on the Louvre is the gallery for musicians, which stands in the hall now occupied by a part of the Museum of Antiquities. The four caryatides which support this gallery have been compared with the caryatides of the Erechtheion at Athens. The date of the last one is Sept. 6, 1502. Goujon, like many of the great artists of his day, was a Huguenot and he may, like other coreligionists, have been dismissed from the royal service that year. The tradition that he was killed in the Massacre of St. Bartholomew (Aug. 24, 1572) has been completely disproved. From the testimony of a French Protestant interrogated before the Inquisition at Bologna in 1568, it appears that Goujon lived in exile at Bologna from c.1563 and died between that time and 1568.

Bibliography. For reproductions of his work, see *Œuvre de Jean Goujon* (Paris, 1844), text by Pottier; and his biography by Vitry (ib., 1908) and Lister (London, 1903); Goussé, *La sculpture française depuis le XIV^{ème} siècle* (Paris, 1895); Palustre, *La renaissance en France*, vol. ii (ib., 1881); Lami, *Dictionnaire des sculpteurs de l'école française* (ib., 1898); and Montaiglon, "Jean Goujon et la vérité sur la date de sa mort," in *Gazette des Beaux-Arts*, vols. xxx-xxxi (ib., 1884-85).

GOULBURN, göl'bŭrn. An episcopal city in New South Wales, Australia, 134 miles southwest of Sydney, on the left bank of the Wollondilly River, and on the Great Southern Railroad (Map: Australasia, G 6). Gold and copper are found near by, and there are tanneries, boot and shoe factories, flour mills, and breweries; but the main business of the region is agriculture. The city, which stands at an elevation of 2129 feet above sea level, is well-built; it possesses an Anglican and a Roman Catholic cathedral, both attractive buildings, and owns its gas and water works. Pop., 1901, 10,680; 1911, 10,900.

GOULBURN, HENRY (1784-1850). An English statesman. He was born in London, was

educated at Trinity College, Cambridge, and entered Parliament for Horsham in 1808. Four years later he became Undersecretary for War and the Colonies, and was one of the peace commissioners at the close of the war with the United States (1814). His further political appointments were: member of the Privy Council and Secretary to the Lord Lieutenant of Ireland (1821); Chancellor of the Exchequer under the Duke of Wellington (1828); Home Secretary (1835); and Chancellor of the Exchequer in the cabinet of his intimate friend Sir Robert Peel (1841). He retired from the government in 1846, but represented Cambridge University in Parliament until his death.

GOULD, göld, AUGUSTUS ADDISON (1805-66). An American zoologist, born at New Ipswich, N. H., April 23, 1805. He graduated at Harvard in 1825, and took his medical degree five years later. He was an instructor in botany and zoology at Harvard for two years, and practiced medicine in Boston. He was one of the leading conchologists of his time, and was one of the most active naturalists in America. He published: *System of Natural History* (1833); *The Invertebrate Animals of Massachusetts* (1841); *Principles of Zoology*, with L. Agassiz (1848).

GOULD, BENJAMIN APTHORP (1787-1859). An American educator, born at Lancaster, Mass. He graduated at Harvard in 1814, and was principal of the Boston Latin School from that time until 1828, when the failure of his health compelled him to resign. He prepared for the school several textbooks, including *Adams's Latin Grammar* (1825) and editions of Latin classics.

GOULD, BENJAMIN APTHORP (1824-96). An American astronomer, born in Boston, Mass. He graduated at Harvard in 1844, and received the degree of Ph.D. from Göttingen in 1848; established the *Astronomical Journal* in 1849, continued it until 1861, and resumed its publication in 1885. In 1852 he was appointed director of the longitude determinations of the Coast Survey, and in 1867, after having organized and greatly developed this service, retired. From 1855 to 1859 he was director of the Dudley Observatory, at Albany, N. Y., and in 1866 established, by means of the Atlantic cable, the relations in longitude between American and European stations. From 1865 he was much interested in the study of the southern celestial hemisphere, and in 1870 established at Córdoba, Argentina, the National Observatory, where he accumulated the material for his *Uranometria Argentina* (1874) and *Catálogo de zonas estelares* (1884), both classic in the literature of astronomy. In 1872, with the assistance of the Argentine government, he further established a system of meteorological stations extending southward to Tierra del Fuego and eastward to the Atlantic. He returned to the United States in 1885. He was a charter member of the National Academy of Sciences, was elected president of the American Association for the Advancement of Science in 1868, and was the recipient of many foreign distinctions. His contributions to the scientific knowledge of the southern celestial hemisphere must be regarded as having marked an epoch in the modern study of astronomy.

GOULD, EDWIN (1866-). An American capitalist, son of Jay Gould and brother of Helen Miller Gould Shepard, George Jay, Howard, and Frank Jay Gould. Born in New York

City, he studied for a time at Columbia College. He was chosen a captain in the Seventy-first Regiment of the State National Guard. He served as secretary of the St. Louis, Arkansas, and Texas Railway from 1888 until it was reorganized as the St. Louis and Southwestern in 1891, and afterward as vice president and president. He organized the Continental Match Company in 1894 (consolidated with the Diamond Match Company in 1899); was president of the Bowling Green Trust Company until it was merged in the Equitable Trust Company; and became vice president of the American Writing Paper Company, president of the Five Boroughs Realty Company, and director in many railroad and other corporations.

GOULD, SIR FRANCIS CARBUTHERS (1844-1925). An English caricaturist, born in Barnstaple, the son of an architect. He became a bank clerk and then a member of the London Stock Exchange, where his amusing portraits of members directed attention to him. An ardent Liberal, he used his gift as a caricaturist for political purposes in the *Pall Mall Gazette* from 1887 until 1892, when it became a Conservative paper, and then (1893) in the *Westminster Gazette*, of which he became assistant editor in 1895 and towards the success of which he contributed greatly. Principally for his work on the *Westminster Gazette*, he was knighted in 1906. From 1879 on he usually contributed to the Christmas number of *Truth*, sometimes in colors. He published *Who Killed Cock Robin?* (1897), *Tales Told in the Zoo* (1900), *Froisart's Modern Politics* (1900-02), and the annual *Westminster Cartoons* (1895-1905).

GOULD, GEORGE JAY (1864-1923). An American capitalist, born in New York City, the eldest son of Jay Gould. He was privately educated, and afterward assumed control of large railway interests. In 1888 he became president of the Little Rock and Fort Smith Railway; in 1893 of the St. Louis, Iron Mountain, and Southern, the International and Great Northern, and the Missouri Pacific. From 1892 to 1913 he was president of the Manhattan Elevated Railway of New York City, and he also became director of many other railroad companies.

GOULD, HANNAH FLAGG (1789-1865). An American author, born at Lancaster, Mass. She wrote extensively for magazines and newspapers, and some of her verses were at one time very popular. They are simple and pleasing, with a decided moral tone. A volume of her poems appeared in 1832, a second in 1836, and a third in 1850. Among her other works are: *Gathered Leaves*, prose sketches (1846); *The Diosma*, composed partly of original and partly of selected poems (1851); *The Youth's Coronal* (1851); *The Mother's Dream* (1853); *Hymns and Poems for Children* (1854).

GOULD, HELEN MILLER. See SHEPARD, HELEN MILLER GOULD.

GOULD, JAMES (1770-1838). An American jurist, born in Branford, Conn. He graduated at Yale in 1791, was admitted to the bar in 1798, and thereafter almost continuously until 1833 was connected with the famous Litchfield Law School (see REEVE, TAPPING), first as professor, and from 1820 to 1833 as superintendent. From 1816 to 1818 he was a justice of the Connecticut Supreme Court. He published *A Treatise on the Principles of Pleading in Civil Actions* (1832; 6th ed., ed. by F. F. Heard, 1909).

GOULD, JAY (1836-92). An American capitalist, born in Roxbury, Delaware Co., N. Y. He passed his boyhood on his father's farm and was educated at Hobart Academy. In 1852 he entered a hardware store which his father had established; but although he did not neglect the business, his evenings were devoted to the study of surveying, at which he spent the years from 1852 to 1856, preparing and publishing maps of Albany and Delaware counties, of various counties in Ohio and Michigan, and of a proposed railway from Newburg to Syracuse. In 1856 he published a *History of Delaware County*. In the same year he engaged in the lumber and tanning business in western New York, selling out just before the panic of 1857 and removing to Stroudsburg, Pa., where he became the controlling director in a small bank. It was shortly after this that he first became interested in railroading. In the great financial depression following the panic of 1857 he disposed of his bank stock and bought a controlling interest in the Rutland and Washington Railroad running from Troy, N. Y., to Rutland, Vt., for 10 cents on the dollar. Of this company he became president, treasurer, and general manager, and subsequently brought about a consolidation of his road and the Rensselaer and Saratoga Railroad. In 1859 he sold out his stock in the consolidated roads at 120, and removed to New York, where he embarked in the brokerage business. He made a special study of railway stocks and set out to obtain control of the Erie Railroad, then in financial straits, and the object of strife between the Drew and Vanderbilt interests. By methods new in railway speculation, Gould secured control of the road, and in 1868 was elected its president. His administration of the road may, as he asserted, have reclaimed it from bankruptcy, but it saddled it with a debt of \$64,000,000 and resulted in its paying no dividends until 1891. The manipulation of the Erie was the first of a long series of speculations by which Gould obtained the mastery of some of the greatest railway corporations in the country. His method of obtaining control was the same in almost every instance: to depress the value of the stock which he sought to control and acquire the property during the period of depression. By these methods in the next few years he obtained control of the Union Pacific, which he held from 1873 to 1883, during which time the value of its stock rose from 15 to 75; of the Missouri Pacific, which under his management and by consolidation and extension developed from a short line 287 miles long with earnings of \$280,000 a month to an immense system with earnings, before his death, stated at \$5,100,000 a month; of the Wabash, the Texas Pacific, the St. Louis and Northern, and the St. Louis and San Francisco. In 1880 he controlled fully 10,000 miles of road, more than one-ninth of the mileage of the country. Gould also consolidated competing telegraph lines into the Western Union system in 1881 and obtained control of the Manhattan Elevated Railroad in the same year. What has been considered the most indefensible of all his actions was his entering with "Jim" Fisk, who was also his partner in some of his railroad deals, into a scheme to corner the gold market, which resulted in the disastrous "Black Friday" panic of 1869.

GOULD, JOHN (1804-81). An English ornithologist, born at Lyme Regis. In 1827 he was

appointed taxidermist to the Zoölogical Society of London. In 1832 he published his *Century of Birds from the Himalayan Mountains*, based on a collection of bird skins obtained from that region, and containing 80 plates from drawings by himself. He was elected a fellow of the Royal Society in 1843. His works include 40 other volumes, with careful plates. The most important of them are *The Birds of Australia* (7 vols., 1840-48), with 601 plates, material for which was largely collected on a scientific journey to that continent and the adjacent islands; a *Monograph of the Trochilidae* (humming birds) (1849-61), with 360 plates; and *The Birds of Great Britain* (5 vols., 1862-73), with 367 plates. His Australian birds are in the Academy of Natural Sciences of Philadelphia.

GOULD, SABINE BARING-. See **BARING-GOULD**, SABINE.

GOULD, THOMAS R. (1818-81). An American sculptor, born in Boston. He was at first a merchant and did not adopt sculpture as a profession until after the Civil War. He practiced in Boston until 1868, when he established a studio in Florence, Italy. Among his works are ideal busts of "Christ" and "Satan"; the "West Wind," Mercantile Library, St. Louis; portrait busts of Emerson, John A. Andrew, and the elder Booth; a statue of John Hancock in the town hall of Lexington; a colossal bronze statue of King Kamehameha I, Honolulu; "A Puritan," on Cambridge (Mass.) Common, completed by his son. Although a man of fine culture and true personal worth, he was deficient in technical training and real sculptural feeling. Consult Tuckerman, *Book of the Artists* (New York, 1867).

GOULDING, GOULDING, FRANCIS ROBERT (1810-81). An American author. He was born at Roswell, Ga., and was educated at the University of Georgia and at the Presbyterian Theological Seminary, Columbia, S. C. His story for boys, *Robert and Harold, or the Young Marooners on the Florida Coast*, first published in 1852, became very popular. His other stories include: *Marooner's Island* (1868); *Frank Gordon* (1869); *Woodruff Stories* (1870).

GOUNOD, GOUNOD, CHARLES FRANÇOIS (1818-93). A distinguished French composer of sacred and dramatic music. He was born in Paris, June 17, 1818, the son of an eminent painter and engraver, who died in 1823, leaving his widow and family in comparative poverty. In his autobiographical *Memoirs*, published in 1895, Gounod ascribes all his artistic success to the training and influence of his mother, who was a woman of remarkable character as well as an accomplished musician. At 18 he entered the Paris Conservatory, where his masters were Reicha, Halévy, Lesueur, and Paër, and at the end of his first year he won the second Prix de Rome with the cantata *Marie Stuart et Rizzio*. In 1839 he won the Grand Prix de Rome with the cantata *Fernand*. His first appointment was as organist and precentor of the Missions Étrangères, Paris, where for five years little was heard of him until portions of a *Messe Solennelle*, produced at one of Hullah's concerts in London in 1851, attracted general attention. In the same year he made his début as an operatic composer with *Sappho*. Although not a success, the work earned for its composer a solid reputation. *Ulysse* followed in 1852, shortly after his marriage to a

daughter of Zimmerman, a professor at the Conservatory. He became superintendent of instruction in singing to the communal schools of Paris, and also director of the choral society connected with them, succeeding Hubert, the original founder of the society. The experience gained in this employment was of inestimable value to him, in that he learned to direct and utilize large masses of vocal sound so as to develop the mechanism of sonority, under very simple methods of treatment. *La nonne sanglante*, an opera in five acts, written in 1852, presented in 1854, and performed only eight times, was his next work, its failure proving a great disappointment to him. In 1856 he made the acquaintance of Barbier and Carré, who agreed to supply the libretto of *Faust*; but by the time it was half finished a difficulty arose which precluded an immediate presentation, and Carvallo, who was to stage the new opera, asked that instead Gounod would write a comic opera, taking the subject from Molière. *Le médecin malgré lui* (1858) was accordingly written, its success being immediate and complete. A melodrama, *Faust*, had meanwhile been given at a rival theatre with but little success, and the collaborators returned to their work on their own half-finished opera of *Faust*, which was produced March 19, 1859. It did not meet with immediate approval, but has subsequently come to be regarded as the composer's operatic masterpiece and still holds its place as one of the most popular operas. *Roméo et Juliette* (1867) is, however, regarded by French critical opinion as of greater musical value than *Faust*. Smaller and less successful compositions were the following: *Philémon et Baucis* (1860); *La Colombe* (1866); *La reine de Saba* (1862); *Miracle* (1864). His sojourn in England during the Franco-German War was as profitable to him as it was beneficial to the cause of music in England. He formed the Gounod Choir, a choral society of mixed voices, which gave very successful concerts. To this period belong *Gallia*, a small cantata of enduring merit, and the *entracte* music to several stage productions. His great oratorios, *The Redemption* (1882) and *Mors et Vita* (1885), are standard. Of his five masses the most beautiful and famous is the St. Cecilia (1882). In 1896 his *Mémoires d'un artiste* (which end with the year 1869) appeared posthumously. The most comprehensive biography is that by J. G. Prod'homme, *Gounod: Sa vie et ses œuvres* (2 vols., Paris, 1911). Consult also: H. Tolhurst, *Gounod* (New York, 1904); P. L. Hillemacher, *Gounod* (Paris, 1905); H. Imbert, *Charles Gounod* (ib., 1907); C. Bellaigue, *Gounod* (ib., 1910).

GOUPIL, ADOLPHE (1806-93). The founder of the famous French art firm of Goupil et Cie. (now Manzi, Joyant et Cie.). He started in Paris in 1827 as a dealer in copperplate engravings, but before long acquired a plant and began to publish prints as well as sell them. Among the many French artists whose paintings were reproduced are Delaroche and Ary Scheffer. Later the processes of photogravure and of color printing were added, and the principal pictures of each year's Salon were thus multiplied. Illustrated works, books of patterns, and study sheets for painters and designers were also published. The firm has branches in New York, Berlin, and The Hague.

GOUR. See **GAUR**.

GOURA, gōō'ra (Neo-Lat., from the native name). A genus of remarkable fruit-eating pigeons, by far the largest of the family, and natives of Java, New Guinea, and other islands of the Indian Archipelago. The best known (*Goura coronata*) is 2 feet 4 inches in length and is a very beautiful bird, of a grayish-blue color, with parts of the back and wings black and purplish brown and with a broad white bar across the wings. The head is adorned with a large semi-circular crest of narrow straight silky feathers, always carried erect. Gouras are in the highest esteem for the table. Attempts to introduce them into Holland have failed. Seven or eight forms are known. They have become rare on account of continued persecution, their crests being much in demand by milliners. See Plate of PIGEONS.

GOURAMI, gōō'ra-mī (Javanese name). An excellent fish (*Osphromenus olfai*), native in the rivers and brackish waters of China and the East Indian Archipelago, which has a deep oval, compressed body, large scales, and long dorsal and anal fins. The first ray of the ventral fins is prolonged backward as a long filament. The fish grows 3 to 5 feet long, though the usual size averages below this, and is greenish brown obscurely banded with vertical stripes. It is one of the nest-building fishes and at the breeding season forms its nest by entangling the stems and leaves of aquatic grasses. Both the male and female watch the nest for a month or more with careful vigilance and violently drive away every other fish which approaches, till the spawn is hatched, afterward affording a similar parental protection to the young fry.

This fish is usually regarded as the best table fish of Eastern waters and has been artificially cultivated for a long period in tanks, etc., by the Malays and Dutch of the East Indies. It is hardy and omnivorous and was long ago carried to India, Mauritius, Australia, and even to the French West Indies, thriving well in all these places and multiplying in the local streams.

GOURAND, GENERAL. French commander. For his biography see SUPPLEMENT.

GOURD, gōrd or gōōrd (Fr. *gourde*, Portug. *cougourdo*, It. *cucuzza*, from Lat. *cucurbita*, gourd). The name "gourd," or its equivalent, as employed in Europe includes squashes and pumpkins, but in America it is confined largely to the inedible hard-shelled fruits of certain members of the family Cucurbitaceæ. The more common American gourds are *Lagenaria vulgaris* and some small egg and pear shaped ornamental fruits belonging to *Cucurbita pepo*, var. *ovifera*. The former is a rampant climbing vine, which finds considerable use as a cover for unsightly places. On account of their shapes the fruits are frequently used for dippers, bottles, or dishes, after their contents have been removed and they have been soaked to get rid of the bitter principle. The Luffa (vegetable sponge), or dishcloth gourd (*Luffa cylindrica*), has recently come into prominence in America. The young fruit is edible and the fibrous interior of the dried fruit, when properly prepared, is used as a bath sponge. It also makes a durable dishcloth. These and smaller ornamental gourds are all of the easiest culture, requiring about the same treatment as do squashes. See BOTTLE GOURD; CALABASH GOURD; CUCUMBER. See Plate of CUCUMBER ALLIES.

GOURD FAMILY. See CUCURBITACEÆ.

GOURD/SEED. A local name in the Western

United States for the Missouri or black-horse sucker (*Cydeptus elongatus*). See SUCKER, BLACK HORSE.

GOURGAUD, gōōr'gō', GASPARD, BARON (1783-1852). A French general, born at Versailles. After serving with distinction in the various campaigns of Napoleon from 1805 until 1813, he was appointed his adjutant general and later given the title of Baron. He accompanied Napoleon to St. Helena, but was compelled for political reasons to leave the island in 1818, after he had assisted Napoleon in preparing his *Mémoires*. In 1832 he became aide-camp to Louis Philippe and in 1841 was appointed to the House of Peers. His principal publications are: *La campagne de 1815* (1818); *Mémoires pour servir à l'histoire de France sous Napoléon, écrits à Sainte Hélène sous la dictée de l'empereur* (8 vols., 1822-24); *Réputation de la vie de Napoléon par Sir Walter Scott* (2 vols., 1827); *Journal de Ste. Hélène* (1899).

GOURGUES, gōōrg, DOMINIQUE DE (1530-93). A French soldier and adventurer, born in Mont-de-Marsan, Gascony. In his youth he served in Italy with the French armies under Maréchal de Strozzi and in 1557 was captured by the Spanish at Siena. He was condemned to the galleys, where he was still serving, two years later, when his ship was captured by the Turks. The change of masters brought no immediate relief, and he was still kept at the oar, until the vessel fell in turn into the hands of the Knights of Malta, by whom he was set at liberty. His rough life had bred in him a love of adventure, and in the next few years voyages to Africa, to Brazil, and other far-off regions increased his experience and won for him renown as a leader of men and a sailor. He returned to France at a time when the blood of all Frenchmen and of French Huguenots in particular was stirred by the report that the year before (1565), although France and Spain were at peace, Menendez (q.v.) and a Spanish force had descended upon the French Huguenot settlement of Jean Ribault at Fort Caroline on the Florida coast, had massacred the greater part of the colonists, and had afterward hung a large body of Ribault's followers under a placard, which read, "Not as to Frenchmen, but as to Heretics." Gourgues planned to wreak vengeance with his own hands. He sold his family estate, borrowed all the money he could, and fitted out three small ships, manned with 80 sailors and 150 arquebusiers, for the ostensible purpose of kidnapping negroes in Africa. Sailing in August, 1567, to the coast of Benin (Africa), he secured a cargo of negroes with which he sailed across the Atlantic, and which he sold to the Spaniards in the West Indies. He landed near the mouth of the St. John's River, on which Fort San Mateo stood, and found willing allies in Chief Satouriona and his tribe of Indians, who had suffered much at the hands of Menendez. Gourgues and his allies descended at once on the two small forts which the Spanish had built at the entrance of the St. John's, and after destroying their garrisons attacked Fort San Mateo itself the next day. Such of the Spaniards as had not been killed in the assault were hung on the very trees upon which they had hung their captors' fellow countrymen, and over their heads was placed a pine board, whereon was written, "Not as to Spaniards, but as to Traitors, Robbers, and Murderers." The fortifica-

tions were razed, and Gourgues set sail for France, arriving at La Rochelle on June 8, 1668, where he was received with honor and rejoicing. He is probably the author of *Reprise de la Floride*, the best edition of which is by Tamizey de Larroque (Paris, 1857). Consult: Basanier, *L'Histoire notable de la Floride* (Paris, 1586), which was translated and published by Hakluyt (London, 1587) as *Notable History* and reprinted in French's *Historical Collections of Louisiana and Florida* (New York, 1869); also Parkman, *Pioneers of France in the New World* (Boston, 1903); Gaffarel, *Histoire de la Floride française* (Paris, 1876).

GOURKO, gūr'kō, OSSIP VLADIMIROVITCH. See GURKO.

GOURLAY, ROBERT FLEMING (1784-1863). A Canadian statistician and political reformer, born in Fifeshire, Scotland. He devoted much study to statistics and economic subjects, and on the basis of his report on the condition of the British poor a measure passed the House of Commons, but was rejected by the Lords. In 1817 he came to Upper Canada, where the political dominance of the Family Compact and the ecclesiastical privileges of the Anglican church had caused widespread discontent. (See CANADA, *History*; *POLITICAL PARTIES, Canada*.) Gourlay, who sided with the popular party, called a convention through which to present the public grievances before the British government. This made him a marked man. When tried for sedition, at Kingston and at Brockville, he was acquitted, but ordered to leave Upper Canada. He refused, and in 1819 was imprisoned in the jail at Niagara, where he remained so long and under such privation that his health was seriously injured. He was found guilty of disobeying the order of banishment, was compelled to quit the country, and, after residing for some time in the United States, went to England. In 1836 the sentence against him was nullified, his imprisonment declared illegal, and he was granted a pension, which he declined. He came again to Canada, but eventually went to reside in Edinburgh, where he died. He wrote a number of able political pamphlets, but his most important work was a *Statistical Account of Upper Canada* (1822).

GOURMONT, gūr'mōn', RÉMY DE (1858-1915). A French scholar, born at Bazoches-en-Houlme (Orne). In 1883 he obtained a position at the Bibliothèque Nationale, but lost it (1891) on account of a radical article which displeased the government, *Le joujou: patriotisme* (The Plaything: Patriotism). A profound scholar and an aristocrat by temperament, he was strangely won over to the blunt naturalism of his friend Huysmans and the symbolism of Gérard de Nerval and Mallarmé, whose contentions he continued to uphold, especially in matters of literary style. His unimpeachable sincerity and distrust of second-hand information, together with a constant contact with modern French writers of the most advanced schools, make him, if not always an impartial critic, at least a frequently reliable authority on the literature of the day. In this respect he is second only to Anatole France (q.v.). He came to be at the head of a most important periodical, *Le Mercure de France*. Of his many publications, the following are the most typical: *Le Français au Canada* (1888); *Prose moroses* (1896); *Le pèlerin du silence* (1896), which contains one of the

gems of French symbolist prose poetry: *Le livre des masques* (1896-98); *Promenades littéraires* (1904-06) and *Promenades philosophiques* (1906-08), which contain a comprehensive view of the latest products in their respective fields; *Des divertissements* (1912), a volume of poetry. Consult: P. de Querlon, *Rémy de Gourmont* (Paris, 1903); J. Huneker, *The Pathos of Distance* (New York, 1913); A. Ransome, *Portraits and Speculations* (London, 1913).

GOURNAY, gūr'nā', JACQUES CLAUDE MARIE VINCENT DE (1712-59). A French administrator and political economist, born at Saint-Malo. He was the son of a wholesale merchant, and at an early age became a partner in a mercantile firm established in Cadiz. As a representative of the firm, he traveled extensively in Spain, Germany, England, and Holland, and acquired a wide knowledge of commercial practice and policy. In 1751 he purchased the administrative post of Inspector of Trade in Paris, from which he retired in 1758. Gournay was a man of inquiring turn of mind and early became convinced of the irrationality of the restrictive commercial policy then pursued by France. Familiar with the writings of the liberal mercantilists of England and Holland, he sought to popularize their work in France. He exercised a considerable influence over a group of ambitious young men in the civil service, of whom Turgot (q.v.) later rose to distinction. Although the popularization of the phrase, "Laissez faire, laissez passer," was attributed to Gournay by the later Physiocrats, he was far from an acceptance of the absolute free-trade ideas of the Physiocratic school. He is properly to be regarded as a moderate protectionist, with interest directed towards the development of industry rather than of agriculture. His influence upon the development of economic doctrine, which was considerable, was exerted chiefly through oral tradition. His writings are scant and of no especial importance.

GOURNIA, gūr'nī-ā. A town in the eastern part of Crete, 60 miles east of Candia, in a valley leading to a sheltered bay on the northern coast. The name, derived from the shape of the valley, signifies "trough" or "basin." Though not mentioned in ancient writers, this town was long an important centre of Minoan civilization. Later, about 1500, it was completely destroyed. Excavations were conducted on its site in 1901, 1903, 1904, by Mrs. Harriet Boyd Hawes (Miss Harriet A. Boyd). At the top of the hill on which the town lay, where the rock had been largely denuded, many of the best objects in bronze and terra cotta were found within 2 feet of the surface; lower down the hill the town had been buried to a depth of 15 feet or more. The culture represented at Gournia dates in the main from 1700 to 1500 B.C., though many of the objects found belong to much earlier times. The ground plan of houses can be clearly made out; indeed, upper walls of fire-baked brick resting on stone bases and traces of staircases have been found. Paved roads, too, were laid bare; so also a market place. In the houses was found "much the most varied and comprehensive apparatus of Minoan domestic economy available for study, and nowhere else is better revealed what high artistic aim and achievement went with restricted provincial means in that remote age." See CRETE, *History*; ARCHAEOLOGY, I, *The Pre-Mycenaean or Minoan Period*, and, II, *Mycenaean Period*. Consult: Burrows, *The*

Discoveries in Crete (London, 1907); C. H. Hawes and H. B. Hawes, *Crete, the Forerunner of Greece*, especially 88-102 (London, 1909), with plan; H. B. Hawes and others, *Gournia, Tasliki, and other Prehistoric Sites on the Isthmus of Hierapetra, Crete* (Philadelphia, 1908), a richly illustrated work.

GOUROFF, гоу'роф', real name JARDY DUGOUR (1766-1840). A Franco-Russian author. He was born at Clermont-Ferrand, of Russian extraction. After acting as director of the Collège de la Flèche until the outbreak of the Revolution, he went to Russia, where he adopted the name of Gouroff, and successively became professor at Kharkov and St. Petersburg. His literary productions include: *Mémoire justificatif pour Louis XVI* (1792-93); *Mémoires sur les Tatars Nogaïs* (1816); *De l'influence des lumières sur la condition des peuples* (1826); and *Essai sur l'histoire des enfants trouvés depuis les temps les plus anciens jusqu'à nos jours*, an interesting work later embodied in the publication entitled *Recherches sur les enfants trouvés*, etc. (1829), which contains statistics on illegitimacy in Europe, Asia, and America.

GOUSAT, гоу'са', EDOUARD JEAN BAPTISTE (1858-). A French mathematician, born at Lanzac, Lot, France, and educated at the Collège de Brive, the Lycée Henri IV, and the Ecole Normale Supérieure. He was instructor in the faculty of science, Paris (1879-81) and Toulouse (1881-85); from 1885 to 1889 was chief lecturer in mathematics at the Ecole Normale Supérieure; and became in 1896 a tutor at the Ecole Polytechnique and in 1897 professor of differential and integral calculus at the Sorbonne. He obtained the grand prize of mathematical science in 1886, the Poncelet prize in 1889, and the Petit d'Ormoy prize in 1891. He also became a Chevalier of the Legion of Honor and an officer of public instruction. His works include: *Leçons sur l'intégration des équations aux dérivées partielles du premier ordre* (1891; Ger. trans. by Maser, 1893); *Leçons sur l'intégration des équations aux dérivées partielles du second ordre à deux variables indépendantes* (2 vols., 1896-98); *Théorie des fonctions algébriques et de leurs intégrales*, with Appell (1895); *Cours d'analyse mathématique* (2 vols., 1902-05; 2d ed., 3 vols., 1910-13; Eng. trans. of vol. i by E. R. Hedrick, 1905); "Equations non linéaires du premier ordre" in *Encyclopédie des sciences mathématiques* (1913).

GOURVILLE, гоу'вél', JEAN HÉRAULT DE (1625-1703). A French political agent and adventurer, born at La Rochefoucauld. He entered the service of the Abbé de la Rochefoucauld, went to Paris with him, and there became secretary to the Prince de Marsillac (1646). From that time he was deep in all the political intrigues of the day, sometimes being in the pay of both sides. During the wars of the Fronde he attached himself particularly to Condé. By various means he had enriched himself considerably, so that when condemned to lose his fortune through confiscation after the fall of Fouquet, he escaped to England, and finally settled in Brussels. In 1667 he was able to be of service to France at the Congress of Breda, and afterward was employed in political missions until he obtained the official pardon necessary before he could return to court in 1690. The last years of his life were spent in the best literary society of the time. He left some *Mémoires* (2 vols., 1894-95).

GOUT (from OF. *goute*, *goutte*, It. *gota*, drop, gout, from Lat. *gutta*, drop); **PODAGRA**. A term first used by Radalplus in the thirteenth century, who taught that gout was caused by a humor that flowed drop by drop into the joints. The numerous references to the disorder, not only in the medical writings of Hippocrates, Galen, Aretæus, Cælius, Aurelianus, and the later Greek physicians, but in such purely literary works as those of Lucian, Seneca, Ovid, and Pliny, show not only the frequency, but the notoriety of the disease. It is caricatured by Lucian in his burlesque of *Tragopodagra* in language quite applicable to the disease as now observed; while the connection of it with the advance of luxury in Rome is recognized by Seneca in the remark that in his day even the women had become gouty, thus setting at naught the authority of physicians, who had asserted the slight liability of women to gout. Pliny likewise remarks upon the increase of gout, even within his own time. Ovid and Lucian represent the disease as mostly incurable by medicine; from this view Pliny dissents. The list of quack remedies given by Lucian is one of the most curious relics of antiquity. Gout is both a local disorder and a general perversion of nutrition. Consequent upon imperfect oxidation, there is found an excessive formation of uric acid, fats, and fatty acids, instead of water, carbonic acid, and urea. Sometimes there is an excess of unoxidized sugar. The disease is a special manifestation of a tendency called the arthritic diathesis. (See DIATHESIS.) Baldness, pityriasis, acne, eczema, urticaria, prurigo, asthma, catarrhal inflammations of the mucous membranes, varicose veins, hemorrhoids, and neuralgia are often resultants of the same perversion of nutrition that in some cases manifests itself as gout. Iritis and irido-choroiditis are the most common of the gouty inflammations of the eye. The external and middle ear, too, suffer from gout. Biliary lithiasis, visceral calculi, diabetes, obesity, hemicrania, and arthritis deformans are among the morbid affinities of gout. The malady is to some extent hereditary; and in some gouty families functional nervous diseases are very common among the descendants (especially the females) of gouty ancestors. But diet and mode of life are far more potent factors than heredity in its causation. Some families ascribe to heredity diseases that are actually due to living under the same faulty conditions of hygiene and dietetics, whereby a morbid predisposition becomes established. Gout has disappeared from many localities in Europe step by step with the growth of temperance and the acquisition of hygienic knowledge.

Acute gout, however, followed by uratic deposits in the joints, is frequently transmitted in families. It is almost always a disease of adult age. Women are far less liable to acute gout than men. The character of food largely determines the amount of urea and uric acid produced in the body, and nitrogenous food is provocative of gout. Active muscular exercise and avoidance of grief or anger, or disturbance of psychic balance, are valuable preventives of attacks, even in those who inherit the gouty tendency. Change of season favors gouty outbreaks, the spring and autumn furnishing a large proportion of cases. Climate is a determining, though not decisive, cause. The free perspiration induced in warm countries is a safeguard against gout. Workers in lead,

plumbers, painters, enamelers, and tanners are especially liable to be attacked by gout, various observers finding lead poisoning a factor in from 15 (Osler) to 33 per cent of cases.

Pathologically, gout is characterized by the presence of an excessive amount of uric acid in the blood and the deposition of uric-acid salts in the tissues. The most common seat of deposits is the articular cartilage of the first joint of the great toe, but other articular cartilages may also be involved, as may also the cartilages of the eyelids, larynx, and ears, and the ligaments of joints. The deposit incrusts or infiltrates the cartilage, and if ulceration of the overlying skin takes place, may appear on the surface as the so-called "chalkstones." According to Ebstein, the primary changes in the joints are those of a local necrosis due to the excess of urates in the blood. Sclerotic conditions in the arteries and kidneys are quite common, and deposits of urates in the latter may occur. Hypertrophy of the heart is often associated with the arterial changes. As to the cause of the accumulation of urates in the system in gout we are uncertain. It may be due to defective elimination of urates or to local conditions which favor their deposition. A typical attack of acute gout presents the following symptoms: After some weeks of previous indigestion, attended with flatulent swelling and a feeling of weight, the patient goes to bed free from pain, and having had rather an unnaturally strong appetite the day before. In the middle of the night he is awakened by a pain in the great toe, or sometimes in the heel, the ankle, or the calf of the leg. The pain resembles that of a dislocated bone, and is accompanied by a sense as if water not perfectly cold were poured over the affected limb; to this succeeds chilliness, with shivering and slight fever, these last symptoms diminishing as the pain increases. From hour to hour, until the next evening, the patient suffers every variety of torture in every separate joint of the affected limb; the pain being of a tearing, or crushing, or gnawing character, the tenderness such that even the weight of the bedclothes, or the shaking of the room from a person's walking about in it, is unbearable. The next night is one of tossing and turning, the uneasy limb being constantly moved about to find a better position; till towards morning the victim feels sudden relief, and falls over into a sleep, from which he wakes refreshed, to find the limb swollen, the venous distention usually present in the early stage having been succeeded by a more general form of swelling, often with itching between the toes, and a peeling off of the cuticle. This individual attack may be repeated many times in the course of what is termed "a fit of the gout," which commonly extends over a period of weeks, or even months, before the patient is completely relieved; or the attacks may occur in both limbs, or in several other parts of the body in succession, the real termination of the "fit" being at last indicated by an apparently complete restoration of health, and even, in some cases, by a period of improved condition and capacity for exertion, as compared with the state of the patient before the attack. In this form, acute gout might almost be called a local disease; although the connection of the attacks with deranged digestion, or with the other morbid affluities already described, and the obvious relief obtained after a sharp attack, from the

symptoms of constitutional suffering, point to a cause of the disease operating over a larger range of functions than those included in the local manifestations at this period.

The joints which have been repeatedly the seat of the regular paroxysm become more or less permanently crippled and distorted. The patient is laid up more or less permanently; and exercise, the great natural specific remedy of the gouty, is rendered impossible. Then follow aggravations of all the constitutional troubles. Indigestion continues or becomes constant, assuming the form chiefly of acidity after meals; the liver becomes torpid, the abdomen corpulent, the bowels constipated; the kidneys fail to perform their functions satisfactorily, and not infrequently there is a tendency to gravel and calculus (q.v.); the heart is affected with palpitations, or fainting occurs, sometimes with spasmodic attacks of pain; the arteries become the seat of calcareous deposits, and the veins are varicose in the limbs and in the neighborhood of the rectum (see PILES); the temper is singularly irritable, and often morose; sooner or later the appetite fails or is only kept up by very stimulating and unwholesome diet, with an excess of wine or of alcoholic liquors; in the end, the body emaciates, and premature old age supervenes. Sometimes the end is sudden, as by cerebral hemorrhage, uræmia, dropsy from the heart condition, or gouty kidney (interstitial nephritis). Uric acid in a certain excess has been shown by Garrod, and subsequently by Alexander Haig, to be characteristic of the blood of the gouty, although a minute amount of this substance is probably present even in perfect health. The most recent speculations, accordingly, tend to connect the gouty predisposition either with an excessive formation or a checked excretion of this important substance, the product of the vital distintegration of flesh and other food, after these have subverted the wants of the system. The cure of gout demands the careful consideration of all its predisposing causes in the individual, and the strict regulation of the whole life and habits accordingly, from the earliest possible period. The amount of meat food and sugar must be lessened, and milk and vegetables must constitute the diet. In old people, fruit acids should be avoided, wine and malt liquors absolutely prohibited, and large quantities of pure water imbibed. In some cases very small quantities of distilled spirits do not harm a patient who is taking no nitrogenous food but milk. Tea, coffee, and cocoa are forbidden.

Exercise in the open air facilitates interstitial oxidation, and improves excretion. Mountain climbing benefits many. Cold sponge baths, with brisk friction from a rough towel thereafter, are desirable, unless reaction be feeble. In the latter case warm baths are indicated. The bath should be taken in the morning and the patient should return to bed for an hour at least. For certain patients dry, hot-air baths, Turkish or Russian baths are desirable; to others, sea baths are beneficial.

Medicinal treatment consists in the intelligent use of alkalies, salicylates, and benzoates, mineral acids, purgatives, mineral waters, colchicum, lithium salts, piperazine, mercurials, iodides, quinine, antipyrin, guaiac, and certain other drugs. There is no routine treatment for the disease; the patient must be studied and treated according to the nature of the case.

Consult Haig, *Uric Acid in the Causation of Disease* (London, 1894); and article by Fitcher in Osler's *Modern Medicine* (2d ed., New York, 1914).

GOUTHIERÈ, gū'tyâr', PIERRE (1740-1806). A French worker in metals and minerals, born at Troyes, France. He studied under Martin Cour. He executed a great many pieces of metal work, principally for the Duc d'Aumont, the Duchesse de Mazarin, and Madame du Barry. At the Duc d'Aumont's auction in 1782 more than 50 pieces of Gouthière's work, including chandeliers, candelabra, porphyry vases, lacquer cabinets, jaspers, marbles, and porcelains mounted in bronze, were sold. Marie Antoinette paid 12,000 livres for a red jasper bowl that was in the collection. Gouthière, who had spared no effort in embellishing the château of Madame du Barry, was ruined when she was guillotined—she owed him 756,000 livres. The red jasper bowl and many of the finest specimens of Gouthière's art are to be found in the Wallace collection, London.

GOVERNEUR, gū'ër-nōōr'. A village in St. Lawrence Co., N. Y., 36 miles by rail south of Ogdensburg, on the Oswegatchie River, and on the New York Central and Hudson River Railroad (Map: New York, E 2). It has extensive marble, dairying, and wood-pulp interests, iron mines, talc mines and mills, and other manufactures. These are facilitated by abundant water power. There is a public library, and the water works are owned by the municipality. Pop., 1900, 3689; 1910, 4128.

GOUVION, gū'vyōn', LAURENT, MARQUIS DE SAINT-CYR. See SAINT-CYR.

GOUVY, gū'vê, THÉODORE LOUIS (1822-98). A German pianist and composer, born at Goffontaine, near Saarbrücken, in Rhenish Prussia. At the age of 21 he was a student of law in Paris, but abandoned that profession for music. For three years he was a private pupil in counterpoint of the celebrated Elwart (q.v.). After further study in Berlin and Rome, he returned in 1846 to Paris, and gave his first concert under very successful auspices one year later. The programme consisted of his own compositions. He was throughout his life a popular teacher in both France and Germany. In the former country he was made Chevalier of the Legion of Honor in 1886. His works include: *Missa Brevis*, for solo, chorus, and orchestra; *Frühlings Erwachen*, for soprano solo, male chorus, and orchestra; a *Requiem High Mass*; *Golgotha*, a sacred cantata; several dramatic cantatas, and numerous smaller vocal and instrumental pieces. His compositions, which had a considerable vogue, contain many elements of permanency, and are characterized throughout by a melodious blending of solid German and graceful French harmonic construction. He died at Leipzig. Consult O. Klauwell, *Th. Gouvy* (Leipzig, 1902).

GOVAN, gūv'an. A burgh in Lanarkshire, Scotland, on the left bank of the Clyde. Its prosperity depends upon Glasgow, which has embraced it within its natural boundaries. It contains large shipbuilding yards, engineering works, foundries, and other industrial establishments. Pop., 1901, 76,351; 1911, 89,725. In the sixteenth century this ancient village was one of the largest in Scotland, and down to the middle of the seventeenth century bore the name of "Meikle Govane."

GOVERNMENT (OF. *government*, *gouvernement*, Fr. *gouvernement*, from Lat. *gubernare*, to

govern, steer, from Gk. κυβερνᾶν, *kybernan*, to steer). In the most general sense, any orderly arrangement and management of affairs, especially in human society. It is in this sense that we employ the term, in such widely related expressions as the divine government, household government, and the like. Specifically the term is most commonly used as a condensed expression for political government, or the authoritative regulation of the affairs of a political community or state. Though often confused with the state itself, government is more properly conceived of as the external political organization of the state, as the mode in which, and the agencies by which, the state puts forth its energies. A state may thus completely change its political organization without losing its political identity, as the French nation has in little more than a century passed through all the phases of government from absolute monarchy to republican democracy, without a change in its essential character and unity as a state. Indeed, we may conceive of a state as existing without any government, the authority of the latter in the preservation of order and the enforcement of obligations being supplied by mutual coöperation and good will on the part of the citizens. It is at the realization of such a state, and not at the dissolution of all civic and social relations, that the philosophic anarchism of the present day is aimed. The imaginary "state of nature," pictured by Rousseau and other writers of the eighteenth century, involves, on the other hand, the complete negation of the state, i.e., of all civic relations, as well as of government. It does not seem likely that humanity will ever be able to dispense with either. With the growing complexity of human affairs, the necessity for the organization of society in political communities grows ever greater, and there are no indications of the disappearance of those predatory instincts of human nature upon which the necessity for organized government is based.

Nature of Government. Government means authority, and in the last analysis all government rests upon force, i.e., upon the power of constraining the action of any citizen or any number of citizens through the organized agencies of the state. This power may not be wisely or uniformly exercised; it may even, in the case of the modern industrial state, seldom or never be openly exerted; but no government can exist without it, and a government is partial and incomplete, or perfect and complete, in proportion as it is able to command this power. The mere fact that the governing authorities of a state tolerate certain forms of injustice, or refuse or neglect to enforce certain laws, does not detract from the completeness of the government, so long as it has in reserve the power to compel obedience to its decrees. But a government may be one of limited powers, not because of any inherent lack of force, but because its authority is restricted by its constitution to a limited class of matters. Such limitation may be voluntary, as is the case in the United States and the self-governing colonies of Great Britain, where governmental power is distributed between the several States and the central government, or it may be imposed upon a state by the action of a paramount state, as is the case with Cuba under the recent convention with the United States. In much the same sense, we may speak of the government of minor political divisions of a state, as of cities,

towns, and counties, as a government of limited powers. Within the sphere of their chartered authority, these may have ample governmental powers, but the scope of that authority and the field of its exercise are strictly limited by the grant or charter conferring it.

The two most striking facts in connection with political government are, first, its universality, and, second, the variety of forms in which it has manifested itself. It has existed in all stages of human society and, in at least a rudimentary form, in every considerable group of men and women united, however loosely, in a political community. This universality of its occurrence testifies to its necessity, and probably to its permanence as an institution of human society. Of all human institutions, it has proved to be the most enduring, and, with the exception of the family, probably the most important and influential in shaping the destiny of mankind. Men have found it possible—as in China to-day—to live without an organization of religion, and, as in Sparta and among many barbarous tribes, without the institution of the family as we understand it; but wherever men and women live in society, some form of government arises to regulate their relations to one another and to other communities.

But, although government is the oldest, the most persistent, and the most widespread of human institutions, there is no normal or absolute type of political organization. We may trace its origin to the institution of the patriarchal family, but the patriarchal type of government is limited to society in its primitive stages, and in small aggregations. Men have sought for an ideal or absolute type in their conception of the divine government, and for centuries the glamour of the later Roman Empire cast its spell over Europe, and successive generations of statesmen and political philosophers endeavored to recast the governments of Europe into a Holy Roman Empire; the seventeenth century brought to its culmination the mediæval theory of the divine right of kings, and the eighteenth resolved all political authority into a social compact (*contract social*) among the members of the state. But no one type of government has emerged, either in fact or in theory, out of all this speculation. Governments are as diverse as ever, and we have come to recognize this diversity as a proof of their excellence and not as a defect. It is a part of the accepted philosophy of our time that a government should in its spirit and its form express the political consciousness and aims of the community, and that that government is best which most accurately reflects the character, the interests, and the purpose of the state. See SOCIETY; SOCIOLOGY; STATE.

Forms of Government. In respect of its nature a government may be either autocratic, as wherever the essential power of the state is, under whatever form, directed by an individual or by a select class of persons constituting a minority of the state; or it may be popular, as where the substantial power is vested in the entire body of persons constituting the state. The old classification of governments into monarchies or tyrannies, aristocracies or oligarchies, and democracies, which we owe to Aristotle, is defective in that it confuses the external form with the essential character of the government. It presupposes a simplicity of organization, and a correspondence between the form of the government and the actual seat of power, which are

not often realized outside of the ideal commonwealth. There is, it is true, a form of political organization which is peculiarly appropriate to every kind of government. Under such an ideal arrangement, a tyrant would always be a king or emperor; an oligarchy would dispense with the trappings of royalty and with the fiction of republican forms; and popular government would always appear in the proper guise of a republic. But in practice the matter is by no means so simple. Old forms of government remain long after the balance of power and the actual seat of authority have been shifted and transferred, or a popular form may be deliberately adopted to veil an unpopular exercise of authority. The republican form of government survived in Rome for centuries after the assumption of power by the emperors had become complete. The government of Mexico, like that of most of the Spanish-American republics, is a scarcely disguised autocracy. The same was true of the consulate of the first Napoleon, while the government which bears the name of King George V of England is one of the best existing examples of a government of the popular or democratic type.

The monarchical form of government is still the prevalent form, covering as it does substantially the whole of Europe, Asia, and Africa, and half of North America. These royal governments may be divided into two groups—those in which the royal power has been wholly or partially transferred to the body of the people, known as limited monarchies; and those in which the autocratic principle remains substantially unimpaired. The more usual type of autocracy is an oligarchy, more or less thinly disguised under the forms of monarchy. In such states it is not an individual, but a caste, a ruling class, which actually directs the energies of the state. This caste may be hereditary, as in Japan, in which case we call it an aristocracy; or it may be tribal, or racial, like the Manchû oligarchy which until recently swayed the destinies of the vast Chinese Empire, and the castes which formerly dominated the native states of India; or it may be merely bureaucratic, a compact guild of officeholders, such as that which, under the influence of Russian traditions, directs the policy of the Czar. This continued prevalence of the monarchical form of government is one of the surprises of recent political history. To the observers of half a century ago it seemed as though the democratic movement which swept over Europe at that time was destined to destroy all the ancient thrones, and set up self-governing republics in their stead. But such observers forgot that royalty might continue, though shorn of much of its power, and that the people might rule through the forms of monarchy. Accordingly every government in Europe, with the exception of Russia and Turkey, has become largely popular in substance, if not in form. See ARISTOCRACY; DEMOCRACY; MONARCHY; OLIGARCHY.

Complex Varieties of Government. Thus far the government of states has been dealt with as though each were a unit, animated by a single political principle. But the matter of civil government is far too complex to be covered by a single formula. Each state is the theatre of different, and often conflicting, political experiments. There is always a central government, sometimes strong, and sometimes so weak that it can scarcely hold together; and

in either case there is usually a considerable organization of local governments—of towns, parishes, boroughs, communes, and the like—largely independent of the central government, and often organized on diametrically different principles. We are not surprised to find a considerable development of local self-government in the towns and parishes of England and the United States; but that a democratic system of local self-government should have existed in Russia long before the promulgation of a constitution, and that the communal governments of France should be strictly controlled from Paris, would hardly be expected from the nature of the central government. The inconsistency is explained by the fact that the local governments, which touch the average citizen most nearly and by which all of the ordinary affairs of life are regulated, are seldom created by the central government, but in most instances had been fully developed before the latter came into being, and not only is the hamlet or village government usually much older than the general government of the state, much older, indeed, than the state itself, but it is also much more enduring, much more tenacious of life, and, upon the whole, much more important to the state than the central government. The latter may be a usurpation, or the accidental result of a war; it may change with the death of a ruler or the end of a dynasty, without affecting the internal structure of the state or the organization of society. But the local government is the slow growth of time, interwoven with the habits and compounded of the customs of the community; it is never foreign, never alien; while it lasts the state endures, and when it is dissolved the social foundations of the state are disintegrated.

Other elements of complexity result from the union of different states in one political organization, or under one sovereign, or from the administration by one state of a variety of colonies or dependencies. The first of these is the federation, or federal state, of which the United States of America, the Dominion of Canada, the Australian Commonwealth, and the German Empire are the leading examples. Akin to this is the union of England, Scotland, and Ireland in the Kingdom of Great Britain. The union of two or more states under a common ruler, but without becoming one nation, is illustrated by the ephemeral political leagues of ancient Greece, by the German Confederation of 1867, by Austria-Hungary, and until recently by Scandinavia. The British Empire affords the most striking illustration of the union of a great variety of governmental forms under one central authority. The government of Great Britain is a score of different governments rolled into one. In England and the self-governing colonies, it is a democratic kingdom; in Ireland, a parliamentary autocracy limited by constitutional forms; in India, an empire wholly autocratic; in Egypt, a satrapy; and everywhere, in the villages of India, in the commonwealths of Canada and Australia, and in the counties of England, it shelters a variety of local governments which perform their ancient functions under the central authority of the Empire. See *FEDERAL GOVERNMENT*; *GREAT BRITAIN*; *UNITED STATES*.

Modern Innovations in Government. The rise of democracy and the spread of popular government have been referred to above, and are elsewhere described. (See *DEMOCRACY*.) But one

result of this movement remains to be considered—the discovery and wide application of the principle of representation in government. It was the lack of this principle that hampered the development of the republics of antiquity and that forced them to assume the imperialistic form. Expansion under those conditions could mean only imperialism—the extension of the rule of the republic over populations which could not, in the nature of the case, participate in the government. It is to England that we owe the discovery of this principle, and to the United States that we owe the demonstration of its capacity to serve the needs of a great and expanding nation, stretching over a vast continent. But it has not only performed the inestimable service of creating great states on the republican model; it has also furnished means for introducing a measure of popular government into the ancient monarchies of Europe, and thus of satisfying the political aspirations of the democracy of the Old World. Since its introduction in England it has become the accepted model of a popular government wherever such government has been introduced. See *CABINET*; *CONSTITUTION*; *PARLIAMENT*; *REPRESENTATION*.

Objects of Government. Broadly speaking, the objects of political government are well expressed in the preamble to the Constitution of the United States, to “establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity.” That these are the principal objects for which governments exist, and that they are all within the sphere of proper governmental action, are propositions which no one denies. It is in the definition of these general objects that differences of opinion appear. A recent writer of authority has divided the functions of government into two groups—the *constituent functions*, or such as are fundamental and necessary in every organized political society, and the *ministrant functions*, which are undertaken, not of strict necessity, but in order to minister to the general welfare. The former include the defense of the state against foreign aggression, the preservation of the peace, the administration of justice, the definition and punishment of crime, the regulation of the domestic relations and of property rights, and the determination of the political rights and duties of citizens and the status of aliens—all of them purely public functions which could not under prevailing conceptions of social and political well-being be left to be determined by chance or committed to the citizens individually. The ministrant functions, on the other hand, are such as might conceivably be left unperformed or left to private initiative, as the coinage of money, the regulation of trade, the maintenance of highways and of postal and telegraph systems, sanitary regulation, public education, the care of the poor and incapable, and the like. It is in determining the extent to which government should go into this broad field of service to society that political philosophers and statesmen are at odds. The *laissez-faire* school, represented by John Stuart Mill and Herbert Spencer in England and by the “fathers” of the American republic, would confine the functions of government as closely as possible to those of the constituent class; while, at the other extreme, there are many thinkers of advanced socialistic views who favor a great extension of ministrant activity on the part of

the government. Though the last quarter century has witnessed a decided reaction from the principles of the *laissez-faire* philosophy, it has as yet produced less marked effects in England and in the United States than on the continent of Europe, and still more in the Dominion of New Zealand. That these enlarged views of the functions of government have not made greater progress in the two most democratic states in existence appears to be due to the large part which the conceptions of individual liberty and private rights play in their political thinking, and to their consequent jealousy of any extension of state action. Even in England and the United States, however, the last decade has witnessed a considerable extension of the field of political action in the direction of social reform and industrial regulation. See **POLITICAL SCIENCE**; **SOCIALISM**.

For the methods of governmental action, see **ADMINISTRATIVE LAW**; **CIVIL ADMINISTRATION**; **CIVIL SERVICE**; **COURT**; **LAW**.

Bibliography. The authorities are numerous. Only the most important can here be given. Aristotle, *Politics* (Jowett's translation); Plato, *Republic and Dialogues* (Jowett's translation); Cicero, *On the Commonwealth and On the Laws*; Machiavelli, *The Prince* (Morley's translation) and *Discourses on the First Decade of Livy* (Thompson's translation); Locke, *Civil Government*; Hobbes, *Leviathan*; Rousseau, *The Social Contract*; Montesquieu, *The Spirit of Laws*; De Tocqueville, *Democracy in America*; Guizot, *Representative Government*; John Stuart Mill, *Liberty and Representative Government*; The Federalist; Woolsey, *Political Science*; Burgess, *Political Science*; Bagehot, *The English Constitution*; Ames, *Law and Custom of the Constitution*; Dicey, *The Law of the Constitution and Law and Opinion in England*; Bryce, *The American Commonwealth*; Wilson, *The State*; Mulford, *The Nation*; Jenks, *Law and Politics in the Middle Ages* (New York, 1898); Dunning, *A History of Political Theories* (ib., 1902-05); Gierke, *Political Theories of the Middle Ages*, Maitland's translation (Cambridge, 1900); Wood, *Government and the State* (New York, 1902); Bluntschli, *Theory of the State* (2d ed., Oxford, 1892); Moses, *The Government of the United States* (New York, 1906); Lowell, *The Government of England* (new ed., 2 vols., London, 1912);oley, *Federal Systems of the United States and the British Empire* (Boston, 1913); Lefroy, *Canada's Federal System* (London, 1913); Beard, *American Government and Politics* (New York, 1914). Consult the authorities under **CONSTITUTIONAL LAW**; **INTERNATIONAL LAW**; **JURISPRUDENCE**; **POLITICAL SCIENCE**; and the titles referred to above.

GOVERNMENT, MUNICIPAL. See **MUNICIPAL GOVERNMENT**.

GOVERNMENT LAND. In the widest sense, all land within the United States the title to which is not in a State or an individual but in the nation as a whole and, as such, administered by the government at Washington. This includes all land occupied for governmental purposes, as for military or naval posts and stations, public buildings, etc., but the term is popularly used as being synonymous with "public land." In this sense, only such land owned by the national government as is open to sale or occupation under the "Homestead Laws" is included. Land may be acquired by the government for public use under the power

of eminent domain, and property thus acquired would be "government land" in the broadest sense, but not as the term is commonly used, as such lands would not be open to public occupation and preemption. See **EMINENT DOMAIN**; **HOMESTEAD LAWS**; **LANDS, PUBLIC**.

GOVERNMENT'S ISLAND. See **ROCK ISLAND**.

GOVERNOR (OF. *gouverneur*, Fr. *gouverneur*, It. *governatore*, from Lat. *gubernator*, governor, pilot, from *gubernare*, to pilot, from Gk. *κυβερνᾶν*, *kybernan*, to steer). The chief executive officer in the States of the American Union. He is elected by the people of the State, and his rights and duties are, in general, those usually associated with the head of the executive department in a republican form of government, namely, the appointment of certain classes of officials, the exercise of the pardoning power and the right of veto, and the command of the State militia. The term of office and the specific limitations on the Governor's powers vary, naturally, from State to State, and will be found under the heading *Government*, in the articles on the different States.

GOVERNOR. A device for controlling the running speed of a steam engine, gas engine, water wheel, or other motor. Governors are made in a variety of forms and with various methods of action. In all, the action is in substance to increase or decrease the supply of the motive power as the speed or the load decreases or increases, and thus to preserve a constant speed. The steam-engine governor, one form of which is shown in the illustration (see **STEAM ENGINE**), is an excellent example. The balls, which are mounted on a spindle revolved by gearing or belting connected with the main shaft, tend to fly out from the centre by centrifugal force as the speed of the engine is increased. This action can be made to close the valve in the pipe or passage supplying energy, and thus slow down the motor by reducing pressure or quantity. Governors are called isochronous when their action is so sensitive to changes in speed that they tend to keep the engine at a uniform speed under all variations of load or resistance. A governor is practically isochronous when the variation is not allowed to be more than 2 per cent on either side of the desired mean speed. The higher the speed the closer the regulation possible. Governors may act on the supply valve or throttle valve, or on the valve gearing which distributes the steam to the two ends of the working piston. Governors may act to apply a brake on the mechanism, as in some chronographs or in the mechanism of celestial telescopes. Disengagement governors are those which are out of gear at normal speeds, but come into action to turn power off or on as the speeds exceed or fall below such desired normal speed. See **SHAFT GOVERNOR**; **INTERNAL COMBUSTION ENGINES**; **WATER WHEEL**.

GOVERNOR'S ISLAND. An island in Boston harbor, Massachusetts, occupied entirely by the national government for purposes of defense

STEAM-ENGINE GOVERNOR.

(Map: Boston, F 5). The principal fortification is Fort Winthrop.

GOVERNOR'S ISLAND. A small island in the Bay of New York, near the lower point of Manhattan Island, at the entrance of the East River (Map: New York City, Greater New York, D 6). Its original area of 65 acres has been about doubled by the addition of "made land," and many other improvements have been made. It is occupied entirely by the national government for military purposes. The forts are Jay, Castle William, and South Battery. There are some fine buildings for the principal officers, the island being the headquarters of the military division of the Atlantic. See **FORT JAY**.

GOVI, gō'vê, **GILBERTO** (1826-89). An Italian scientist, born at Mantua. He successively occupied the chair of physics at Florence, Turin, and Naples. He was a voluminous writer and enjoyed considerable repute as a scientist, in which capacity he represented Italy at the International Commission on the Metric System, held at Paris in 1872. His principal writings include: *Metodo per determinare la lunghezza del pendolo* (1866); *Galileo Galilei* (1864); *Romagnosi e l'elettro-magnetismo* (1869); *Il Sant'Uffizio, Copernico e Galileo* (1872); *Leonardo letterato e scienziato: studio sul genio e sulle scoperte di Leonardo da Vinci* (1872); *Teoria dell'elettroforo* (1882).

GOVIND, gō-vind', or **GOVIN'DA**. The familiar scavenger kite of East Indian towns. See **KITE**.

GOW, gou, **GEORGE COLEMAN** (1860-). An American teacher of music. He was born at Ayer, Mass., graduated from Newton Theological Institution in 1889, and studied one year in Berlin. He was instructor in musical theory and composition at Smith College from 1889 to 1895, when he became professor of music at Vassar College. In 1912-13 he was president of the Music Teachers' National Association. Besides contributions to musical magazines, he is author of several songs and of *The Structure of Music* (1895).

GOWAN, gou'an. See **DAISY**.

GOWAN, gou'an, **OGLE ROBERT** (1796-1876). A Canadian journalist and legislator. He was born in County Wexford, Ireland, and removed in 1829 to Escott, Leeds Co., Upper Canada, and became distinguished as a commander of British troops during the rebellion of 1837-38, rising to the rank of lieutenant colonel. The name of "The Queen's Royal Borderers" was conferred upon the regiment which he had commanded. As a political and religious pamphleteer Gowan had become known in Ireland before 1829, and shortly after his arrival in Canada he wrote an able pamphlet on responsible government. In 1834 he was elected a member of the Parliament of Upper Canada, and served in that body till 1841. In 1844-48 and in 1858-61 he was a Conservative member of the Legislative Assembly of Canada. He was the founder and for 20 years the grand master of the Orange Lodges of British America, and as such wielded a powerful political influence in favor of the Conservative party. He wrote two books on the subject, and also was conspicuous in Masonry. He was editor of the *Brockville Statesmen* in 1829-51 and the *Patriot* and the *British Empire* (Toronto) in 1851-55.

GOWER, gou'ër, **JOHN** (c.1325-1408). An English poet. He was probably connected with the family of Sir Robert Gower (died about

1340), a large landholder in Suffolk and in Kent. He married (probably for the second time) in 1397. He was then residing in the priory of St. Mary Overies, Southwark. In some way he made money, with which he bought land. It is inferred from his writings that he was a merchant, very likely an exporter of wool. Chaucer dedicated to him *Troilus and Cressida*, and before going abroad in 1378, nominated him one of his attorneys. Gower, in turn, paid Chaucer a compliment near the close of the *Confessio Amantis* (first version). In 1400 Gower became blind. He died in 1408 (between August 15 and October 24), and was buried in St. Saviour's Church, Southwark.

Gower sought to rest his fame on three great poems, written in three languages, French, Latin, and English. To each poem he gave a Latin title. The first, *Speculum Meditantis* (assigned to 1376-79), long supposed to be lost, was identified by G. C. Macaulay, in 1895, with a manuscript in the Cambridge University library, bearing the title *Mirour de l'Homme*. The poem aims to give a complete account of the moral nature of man and to explain God's dealings with him and the world. The second poem, *Vox Clamantis* (1382-?84), written in Latin elegiac verse, describes the insurrection led by Wat Tyler. Of the third poem, *Confessio Amantis*, there are two versions, one dedicated to King Richard II and the other to Henry of Lancaster. They are assigned respectively to 1383 and 1393. The poem, which contains about 30,000 octosyllabic lines, is divided into a prologue and eight books. After the long prologue descriptive of the degradation of the time, a lover appeals to Venus to cure his malady. Venus sends a confessor called Genius to shrive him. Then ensues a long dialogue, in which the confessor relates current moral stories for the purpose of warning the lover against the various vices. Besides these longer works, Gower wrote minor poems in French, Latin, and English. Among them are the *Traitié* (?1397) and the *Cinkante balades* (?1399), both in French verse. The former sets forth the nature of the marriage state; the latter, a collection of 51 ballades, contains more poetic feeling than Gower's other poems. Chaucer called his contemporary "moral Gower." The epithet exactly describes the intent of all his work. Possessing no originality, Gower took tales from many sources and moralized them. Popular in his own time, and long regarded as the equal of Chaucer, he has become for the modern reader tedious and monotonous. With some exaggeration, Lowell called him "the undertaker of the fair mediæval legend." His work, however, has very great philological interest. His *Complete Works* were edited by G. C. Macaulay (New York, 1899-1902). A study of one aspect of Gower's work is found in W. G. Dodd, *Courtly Love in Chaucer and Gower* (New York, 1913).

GOWER, LORD RONALD SUTHERLAND (1845-1916). An English sculptor and author. He was born in 1845 at Stafford House, the youngest son of the second Duke of Sutherland, and was educated at Eton and at Trinity College, Cambridge. Among his works of art are "Marie Antoinette on her Way to Execution," "The Old Guard at Waterloo," the "Shakespeare Monument" at Stratford, and "Christ," presented to the city of New York in 1889. Among his publications are the interesting *Reminiscences* (1883); *Life of Joan of Arc* (1893); *Last Days*

of Marie Antoinette (1885); *The Tower of London* (1901); *Gainsborough* (1906); and *Stafford House* (1910).

GOWERS, SIR WILLIAM RICHARD (1845-1915). An English physician, born in London, and educated at Christ Church College School at Oxford and in University College, London. He became consulting physician of the University College Hospital and of the National Hospital for the Paralyzed and Epileptic; received honorary degrees from Dublin and Edinburgh universities; and was knighted in 1897. His great *Manual of Diseases of the Nervous System* (1886-88; new ed., 1904) has been translated into German, Spanish, and Italian and is a standard work. Among his other publications are: *Diagnosis of Diseases of the Spinal Cord* (1880), *Epilepsy and other Chronic Convulsive Diseases* (1881), *Diagnosis of Diseases of the Brain* (1885). The sensory fascicle of the spinal cord immediately outside the lateral basis bundle is called the "tract of Gowers," or the ventrolateral ascending tract. See NERVOUS SYSTEM AND BRAIN.

GOWLAND, WILLIAM (1842-1922). An English metallurgist. He was born in Sunderland, Durham, and was educated at the Royal College of Chemistry and the Royal School of Mines. In 1872-88 he was in Japan as chemist, assayer, and foreign head of the Imperial Mint. Upon his return to England he entered the employ of a great copper company and became professor of metallurgy in the Royal School of Mines. He was known as an archaeologist, and had charge of preservation work at Stonehenge, where his discovery of stone mauls, and no metal tools, led him to date the construction of the monument at the end of the neolithic period. He also made careful studies of primitive metallurgy.

GOWN, ACADEMIC. See DEGREE.

GOWRIE CONSPIRACY. One of the most mysterious events in the history of Scotland. It took place in August, 1600. John Ruthven, third Earl of Gowrie, was then residing on his estate at Perth, and with him lived his brother, Alexander Ruthven. There was ill feeling at the time between the Earl and James VI, afterward James I of England, who had put the Earl's father to death for treason, and who owed Gowrie a large sum of money. On the 5th of the month, the King, with a few attendants, visited Gowrie Castle in order, as Alexander told a servant, to confer with the Earl in regard to the debt. After dinner Alexander led the King to a private study on "a quiet errand," and Gowrie took the other guests into the garden to eat cherries. While the guests were thus engaged, a servant came and told them that the King had quit the castle and had ridden off to the Inch. Gowrie left the company for a moment, and on his return confirmed the servant's report. While the guests were in great excitement, not knowing what to do, they heard the King shouting "Treason!" from the study window, and looking up, caught a glimpse of his face. Naturally suspecting Gowrie, they tried to seize him; but as he escaped, four of them made their way to the study, where they are said to have found Alexander Ruthven struggling with the King. They killed Ruthven with their daggers, after which Gowrie, accompanied by his servant, Cranston, burst into the room with a sword in each hand. Though he fought desperately to avenge his brother, he was over-

powered and killed. In the room with Ruthven the King had found a man in armor, who, it was afterward alleged, was Henderson, Gowrie's chamberlain. This man testified in court that Gowrie had ordered him to go to the chamber, put on his armor, and do Ruthven's bidding. As it appeared that Henderson had not raised his hand against the King, he was pardoned. The court used torture to extort evidence from Gowrie's servants, and accepted nothing in favor of their master. Three servants were hanged, the estates of the Ruthvens were confiscated, their name and honors were abolished, and the house in which the strange event took place was destroyed. In explanation of the mystery it has been suggested that the Ruthvens were the tools of Queen Elizabeth, who may have wished to secure possession of the King's person in order to control Scotland in his name, but in her own interest. Possibly, however, there was no plot—a quarrel over the debt may have led to violence, after which the King, with the help of the court, may have contrived the story to hide his own fault. Consult: *Register of the Privy Council of Scotland*, vi; *Acta Parl. Scot.*, iv; Mackenzie, *An Historical Account of the Conspiracies by the Earls of Gowrie and Robert Logan of Restalrig against King James VI* (Edinburgh, 1713); Burton, *History of Scotland* (ib., 1867-70); Tytler, *History of Scotland* (ib., 1828-43); Barbé, *Tragedy of Gowrie House* (Paisley, 1887); Pitcairn, *Ancient Criminal Trials in Scotland* (Edinburgh, 1833); Calderwood, *History of the Kirk of Scotland* (ib., 1842-49); Lang, *James VI and the Gowrie Mystery* (London, 1902) and *A History of Scotland*, vol. ii (Edinburgh, 1902); Hume Brown, *History of Scotland*, vol. ii (Cambridge, 1900).

GOYANA, gō-yā'nā. A city of Brazil, in the State of Pernambuco, situated on the Goyana River, 18 miles from its mouth. It manufactures sugar and alcohol, and carries on an active trade in sugar, cotton, and dyewood. During the war with the Dutch in the seventeenth century, Goyana was an important centre. Pop., 28,000.

GOYATACAN, gō-yā-tā-kān'. A tribe of eastern Brazil, South America. Consult: Karl von Steinen, *Durch Central Brasilien* (Leipzig, 1886); B. Taverro-Acosta, *En el Nur* (Ciudad-Bolivar, 1907); A. Ernst in *Zeitschrift für Ethnologie*, vol. xxxiii (Berlin, 1891); Rivet in *L'Année Linguistique*, vol. iv (Paris, 1912).

GOYA (Y LUCIENTES), gō-yā ē lū-thyān'tās, FRANCISCO JOSÉ DE (1746-1828). The leading painter, etcher, and designer of the Spanish school in the eighteenth century. He was born March 30, 1746, at Fuendetodos, a village of Aragon, near Saragossa. According to the most likely tradition, his family were peasants, who nevertheless placed their son in the academy established at Saragossa by José Lusan y Martínez, a painter of ability, who had studied in the Neapolitan school. According to tradition, Goya was obliged to leave Saragossa on account of some escapade, and went to Madrid. There he was powerfully affected by the works of Velazquez (q.v.) and by the great frescoes Tiepolo was then painting in the Royal Palace. He seems to have studied with Francesco Bayeu, a classicist and disciple of Raphael Mengs. After some years in Madrid he went to Rome. He studied the Italian masters rather by contemplation than by actual copying, and in Rome, as everywhere, was most interested in the picturesque life of

the people. Returning to Spain, he received at Saragossa his first important commission, the frescoes of the ceiling of the church of Santa María, with the "Adoration of God." In 1772-74 he painted in the Cartuja Aula Dei, a Carthusian convent 10 kilometers north of Saragossa, a large series of frescoes of the "Life of the Virgin," many of which survive in a damaged but unrestored condition. In 1775 Goya returned to Madrid. He was employed by Raphael Mengs, then superintendent of fine arts in Madrid, to design cartoons for the royal manufactory of tapestries at Santa Barbara intermittently until 1791. There were 92 in all, woven on high- and low warp looms from 45 cartoons, which are still preserved along with the tapestries in the Escorial and Prado. The subjects are characteristic pictures of contemporary Spanish life, such as "Child Riding a Sheep," the "Washerwoman," the "Seesaw," the "Reapers." About 1780-81 he frescoed a chapel of the church of Santa María del Pilar at Saragossa, and between 1787 and 1798 he painted the decoration of the palace of Alameda near Madrid. Goya's most monumental work is the cupola frescoes of the church of San Antonio de la Florida, near Manzanares, finished in 1798, a series of religious pictures from the life of St. Anthony, showing the influence of Tiepolo. This is the period of his greatest success. In 1788 he was made member by merit of the Academy of San Fernando in Madrid, and in the same year painter of the chamber to the new King, Charles IV. Ten years later he was made chief painter of the chamber. He was created lieutenant director of the Academy of San Fernando in the place of Andreas Calleja in 1793.

The insurrection of March 19, 1808, which ended the reign of Charles IV, interrupted the career of Goya. He endeavored to associate himself with the Bonapartes, even serving on the commission to select 50 of the best Spanish pictures for the Louvre. After a time, however, the French occupation exasperated him. After the return of the Bourbon King Ferdinand VII in 1813, Goya was reinstated as painter of the chamber. His political views forced him to leave Spain, and in 1822 he visited Paris for the first time. With the exception of a short visit to Madrid in 1827, when his portrait was painted by his successor, Vicente López, he passed the rest of his life at Bordeaux, where he died April 16, 1828.

The chief interest of Goya was with the lower classes. He loved a vagabond life, and even at the summit of his success was most often to be found in the resorts of the common people. From them were taken the motives and subjects for the immense mass of drawings, etchings, water colors, genre pictures, and portraits which he left. Using a very simple palette, he painted directly, without glazes. His brilliant style was unique, but his technical qualities were founded upon a profound study of the great technicians of the seventeenth and eighteenth centuries. Goya was quite celebrated as a portrait painter, but his portraits were only good when the subject pleased him. Among his best portraits are those of himself, one in the Academy of San Fernando; a group of Charles IV and his family, in the Prado; equestrian portraits of Charles IV and his Queen, Maria Louisa, in the Prado; the Duke of Ossuna, his wife and family. He appears at his best in the marvelous double

portrait of "La Maya," in the Academy of San Fernando, representing the same beautiful young girl nude and lightly draped. While his paintings can only be studied at Madrid, he is represented also in other public collections, Berlin, London, and Paris, especially in the Louvre. The Metropolitan Museum, New York, has his portrait of Don Sebastian Martinez and "Jewess of Tangier"; and the Hispanic Society, New York, the admirable portraits of the Duchess of Alba (whose name scandal linked with the artist's and whom he painted many times) and General Forastera, besides many drawings. Mention should also be made of his genre subjects, street fights from the insurrection of 1808 (Prado) and other folk scenes, bullfights (Berlin) and other popular amusements.

Goya ranks as one of the world's greatest etchers. No one has ever used the needle with greater vivacity, freedom, and strength than he. He was the first master to realize the possibilities of the aquatint (q.v.). His technical means are very simple—the broad massing of sharply contrasted light and shade; he possesses a wonderful narrative and selective power. Among his earliest plates were a series of 16 after important paintings by Velazquez. His most celebrated series are: "Los caprichos" (Caprices), a bitter satire upon government, religion, and society; "Los desastres de la guerra" (Disasters of War), the testament of a Liberal; and the "Tauromaquia" (Bullfight). In his last years he took up the newly invented art of lithography, achieving great success in such prints as the series "Los toros de Bordoas" (Bulls of Bordeaux).

As a designer of tapestries, he stood first among Spanish painters, and the reputation of the Santa Barbara factory, Madrid, which is still in operation, rests mainly on his designs. Goya's place in art is unique—the greatest Modernist of his day, the first of the nineteenth century to break the shackles of classicism and to solve the problems of light and movement. His influence on the leaders of modern painting, such as Delacroix and especially Manet, was very great.

Bibliography. The traditional view of Goya's wild life and eccentric character is based upon the biography by Zapater (Saragossa, 1868). This exaggerated point of view was spread by the biography of Yriarte (Paris, 1867). The most scholarly and critical life of Goya is by Von Loga (Berlin, 1903); the best English work by Calvert (London, 1908). Others are by Brunet (Paris, 1865); Lefort (ib., 1877); Lafond (ib., 1909); Oertel (Bielefeld, 1907); Stokes (New York, 1914). Brief popular accounts and appreciations are by Rotenstein (Leipzig, 1900) and Muther (London, 1905). For his etchings, consult Bertels in the *Klassische Illustratoren* series (Munich, 1907), and Hind, in *Great Engravers* (London, 1911). The best catalogue of his etchings is by Hofmann (Vienna, 1907). His tapestry designs are best discussed by Villamil, *Los tapices de Goya* (Madrid, 1870), and Hunter, *Tapestries* (New York, 1912).

GOYAZ, gô-yáz' (from the extinct Indian tribe of *Guayazes*). A state of Brazil, bounded by the states of Pará and Maranhão on the north; by Maranhão, Piauí, Bahia, and Minas-Geraes on the east; by Minas-Geraes and Mato-Grosso on the south; and by Mato-Grosso and Pará on the west (Map: Brazil, H 6). Area,

236,232 square miles. Goyaz forms a part of the Brazilian table-land, and it has a number of mountain ranges forming chains from north to south in the western part of the state and along the eastern boundary. Forests are found only along the rivers, but a large part of the state is covered with a low brushwood. The chief rivers are the Tocantins, which flows northward through the central part of the state, and the Araguaya, which forms the west boundary. Little is known of the northern part of Goyaz. The climate of the state is moderate and generally healthful. In spite of its abundant natural resources and favorable climate, Goyaz is one of the most isolated and least developed of the Brazilian states. One of the chief reasons for this is to be found in the lack of transportation facilities. The large rivers are rendered unfit for navigation by their numerous rapids, and railways are only in the constructive stage. Stock raising is the principal industry; agricultural possibilities are undeveloped. The gold deposits, once extensive, seem to be nearly exhausted; other mineral resources, iron, marble, silver, and copper, are unexploited. The chief centres of population are found in the south. Pop., 1890, 227,572; 1900, 255,284; 1911 (official estimate), 340,000. The Indians number about 23,000, and there are large numbers of negroes. Capital, Goyaz (q.v.). In the southern portion of the state a territory of about 5500 square miles has been set aside for the future capital of the Republic of Brazil.

GOYAZ (formerly Villa Boa de Goyaz). A city of Brazil, and the capital of the state of the same name, situated on the river Vermelho, 600 miles northwest of Rio de Janeiro (Map: Brazil, H 7). The town is handsomely built; the principal buildings are the cathedral, government palace, and town hall. It has law and normal schools. Some gold is found in the river Vermelho, and both gold and diamonds in the neighboring district. The city was founded in the latter part of the seventeenth century by the son of Bueno de Silva, one of the early explorers of the region. Pop., 25,000. Pop. of state in 1900, 255,284.

GOYEN, goi'en, JAN VAN (1596-1656). A Dutch landscape painter. He was born at Leyden, Jan. 13, 1596, and after studying under various masters and spending a year in France, he finally became a pupil of Esaias van de Velde of Haarlem, who had the greatest influence upon his art. He then practiced in Leyden, but in 1631 he sold his house there and removed to The Hague, where he became a citizen in 1634 and dean of the Painters' Guild in 1640. At The Hague he prospered greatly in his art, numbering among his patrons the Stadholder Frederick Henry and the Town Council; but his restless spirit sought occupation also in arranging sales of pictures and in extensive speculations in real estate and in tulips. These ventures proved unfortunate, and he died insolvent about the end of April, 1656.

Van Goyen is perhaps the most characteristic of Holland's landscape painters. His subjects are its most typical scenery—harbor, canal, and river banks, with boats and ships, the grassy downs, or winter scenes with skating and sleighing. These he depicts with a naturalistic truth undisturbed by sentimental motives, much as Frans Hals depicts the people of Holland. His paintings were at first detailed in execution and

bright in color, like those of his master Van de Velde, but he soon acquired the tonal qualities which are the chief characteristic of his work. Although his paintings are usually dominated by a sad tone, usually grayish green, he avoids monotony by subtle local color and by an admirable treatment of light and shade. His execution is unusually facile and economical of means; his mastery of atmosphere and perspective is complete. His skies with flitting cloudlets are particularly fine. His numerous paintings are well represented in nearly all the public collections of Europe and in many private collections, both in Europe and America. Among the most typical are the large panorama of Haarlem painted in 1651 for the municipality and now in the town museum; the "View of Dordrecht" (1650), Rijks Museum, Amsterdam, a subject which he painted nine times; "Banks of a Canal" (1653), Louvre; "Environs of Haarlem" (1646), Metropolitan Museum, New York. Consult Bode, *Great Masters of Dutch and Flemish Painting* (London, 1908).

GOZAN. 1. A province in Mesopotamia, called Guzanu in the Assyrian inscriptions and Gauzanitis by Ptolemy, situated on both sides of the river Chabur (Khabur), a tributary of the Euphrates, and comprising roughly the northern half of the later Kingdom of Osroene. It seems to have been added to the Assyrian Empire in the ninth century B.C. In 800 it revolted against Adadnirari V (812-783) and again in 750 against Asurdan III (773-753), but was finally subdued in 758. This province was ruled by a prefect who occasionally appears as *limmu*, after whom the year was named. In this district a colony of Israelitish exiles was settled by Sargon II (722-705 B.C.), after Samaria had been captured by Shalmaneser V (728-722) in 723 (2 Kings xvii. 6; xviii. 11). (See SAMARIA.) 2. A city situated between Nisibis and Tushchan in Mesopotamia, probably the capital of the Province of Gozan. Consult: Delitzsch, *Wo lag das Paradies?* (Leipzig, 1881); Schrader, *Keilinschriften und Geschichtsforschung* (Giessen, 1878); Winckler, *Alttestamentliche Untersuchungen* (Leipzig, 1892); Jeremias, *Das Alte Testament im Lichte des Alten Orients* (ib., 1906).

GOZLAN, gôz'lan', LÉON (1803-66). A French novelist and playwright, born at Marseilles. After trying his hand at various professions, he became a journalist. He was for a time president of the Société des Gens de Lettres and also of the Société des Auteurs Dramatiques. His productions include: *Aristide Froissart* (1843); *Les émotions de Polydore Marasquin* (1857); *La nuit blanche* (1844); some souvenirs of Balzac, *Les jardins*, *Balzac en pantoufles* (1856). His two best plays are *La pluie et le beau temps* and *Une tempête dans un verre d'eau*. His *Châteaux de France* (2 vols., 1844) is of rather important archaeological value and contains very useful illustrations.

GOZO, or **GOZZO**, gôz'sô (Lat. *Gaulus*). An island belonging to Great Britain in the Mediterranean, situated about 4 miles northwest of Malta, with which it was probably at one time connected (Map: Italy, E 6). Its area is 25 square miles. The surface is diversified and consists largely of coralline limestone. It has a rich and well-cultivated soil. There are some Phœnician remains in the shape of Cyclopean walls and some Roman monuments. Chief town,

Victoria, formerly called Rabat. Pop., 1901, 20,003; 1907 (est.), 21,911.

GOZZI, gòt'sè, CARLO, COUNT (1720-1806). An Italian dramatist, born at Venice, brother of Gasparo Gozzi. He began in his youth to write, and his pieces, slight but satirical, were directed against Goldoni, in defense of the *Commedia dell'Arte* with its accepted types, which Goldoni had abandoned. In 1761 he wrote what he called a "dramatic fairy tale," *Fiaba dell'amore delle tre melarancie*, which was received with enthusiasm. This was followed by others on the same order; among them *Turandot*, translated by Schiller, and *L'Angellin Bel Verde*, and others taken from old Italian fairy lore or Oriental tales. For a while these held a prominent place on the Venetian stage, attracting the public by their spectacular features and liveliness. Gozzi also adapted French and Spanish plays and wrote some dramas modeled after Calderón. His fairy plays (written in the Venetian dialect) are little known outside Italy; they deserve a wider reputation. One of his last and most interesting works is *Memorie inutili* (1797; new ed., Bari, 1910), trans. by Symonds (1889). He edited part of his own works (1772-74); a complete edition was published in 1802. The best edition of the *Fiabe* is that of E. Masi (Bologna, 1884). Consult: Magrini, *I tempi, la vita e gli scritti di Carlo Gozzi* (Benevento, 1883); id., *Carlo Gozzi o le fiabe* (Venice, 1883); Masi, *Sulla storia del teatro italiano nel secolo XVIII* (Florence, 1892); Paget, *Studies of the Eighteenth Century in Italy* (2d ed., Chicago, 1908).

GOZZI, GASPARO, COUNT (1713-86). An Italian author, born at Venice, brother of Carlo Gozzi the dramatist. He attempted the management of the Sant' Angelo Theatre in Venice and translated plays from the French for representation there, but failed signally. He then founded the *Gazzetta Veneta* (1760-61); and later the *Osservatore Veneto* (1761-62), taking as a model Addison's *Spectator*. He aimed at reviving in Italian literature the simplicity and sincerity threatened by academic pettiness. He revived the cult of Dante through his defense of Dante against Bettinelli in *Giudizio degli antichi poeti sopra la moderna censura di Dante*, etc. (1755), and wrote clever satirical verse as well as prose, holding up to gentle ridicule the foibles of his contemporaries. Works (12 vols., Venice, 1794; 20 vols., Bergamo, 1825-29). Among his many writings are *Il mondo morale e Scermoni*. Consult: Pindemonte, *Elogio del conte Gasparo Gozzi* (Venice, 1787); Gherardini Giovanni, *Vita di Gasparo Gozzi* (Milan, 1821); N. Tommaseo, "G. Gozzi, Venezia e l'Italia de suoi tempi," in *Storia civile nella letteratura* (Turin, 1872); Malmignati, *G. Gozzi e i suoi tempi* (Padua, 1890).

GOZZO, gòt'sò. See Gozo.

GOZZOLI, gòt'sò-lé, BENOZZO, properly BENOZZO DI LÈSE (1420-98). A Florentine painter of the early Renaissance. He was born at Florence, and began his career as a goldsmith, assisting Ghiberti on the bronze gates of the baptistery at Florence. A pupil of Fra Angelico, he assisted him in the painting of the vault in the chapel of the Madonna di San Brizio, in the cathedral at Orvieto, in 1447; the following two years he was at Rome. On leaving Angelico in 1449 he went to Montefalco, where in San Fortunato he painted, among other works, a triple series of frescoes from the life

of St. Francis in the choir of San Francesco. He was active at Viterbo, at Perugia (1456), at Rome (1458). Returning to Florence, he completed in 1459 his masterpiece, the frescoes in the private chapel of the Riccardi Palace, Florence. The subject is the "Procession of the Magi," with "Angels" in the tribune above—all interpreted as a pageant of the fifteenth century. The procession contains many portraits, including Lorenzo, Piero, and other Medici; the Emperor John Palaeologus and the Patriarch Joseph; Sigismondo Malatesta and the artist, 17 chief subjects, affording an inimitable picture of the life of his day. It is executed with the charm of a miniature on a large scale, and a decorative quality rarely equaled in the same century. From 1464 to 1467 he painted an important series from the life of St. Augustine, in the church of San Agostino at San Gimignano. Of especial charm is "St. Augustine Teaching Rhetoric at Rome," showing a Renaissance scholar in the classroom. The series of 22 frescoes on the wall of the Campo Santo, Pisa (1469-85), shows his versatility in the interpretation of scenes from the history of the Old Testament, beginning with the "Life of Noah" and ending with the "Visit of the Queen of Sheba to Solomon." In the former the "Invention of Wine by Noah" is a Tuscan vintage scene; while the "Tower of Babel" represents the Medici family inspecting a building. In this as in other great frescoes series he made use of assistants. He had houses and land in Florence and a house in Pisa, and after his death at Pistoia (Oct. 4, 1498) he was interred in a tomb of the Campo Santo presented him by the Pisans. His life is said to have been one of singular rectitude. His color was light and pleasing in tone; his drawing often deficient; his technique smooth in quality; his subjects were interpreted with a religious feeling and poetic naturalness, each detail being painted with a goldsmith's love for the decorative quality. His story-telling quality is his greatest achievement, revealing his varied interests as a portrait painter, landscape painter, animal painter, costumer, architect, and decorator. His easel pictures are rare. The best known are "Madonna with Four Saints," in the Gallery of Perugia; "Madonna with Saints and Angels," in the National Gallery, London; and the "Apotheosis of St. Thomas Aquinas," in the Louvre. Consult: Crowe and Cavalcaselle, *History of Italian Painting*, ed. by Douglas, vol. iv (London, 1911); Supino, *Il campasanto di Pisa* (Florence, 1896); Stokes, *Benozzo Gozzoli* (London, 1903), brief and popular; Mengin, *Benozzo Gozzoli* (Paris, 1909).

GAAFF, gräf, REGNIER DE (1641-73). A celebrated Dutch physician, born at Schoonhoven. He studied under Sylvius at the University of Leyden. In 1664 he published his *Disputatio Medica de Natura et Usu Succu Pancreatici*, which gained for him a great reputation. He studied at Löwen, Utrecht, and Leyden, and settled at Delft. He discovered, in 1672, the follicles of the ovary which are named after him. He published several dissertations on the organs of generation in both sexes, which involved him in a controversy with Swammerdam. An edition of his complete works was first published in 1677.

GAAFFIAN FOLLICLES, or **VESICLES**. See GAAFF; OVARY.

GAAFF REINET, gräf r'ñët. The oldest

and largest town in the Midland district of the Cape Province, South Africa, and a strong Dutch centre, situated on the Sunday River, 184 miles by rail from Port Elizabeth (Map: Cape of Good Hope, G 9). It lies in the heart of the Karoo, and from its numerous orchards, vineyards, and gardens, due to a plentiful water supply, it is known as the "Gem of the Desert." It is the centre of the South African mohair trade and produces wine and fruit in large quantities. The Dutch Church, founded in 1786, a large modern building, seating 1500, cost some \$90,000, and is one of the finest churches in South Africa. There is also a large college attended only by Dutch students. Near the town are mineral springs. Pop., 1911, 8129, of whom less than half were white.

GRAAL, grāl, HOLY. See **GRAIL**, THE HOLY.

GRAB (Marathi *gurāb*, *ghurāb*, from Ar. *ghurūb*, from *gharaba*, to go). The Anglo-Indian name for the large flat-bottomed coasting vessel, of 150 to 300 tons, used on the coast of Hindustan. It has usually two masts. Its most peculiar feature is the extension of the upper deck over the projecting prow, the extension being separated from the forecabin by a bulkhead. When armed, as many of them have been in the Royal Indian Marine, these vessels carried 12-pounders, or guns of less calibre. They were also used at one time by the native pirates of the coast.

GRÄB, grāp, KARL (1816-84). A German architectural and landscape painter. He was born in Berlin, where he studied under the Court Theatre painter, J. Gerst, and at the Academy. In 1839 he set out to travel in Switzerland, southern France, the Pyrenees, Italy, and Sicily, and after his return, in 1843, was for several years associated with Gerst in decorative work, but about 1851 devoted himself almost exclusively to easel pictures, cultivating architectural subjects, especially the interiors of mediæval churches, which he depicted with a rare knowledge of perspective and architectural detail, vigorous coloring, and beautiful light effects. Among the finest of these views are: "Choir in the Cathedral at Halberstadt" (1854), Ravené Gallery, Berlin; "The Scaliger Tombs in Verona" (1859); "Tombs of the Mansfeld Family in St. Andrews at Eisleben" (1860) and "Lectern in Halberstadt Cathedral" (1870), both in the National Gallery, Berlin; "Interior of Old Synagogue in Prague" (1870), in the Breslau Museum. His landscapes are likewise of a high order, and in water colors he painted, by royal order, 94 views from the castles of Stolzenfels, Potsdam, Charlottenburg, and others. In the new museum at Berlin he executed two mural paintings of ancient Athens and Olympia. He was made court painter in 1851, professor at the Academy in 1855, and was awarded the great gold medal at the Berlin Exhibition in 1854.

GRABAU, grā'bō, AMADEUS WILLIAM (1870-). An American paleontologist, born at Cedarburg, Wis. He graduated from Massachusetts Institute of Technology in 1896 and studied at Harvard University (S.M., 1898; S.D., 1900). In 1901 he married Mary Antin. (See **GRABAU**, MARY ANTIN.) After serving as professor of geology at the Rensselaer Polytechnic Institute, Troy, N. Y. (1899-1901), he became adjunct professor of paleontology in 1902 and full professor in 1905 at Columbia University. He also served as paleontologist on the Michi-

gan Geological Survey. He is author of *North American Index of Fossils, Invertebrates*, with H. W. Shimer (2 vols., 1909-10), and *Principles of Stratigraphy* (1913).

GRABAU, MARY ANTIN (1881-). An American writer. Born in Polotzk, Russia, she emigrated to America in 1894. She was educated in the public schools and in the Girls' Latin School of Boston and studied at Teachers College (Columbia University) in 1901-02 and at Barnard College in 1902-04. She married Prof. Amadeus William Grabau in 1901. Her first book (1899) was called *From Polotzk to Boston* (1899), but it was not until 1912 that she gained wide recognition through *The Promised Land*, in which she tells in a peculiarly vivid and convincing way of her early life in Russia, emigration to America, and experiences in the new environment. She wrote also *They who Knock at our Gates* (1914).

GRABBE, grā'bē, CHRISTIAN DIETRICH (1801-36). A German dramatist, born at Detmold. He studied law at Leipzig and Berlin and wrote his first drama at 18, *Herzog Theodor von Gothland*, an eccentric but promising piece. He then went on the stage and, after failing as an actor, returned to the law and finally obtained a military position in his native town (1827). This he did not keep long, owing to his irregular life, and he ultimately died from the effects of continued drinking. His plays further include: *Don Juan und Faust* (1829); *Friedrich Barbarossa* (1829); *Heinrich VI* (1830); *Napoleon oder die Hundert Tage* (1831); *Hannibal* (1835). His dramas betray dramatic power of a high order, but are marred by eccentricities of language and faulty construction. His complete works were published at Leipzig in 1870 and at Detmold in 1874; a critical edition by E. Grisebach (4 vols., Berlin, 1902). Consult also Ziegler, *Grabbes Leben und Charakter* (Hamburg, 1855), and a study by C. A. Piper (Berlin, 1898).

GRABE, grā'bē, JOHN ERNEST (1666-1711). A German biblical and patristic scholar. He was born at Königsberg and was educated there. Becoming dissatisfied with the Lutheran church, he thought of joining the Catholic church, but changed his mind and betook himself to England instead. He settled at Oxford in 1695 and won distinction by his histories of the early Church, his editions of the Fathers, and particularly of the Septuagint (1707-19). He died in London, Nov. 3, 1711.

GRABEN-HOFFMANN, grā'bēn hōf'mān, GUSTAV. See **HOFFMANN**, GUSTAV (**GRABEN**).

GRABOW, grā'bō, WILHELM (1802-74). A Prussian politician, born at Prenzlau (Brandenburg). He studied at Berlin, became councillor of the city court, and was a prominent Liberal member of the United Diet of 1847-48 and of the National Assembly of 1848, acting for a short time as its President. From 1862 to 1866 he was repeatedly elected President of the Lower Chamber of the Prussian Diet. He was a consistent opponent of Bismarck in Prussian politics, leaving the Diet finally because of Bismarck's overbearing methods.

GRABOWSKI, grā'bōv'skē, MICHAŁ (1805-63). A Polish author, born in the Government of Kiev. He was one of the group of Ukrainians who gathered about Groza, Zaleski, and Goszczynski, and was an ardent defender of romanticism and an opponent of French literary standards. Besides critical writings, he wrote

some novels in the manner of Scott. His works include: *Literatura i Krytyka* (1837-40); *Korrespondencya literacka* (1843-48); *Koliszczyzna i Stepy* (1838), a novel dealing with the peasant revolt of 1768; *Stannica hulajpolska* (1841); *Zamiec w stepach* (1862); *Taikury* (1845); *Pan Starosta Kaniowski* (1856); *Pamiętniki domowe* (1845); and an interesting work on *Ukraina dawna i teraźniejsza* (The Ukraine as It Was and as It Is, 1850). His critical essays are superior to his novels.

GRACCHANUS, grā-kā'nūs or grāk-kā'nūs, M. JUNIUS. A Latin author, who, according to Pliny, assumed his cognomen on account of his friendship with C. Gracchus. He wrote a treatise, *De Potestatibus*, addressed to T. Pomponius Atticus, the father of Cicero's friend, in which he gave an account of the Roman constitution and magistracies from the time of the kings. This work is lost, but it is frequently cited by Pliny, Varro, and Cicero, and parts of it are preserved in the *De Magistratibus* of Joannes Lydus. Consult: Gerlach, *Geschichtschreiber der Römer* (Hamburg, 1851); Mercklin, *De Junio Gracchano* (Dorpat, 1840-41); Huschke, *Jurisprudentia Anteiustiniana* (Leipzig, 1886).

GRACCHUS. The cognomen of a distinguished branch of the Gens Sempronia in ancient Rome. Many of the name became famous in history. The following are the most important:

1. **TIBERIUS SEMPRONIUS GRACCHUS** (?-212 B.C.). A general during the Second Punic War. Elected consul in 215, when Hannibal was scouring Campania and Apulia, he gathered a force of volunteer slaves (to whom he promised freedom, if the victory should be his) and provincials, and routed the Campanians with great loss near Cumæ, which he seized and held against the assaults of Hannibal's army. At the end of his consulship his *imperium* (q.v.) was continued, so that he could spend the year 214 in Apulia, with headquarters at Beneventum, from which the Carthaginian general Hanno tried in vain to dislodge him. He was consul again in 213 and carried on an active war in Lucania. In 212, while again operating in Apulia, he was betrayed by a Lucanian and perished in an unequal struggle with Mago the Carthaginian. Hannibal gave him the honor of a public funeral.

2. **TIBERIUS SEMPRONIUS GRACCHUS** (c.210 B.C.-?), statesman and general. As a young man, he served on the staff of the consul L. Cornelius Scipio in Greece (190); was tribune plebis in 187; prætor in 181 in Spain, where by his tact and justice he brought the wild Celtiberian tribes under Roman control; consul in 177. He crushed a formidable revolt in Sardinia and returned to celebrate his triumph with large numbers of captives. As censor, in 169 he constructed the Basilica Sempronia, near the Roman Forum. He was special envoy in Asia Minor in 164 and consul again in 163 and established friendly relations between the Romans and some of the native rulers there. The year of his death is not known. He married Cornelia (q.v.), daughter of P. Scipio Africanus, by whom he had 12 children, all of whom died young but three—two sons, the famous Gracchi, and a daughter.

3. **TIBERIUS SEMPRONIUS GRACCHUS**, son of the preceding (c.163-133 B.C.). Tiberius and his brother Gaius (see below) were brought up under the special care of their mother, Cornelia,

since their father died when they were very young. Tiberius had his first military experience in Africa, on the staff of his brother-in-law, Scipio Africanus the Younger, and took part in the capture and destruction of Carthage (146), on which occasion he is said to have been the first Roman to scale the city wall. In 137 he acted as questor to the army of the consul Gaius Hostilius Mancinus in Spain; the people of Numantia would treat with no other Roman than the son of their former benefactor. (See 2, above.) He was thus enabled to save from utter destruction an army of 20,000 Romans, who had been defeated and were at the mercy of the Numantines. But the peace was considered disgraceful by the aristocratic (senatorial) party at Rome and was repudiated. On their return to Rome the consul Mancinus was disgraced, as being wholly responsible, but Tiberius was held in high esteem by the populace, who saw in him a champion of justice. His interest in the cause of the common people was roused by the sight of the vast estates of wealthy Romans worked by gangs of slaves, while the poor free citizens had neither land nor means of employment. He determined to dedicate himself to the reform of this deplorable state of things and became a candidate for the tribuneship, to which he was elected in 133. The bill which Tiberius, as tribune, now proposed involved a renewing of the Licinian Rogations (q.v.; see also AGRARIAN LAWS), with many modifications designed to lighten the hardships of those who in good faith or profiting by the laxness of a century or more had acquired "title" to the public domain. Such a bill was to be submitted to the vote of the people, tribe by tribe, in the *comitia tributa*. (See COMITIA.) Its popularity was manifest, and its passage was assured, when the opposition found a means to block its way, at least temporarily. One of the tribunes, Cæcina, was induced to put a veto on the measure, and the veto of a tribune overweighed even the voice of the tribes themselves. Tiberius was forced to impeach the tribune, an unheard-of measure and one which laid him open to the charge of unconstitutionality. The *comitia tributa*, however, voted to depose Cæcina, and the obstacle was removed. The bill was thus passed, and a committee of three (*triumviri*), consisting of Tiberius himself, his brother Gaius, and Appius Claudius, was appointed to carry out its provisions. Not content with the aid given to small farmers by his new law, Tiberius now devised further means of aiding them to begin life with live stock and implements. He suggested that the wealth bequeathed to the Roman people by Attalus III (q.v.), King of Pergamum, should be devoted to this purpose. When the term of his tribuneship came to an end, he presented himself again for the office, as a measure of self-defense, though this was most unusual. The election took place in June, when the mass of his supporters were busy in the country, and when everything was favorable to the intrigues of his opponents. Partisan feeling ran very high, threats and calumnies were rife, and the election was marked by terrible riots, in one of which Tiberius himself was killed.

4. **GAIUS SEMPRONIUS GRACCHUS**, younger brother of the preceding (169-121 B.C.). When Tiberius was murdered, Gaius was serving with the army in Spain, under his brother-in-law, the younger Scipio Africanus. He returned to Rome a year or two later, but took no part in

public affairs other than to deliver speeches in court, where his eloquence met with telling effect. Upon attaining the quaestorship (126), he went with the army, under the consul L. Aurelius Orestes, to Sardinia, then in revolt. He had a strong feeling that he should return to Rome to avenge his brother's death and take up his work, and it is said that in his dreams Tiberius' shade appeared and urged him on. Accordingly, when the Senate, to keep him longer away from Rome, extended his term as quaestor, he left Sardinia unexpectedly and went to Rome, to the discomfiture of his enemies and political opponents, who feared him and did not hesitate to resort to persecution and groundless accusations. Gaius stood for the tribuneship, and was elected in 123. He now renewed the enforcement of his brother's laws, which had gradually been allowed to lapse, and carried out important legislation—drafted in the interest of the people as opposed to that of the Senate and the nobles. To develop the resources of Italy and at the same time to employ the poor, he made new roads throughout all parts of the country, repaired old ones, and erected milestones. He had a law passed entitling every citizen who resided in Rome to grain at half price; made service in the army far less burdensome; had 6000 colonists sent out to found a colony on the site of Carthage; and aimed to diminish the power of the Senate and correspondingly to increase that of the *equites* (see EQUESTRIAN ORDER), especially by carrying laws which provided that jurors in trials of provincial governors for extortion should be chosen from the *equites*, not, as before, by the Senate, and that the gathering of the taxes of the new Province of Asia should be let out to the *publicani* (q.v.), who were *equites*. He was reelected tribune in 122, with his friend and supporter, the ex-consul Fulvius Flaccus, among his colleagues. He now proposed a measure for the extension of the Roman franchise to all the Latins, offering at the same time "Latin franchise" to all the Italian allies of Rome. The aristocratic party, finding it impossible to check his reforms by open opposition, had recourse to the trick of offering in bad faith still greater advantages through M. Livius Drusus, thus undermining Gaius's influence with the people. Events drifted into civil war. Gaius's bitter enemy, L. Opimius, became consul; Gaius failed to gain the tribuneship the third time. Gaius Gracchus and Fulvius Flaccus were now deserted by most of their supporters; they were compelled to take refuge on the Aventine Hill. Negotiations proved of no avail. Flaccus and his eldest son were murdered, and Gaius, trying in vain to escape across to the Janiculum, seeing all hope gone, ordered his slave to kill him, who then also killed himself (121). For the careers of Tiberius and Gaius, consult their lives by Plutarch; Beesly, *The Gracchi, Marius and Sulla* (London, 1878); Mommsen, *History of Rome*, vol. iv (Eng. trans., New York, 1903-05); Meyer, *Untersuchungen zur Geschichte der Gracchen* (Halle, 1894); Greenidge, *History of Rome*, vol. i (London, 1904); Fowler, in *English Historical Review* (ib., 1905); Oman, *Seven Roman Statesmen of the Later Republic* (ib., 1902). For the family in general and for the ancient authorities, consult Nitzsch, *Die Gracchen und ihre nächsten Vorgänger* (Berlin, 1847), and Long, *Decline of the Roman Republic* (5 vols., London, 1864-74).

GRACE (from Lat. *gratia*, favor). An expression frequently used in the Scripture and theological discussion. Its distinctive meaning is the idea of free and unmerited favor. It is a benefit springing out of the liberality and free-heartedness of the giver, bestowed irrespective of the worth of its object. Applied to God in the Old Testament, it is His favor primarily to the Hebrew race, in the later books to individuals. The New Testament extends the application of grace to all men, without regard to race. St. Paul differentiates grace as the free gift of God, which man receives by faith. Theologians have distinguished grace into *common* or *general* and *special* or *particular*. Common grace is employed to denote the love which God has to all His creatures, and the light of nature and of conscience which they all enjoy. Special grace is the outflow of the love of God for lost sinners, by which He brings them to repentance and saves them. This special or saving grace is sometimes also divided in various ways and spoken of as *selecting*, *justifying*, *sanctifying* grace; also, in respect of man, as *imputed* or *inherent* grace—the grace, i.e., of Christ's righteousness imputed or reckoned to the account of those who believe on Him, and the grace of holy and pious dispositions wrought in the heart by the spirit of God.

In theology grace is a supernatural gift of God by which man is enabled to choose the right and so to find salvation. Protestant theology thinks of this grace as being manifested in Christ; Catholic theology, as manifested in Christ but dispensed by the Church, especially in the sacraments. Both regarded it as the direct act of God upon the hearts of men. The Augustinian and Calvinistic theology regarded grace as the supernatural origin of all man's good choices; Pelagian and Arminian theology, as coöperating with man's own good choices, and as necessary for the development of righteous character. For the *covenant of grace*, see COVENANT. For the history of the doctrine to the Reformation, consult Harnack, *History of Dogma* (Boston, 1894-1900); for the Catholic doctrine, Lépiciér, *De Gratia* (Paris, 1907); Ligouri, *Opera Dogmatica*, ed. by Walter (New York, 1903); for the Protestant doctrine, Robinson, *Christian Doctrine of Man* (Edinburgh, 1911), and manuals of theology.

GRACE, DAYS OF. A period allowed for the payment of a negotiable instrument, as a bill of exchange or promissory note, in addition to the time named in the paper itself. As the expression indicates, this additional period was formerly a matter of indulgence or favor on the part of the holder, but it has long been recognized by the courts as a matter of right. Chief Justice Marshall declared, nearly a century ago, that "the allowance of days of grace is a usage which pervades the whole commercial world. It is now universally understood to enter into every bill or note of a mercantile character and to form so completely a part of the contract that the bill does not become due, in fact or in law, on the day mentioned on its face, but on the last day of grace." Paper payable on demand has always formed an exception to this rule; and days of grace have been abolished by statute in several European countries and in most of the United States. Where days of grace are still recognized, the period allowed varies in different countries from 3 to 30. In Great Britain, and generally in this country, the num-

ber is three. Accordingly if a bill or note is dated February 1 and is payable three months after date, it matures May 4: that, and not May 1, is the day on which to demand payment and on which it is dishonored by nonpayment. If the last day of grace falls on Sunday or a bank holiday, the paper generally falls due on the second day of grace. The number of days to which a bill or note is entitled depends on the law of the place where it is payable, not of that where it is drawn, made, or indorsed. Consult the authorities referred to under NEGOTIABLE INSTRUMENT.

GRACE, WILLIAM RUSSELL (1832-1904). An American merchant and politician, born at Queenstown, County Cork, Ireland. He ran away from home when 14 years old and worked his way on a sailing ship to New York City. In 1850 he went to Callao, Peru, where he became a clerk in the firm of Bryce & Co., shippers and commission merchants. Two years later he was admitted to partnership and finally became the leading member of the firm, the name of which was changed to Grace Bros. & Co. He returned to New York in 1865 and organized the firm of W. R. Grace & Co., to trade with South and Central America, and in 1891 established the New York and Pacific Steamship Company. He was elected mayor of New York on the Democratic ticket in 1880 and again in 1884. He established Grace Institute in New York in 1897.

GRACE ABOUNDING TO THE CHIEF OF SINNERS. A work by John Bunyan, written in prison and published in 1666. It is autobiographical and one of the three great works on which this author's reputation rests.

GRACE NOTES. Mere embellishments, not essential to either the melody or harmony of a composition. They are called for by special signs or are written in notes of smaller type. During the sixteenth and seventeenth centuries the introduction of grace notes was left chiefly to the intelligence and taste of the performers. But this led to the abuse of overloading a composition by means of useless and often tasteless ornaments, so that J. S. Bach did not leave them to the performers, but took great pains in writing out in detail whatever embellishments he wished. Since Beethoven all grace notes are written by the composer. Although the original function of these embellishments was merely to render a composition more "elegant" and they can be left out without detriment to the music, Chopin completely revolutionized the employment of grace notes by using them in a novel and entirely original manner, so that in his works they become a means of deep emotional and artistic expression. In Chopin's compositions the grace notes form an essential part and cannot be altered or omitted without seriously affecting the character of his music. See APPOGGIATURA; ARPEGGIO; TRILL.

GRACES (Lat. *Gratiae*, Gk. *Χάρεις*, *Charites*). In Greek mythology, originally goddesses of heavenly light, who bring fertility to the fields and joy to men; later, the personification of grace and charm. (See **CHARIS**; **CHARITES**.) Like all such divinities, they are at first anonymous and of varying number, and this is reflected in the local variations in their cult and names throughout Greece. At Orchomenus in Boeotia they had a very venerable shrine, where they were worshiped under the form of three stones, said to have fallen from heaven. In Hesiod we find them called Aglaia (Brightness),

Euphrosyne (Joy), and Thalia (Bloom). These names attached themselves to the Orchomenian cult and later spread through Greece. At Sparta the Graces were two in number, Kleta (Noise, Fame), and Phaëna (Brightness), and the same number seems original at Athens, where the names were Auxo (Increase) and Hegemone (Queen); later Thallo, originally one of the Horæ (q.v.), was joined with them, and this triad appears in the oath taken by the Athenian *ephebi* (see **EPHEBUS**). Their early connection with the bloom of nature was soon obscured by the conception of them as goddesses of the joy of life and beauty, present at the dances and the feasts of the gods and closely joined with Hera, as marriage goddess, and above all with Aphrodite. The legend represented them as daughters of Zeus and Eurynome. In art the triad prevails, and until the end of the fourth century they always appear fully draped. In the third century the growing connection with Aphrodite leads to a change; they now appear slightly draped or wholly nude, and usually embracing one another or clasping hands. To the Romans the *Gratiae* were not really deities, but rather artistic abstractions borrowed from the Greeks by poets and others.

Bibliography. Krause, *Musen, Gratien, Horen, und Nymphen* (Halle, 1871); Usener, *Götternamen* (Bonn, 1896); Furtwängler in Roscher, *Lexikon der griechischen und römischen Mythologie* (Leipzig, 1884-86); Preller-Robert, *Griechische Mythologie* (Berlin, 1894); Escher, in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. iii (Stuttgart, 1899), very full references. For the view that there were three Charites at Athens, consult Robert, "De *Gratiis Atticis*," in *Commentationes in Honorem Mommseni* (Berlin, 1877).

GRACIÁN, grā'thyān', BALTASAR (1601-1658). A Spanish author, born near Calatayud, Aragon. He was a Jesuit preacher, and he became rector of the College of Tarragona. His works were often published under the name of his brother Lorenzo. *La agudeza, y arte de ingenio* (1642) was a book which had a great vogue in its day and influenced an entire school of followers called Gracianists. Gracián belonged to the cult of Euphuists; his style was obscure and affected, but he was a keen observer and at times a powerful writer. Schopenhauer, who translated Gracián's *Oráculo manual* (Maxims of Conduct) into German, calls his *El crítico* (1650-53) "one of the best books in the world." His other works are: *El héroe* (1630); *El discreto* (1645); *El político Don Fernando el Católico* (1640). Consult Borinski, *Baltasar Gracián und die Hoflitteratur in Deutschland* (Halle, 1894); *Biblioteca de autores españoles*, vol. lxx (Madrid, 1873).

GRACIOSO, grā'thé-ŏ'sō. A stock comedy character in sixteenth and seventeenth century Spanish drama, similar to the euphuistic and "fantastical" knight of the Elizabethan stage. The type originated with Lope de Vega.

GRACKLE, grāk'l (from Lat. *graculus*, *graculus*, jackdaw, onomatopoeic in origin). A kind of bird. 1. In America, a blackbird of the genus *Quiscalus* or the genus *Euphagus* of the family Icteridae. (See **BLACKBIRD**.) The best known of those is the purple grackle, or "crow blackbird" (*Quiscalus quiscula*), which is found throughout the United States as far as Dakota and thence northwestward to Alaska. It is about 12 inches long, and the male is uniform glossy

black with metallic reflections. A larger species, recently removed from this genus, is the boat-tail (*Megaquiscalus major*), and a Mexican grackle is distinguished by having a disproportionately long tail. Well-known species of the other genus are the widely distributed rusty grackle (*Euphagus carolinus*), 9 inches long, the male dead black; and Brewer's (*Euphagus cyanocephalus*), of the Rocky Mountain region, which is a uniform glossy, greenish black, the head and neck glossy violet black. In all species the females and young are gray or brownish, more or less streaked. These birds have all the characteristics described under BLACKBIRD. See Plate of BLACKBIRDS, and Colored Plate of EGGS OF SONG BIRDS.

2. In the Old World the name is given to various birds of the starling family (Sturnidæ) and myna family (Eulabetidæ), of the genera *Acridotheres*, *Eulabes*, etc. The Linnæan genus *Gracula* is difficult of definition and is passing out of use. Most of the Indian birds called "grackles" are better known as mynas, or hill mynas. See HILL MYNA; MYNA BIRD.

GRADATION. A term that has been introduced into geology to describe the work of streams in leveling off an irregular land surface. This work is effected by erosion within the upper reaches of the rivers, where the hilly or mountainous topography gives a rapid flow and thus considerable erosive power to the streams, and by sedimentation along the lower or flood-plain sections, where the velocity is relatively slow. The final result is to produce a flat surface with a gentle slope that is neither being eroded (degraded) nor built up (aggraded) and that is then known as a base-leveled plain. See EROSION; GEOLOGY.

GRADE CROSSING. The intersection of a railroad track or right of way with a highway or private road or another railroad. The corresponding phrase in England is "level crossing." It is the duty of a person using the highway or private road at such crossing to exercise due care in looking and listening for approaching trains. What amounts to due care depends largely upon the facts of each case, such as the distance which the traveler can see along the track, the ease with which he can traverse the crossing or retreat from a point of danger, and the signals which are given by the road. On the other hand, the railroad is also bound to exercise due care in warning travelers of the approach of its trains and in attempting to avoid collision with those using the crossing. In the absence of a statute or ordinance requiring gates or guardsmen at crossings, failure to supply them is not negligence on the part of the company. Acts of Parliament require all English railroads to maintain gates at level crossings, with proper persons to open and close them; to slacken speed to 4 miles an hour at such crossings adjoining a station and prohibit shunting at such crossings. It is also their duty to keep level crossings in proper repair and to open gates promptly for travelers. Similar statutes exist in many of the United States. Even though a railroad company fails to do its duty at a grade crossing, it will not generally be liable in damages to a person whose injury is not solely due to such failure, but is due in part to his own carelessness. He is not entitled to recover if his own negligence contributed to the accident. See NEGLIGENCE; CARRIER, COMMON; RAILWAYS, and the authorities there cited.

GRÄDENER, grä'de-nēr, HERMANN (1844-). An Austrian musician, a son of Karl Grädener. He was born at Kiel. After studying with his father he attended the Vienna Conservatory. He taught violin at several music schools of Vienna and in 1899 began to lecture on harmony and counterpoint at the university there. He is also conductor of the Vienna Singakademie. He has written a number of meritorious compositions for orchestra, chamber music, and pianoforte.

GRÄDENER, KARL (1812-83). A German musician, born at Rostock. After studying music under the violoncellist Mattstadt and others, he was engaged at Helsingfors and subsequently at Kiel, where for 10 years he was director of music at the university. From 1851 to 1861 he conducted the singing academy which he had founded at Hamburg. After an association of three years with the Vienna Conservatory he was appointed president of the Tonkünstler-Verein of Hamburg. His excellent choral works include the oratorio *Johannes der Täufer*. His other compositions, which are distinguished by fine harmonic effects, include two symphonies, the overture to *Fiesco*, a pianoforte concerto, and considerable chamber music.

GRADENIGO, grä'da-nē'gō, PIETRO (1249-1311). Doge of Venice, elected in 1289. Under him the law was passed suppressing election for the recruitment of the Council of Forty and leaving to the aristocracy the choice of its members. Gradenigo was involved in various wars, especially against the Genoese (1294-99), and was uniformly unsuccessful. In 1310 he defeated the conspiracy of the Tiepoli. See VENICE.

GRAD'GRIND, THOMAS. A thoroughly practical utilitarian in Dickens's *Hard Times*.

GRADISCA, grā-dis'ká. A town of Austria in the coast district of Görz and Gradisca, on the right bank of the Isonzo, near the Italian frontier, about 30 miles northwest of Trieste. It has an ancient citadel (now a reformatory), a large silk mill, an emery factory, and large electric works. The old fortifications have been destroyed and replaced by fine squares and promenades. Pop. (town), 1890, 3352; 1900, 3843; (district), 1900, 31,230; 1910, 34,155. Gradisca was the capital of the old County of Gradisca.

GRADUAL. 1. In the liturgy of the Roman and other western churches, that portion of the mass which intervenes between the epistle and the gospel and consists of a few verses of the Holy Scriptures, generally taken from the Psalms. It is the oldest and most important of the chants of the mass and represents the singing of Psalms in the early Church. It was originally called the "Responsum," or "Cantus Responsorius"; but, probably for the sake of distinguishing it from other portions of the service called by the same name, its present appellation has been substituted. The name is derived from the place at which this response was chanted, and which was either the ambo, or chanting pulpit, which is approached by steps (*gradus*), or the steps themselves, whether of the ambo or of the altar. Originally, as we find from St. Augustine, the gradual consisted of an entire Psalm, and in the mass of the first Sunday in Lent the entire Ninety-first (Ninetieth in the Vulgate) Psalm is chanted. In the Ambrosian liturgy the gradual is partly from the Old and partly from the New Testament.

The gradual, in the Roman liturgy, is always followed by the "Alleluia," except in penitential time, when a slow and mournful chant, called the "tract," is substituted. In Eastertide, from Easter to Pentecost, it is displaced by "the great Alleluia." 2. The liturgical book which contains the music of the part of the mass sung by the choir. The official editions now current were published at Regensburg by the Congregation of Rites, folio in 1872, octavo in 1877. Consult Atchley, *Ordo Romanus Primus* (London, 1905), and Nikel, *Geschichte der Katholischen Kirchenmusik* (Breslau, 1908).

GRADUAL PSALM, **PSALM OF THE STEPS**, or **SONG OF DEGREES** (Heb. *shir hamma'aloth*, Gk. *ὕμν ἀναβαθμῶν*, *ōdē anabathmōn*, Lat. *canticum graduum*, song of the steps). A name given both by the Hebrews and in the Christian service books to each of the 15 Psalms, cxx-cxxxiv (in the Vulgate cxix-cxxxiii). The origin of the name is uncertain. In rabbinical literature it is traced to a legendary incident connected with the building of the second temple, or explained as an allusion to the 15 steps by which the temple was reached (Ezek. xl. 22 et seq.). These Psalms have been connected either with the "going up" from Babylon to Jerusalem or with the "ascent" of the temple mount. The latter is the more plausible opinion. The Psalms are "pilgrim's songs," and the contents, though reflecting political and religious conditions of various periods, all emphasize the longing of the pious Israelite for Yahwe's temple or express his joy upon beholding it. The composition of the entire series belongs to the post-exilic period of Hebrew literature. They are not the work of a single hand, nor were they produced at a single time, being united, simply by the same heading attached to each one. They form a special title, Pilgrim Psalter, the title of which should probably be translated "Songs of Ascent," and which ultimately found a place in the fifth division of the completed Psalter. These Psalms in the Roman Catholic church are recited on each Wednesday in Lent. See **PSALMS**.

GRADUATION (ML. *graduatio*, from *graduire*, to give a degree, from Lat. *gradus*, degree, step, from *gradi*, to walk). The art of laying off scales of measurements, as the tape, protractor (q.v.), or vernier (q.v.). The simplest problem in graduation is the dividing of a straight line, such as the linear scale, or rule. Standard scales being abundant, it is only necessary to make a careful copy of an original. If the material used is wood or iron, the divisions may be marked off by the use of a dividing square and knife-edge. The dividing square is simply a piece of steel in the form of an L, one arm of which may be moved from one division of the scale to another, while the other arm serves to guide the knife in marking the new scale. The original graduation of linear scales into equal divisions was performed either on the principle of bisection or of "stepping." In the case of bisection, beam or extension compasses (see **COMPASSES**) serve to describe an arc from each end of the line to be graduated, so as to locate the bisection point. The two arcs drawn by the compasses cannot be made to touch with sufficient precision for accurate dividing. The small interval between the arcs may be divided by the aid of a microscope and delicate compasses, thus approaching more nearly the bisection point of the original line. In the same way each segment may be divided

again, and so on. It is evident that all divisions cannot be effected by bisection; hence such instruments as the diagonal scale (q.v.) are employed. "Stepping" is performed with delicately pointed compasses, which are adjusted as nearly as possible to the length of a required division. Beginning at one end of the line the compasses are turned round each leg alternately until the whole line is stepped off. If the last step falls short of or beyond the end the compasses are adjusted accordingly, and the process is repeated until the desired accuracy is attained. The method of bisection is more accurate in practice and was adopted by Graham (1725), Bird (1767), Ramsden, Troughton (1800), and other eminent instrument makers in original graduation. Curve lines may also be graduated on this principle. Since the chord of an arc of 60° is equal to the radius of the circle, the circumference may be divided into six equal parts with a precision depending only on the delicacy of the instruments. Further division depends upon bisection. The amount of care, patience, skill, and delicacy of touch required in the original graduation of important astronomical instruments is such that comparatively few men have been found competent for the task, and these have been almost as famous as the astronomers who have successfully used the instruments. The necessity of extreme accuracy in graduating a scale will be understood by considering the application that is made of these divisions. The mariner, e.g., determines his latitude by taking the meridian altitude of the sun. For this purpose he uses a sextant, the arc of whose limb corresponds to the curved surface of the globe. Whence the real error in latitude bears the same ratio to an error in the scale that the earth's radius bears to the radius of the arc. If each degree occupied an arc of $\frac{1}{4}$ of an inch, an error of $\frac{1}{100}$ of an inch in a division would thus mislead the mariner to an extent of more than 4 statute miles as regards his position at sea. But a ship's quadrant is a rude instrument compared with astronomical transits for measuring celestial angular distances by means of a divided arc; in these a deviation of a thousandth part of an inch is regarded as a serious error.

The methods of original graduation above described are used only for the largest and most important astronomical or geodetic instruments. Ordinary instruments are graduated by dividing plates or engines which copy and adapt a standard set of divisions. The dividing plate which is used for common purposes, such as dividing compass rings, theodolites, and sextants, is a divided circle with a straightedge, made movable on the axis or arbor of the plate in such a manner that its edge during every part of its revolution shall fall in the exact line from centre to circumference. The ring, protractor, or other instrument to be divided is clamped upon the plate with its centre exactly coinciding with that of the plate, and the straightedge is moved round and made to halt at the required divisions on the circumference of the dividing plate; and by using the steel straightedge as a guide corresponding divisions are marked off upon the concentric arc of the instrument to be divided. The dividing engine is a very complex machine, requiring the greatest accuracy and care in its construction. Among the styles of dividing engines may be mentioned the English types of Ramsden (1777), Troughton (1793), Simms,

and Ross, the German types of Reichenbach and the French type of Gambey. A detailed account of these would far exceed the limits of this article. Their principal parts consist of a large toothed circle, graduated with extreme care by original division; a very carefully constructed endless screw works in these teeth and is moved through any given number of revolutions, or any measured fraction of a revolution, by means of a treadle or other suitable power, thus making the requisite steps for each division, another part of the machine cutting a fine line at the moment of the halt of each step. These divisions are cut upon an arc of silver, gold, or platinum, which is soldered or inlaid upon the limb of the instrument, the precious metals being used on account of the oxidation to which common metals are liable.

Bird, *Method of Dividing Astronomical Instruments* (London, 1767); Ramsden, *Description of an Engine for Dividing Mathematical Instruments* (ib., 1777); "Memoir" of Troughton, in *Philosophical Transactions* (ib., 1809); a treatise on dividing scientific instruments, in the *Edinburgh Encyclopædia* (Edinburgh, 1832); Ambrom, *Astronomische Instrumentenkunde* (Leipzig, 1899). For history of efforts at graduation and notes on the modern methods, consult Watkins, "The Ramsden Dividing Engine," in *Smithsonian Report* (Washington, 1890).

GRADUS AD PARNASSUM (Lat., steps to Parnassus). 1. A name applied to a Latin or Greek dictionary, in which the vowel quantities are marked, and which hence is useful in verse composition. The first Latin Gradus was made in 1702 by the Jesuit Paul Aler; another, in 1850, was compiled by Yonge. In Greek we have a Gradus by the Bishop of Durham (1815) and another by Brasse (1828). 2. The name was also used as the title of a Latin work on composition and counterpoint by J. J. Fux (1725), and of a French work on the art of piano playing by Clementi (1817).

GRADY, HENRY WOODFIN (1851-89). An American journalist and orator. He was born at Athens, Ga., 1851, and after being educated at the University of Georgia at Athens, he began his work as a journalist in a series of letters on the resources of his native State, which attracted much attention. In 1880 he purchased an interest in, and became editor of, the *Atlanta Constitution*, in which position he remained until his death. A public hospital and a monument in Atlanta commemorate his services, which were especially influential on account of the fact that Mr. Grady was one of the first prominent representatives of the New South to express the willingness of that generation and section to throw in their lot with the rest of the nation. For his life, consult Lee (New York, 1896), in which also some of his speeches and articles are included; and, for his speeches, *Complete Orations* (Austin, Tex., 1910), ed. by E. DuB. Shurter.

GRADY, THOMAS FRANCIS (1853-1912). An American lawyer and politician, born in New York City. He was educated in the parochial schools and in Manhattan College, studied law, and held several city positions. Soon after joining Tammany Hall he was elected a member of the State Assembly, and in 1881 a member of the State Senate. As a result of his opposition to the measures desired by Grover Cleveland, then Governor of New York, he lost his

seat in the Senate. But having supported Cleveland for the presidency in 1888, in the following year he returned to the State Senate. There he was minority leader of the Democrats for 10 years, but was refused the position of majority leader when the Democrats came into power in 1910. Grady was regarded as the foremost orator connected with Tammany Hall. He opposed most of the reform measures advocated while he was in the Legislature.

GRÆÆE, gr'æ (Lat., from Gk. Γραῖα, *Graiai*, from γραία, *graiā*, old woman). Dino, Enyo, and Pephredo, daughters of Phoreys and Ceto, thence called Phoreydes. Sisters and guardians of the Gorgons (see GORGON), they are described by Hesiod (q.v.) as fair-faced, gray-haired from birth, and possessing between them but a single eye and tooth, which they had to use in turn. Perseus (q.v.) craftily stole the eye and the tooth and restored them only when the Grææ instructed him how to procure the articles by aid of which he was to behead Medusa.

GRAEBE, gr'æbe, KARL (1841-). A German industrial chemist, born in Frankfurt-on-the-Main. He was educated in the Karlsruhe technical school and at the universities of Heidelberg, Marburg, and Berlin, and was an assistant of Bunsen and Baeyer, lecturer at Leipzig in 1869, professor at Königsberg in 1870, and from 1878 to his retirement in 1906 at Geneva. In 1868, with Liebermann, he discovered an artificial method (which they, and independently Perkin, later improved and cheapened) of producing alizarin from anthracene—the most important early synthesis of coal-tar products. His technical papers are in Liebig's *Annalen* and the *Berichte* of the Deutsche Chemische Gesellschaft, and his *Untersuchungen über Chinone* were edited in 1911 by Decker.

GRÆCOSTASIS (Lat., from Gk. Γραῖκostas, *Graikostasis*, Greek place). A raised platform, without a roof, west of the rostra in the forum at Rome. It served as the place of assembly for foreign ambassadors, who there awaited the summons to appear before the Roman Senate. Thence, also, they could witness the assemblies of the people. Consult Connor, "The Græcostasis of the Roman Forum and its Vicinity," in *University of Wisconsin Bulletin*, pp. 150-203 (1904).

GRÆCO-TURKISH WAR OF 1897. See GREECE, *History*.

GRÆFE, gr'æfe, ALBRECHT VON (1828-70). A German ophthalmologist. He was born in Berlin, where his father, Karl Ferdinand von Graefe, a noted surgeon, held a professorship at the university. Graefe took his medical degree in Berlin in 1847 and then made a special study of ophthalmology in Prague, Vienna, Paris, and London. In 1850 he returned to Berlin and founded there a private hospital for diseases of the eye. By means of his investigations and his success in difficult operations, he soon became recognized as the leading authority in this branch of medical science. He founded in 1855 the *Archiv für Ophthalmologie* and was the author of numerous scientific monographs of great value. In 1857 he was made professor extraordinary, in 1866 ordinary professor, of diseases of the eye. Graefe may be regarded as the founder of modern ophthalmology. The invention of the ophthalmoscope by Helmholtz in 1851 opened up new possibilities to the science, of which Graefe hastened to take advantage. By use of the instrument he improved vastly

the methods of cure for glaucoma. He also introduced new operative methods in cases of strabismus, which established a favorable prognosis in many cases which until then had been considered hopeless. Graefe was also considered an authority on diseases of the brain and was the first to recognize the importance of diseases of the eye in the diagnosis of such cases. Consult: Michaelis, *Albrecht von Graefe, sein Leben und Wirken* (Berlin, 1877); Jacobson, *Albrecht von Graefes Verdienste um die neuere Ophthalmologie* (ib., 1885); Alfred Graefe, *Ein Wort zur Erinnerung an Albrecht von Graefe* (Halle, 1870).

GRAEFE, ALFRED KARL (1830-99). A German ophthalmologist, cousin of Albrecht von Graefe. He was born at Martinskirchen, studied medicine in various German universities and in Paris, acted as an assistant to Albrecht von Graefe in Berlin from 1854 to 1858, and from 1858 to 1892 was professor of diseases of the eye at Halle. He founded at Halle an ophthalmic hospital which attracted many thousands of patients, and devised a method of operating whereby, without injury to the eye, parasites deeply lodged in that organ could be removed. He wrote a number of papers on ophthalmology and published, in conjunction with Sümisch, *Handbuch der gesamten Augenheilkunde* (1874-80).

GRAESSE, gräs'se, JOHANN GEORG THEODOR (1814-85). A German antiquary and bibliographer, born at Grimma and educated at Leipzig. He was appointed director of the royal numismatic collection at Dresden (1878), from which position he retired in 1882. Graesse's most important writings are: *Lehrbuch einer allgemeinen Litterargeschichte* (1837-59); *Trésor de livres rares et précieux* (1858-60); a translation of the *Gesta Romanorum* (1842); an edition of the *Legenda Aurea* (1846); *Die Sage vom ewigen Juden* (1844); *Die Sage vom Ritter Tannhäuser* (1846); *Beiträge zur Litteratur und Sage des Mittelalters* (1850); *Geschlechts-, Namen- und Wappensagen des Adels deutscher Nation* (1876); *Des deutschen Landmanns Praktika* (1858); the very valuable guide to Latin geographical names, *Orbis Latinus* (1861); the guides and textbooks: *Handbuch der alten Numismatik* (1853); *Guide de l'amateur d'objets d'art et de curiosité* (2d ed., 1877); *Guide de l'amateur de porcelaines et de poteries* (9th ed., by Jännicke, 1901); and *Unsere Vor- und Taufnamen* (1875). In 1878 he began to edit a *Zeitschrift für Muscologie*.

GRAETZ, grêts, HEINRICH (1817-91). A prominent Jewish historian, born at Xions, Province of Posen. After an academic course at the universities of Berlin and Jena, where he graduated in 1845, he was for some time a preacher, but, finding himself unsuited for this career, devoted himself to teaching, and became an instructor at the Breslau Seminary in 1854. Here he remained until 1870, when he received a professorship at the University of Breslau. His principal work is the history entitled *Geschichte der Juden von den ältesten Zeiten bis auf die Gegenwart* (11 vols., 1853-75; popular ed., 1888-89). The work is skillfully arranged, and, although somewhat unequal in merit—the first four volumes being the best—it evidences minute research. It has been translated into Hebrew, Russian, French, English, and several other languages, and parts of it have been frequently reprinted.

GRAEVIUS, grá'vé-ús (originally GRÄVE, or GREFFE), **JOHANN (GEORG)** (1632-1703). A distinguished German philologist, born at Naumburg on the Saale, Jan. 20, 1632. He studied law at the University of Leipzig, but while on a visit to Holland was led to abandon jurisprudence for philology. In 1656 he was called to the University of Duisburg and two years later was summoned to Deventer. In 1662 he became professor at Utrecht, teaching at first rhetoric, but later history and political science. There he built up a great reputation and received flattering offers from several universities, all of which he declined. Pupils crowded to his lectures, not only from all Holland, but from all Europe. In Germany particularly the great noblemen sent their sons to be educated by him. He died at Utrecht, Jan. 11, 1703. During his life as a teacher he edited some classical authors, especially some of the works of Cicero, and also, in addition to other writing, compiled two monumental works: *Thesaurus Antiquitatum Romanarum* (12 vols., Utrecht, 1694-99) and *Thesaurus Antiquitatum et Historiarum Italiae* (9 vols., Leyden, 1704), completed by his pupil and biographer Burman. Consult Burman, *Oratio Funebris* (Utrecht, 1703), which contains a complete list of the works of Grævius, and Sandys, *History of Classical Scholarship*, vol. ii (Cambridge, 1908).

GRAF, gráf (Ger., count). In the early Middle Ages an Imperial or royal officer, like the *comes* of the Roman Empire, whose office gradually developed into an hereditary feudal grade. The word appears in English in its compounds, margrave, or marquise (*markgraf*), landgrave (*landgraf*), and burgrave (*burggraf*), and is used frequently in the simple German form. The graf, in all probability, was originally a fiscal officer, whose duty it was to collect the revenue of a district. The title first appears in the Lex Salica (compiled in the fifth century), under the Latinized form of *grafio*; at a later period the office is often designated by the Latin equivalent *comes*. Charles the Great divided his whole Empire into graf districts (*grafengau*), or counties, each of which was presided over by a graf. The people were in the habit of appointing a representative called the *centgraf* to attend to their interests with the graf, and probably, if necessary, to appeal from his decisions to the central government. Then there was the *stallgraf*, or stable graf, the *comes stabuli*, or constable of later times; the *pfalzgraf* (*comes palatii*), who presided in the domestic court of the monarch, which was the highest court in the realm; the *sondgraf*, who was sent as an extraordinary deputy of the King to control the ordinary *gaugrafen*; and lastly, the *markgraf*, or marquis, on whom the important duty of defending the borderlands devolved. Consult Waitz, *Deutsche Verfassungsgeschichte* (Berlin, 1874-85), and Brunner, *Deutsche Rechtsgeschichte*, vol. ii (Leipzig, 1892).

GRAF, ARTURO (1848-1913). An Italian poet and critic of German extraction, born at Athens and educated at the University of Naples. After lecturing at the University of Rome for several years, he was appointed to the chair of Italian literature at the University of Turin (1882). His publications include voluminous treatises on the history of art and literature, and the following poetic works: *Versi* (1874); *Poesie e novelle* (1876); *Medusa* (3d ed., 1890); *Dopo il tramonto, Versi* (1893); *Morgana* (1901); *Poemetti drammatici* (1906). Sadness

and a spirit of pessimism, combined, however, with a strong faith in science, are prevailing features of the poetry of Graf, who occupied a high rank among the recent poets of Italy. His critical writings are valuable, as, e.g., *A traverso il cinquecento*. He was one of the founders of the *Giornale storico della letteratura italiana*.

GRÄF, gräf, GUSTAV (1821-95). A German historical and portrait painter. He was born at Königsberg and studied with Hildebrandt and Schadow at Düsseldorf (1843-46). He then supplemented his studies in Antwerp, Paris, Munich, and Italy, and in 1852 settled in Berlin, where his first important work was the mural painting "Subjugation of Wittekind by Charlemagne," after Kaulbach's design, in the cupola saloon of the New Museum. Among several historical genre scenes of sterling technique which followed, the "Patriotism of Ferdinand von Schmettau, 1813" (1863, National Gallery, Berlin), deserves especial mention. He next devoted himself with great success to painting portraits, among the best of which are those of Field Marshal von Roon (1882, National Gallery, Berlin), Du Bois-Reymond (1886), and Robert Koch (1891). In 1868-70 he executed the fresco paintings, impersonating "Jurisprudence" (Solon), "Art" (Phidias), and "Eloquence" (Demosthenes), in the aula of the University at Königsberg. His more recent works include: "Prometheus and the Oceanids" (1886, Königsberg Museum); "Viking's Death" (1892); "Will o' the Wisp" (1893). He was professor and member of the Berlin Academy.

GRAF, gräf, KARL HEINRICH (1815-69). A German Orientalist, born at Mühlhausen in Alsace. He was educated in the school and college of his native place and then at the gymnasium and Protestant Seminary of Strassburg (1830-32) and in the university of that city. He devoted himself to Old Testament exegesis and Eastern linguistics under Bruck and Russ and studied later under Fleischer at Leipzig. In 1840 he became professor of French and Hebrew at Meissen. He retired in 1868. His biblical criticism was independent and liberal. He wrote: *Der Segen Moses, Deuter. 33* (1857); *Der Prophet Jeremia erklärt* (1862); *Die geschichtlichen Bücher des alten Testaments* (1866). But his work in Persian, especially on the poet Sadi, is better known and more important. It includes: *Moslicheddin Sadis Rosengarten . . . übersetzt mit Anmerkungen* (1846); *Sadis Lustgarten* (1850); *Sadi: Ic Boustan, texte persan avec un commentaire persan* (1858); "Die Moral des Sadi," in Reuss and Cunitz, *Beiträge zu den theologischen Wissenschaften* (1851); and editions and translations of quatrains, distichs, elegies, and ghazals of Sadi in vols. ix, xiii, xv, and xviii of the *Zeitschrift der deutschen morgenländischen Gesellschaft*. Consult Cheyne, *Founders of Old Testament Criticism* (London, 1893).

GRÄFE, gräfe, KARL FERDINAND VON (1787-1840). A German surgeon. He was born at Warsaw, studied medicine and surgery at Halle and Leipzig, became professor of surgery and director of the surgical clinic at Berlin in 1811, and during Napoleon's Prussian campaign superintended the military hospitals. During the war he became in 1813 a surgeon general on the staff of the King of Prussia, and professor and finally (1822) vice director in the Academy of Medicine and Surgery at Berlin. He was the founder of the surgical clinic and the polyclinic

at Berlin, where his investigations and discoveries won for him a world-wide reputation. He was particularly well known for his autoplasmic operations, in which he applied new methods and made use of new instruments of his own invention, which revolutionized the existing method of treatment. Among his numerous published works are: *Rhinoplastik* (1818); *Die epidemisch-contagiose Augenblennorrhöe Aegyptens in den europäischen Befreiungsheeren* (1823), and the *Jahresberichte über das klinische chirurgisch-äugenärztliche Institut* (Berlin, 1817-34). With Ph. von Walther he edited the *Journal für Chirurgie und Augenheilkunde*.

GRÄFENBERG, gräfen-bërk. A village in Austrian Silesia, 37 miles west-northwest of Troppau. It is celebrated as the place where the water cure was introduced in 1826 by Priessnitz. It is annually visited by many hundreds of patients. Pop., 1100.

GRAFENBERG, gräfen-bërk, WIENT VON. See WIENT VON GRAFENBERG.

GRAFF, gräf, ANTON (1736-1813). A German portrait painter. He was born at Winterthur, Switzerland, and studied with Schellenberg in his native city. About 1776 he removed to Augsburg, then to Ansbach as assistant to the court painter Schneider. On his return to Augsburg he was associated with the line engraver Bause, a lifelong friendship which exercised great influence on his art. He practiced also at Munich and Ratisbon and in 1766 was called to Dresden as court painter and member of the Academy, becoming professor in 1789. Although he practiced also in Berlin and at Leipzig, Dresden remained his home. He painted many historical pieces and many copies of the old masters, but his portraits alone have permanent value. For he was the most prominent portraitist of the *Sturm und Drang* period in Germany, and depicted, with absolute fidelity to nature, the great men of his day—Lessing, Schiller, Wieland, Herder, Bürger, Gillert, Hörner, Gluck, Moses Mendelssohn, and the rest. His treatment is simple and unaffected, clear and plastic; the technique adroit and powerful. He is best represented in the galleries of Dresden with 23 pictures, and Leipzig with 13; also by good portraits in the galleries of Winterthur, Berlin, Weimar, and other German cities. See Plate of SCHILLER. Consult the monographs by Muther (Leipzig, 1881); Vogel, with 60 plates (ib., 1898); Waser, 40 plates (ib., 1903).

GRAFF, EBERHARD GOTTLIEB (1780-1841). A German philologist. He was born at Elbing, Prussia, and was educated at Königsberg, where he became professor of the German language in 1824. A pupil of Jacob Grimm and Lachmann, he followed in the footsteps of these eminent scholars and produced several philological works distinguished by careful research, such as his valuable contribution to Old High German, entitled *Althochdeutscher Sprachschatz* (6 vols., 1834-42); *Deutscha: Denkmäler deutscher Sprache und Literatur aus alten Handschriften* (1826-29); *Die althochdeutschen Präpositionen* (3 vols., 1824), besides numerous editions of Old German texts.

GRAFF, FREDERIC (1775-1847). An American hydraulic engineer, born in Philadelphia. He learned the trade of a carpenter and later became a skillful draftsman. He was an assistant to H. B. Latrobe in the construction of the first Philadelphia water works, becoming chief engineer and superintendent of the system in 1806.

Subsequently he planned and constructed the new city water works at Fairmount Park, introducing iron pipes and fire plugs and stopcocks of his own invention. The success of this system won for him a wide reputation, and he was a consulting engineer in the execution and expansion of similar works at New York, Boston, and numerous other cities. He remained in the service of the city of Philadelphia for 42 years. In 1885 he was president of the American Society of Civil Engineers.

GRAFF DE PANC SOVA, gräf de pän'chó-vá, LUDWIG (1851-). A Hungarian zoölogist, born in Pancsova. He was educated at Vienna, Graz, and Strassburg; was lecturer at Munich, professor at Aschaffenburg, and then professor at Graz. His important works, particularly on the planarians, include: *Das Genus Myxostoma, Monographie der Turbellarien* (1882-90); *Organization der Turbellaria Acoela* (1891); *Zoologie seit Darwin* (1896); *Parasitismus im Tierreich* (1907). He edited the valuable *Arbeiten aus der zoologischen Institut zu Graz*. Graff received honorary degrees from Cambridge and St. Andrews universities.

GRAFFENRIED, grä'fen-rät, CHRISTOPHER, BARON DE (?-1735). A Swiss nobleman, who established a colony of Swiss and Germans in North Carolina. In 1709 the Lords Proprietors of Carolina granted to him 10,000 acres on the Neuse and Cape Fear rivers, and soon afterward a large number of Palatines and Swiss followed him to the confluence of the Trent and Neuse, where they founded a town which they called New Bern in his honor—Bern, Switzerland, having been his birthplace. While he and Lawson, the surveyor-general of the province, were exploring the Neuse River in 1711, they were captured by the Tuscarora Indians, who had become incensed at the encroachments of the colonists, and Lawson was soon put to death, though Graffenried, after many weeks, was allowed to return on condition that no settlements should be made without the sanction of the native chiefs. Graffenried soon afterward sold his possessions in North America and returned to Switzerland.

GRAFFIGNY, gräffé'nyé, FRANÇOISE D'ISEMBOURG D'HAPPOUCOURT DE (1695-1758). A French author, born at Nancy. She was married when young to François Hugues de Graffigny, chamberlain to the Duke of Lorraine, from whom she obtained a separation. In 1738 she spent an unhappy few months with Madame du Châtelet, the friend of Voltaire, where she was accused of having stolen a copy of *La Pucelle*. She published her first novel in 1740, but it was not until her *Lettres d'une Péruvienne* (1747) appeared that she became famous in the society of her time. Her salon was a literary centre of Paris. In 1750 her drama *Cécile* was played with great success, but another comedy, *La fille d'Aristide* (1758), failed completely, and this, says the Abbé de Voisenon, hastened her death. Her complete works were published in 1788, and her letters (which give a most minute account of Voltaire's life at Cirey) under the title *Vie privée de Voltaire et de Madame du Châtelet*, in 1820 (reëdited with a biography, 1879). Consult Guerle, *Madame de Graffigny* (Nancy, 1882).

GRAFFITI, gräf-fé'té (It., writings, scribbles). An interesting and important class of ancient inscriptions. The graffito is a rude casual scribbling or scratching on the plaster of a wall, a pillar, or a doorpost. Such scribbles

are pretty commonly found on the substructions of Roman ruins, as in the golden house of Nero, and the palace of the Cæsars on the Palatine, and in still greater numbers in Pompeii and in the Roman catacombs. Their literary value, of course, is very slight; but, as illustrating the character and the habits of a certain class of the ancient Romans, and what may be called the "street life" of the classic period, they richly deserve study. They are also valuable for the light they throw on the forms of the alphabet in daily use, and the vulgarisms and the corruptions existing in the speech of the common people. The graffiti of Pompeii are far the most numerous and important, forming upward of one-half the inscriptions from that place. A few are in Greek, many in Oscan, but most of them are Latin. They include nominations to office, advertisements, caricatures, single names, words of greeting or abuse; but the favorite subject of the scribblers was love, often in verse, quoted, adapted, or original. Ovid and Propertius were favorites with the writers of graffiti at Pompeii. Lines of Vergil, too, appear. Some of the graffiti at Pompeii deal with the gladiatorial shows, giving rude drawings of kinds of gladiators, etc. That such scribbles were felt to be a nuisance is shown by an inscription found at Rome begging persons not to scribble on the walls. Of the Roman graffiti, the most famous is the one found on the Palatine, showing a man worshipping a cross on which is suspended a figure with the head of an ass; a Greek inscription says it is Alexamenus worshipping his god. Consult: Lanciani, *Ancient Rome in the Light of Recent Discoveries* (Boston, 1889); Kraus, *Das Spottcrucifix vom Palatin* (Freiburg, 1872); Wünsch, *Äthianische Verfluchungstafeln* (Leipzig, 1898). The interpretation of the scene as a parody of the Crucifixion, though generally accepted, is not certain: it is possibly the confession of Alexamenus of his membership in the Gnostic sect which worshiped Typhon-Set. The graffiti of Pompeii are collected by Garucci, in *Graffiti de Pompéi* (2d ed., Paris, 1856). Consult also Fiorelli, *Monumenta Epigraphica Pompeiana I* (Naples, 1854-56; 2d ed., giving the Oscan inscriptions, 1856); *Corpus Inscriptionum Latinarum*, vol. iv (Berlin, 1871; in 1909, 13 vols. of a new edition had been issued and 4 vols. of supplement); Mau-Kelsey, *Pompeii: Its Life and Art* (2d ed., New York, 1902); Thomas, *Roman Life under the Cæsars* (ib., 1899); Abbott, *Society and Politics in Ancient Rome* (ib., 1909). The later discoveries are scattered through periodicals or uncollected. For Rome, consult Corraa, "Graffiti di Roma," in *Bollettino della commissione municipale archeologica* (Rome, 1893 et seq.).

GRAFFLY, grä'fli, CHARLES (1862-). An American sculptor. He was born in Philadelphia and studied at the Pennsylvania Academy of Fine Arts under Thomas Eakins and later in Paris under Chapu and Dampé. Upon his return to America he settled in his native city, where his strong and thoughtful work earned for him a high rank in his profession. His modeling is firm and sure, without any attempts at bravura and with strict suppression of all unnecessary details and finish. A portrait bust of his is always marked by serious research into character, and no American sculptor has allowed his fancy as free a rein in imaginative works, often of mystic or allegorical significance. Such a work was the strange "Fountain of Man," at

the Pan-American Exposition, Buffalo (1901); and many of the small ideal bronzes, like the "Symbol of Life," for which he is famous. Grafty was elected a member (vice president, 1914) of the National Sculpture Society, of the National Academy of Design (1908), and of the National Institute of Arts and Letters. Among his many awards are the gold medal of the Pennsylvania Academy of Fine Arts and of the expositions of Paris (1900), Buffalo (1901), and Charleston (1902), and the George D. Widener gold medal (1913). Among his works in public collections are: "Mauvais Pré-sage," in the Detroit Museum; "Vulture of War," and a powerful decorative figure, "Truth," in the St. Louis Museum; "England" and "France," on the New York Custom House; a bust of Dædalus and a beautiful nude, "In Much Learning," Pennsylvania Academy; and the General Reynolds Smith Memorial, Philadelphia. Consult Taft, *History of American Sculpture* (New York, 1903).

GRAFSTRÖM, gräf'strēm, ANDERS ABRAHAM (1790-1870). A Swedish poet, born at Sundsvall. His poems won him the special prize from the Swedish Academy in 1825. Many of his songs are very popular and have been set to music by Nordblom. They were originally published in the journals of the day, but have been collected under the title *Samlade skaldestycken* (2 vols., 1864).

GRAFT HYBRIDS. It has long been known that the character of the stock influences to some extent the vigor and development of the scion, and it has also been supposed that new shoots from buds produced from the tissues at the point of union of stock and scion may be intermediate between the two and result in a *graft hybrid*. Several rather famous graft hybrids have been reported, such as the Bizzaria orange and *Cytisus adamii*, the latter from a scion of *C. purpureus* on *C. laburnum*; but closer examination has shown that neither is a true hybrid, but a more imperfect combination of the original species in which there has been no fusion of cells. Remarkable results have also been obtained from the union of the tomato (*Solanum lycopersicum*) and the nightshade (*S. nigrum*), plants that have proved excellent for such experiments. Most of the unions resulted in imperfect blendings, or *chimeras* (q.v.), but in a few instances a fusion of the cell contents seems to have taken place and true graft hybrids to have resulted. One such hybrid has been named *Solanum darwinianum*. See CHIMERA, IN PLANTS; HYBRIDITY.

GRAFTING (from OF. *graffe*, a sort of pencil; slip for grafting resembling a pointed pencil in shape, from Lat. *graphium*, from Gk. *γράφειν*, *grapheion*, pencil, graving chisel, from *γράφειν*, *graphein*, to write). The operation by which the cut surfaces of two branches or roots, either from two different plants or from the same plant, are caused to grow together. The portion used to perpetuate its kind is usually of the present or past season's growth and is called a scion. The portion into which the scion is inserted is termed the stock, and usually carries roots or is a part of a root, although in rare cases unrooted cuttings are used as stocks. The art of grafting has been practiced from prehistoric times. The success of the process depends entirely upon the ability of plants to heal wounds. When two wounded (cut) surfaces are so adjusted that the cambium layer

of one coincides at any point with the cambium layer of the other, union by granulation of the two surfaces may take place, connection between the conduction vessels of stock and scion becomes established (see CONDUCTION), and new growth begins. The great value of grafting consists in the ease and comparative certainty with which cultural varieties can be increased without serious loss of type characters. Were all forms of the art of grafting to be lost to the horticulturist, commercial tree-fruit growing in its high state of perfection would decay with the orchards existing at the time.

WHIP GRAFTING.

1, stock; 2, scion; 3, stock and scion adjusted.

All horticultural varieties or sorts of fruits that belong to the pome, the drupe, or the citrus classes are now multiplied almost wholly by graftage, which includes both budding and grafting. This art and that of cuttage are the foundations of the entire superstructure of tree-fruit growing. The progress in plant breeding and the great rapidity with which new sorts are now disseminated have been largely, and with tree fruits almost wholly, attained by the aid of graftage and cuttage. Graftage permits the originator of a new sort of apples, e.g., to disseminate the variety with the minimum of risk that it will depart from the type, thus avoiding the difficulty, nay, almost impossibility, of reproducing the type from seed. The method of reproducing the sort does not enter as a factor in his efforts to secure a desired variation. Besides being used for reproduction true to type, grafting is used to hasten or to increase fruitfulness; to replace undesirable varieties by desirable ones; to reduce the size of plants by working them on a smaller-growing species of stock, e.g., the pear upon the quince; to overcome the effects of injuries, as in the case of trunk girdling by mice or rabbits. The wood for scions, like that for hardwood cuttings, must be taken while in a resting condition. The time usually considered best is after the leaves have fallen, but before severe freezing begins in early winter. The scions are then tied in branches and buried in

moist soil or sand, where they will not freeze, but will be kept cold enough to prevent swelling of the buds. Good results often follow the cutting of scions in the spring, just before or at the time the grafting is to be done.

The two most popular methods of grafting are the whip and the cleft. For *whip grafting* of roots the scions should be cut in the autumn, because spring cutting allows insufficient time for the union of the two surfaces before growth starts. This style of grafting is the one most extensively used in root grafting. It is well suited to young plants or parts of plants used as stock, and to indoor work during the comparative leisure of winter. Both the stock and the scion are cut diagonally and smoothly with a sharp knife, leaving about an inch of cut surface across which, in both stock and scion, a slit is made parallel with the direction of growth, as shown in Figs. 1 and 2. The one object to secure is the juxtaposition of the cambium layers of stock and scion. This may be accomplished by having the bark of the stock coincide with or cross the bark of the scion at a slight angle. After the scion and stock have been joined as in Fig. 3, they should be wrapped with several turns of cotton soaked in grafting wax, in order that the parts may be held firmly together. The root or stock may be left any convenient length, from $2\frac{1}{2}$ to 6 inches, and the scion cut accordingly. This cutting, however, is usually done before the joining of the two pieces. In general, the shorter the root, the longer the scion, and vice versa. The practices of the more rigorous climates tend to short-piece roots and long scions. The resulting trees, being set deeply, soon send out roots from the scion and become "own rooted," in which case they are believed to be superior to trees that obtain their nourishment solely through the foster roots of a stock. No experiments have been conducted to settle this matter, but common experience is more in favor of the short root deeply set than the reverse. At planting time root grafts thus made should be covered, only the topmost bud of the scion being left above the soil. If the graft is to be exposed, it should be covered with waxed muslin or with hard wax. When deeply planted, either in a furrow or with a dibble, the waxed cotton will be ample protection.

Cleft grafting is particularly adapted to large trees, when the variety is to be changed.

OPENING SLIT WITH GRAFTING CHISEL.

Branches too large to be worked by other methods may be cleft grafted. But, as a rule, the larger the branch, the less satisfactory will be the result. A branch 1 or $1\frac{1}{2}$ inches in diameter is severed with a sharp saw. The stub is then

split with a thin chisel or with the grafting implement shown in Fig. 4 and held open with a wedge or the prong of the grafting tool until the scion shaped as shown in Fig. 5, is inserted, and adjusted, as shown in Fig. 6. The scion should consist of a portion of the previous sea-

FIG. 5. GRAFTING.

FIG. 6. GRAFTING.

son's growth of the variety to be propagated and should be long enough to have two or three buds. In general, it is a good plan to cut the scion so that the basal or proximal bud shall be at the base of the opening of the triangle formed in cutting the scion into the wedge shape necessary in this style of graft. In addition to the advantage of having the proximal bud located as above described, the wedge of the scion should be made thicker on the side to face outward when the scion is in position. The advantage of this is that pressure is brought upon the outer growing parts of both scion and stock, whereas, were the scion thicker on the inner side, the conditions would be reversed, and the death of the scion would follow. The importance of having an intimate connection between the growing tissues of both scion and stock cannot be too strongly emphasized, for upon this alone the success of grafting depends. To make this contact of the growing portions doubly certain, the scion is often set at a slight angle with the stock into which it is inserted, in order to cause the growing portions of the two to cross.

Inarching, or Grafting by Approach, is the process of grafting two branches without detaching either from the parent plant. Suitable wounds having been made in both stock and scion, the cut surfaces are brought in contact, fastened and covered with grafting wax or other material to exclude the air. After the tissues have united, the stock above and the scion below the point of contact are cut away. This style of grafting is used to correct defects in trees by uniting the arms of Y crotches with a brace of living wood to prevent their splitting apart, twigs from each arm being twisted together and so fastened until they have united. Inarching is also used with herbaceous plants that do not readily unite by other methods; potted specimens are usually employed in this latter case. The method is the only one found in nature.

Waxing, which is quite as important as a proper adjustment of the scions, consists in covering all cut or exposed surfaces with grafting wax, grafting clay, or some noncorrosive substance which will exclude air and moisture. The wax may be applied hot, with a brush, but the safest plan is to spread it with the hand while it is warm enough to be worked. In warm climates a soft wax is not desirable for exposed work. It may be used in whip grafting, but in cleft grafting, where all wounded surfaces are exposed to the weather, a hard wax, made by melting together five pounds of resin, two and a half pounds of beeswax, and one-half pound of tallow or one-half pint of linseed oil is preferable. In addition to these two styles of grafting, there are others in common use, among which are veneer, saddle, and bud grafting. Some of these are adapted to both herbaceous and woody plants. Consult: Bailey, *The Nursery Book* (New York, 1896); id., *Cyclopedia of American Horticulture* (ib., 1900-02); Fuller, *Propagation of Plants* (ib., 1894). See **BUDDING**.

GRAFTING, IN GYNÆCOLOGY. In 1904-05 grafting of ovarian tissue from one woman into another proved successful. Thyroids have been successfully implanted into the abdomen, also suprarenal glands. Grafting glands from animal to man appears to be possible, though thus far it has failed to give permanent physiological results. See **RHINOPLASTIC OPERATION**; **SKIN GRAFTING**.

GRAFTON. A city and river port of Clarence Co., New South Wales, Australia, situated on both sides of the Clarence River, which is navigable for moderate-sized vessels to the sea, 45 miles distant (Map: Australasia, H 5). It is the terminus of a branch railway from Brisbane, 150 miles to the north; has coal, gold, silver, and copper mining industries. It is the seat of an Anglican and a Roman Catholic bishop, and both denominations have built fine cathedrals. The town is the centre of a prosperous district engaged in sugar growing, dairying, and horse breeding for the Indian market. Pop., 1901, 4174; 1910, 4681.

GRAFTON. A town, including several villages, in Worcester Co., Mass., 6 miles southeast of Worcester, on the Boston and Albany and the New York, New Haven, and Hartford railroads (Map: Massachusetts, D 4). It has a public library and manufactures cotton goods, shoes, emery, thread, and boxes. A settlement of "praying Indians" was established here in 1680 by John Eliot, in 1728 white settlers came, and in 1735 the town of Grafton was incorporated. The government is administered by annual town meetings. Pop., 1900, 4889; 1910, 5706. Consult Pierce, *History of Grafton* (Worcester, 1879).

GRAFTON. A city and the county seat of Walsh Co., N. Dak., 40 miles north by west of Grand Forks, on the Great Northern and the Northern Pacific railroads and on the Park River (Map: North Dakota, G 2). The centre of a productive wheat region, it has several grain elevators, flour mills, a creamery, machine shops, etc. Grafton contains the State Institute for the Feeble-Minded, a hospital, and a Carnegie library. The water works and electric-light plant are owned by the city. Pop., 1900, 2378; 1910, 2229.

GRAFTON. A city and the county seat of Taylor Co., W. Va., 99 miles southeast of Wheeling, on the Baltimore and Ohio Railroad and

on the Tygart's Valley River (Map: West Virginia, E 2). There is a national cemetery here with 1261 graves, 620 of unknown dead; and the State Reform School is 2 miles to the west, at Pruntytown. The city is an important railroad centre, the terminus of four divisions of the Baltimore and Ohio Railroad, and has railroad shops, flour and planing mills, foundries and machine shops, cigar, glass, and pottery plants, wholesale grocery and drug houses, etc. Grafton was established in 1854 as a railroad centre and in 1890 received a city charter. It adopted the commission form of government in 1914. The water works and street-lighting plant are owned by the city. Pop., 1900, 5650; 1910, 7563.

GRAFTON, AUGUSTUS HENRY FITZROY, third DUKE OF (1735-1811). An English politician. He was educated at Westminster School and, under Stonehewer, Gray's friend, at Peterhouse, Cambridge. In 1756 he was elected to Parliament and in the following year succeeded his grandfather as Duke, and was made Lord Lieutenant of Suffolk. Seven years later Bute dismissed him from his post, and Grafton, allying himself with Lord Temple, attacked Bute sharply. In 1765 he was made Secretary of State for the Northern Department, under Rockingham, but retired in the following year and forced the resignation of his colleagues and the formation of a new ministry under Pitt, in which Grafton became head of the Treasury. But Pitt retired in 1768, and Grafton became actual head, where he had been first only in name. In 1770 he resigned, urged by a difference with his old friend Pitt. A year later he became Lord Privy Seal in North's cabinet in the hope, if we are to believe his own account, of bringing the quarrel with the Colonies to a peaceable end. He retired from this office in 1775 to enter it again in 1782, but left public life on the downfall of the Rockingham ministry in 1783. He was estranged from orthodox beliefs, became a Unitarian, and wrote *Hints Submitted to the Serious Attention of the Clergy* (1789) and *The Serious Reflections of a Rational Christian from 1788 to 1797* (1797). He refused the degree of LL.D. from Cambridge, because it entailed subscription to the Thirty-nine Articles. Consult: *Autobiography and Political Correspondence of Augustus Henry, Third Duke of Grafton* (London, 1898) and extracts from his *Memoirs* (manuscript) in Campbell's *Lives of the Chancellors* (new ed., 10 vols., New York, 1874-75); Stanhope's *History of England* (5th ed., 2 vols., London, 1889); Walpole's *Memoirs of George III* (4 vols., ib., 1894).

GRAFTON, HENRY FITZROY, first DUKE OF (1663-90). An English sailor, second son of Charles II and Lady Castlemaine. At the age of nine he was married to Isabella Bennett, five years old, and the heiress of the Earldom of Arlington. In the same year he was made Earl of Euston and three years afterward became Duke of Grafton. He entered the navy in 1680, was captain of the *Grafton* in 1683, and campaigned with the French at the siege of Luxemburg. He was Lord High Constable at the coronation of James, served against Monmouth, and escorted D'Adda, the papal nuncio, on his entry to London, but later grew disaffected towards his uncle and was suspected of conspiring with Churchill (the future Duke of Marlborough) against him. He joined William at Axminster and was one of the first to take the oath of allegiance to him. Subsequently he took serv-

ice with Churchill in Ireland and was killed while leading the attack on Cork. He was a typical sailor and was greatly loved and lamented. He was succeeded by his son Charles (1683-1757).

GRAFTON, RICHARD (died ?1572). An English printer and chronicler. With Edward Whitechurch, Grafton had a revision of Coverdale's Bible, under the editorship of Thomas Matthews, printed, probably at Antwerp, in 1537 and again in 1538 at Paris. The latter is the first book with Grafton's name. He was connected with Whitechurch in the printing of the Great Bible in France and in England (1530 and 1540) and of a New Testament in English from Erasmus' Greek text (1540). Two years later *The Order of the Great Turcke's Court* and Erasmus' *Apophthegms* appeared from Grafton's press; in 1544 he received a patent for printing liturgies, in 1545 a monopoly for printing Latin and English primers, and became printer to Prince Edward both before and after his accession, printing the first edition of the *Book of Common Prayer* (1549). Printer for Lady Jane Grey, he lost office under Queen Mary, but sat in Parliament in 1553, 1556, and 1562. As a chronicler, he first revised and printed Hardyng's *Chronicle* (1543); later (1548) he printed Hall's *Union of the Two Noble and Illustrious Families of Lancastre and Yorke*; and after he had retired from business wrote an *Abridgement of the Chronicles of England* (1562) and *Chronicle at large and meere Historie of the Affaires of Englande* (1568).

GRAGAS, grá'gás (Icel., gray goose). A name given to several private collections of Icelandic law and legend under the Commonwealth and suggested by the similar epithet, *Gullfjödhr* (gold feather), applied to the old Norwegian code. The *Gragas* are principally made up of the *Konungsbok* and the *Stadharholtsbok*, the first of which has been ascribed to the eleventh-century historian Ari.

GRAGNANO, grá-nyá'nó. A city in the Province of Naples, Italy, 3 miles east of Castellamare (Map: Italy, G 2). It is well known for red wine and macaroni. Pop. (commune), 1901, 14,099; 1911, 14,642.

GRAHAM, grá'am. A town and the county seat of Alamance Co., N. C., 23 miles east of Greensboro, on the Southern Railway (Map: North Carolina, C 1). Its most important industries are cotton and overall manufacturing, lumbering, and canning. Settled in 1852, the town is governed by a mayor and board of commissioners. Pop., 1900, 2052; 1910, 2504.

GRAHAM, CATHERINE MACAULAY. See MACAULAY, CATHERINE.

GRAHAM, grá'am, CHARLES KINNAIRD (1824-89). An American civil engineer and soldier. He was born in New York City, entered the United States navy as a midshipman in 1841, and served in the Mexican War. Later he studied engineering and was for several years after 1857 constructing engineer of the Brooklyn Navy Yard. At the outbreak of the Civil War he entered the Army of the Potomac as major of the so-called "Excelsior Brigade," and in November, 1862, he was raised from the rank of colonel to that of brigadier general. He was severely wounded in the battle of Gettysburg and upon his recovery was assigned by General Butler to the command of a gunboat flotilla on the James River. In March, 1865, he was brevetted major general of volunteers. After

the close of the war he returned to New York and resumed the practice of his profession. From 1878 to 1883 he was surveyor of the port in New York.

GRAHAM, DOUGAL (1724-79). The dwarf chapbook writer and bellman of Glasgow, born near Stirling. He joined Prince Charles's army in 1745 as sutler and was present at the battle of Culloden. In 1746 he published an account of the Rebellion in a kind of doggerel. About 1770 he became the bellman of Glasgow. His chapbooks are very rare. They are not in any sense literary, but have a certain coarse humor and are interesting as a chronicle of the common events of the town. A complete edition of his writings, with a biographical introduction, was edited by George MacGregor (1883).

GRAHAM, GEORGE PERRY (1859-). A Canadian journalist and statesman. He was born at Eganville, Ontario, and was educated at the Morrisburg Collegiate Institute. After 1880 he was for 12 years editor of the *Morrisburg Herald*, in 1892 he was appointed assistant editor of the *Ottawa Free Press*, and afterward for 14 years he was managing editor of the *Brockville Recorder*. He was a Liberal member of the Ontario Legislature in 1898-1907; in 1904-05 was Provincial Secretary in the administration of Sir George William Ross (q.v.); in 1907 became leader of the Liberal Opposition in the Ontario Legislature, but resigned and was elected to the House of Commons; and in August of the same year was appointed Minister of Railways and Canals in the administration of Sir Wilfrid Laurier. Upon the defeat of that administration in 1911 he retired from office and resumed editorial charge of the *Brockville Recorder*. Later he was reelected to the House of Commons.

GRAHAM, GEORGE REX (1813-94). An American journalist, born in Philadelphia. In 1832 he apprenticed himself to a cabinetmaker in that city. While working at this business, he studied law and in 1839 was admitted to the bar. He had also found time to write a series of articles for the Philadelphia papers, and these led to his becoming editor of the *Saturday Evening Post*, a position he retained until 1846. Afterward he became editor of *Atkinson's Casket*, *Graham's Magazine*, and the *Philadelphia North American*, in all of which he was financially interested. Unfortunate stock speculations swept away most of his fortune, however, and he was compelled to support himself by writing until in 1887 cataracts on both eyes forced him to retire. He was operated on successfully, but from that time until his death did no active work.

GRAHAM, SIR GERALD (1831-99). An English soldier. He was born at Acton, Middlesex, June 27, 1831, and after studying at Wimbledon and Dresden he was admitted (1847) to the Royal Military Academy at Woolwich and completed his training in the School of Military Engineering at Chatham. He served in the Crimean War, participating in the battle of the Alma, at Inkerman, and in the siege of Sebastopol, where by his intrepidity he became the central figure in the assault on the Redan (June 18, 1855). During the campaign in China he again displayed great courage and skill and, although seriously wounded in the storming of the Taku forts (Aug. 21, 1860), subsequently entered Peking with the victors. Following his return to England in 1861, he was for 16 years commanding engineer successively at Brighton,

Aldershot, Montreal, Chatham, Manchester, and York. In 1877 he was appointed assistant director of works for barracks at the War Office. In 1882 he accompanied Sir Garnet Wolseley to Egypt as brigadier general, and his forces had a great share in the victorious campaign against Arabi Pasha. In 1884 he took the field against Osman Digna, whose army he defeated at El-Teb and Tamai. In the meantime he had urged a plan for the assistance of Gordon, which, however, was not accepted. Graham was made a G.C.B. in 1896, and a colonel commandant of the Corps of Royal Engineers in 1899. He died Dec. 17, 1899. He published a number of scientific papers and a contribution to the *Fortnightly Review*, entitled "Last Words with Gordon" (1887), and prepared a translation of Goetze's *Operations of the German Engineers and Technical Troops during the Franco-German War of 1870-71* (1875). Consult Vetch, *Life, Letters, and Diaries of Lieut.-General Sir Gerald Graham* (Edinburgh, 1901).

GRAHAM, HARRY (1874-). An English author, educated at Eton and Sandhurst. He entered the Coldstream Guards in 1895, was aid-de-camp to the Earl of Minto, Governor-General of Canada, in 1898, served in South Africa in 1901-02, and was private secretary to Lord Rosebery in 1904-06. Under the pseudonym "Col. D. Streamer" (from the Coldstream Guards) he wrote *Ruthless Rhymes for Ilcartless Homes* (1899), which made him famous as a master of a cold-blooded, rather American than English, humor. Over his own name he wrote: *Misrepresentative Men* (1904), *Verse and Worse* (1906), *Misrepresentative Women* (1906), *Deportmental Ditties* (1909), *The Perfect Gentleman* (1912), *The Motley Muse* (1913), and other good light verse; and the serious volumes *The Mother of Parliaments* (1910), an account of British parliamentary practice, and *Splendid Failures* (1913), a series of biographical sketches.

GRAHAM, SIR HUGH (1848-). A Canadian journalist. He was born in Huntingdon, Province of Quebec, and was educated at the Huntingdon Academy. He early removed to Montreal and began newspaper work, becoming editor and publisher successively of the *Commercial Advertiser* and *Evening Telegram* of that city. In 1869 he founded the *Montreal Star*, which became a successful and influential independent newspaper. Graham was strongly interested in municipal and political reform as well as in humanitarian projects. He helped to found the Good Government Association of Montreal. In 1910 he was elected vice president of the Institute of Journalists, London, England; and in 1909 he was a delegate to, and chairman of, the Canadian section of the Imperial Press Conference in London. In 1908 he was knighted.

GRAHAM, ISABELLA MARSHALL (1742-1814). An American philanthropist, born in Lanarkshire, Scotland. She married John Graham, a British army surgeon, in 1765, and after his death at Antigua in 1774, returned to Scotland and taught for a number of years. In 1789 she came to New York and opened a girls' school. The philanthropic work she had begun in her own country was there continued on a larger scale. She organized a number of charitable societies, and the first Sunday school for ignorant adults. Consult Mason, *Memoir of Isabella Graham* (New York, 1816).

GRAHAM, JAMES. Fifth Earl and first Marquis of Montrose. See MONTROSE.

GRAHAM, JAMES DUNCAN (1799-1865). An American soldier and engineer, born in Prince William Co., Va., and educated at West Point. He entered the army as third lieutenant of artillery and served as adjutant at the Military Academy until 1819, when he went with Major Long on his trip through the West. After seven years' service in the topographical department, he was assistant topographical engineer (1829-38); then was promoted to be major and appointed to settle the line between Mexico and the United States. He surveyed the north-eastern boundary in 1840 and was principal astronomer on the commission to fix the north-western boundary. He became colonel of engineers in 1863 and spent his last years in coast survey.

GRAHAM, SIR JAMES ROBERT GEORGE (1702-1861). An English statesman. The eldest son of Sir James, the first Baronet, and of Lady Catharine Stewart, eldest daughter of John, seventh Earl of Galloway, he was born at Netherby, Cumberland, June 1, 1792. He was educated at Westminster School and in 1810 entered Christ Church, Oxford. At 21 years of age he became private secretary to Lord Montgomerie, the British Minister to Sicily; and the entire management of the mission devolved upon him during the most critical period of the war, in consequence of the illness of his chief. On the arrival of Lord William Bentinck he retained his position and afterward accepted a military situation attached to the person of Lord William, who was commander in chief in the Mediterranean. In this capacity at Naples he negotiated the armistice with Murat which separated that general from Napoleon. In 1818 he was returned for Hull on Whig principles, but in 1820 lost his seat. In 1824 he succeeded to the baronetcy on the death of his father. In 1826 he published an important pamphlet entitled *Corn and Currency*, and after a successful canvass in which he strenuously advocated the removal of religious disabilities, the repeal of the Corn Laws, and parliamentary reform, he was returned to Parliament from Carlisle. In 1830 he became First Lord of the Admiralty, with a seat in the cabinet, and was one of the committee appointed to discuss and settle the provisions of the first Reform Bill. In 1834 he seceded from the government with Mr. Stanley, on the appropriation clause of the Irish Church Temporalities Act. In 1838 he was elected lord rector of the University of Glasgow. In 1841 he became Secretary of State for the Home Department in the government of Sir Robert Peel, who on one occasion declared that Graham was the ablest administrator and the best man of business he had ever known. In 1844 a warrant issued for opening the letters of Mazzini, and the communication of their contents to the Austrian Minister involved Graham in great obloquy. He also incurred displeasure by his high-handed dealing with the Scottish church troubles which ended in the formation of the Free church. He gave Peel warm support in carrying the Corn Law Repeal Bill and resigned office with his chief as soon as that measure was carried. On the death of Peel, in 1850, he became leader of the Peelite party in the Lower House and led the opposition to the Ecclesiastical Bill. From December, 1852, he held his old office of First Lord of the Admiralty in the

coalition ministry of the Earl of Aberdeen, until his retirement in February, 1855. He died from heart disease, Oct. 25, 1861. His commanding stature, fine personal presence, ripe wisdom, and calm and impressive eloquence made him the Nestor of the House of Commons. But his changes of opinion, from the whiggism of his youth to the conservatism of his manhood and the radicalism of his old age, exposed him to well-founded charges of political inconsistency. Consult Parker, *Life and Letters of Sir James Graham* (London, 1907).

GRAHAM, JOHN, VISCOUNT DUNDEE (1648-89), oftenest spoken of as Claverhouse. The eldest son of Sir William Graham of Claverhouse, head of the branch of the noble family of Montrose in Forfarshire. He entered St. Andrews University in 1665 and served in the French army from 1668 till 1672. He then entered the Dutch service as cornet in the Prince of Orange's horse guards and at the battle of Seneffe (1674) rescued the Prince when in great danger of being either killed or taken prisoner. Returning to Scotland, he obtained (1678) an appointment as lieutenant in a troop of horse commanded by his cousin, the third Marquis of Montrose. At this time the government of Charles II was engaged in an attempt to force Episcopacy upon the people of Scotland. A system of fines and military coercion had been carried on for years against all nonconformists; conventicles and field preachings were prohibited, and penalties were inflicted on all who harbored the recusants. When the people resisted this oppression, many were put to death, the jail was filled with captives, and those who fled were outlawed, and their property was seized. It was now Graham's duty to repress the Covenanters in the south of Scotland. In this work he was continually baffled, and was even put to flight by a body of armed Covenanters at Drumclog. Finally, however, as commander of the cavalry, he aided the Duke of Monmouth in defeating them at Bothwell Bridge, June 22, 1679. The victors killed 400 rebels and captured 1200, who were afterward treated with atrocious cruelty. In these encounters Graham showed no marked ability; but in pursuing, detecting, and hunting down unyielding Covenanters he evinced the utmost zeal. He rose to the rank of major general, was appointed to the Privy Council of Scotland (1683), and in 1688, on the eve of the Revolution, James II raised him to the peerage as Viscount Dundee and Lord Graham of Claverhouse. After this monarch had fallen, Dundee remained faithful to him. Joined by the Jacobite Highland clans and by auxiliaries from Ireland, he raised the standard of rebellion against the government of William and Mary. With 2500 foot and a troop of horse he defeated General Mackay at the pass of Killiecrankie, July, 27, 1689. Dundee was shot while waving on one of his battalions to advance. He was carried off the field to Urrard House, or Blair Castle, and there expired.

The character and services of Dundee have been greatly exaggerated and blackened by party spirit. With the Jacobites he was the brave and handsome cavalier, the last of the great Scots and gallant Grahams. He was upright and virtuous in private life and in military discipline remarkably severe. With the Covenanters he was "wicked-witted, bloodthirsty Claverhouse." As a military commander, he had little opportunity for display, yet the battle of Killiecrankie

was skillfully planned and fought with courage and dash. As a persecutor, he was severe, but not wholly without pity. Consult: Graham, *Letters with Illustrative Documents*, ed. by Smythe (Edinburgh, 1526); Napier, *Memorials and Letters Illustrative of the Life and Times of John Graham of Claverhouse* (ib., 1859-62); A Southern (pseud.), *Claveres, the Despot's Champion: A Scot's Biography* (London, 1889); Morris, "Claverhouse," in Lang, *English Worthies* (ib., 1887); *Acta Parl. Scot.* IX (appendix); *Memoirs of the Lord Viscount Dundee*, ed. by Jenner (ib., 1903); Ian Maclaren, *Graham of Claverhouse* (New York, 1907); Terry, *John Graham of Claverhouse* (London, 1905); Barrington, *Grahame of Claverhouse* (London, 1911). Scott's novel *Old Mortality* gives a spirited picture of Claverhouse.

GRAHAM, PETER (1836-1921). A Scottish landscape and animal painter. He was born in Edinburgh, where he studied under Lauder and Ballantyne; afterward he removed to London, and became an R.A. in 1881. He is noted for his spirited studies of Highland scenery with cattle, such as "Highland Spate" (1866) and "Moorland Rovers," and for finely rendered sea pictures, distinguished for atmospheric effect and sincerity of treatment, such as "Our Northern Wall," "The Fowler's Crag," and "Where Deep Seas Moan." His powerful yet delicate art expresses, as has no other, the poetic melancholy of Highland scenery. He is represented in the Tate Gallery, London, by "A Rainy Day," in several British provincial galleries, and especially at Melbourne and Sydney, Australia.

GRAHAM, RICHARD, VISCOUNT PRESTON (1648-95). See PRESTON.

GRAHAM, STEPHEN (1884-). An English writer on Russia, son of P. Anderson Graham, editor of *Country Life*. He left London in his youth and went to Russia, lived among Russian peasants in different parts of the Empire, traveled with them to Jerusalem and to America, and wrote such illuminating volumes as *A Vagabond in the Caucasus* (1911), *Undiscovered Russia* (1912), *Changing Russia* (1913), and *With the Russian Pilgrims to Jerusalem* (1913).

GRAHAM, SYLVESTER (1794-1851). An American reformer, best known as a temperance lecturer and an advocate of vegetarianism. He was born at Suffield, Conn., studied at Amherst, and in 1826 entered the ministry of the Presbyterian church. A few years later he became a temperance advocate and based his cure for alcoholism upon proposed radical reforms in diet, his theory being that a vegetable diet is incompatible with a craving for stimulants. In particular, therefore, he urged an entire abstinence from meat and an improvement in the making of bread. Graham bread has become a settled name for the article made of unbolted wheat flour and strongly recommended by him. He published: *Graham Lectures on the Science of Human Life* (1839); *Bread and Bread-Making*; *A Lecture to Young Men on Chastity*; and part of a projected work on *The Philosophy of Sacred History*.

GRAHAM, THOMAS. See LYNEDOOH, THOMAS GRAHAM, LORD.

GRAHAM, THOMAS (1805-69). An English chemist, born in Glasgow. Having studied at Glasgow and Edinburgh, he became, in 1830, professor of chemistry at Anderson's College, Glasgow, and continued in that office till 1837,

when he succeeded Dr. Turner in the chemical chair of University College, London. In 1855 he was appointed master of the mint and resigned his professorship. Graham is best known for his researches on the diffusion of gases and of substances in solution. His experiments, carried out with the aid of very simple apparatus, furnished valuable data, which have proved of great importance in the development of the modern theory of solutions. In studying solutions he found that the velocity of diffusion varies with the substance in solution and depends to a great extent on the temperature at which the liquid is kept. He found that amorphous substances like allumen, gum arabic, silicic acid, ferric hydroxide, etc., which he designated by the term *colloids*, diffuse very slowly and are incapable of passing through parchment paper or animal membranes, while substances like sugar, the mineral acids and their salts, etc., which he termed *crystalloids*, diffuse more or less rapidly and pass freely through membranes. He was thus led to the discovery of the analytical method known as *dialysis*. To separate by this method a crystalloid from a colloid, the solution containing both is placed in a suitable vessel and is separated from a volume of pure water usually by parchment paper. Part of the crystalloid then passes out of the solution into the pure water, while the colloid is stopped by the membrane. If the water, now containing some of the crystalloid, is replaced by a new quantity of pure water, some more of the crystalloid diffuses out of the solution containing the mixture. By repeating the operation several times, a solution is finally obtained which contains practically nothing but the pure colloid. Concerning the interdiffusion of gases, Graham showed that the velocity of diffusion of a gas is inversely proportional to the square root of its density. He also studied the rates of effusion of gases through a very fine hole in a disk, and the rates of transpiration of gases through capillary tubes. Graham carried out numerous other classical researches in chemistry, including investigations of the acids of phosphorus, the constitution of sulphates and oxalates, etc. His researches were published in the form of original memoirs, comprising in all 63 papers on various subjects. In addition to these memoirs he brought out an excellent treatise on chemistry, which passed through several editions and was republished in this country and translated into German. He also edited the *Chemical Reports and Memoirs* of the Cavendish Society in 1848. Graham was the first president of the Chemical and the Cavendish societies, was a fellow of the Royal Society, and an honorary member of many foreign scientific bodies. See DIFFUSION; COLLOIDS; CHEMISTRY.

GRAHAM, SIR WILLIAM (1826-1907). A British naval officer. He entered the navy in 1842 and served on the southeast coast of America, gaining distinction by boarding a slave brig from an open boat and capturing its crew. In 1851 he served on the west coast of Africa, where he took part in the destruction of Lagos; in 1854 he served in the Baltic and Gulf of Bothnia and shared in the capture of Kertch; and in 1857 he commanded a gunboat in the war with China. He then served in the West Indies in 1868-71, commanded the *Britannia* in 1874-77, and, becoming rear admiral in 1879, he was admiral superintendent of the Malta Dockyard in 1881-85. He was appointed comptroller of the

navy and a member of the Board of Admiralty in 1885, and from 1888 to 1891, when he retired, he was president of the Naval College at Greenwich. He became full admiral in 1890 and was knighted in 1902.

GRAHAM, WILLIAM ALEXANDER (1804-75). An American politician. He was born in Lincoln Co., N. C., graduated at the University of North Carolina in 1824, and was admitted to the bar soon afterward. He was a member of the North Carolina State House of Commons in 1833-40 and was Speaker of that body in 1838 and 1840. In 1840-43 he was a member of the United States Senate, and he was elected Governor of his State by the Whigs in 1845 and again in 1847. Under President Fillmore he was Secretary of the Navy from July, 1850, until March, 1853, and as such organized Commodore Perry's expedition to Japan. When General Scott ran for President in 1852, Graham was on the ticket as candidate for Vice President. He was again member of his State's Lower House in 1854-55 and of the State Senate in 1861-64, and he was a Senator in the second Confederate Congress in 1865.

GRAHAM BREAD. See BREAD; GRAHAM, SYLVESTER.

GRAHAME, grā'am or grām, JAMES (1765-1811). A Scottish poet. He was born in Glasgow, was educated at the university of that city, and removed to Edinburgh in 1784, where he studied and practiced law. Finding the legal profession unsuited to his tastes, he afterward took orders in the Church of England and was successively curate of Shipton in Gloucestershire and of Sedgefield in the County of Durham. He left several poetic works, the chief of which is *The Sabbath* (1804), a poem admired by Scott for its feeling for nature, and scoffed at by Byron in his *English Bards and Scotch Reviewers*. Grahame also published: *Poems on the Abolition of the Slave Trade* (1804); a pamphlet, *The Birds of Scotland* (1806); *British Georgics* (1800).

GRAHAME, grā'am or grām, JAMES (1790-1842). A Scottish historian. He was born at Glasgow, was educated at St. John's, Cambridge, practiced law for some years, and then devoted his time to the preparation of his *History of the Rise and Progress of the United States of North America* (4 vols., 1836). The work passed through several editions (the edition of 1845 containing a *Memoir* by Josiah Quincy) and was pronounced by Prescott to be the best work before Bancroft's. Bancroft's criticisms of Grahame were answered by Quincy in a pamphlet published in 1846, *The Memory of the Late James Grahame Vindicated from the Charges of Mr. Bancroft* (Boston, 1846). Grahame also denounced slavery in *Who is to Blame? or Cursory Review of the American Apology for American Accession to Negro Slavery* (1842).

GRAHAME, KENNETH (1859-). A Scottish author (born in Edinburgh, and educated in England) whose ability was first recognized by the *Scots Observer* in the nineties. His *Pagan Papers* (1893), in which he appears as an exponent, in essay form, of the joy of living and as a skillful and felicitous phrase maker, found a fit audience; but it was his *The Golden Age* (1895), in part composed of papers from the earlier volume, that established his reputation. The latter book is made from memories of his own boyhood and is alive and vocal with an engaging troop of clever, mischief-making,

and imaginative youngsters whose pranks and adventures are seen with the eyes of an amiable man of the world, in whom irony, tenderness, and a quantum of poetry and romance contrive to coexist harmoniously. In 1898 appeared his *Dream Days*. This was followed 10 years later by *The Wind in the Willows*, a fantasy, grotesque, humorous, and touched with poetry, in which animals—a simple-hearted mole, a water rat of singular sensibility, and a boastful toad in the pride of his motor car—all of them with very human qualities and defects, are satirically presented to the entertainment of the reader. This author is of the few successful writers of the day whom a good reception has not seduced into careless overproduction. Grace, charm, finish, a choiceness of diction, and other stylistic qualities evince his sense of responsibility to an exacting literary conscience.

GRAHAME-WHITE, CLAUDE (1879-). An English aviator and builder of aeroplanes, educated at Bedford Grammar School and at Crondall House College. He engaged in the making of motors in London and later organized an aviation school at Pau. He made several notable flights with a Farman biplane in 1910 and in the same year toured America, won the Gordon Bennett trophy with a Gnome-Bleriot monoplane, making 100 kilometers in 1 hour 4 minutes and 3 seconds, and started an aeroplane works and aviation school at the London Aerodrome, Hendon. Besides his special articles on aviation, he published: *The Aeroplane, Past, Present, and Future* (1911), with Harry Harper; *The Story of the Aeroplane* (1911); *Heroes of the Air: A Book for Boys* (1912); *The Aeroplane in War* (1912).

GRAHAMITE, grā'am-it (named in honor of J. Lorimer Graham, of New York, and Colonel Graham, of Baltimore). A pitch-black, solid bitumen, having a hardness of 2 and a specific gravity of 1.145. It is slightly soluble in alcohol, partly so in ether, and almost completely in turpentine and carbon disulphide. It was originally found in Wood and Ritchie counties, W. Va., where it occupies more or less vertical veins or fissures that traverse carboniferous rocks and evidently lead down to the oil pool found below it. An analysis showed: C, 76.45; H, 7.83; N, trace; O, 13.46; S, trace; Ash, 0.10. The deposit is exhausted. It is said to have been found in Colorado, Texas, and Mexico, but these occurrences may represent some of the other types of solid bitumens. Its origin is supposed to have been through oxidization of petroleum. It is used for making varnishes and insulators. See ASPHALTIC COAL.

GRAHAM LAND. Part of the east coast of a supposed promontory of the so-called Antarctic Continent which lies to the southward of South America (Map: The World, in Vol. i, Q 15). It extends south of lat. 63° S., the meridian of long. 60° W. cutting a part of the coast. The extension of the promontory to the south is not yet determined. In 1832 John Biscoe, the master of a British sealer, while trying to avoid the storms that prevail around Cape Horn, took a course so far south that he accidentally discovered this land. To that portion of this territory which has been seen by various explorers, various names have been given. The Norwegian sealer Larsen sailed along the east coast in 1894 and named the northeast coast region King Oscar II Land, and the southern portion, which he saw from his vessel, Foya Land. His most

southern point (at sea) is lat 68° 10' S. The Belgian Antarctic expedition of 1897-99 discovered what they believed to be the northwest terminus of the mainland and named it Danco Land. The Swedish expedition under the command of Otto Nordenskjöld spent two years in Graham Land (1901-03), wintering on the east coast. On his sledge journey south Nordenskjöld was prevented by an ice wall like that of Victoria Land from passing beyond the 60th parallel, but he was the first to bring information of the interior. He discovered that Louis Philippe Land is an island, found a wide water channel extending north to the west of Mount Haddington, and brought home numerous fossils of Tertiary age similar to those found in Tierra del Fuego. Charcot (French) in 1904-05 corrected the coast surveys of the northwest coast and determined the position of the islands with reference to Adelaide Island. He returned in 1909 and found that Loubet Land is continuous with Graham Land. Argentina established a meteorological station on the west coast.

Bibliography. Gerlache, *Quinze mois dans l'Antarctique* (Paris, 1902); "Résultats du voyage du S. Y. 'Belgica,'" in *Rapports scientifiques* (10 vols., Antwerp, 1901-05); Charcot, *Le français au pôle sud* (Paris, 1906). See ANTARCTIC REGION.

GRAHAM'S DYKE. A popular name in England for the remains of the Roman wall in the south of Scotland. See ROMAN WALL.

GRAHAMSTOWN, grā'amz-toun. See THAMES.

GRAHAM'S TOWN. A city of South Africa, the administrative centre of the eastern portion of the Cape Province. It lies 43 miles northwest of Port Alfred, with which it is connected by rail, as it is also with Port Elizabeth, 106 miles to the southwest (Map: Cape of Good Hope, H 9). It is the seat of an Anglican and a Roman Catholic bishop and is one of the most important educational centres in South Africa. It contains Rhodes University College, St. Andrew's College, St. Aidan's College, a flourishing Jesuit school, and various other denominational institutions. It is the centre of a rich agricultural district and a famous market for ostrich feathers, while it has a small textile industry. Graham's Town is considered one of the pleasantest places of residence in South Africa; the town is well built, the streets broad and shady, and the climate notably healthful. Pop., 1904, 13,887; 1911, 15,000, of whom less than 10,000 were whites. Graham's Town was founded as a military post in 1812 and takes its name from the commander of the local forces, Col. John Graham (1778-1821).

GRAIAL. See GRÆÆ.

GRAIL, grāl, THE HOLY (from OF. *graal*, *gréal*, Prov. *grazal*, Catalanian *gresal*, LL. *gratalis*, *gradalis*, from ML. *cratella*, bowl). The spelling varies greatly in the old manuscripts, but in modern usage the most common English forms are *grail* and *graal*. The Grail had a history, which in the fully developed romance ran somewhat in this wise: It was the dish from which Christ ate at the Last Supper. Joseph of Arimathea, wishing to preserve something which belonged to Christ, took it from the table and afterward collected in it the blood from the body of Christ, either while the body was on the cross or after it had been taken down. The vessel was brought to England by Josephes, a son of Joseph, or by Broun, Joseph's brother-in-law.

It was handed down from generation to generation. It possessed many mystic properties—feeding those that were, like Joseph, without sin; multiplying a few loaves of bread, so that they sufficed for 500 people; blinding from its effulgence all, except the pure, who looked upon it, or striking dumb those who came into its presence. It was also identified with the cup of the Last Supper, and more or less vaguely with Christ Himself. The Grail seems to have first appeared in romance united with the story of Perceval. Living with his mother in seclusion far from the court, the boy Perceval is kept in ignorance of chivalry. One day he meets by chance several knights and is fascinated by the splendor of their armor, taking them for angels. Setting out as knight errant, he comes to the castle of the Fisher King, who lies speechless. Before the King passes a bleeding spear and a sacred vessel, concerning which Perceval fails to ask questions. Had he, a pure man, spoken, the King would have been healed. After many wanderings Perceval returns to the Grail castle, welds together a broken sword, and becomes King. The story is worked out with many details, which often differ from those here given. Later the legend assumed a very different form. It was connected with the Arthurian cycle, and Galahad was given the leading rôle in the quest. Many knights from Arthur's court go on the adventure; but the Grail is seen only by Galahad, Perceval, and Bors, who follow it to the Far East. Galahad's soul is borne up to heaven by a great multitude of angels, Perceval dies in a hermitage, and Bors returns to Britain.

Though there are many unsolved problems connected with the growth of the Grail legend, its development seems to have been somewhat as follows: Chretien de Troyes, a French trouvère (q.v.), left at his death an incomplete poem known as "Perceval," or "Le Conte del Graal," which was continued by other hands. This vast compilation of over 60,000 verses came into existence between 1180 and 1240. In the continuations of the romance the adventures of Gauvain fill as much space as do those of Perceval. On the same source as this romance, Wolfram von Eschenbach, a poet of south Germany, founded his *Parzival* (about 1215), one of the finest poems on the legend. According to this version the Grail is a precious stone which came from heaven after the fall of the angels. It is guarded by a chaste order of knights whom it chooses. Other early Grail romances are a trilogy by the French poet Robert de Boron, known as "Joseph d'Arimathie"; "Merlin"; "Perceval" (at the close of the twelfth century), in which the Grail legend is attached to the Arthurian cycle; *Queste del Saint Graal* (about 1210), a prose romance, in which Perceval is displaced by Galahad, who is thought to be son of Lancelot; *Grand Saint Graal* (about 1220), also in prose; the prose *Perceval le Gallois* (about 1225); the *Mabinogi of Peredur* (i.e., Perceval), a Welsh prose romance (in the thirteenth century); and "Sir Perceval of Galles," an English poem (about 1440). Of the second poem, by Boron, only fragments are extant; and the third, in its original form, is lost, though its matter may be inferred from the prose romance known as the *Didot Perceval* (second quarter of the thirteenth century). Sir Thomas Malory embodied the *Quest*, of which Galahad is the hero, in his *Morte d'Arthur*, printed by Caxton in 1485. From this brief summary the Grail

legend is seen to be the work mostly of French poets in the twelfth and thirteenth centuries. On what did they build? It is generally held that much of the matter—e.g., the hero and the magic vessel—was originally Celtic. Of this there is no reasonable doubt. And yet the precise nature of this Celtic contribution to the legend has not yet been determined. The romance of the Grail, so popular in the Middle Ages, was revived by the poets of the nineteenth century. Best known is Tennyson's poem in the *Idylls of the King*. Tennyson, following Malory, gives the Galahad version and of course infuses into the legend modern ideas. On the other version Wagner founded the great music drama of *Parsifal*. See GALAHAD; PERCEVAL.

GRAIN. See CARYOPYSIS; FRUIT.

GRAIN (OF. *grain*, *grein*, Fr. *grain*, from Lat. *granum*, grain, ultimately connected with Eng. *corn*). A measure of weight derived originally from the use of natural seeds of plants for units of weight on account of their uniformity and general availability. This unit has survived in the Anglo-Saxon weights, the avoirdupois pound being composed of 7000 grains and the troy pound 5760. See WEIGHTS AND MEASURES.

GRAIN ELEVATOR. A structure for the handling, storage, or cleaning of grain during or preparatory to its transshipment by rail or water. In exterior appearance the modern grain elevator often is a tall, windowless, rectangular structure, surmounted by a cupola-like superstructure, or it may be formed of one or more cylindrical or other-shaped units, several of which are united in a common group. The cylindrical form for the bins especially finds application when the elevator is made of steel or reinforced concrete, as under modern conditions. There are two main classes of elevators—one where the storage bins are combined in the same buildings as the main elevator or working house, and those where the working house containing the elevating machinery is distinct from the stor-

age bins, which are in one or more independent structures connected by conveying machinery. The working house is usually a rectangular building with square or circular bins, while the storage bins when independent are usually cylindrical. The simplest elevator is, of course, the country elevator, located along the tracks of some railway, where the farmers drive their loaded wagons onto a dump first to be weighed, after which the grain is passed into a hopper, and the wagon weighed empty. The grain passes into the boot of the elevator leg, where a belt with buckets scoops up the grain and carries it to conveyor belts for distribution to the various bins. The grain is first cleaned and then is elevated into a shipping scale hopper to determine its weight before it is loaded by gravity to the cars from the bins.

In the usual type of elevator the main body of the building (house) is mostly occupied with bins for the storage of grain, while the surmounting structure, which is generally three stories high and is called a cupola, contains the operating machinery and working rooms. Generally the topmost story of the cupola contains the leg-driving machinery and turnhead spouts, the middle story the garnerers, and the lowest story the weighing hoppers and cleaning machinery. Below the cupola and main roof, and extending over the entire width and length of the house, is the distributing, or spout, floor. Here are the conveyors, for transporting lengthwise to the building, and the distributing spouts, for transferring by gravity the grain from the scale hopper to the bins. By means of legs reaching from the bottom of pits sunk below the foundations of the bins to the topmost story of the cupola, and continuous bucket conveyors, the grain is elevated to the turnhead points and discharged into the garnerers. From these it passes to the lower floor, where it is weighed, cleaned if desired, and finally spouted to its proper bin. This description applies in general to all elevators, but the construction and arrangement of details differ for different classes of elevators. The mode of operation of a grain elevator at a railroad terminal, described without technicalities, is somewhat as follows: A string of cars is placed so that each car is opposite one of a number of hoppers near the receiving elevator legs located about a car length apart. The track may enter the building underneath the bins or may pass along one or both sides of the building. Two shovelers enter each car and handle each a shovel operated by a rope from a power-shovel shaft in the elevator. These shovels discharge into the hopper or pits into which the feet of the elevator legs descend. From these the bucket conveyors running inside the legs hoist the grain to the topmost story of the cupola, where it is discharged, in turning over a head pulley, into the hopper of the turnhead spouts, thence into the garnerers, and thence into the weighing hoppers. From the scale hoppers the grain is spouted (1) upon belt conveyors running longitudinally across the building and discharging over movable trippers into storage bins (storage elevators); (2) into car spouts, for reloading or transferring (railway transfer elevators); (3) directly into storage bins, which may be (a) shipping bins with dock spouts, to be loaded into vessels; (b) car spouts (terminal elevators); or (c) garnerers above cleaning machinery (cleaning elevators). All of these classes of elevators are designed

for taking grain from railway cars and transferring it to vessels or to other railway cars.

Marine elevators, for transferring grain from vessels to railway cars, are provided on the dock or water side with elevator legs outside of the house, which are mounted on wheels, permitting movement along the side of the house and allowing the legs to be set opposite the vessel's hatches. These marine legs convey the grain to the turnhead spouts, whence it passes to the garnerers, scales, cleaning machinery, if desired, or to the car-loading spouts. Elevators are also constructed especially for export handling of grain, as those at New York, Philadelphia, and Montreal, where grain received from cars or inland vessels is stored or transferred to ocean vessels. Such an elevator is the enormous 2,622,000-bushel concrete elevator No. 2 of the harbor commissioners of Montreal, Canada. Floating elevators are structures similar to land elevators, which are mounted on floats or barges, which permit the transportation of the structure from one point of a harbor to another and the transfer of cargoes of grain to vessels at their own berths or anchorages.

In America the most common construction for elevators was timber, and this is now found extensively used in small country elevators, but for larger structures steel, concrete, tile, and brick are employed on account of being fireproof as well as for greater strength. Wooden elevators were constructed sometimes with thin brick outside protecting walls for the house, and corrugated iron covering for the roof and cupola walls. This outside protection, however, was of little practical value once fire had gained access to the timber interior, and even with its use insurance rates were very high. Modern construction usually takes the form of steel bins inclosed by a house with brick walls, and a cupola built entirely of steel framing, covered with terra cotta or iron, and having tile or sheet-steel floors, or sometimes the bins are made of concrete, with a reinforcement; elevators of this construction, used extensively in Europe, have found wide application in the United States and Canada, as their cost is less than steel bins. See illustration under CONCRETE.

Another type of fireproof elevator construction considerably practiced in America consists in building the storage bins of steel separated from the fireproof buildings containing the operating machinery. A system of pneumatic conveyors for handling the grain between the bins and the operating house and for loading and unloading it is an essential part of this type of elevator and may be arranged either in the blast system, the suction system, or the combined blast and suction system. At Emden, Germany, a floating pneumatic elevator and grain-discharging plant is in operation for the transfer of grain from large steamers.

As an indication of the character and extent of the elevator business, reference may be made to the records of grain handled by the elevators of Chicago, Ill. In 1914 the elevator warehouses, declared regular warehouses for the storage of grain under the rules of the board of trade of the city of Chicago, had a capacity of 17,730,000 bushels, while others not so designated had a capacity of 27,645,000, or a total of 45,375,000 bushels. At these elevators the rules provide that, on all grain and flaxseed received in bulk and in good condition, the charge shall not be in excess of one cent per

bushel for the first 10 days or part thereof, and one-thirtieth of one cent per bushel for each additional day thereafter, so long as such grain or flaxseed remains in good condition. The largest "regular" elevator in Chicago was the Armour Elevator, including Houses A and B and B Annex, with a capacity of 5,000,000 bushels, while of the others the Union Elevator and Annex had a capacity of 2,000,000 bushels. The total amount of grain received at Chicago in 1913 was 337,488,000 bushels, including wheat, corn, oats, rye, and barley.

Consult: Ketchum, *Walls, Bins and Grain Elevators* (2d ed., New York, 1911); Grain Dealers' Journal, *Plans of Grain Elevators* (3d ed., Chicago, 1913); *Annual Reports, Chicago Board of Trade*; *Annual Reports of the Department of Trade and Commerce* (Ottawa, Canada).

GRAINER PROCESS OF SALT MANUFACTURE. See SALT.

GRAINGER, grăn'jēr, JAMES (1721-66). An English physician and poet. He was educated at a school in North Berwick and studied medicine at Edinburgh. After three years of army life (1745-48) he settled in London, but had so little success in medicine that he turned to literature. Besides making a *Translation of the elegies of Tibullus and of the Poems of Sulpicia* (1759), sharply criticized in Smollett's *Critical Review*, and rendering some assistance in the preparation of Charlotte Lennox's translation of Brumoy's *Théâtre des Grecs* (1759), he wrote, during a stay in the West Indies, a long poem in heroic style on *Sugar Cane*. This was published in 1764, after it had provoked Dr. Johnson's ridicule because of a minute description of rats in the cane fields. Grainger's collected poems were printed in 1801. Besides a dissertation, *De Modo Excitandi Ptyalismum*, he wrote: *Historia Febris Anomala Batavae Anorum 1746, etc.*, *Accident Monita Siphylia* (1753), and an *Essay on the More Common West India Diseases* (1764). He died at St. Christopher, of West India fever.

GRAINING. A European cyprinoid fish (*Leuciscus lancustrionis*), of certain streams of the west of England and in some of the lakes of Switzerland. It is rather more slender than the dace, in its habits and food resembles the trout, rises readily at the artificial fly, and affords good sport to the angler. It may reach half a pound in weight and is excellent eating.

GRAINING (from *grain*, from Icel. *grain*, Swed., Norw. *græn*, branch; a doublet of *groin*). Fishing with the grain, a sort of pitchfork or spear. There are many varieties of grains, from the five-tine pattern, set crosswise, to the single-tine harpoon of the whaler. In some of its forms, notably that used in the capture of swordfish, the head of the grain remains in the fish after it is struck, attached to a line, but the handle is withdrawn. The most frequently used is one with two prongs, each half barbed inwardly.

GRAIN INSECTS. Several insects attack and damage stored grain of all sorts. The most conspicuous one is the caterpillar of a small, grayish-brown and black tineid moth (*Gelechia cerealella*), allied to the clothes moth and called corn moth in Great Britain, but known in the United States as fly weevil and Angoumois grain moth, from the old Province of Angoumois, France, where it has long been extremely destructive. It is most abundant in the Southern States, where on account of it grain cannot long be stored. It may at times attack other

substances, such as books, pasteboard, woolen goods, or even wood. Salt mixed with the grain is said to be useful in checking the ravages of the larvæ, and the frequent turning over of the grain destroys both eggs and larvæ. When emptied, granaries should be thoroughly cleaned and whitewashed.

A different tineid, also called grain moth (*Tinea granella*), is another widespread and serious pest, especially to stored wheat; and a third moth (*Ephestia kühniella*), which since 1877 has been a source of vast damage in Europe, appeared in destructive numbers in North America about 1890. It multiplies with amaz-

GRAIN MOTH AND ITS EFFECTS.

a, adult Angoumois moth (*Gelechia cerealella*); b, a kernel of maize inhabited by a caterpillar; c, part of an ear perforated by caterpillars.

ing rapidly, makes clots in flour or meal, or binds together grains of wheat, Indian corn, etc., by its silk-spinning and voracious caterpillars, and is extremely difficult to get rid of. Another destructive species of the same genus is also known. Consult *Insect Life*, vol. ii (Washington, 1890).

Small beetles (weevils) of various kinds attack stored grain, especially those of the genus *Calandra*. They are minute, numerous, and lay eggs upon the kernels; the larvæ hatched from these bore into and consume the body of the grain, whence they emerge as perfect beetles in the autumn. The most approved remedy is to submit the grain to dry heat of not less than 130° F. or to the fumes of carbon disulphide. See, also, CORN INSECTS; and for insects attacking growing cereals, see the articles WHEAT INSECTS; RICE INSECTS; ETC.

GRAIN RUST. See RUST.

GRAINS OF PARADISE, or MELEGUETTA PEPPER. An aromatic and extremely hot and pungent seed, imported from Guinea. It is the produce of *Amomum meleguetia*, or *Amomum granum paradisi*, a plant of the family Zingiberaceæ, with lanceolate leaves, one-flowered scapes (leafless stems), about 3 feet high, and ovate or elliptic-oblong capsules containing many seeds. By the natives of Africa these seeds are used as a spice or condiment to season their food; in Europe they are chiefly employed as a medicine in veterinary practice and fraudulently to increase the pungency of fermented and spirituous liquors. During the reign of George III brewers and dealers in beer in England were prohibited, under a heavy penalty, from even having the seeds in their possession. The name "meleguetta pepper," or "Guinea pepper" (q.v.), is also given to other pungent seeds from the west of Africa.

GRAM. East Indian name for chick-pea (q.v.).

GRAM (Fr., from Lat. *gramma*, Gk. *γράμμα*, weight of two obols, writing, from *γράφειν*, *graphein*, to write). A measure of weight in the metric system, originally defined as "the absolute weight of a volume of pure water equal to a cube of the one-hundredth part of a meter and at the temperature of melting ice," and the basis of the original kilogram of the Archives. Now, as the mass of the international kilogram is taken as unity, the gram becomes a unit of mass equal to one-thousandth part of it. See **METRIC SYSTEM**.

GRAM, GEEGERS WINTHER WULFSBERG (1846-). A Norwegian jurist and statesman, born at Moss. He was educated at Christiania, studied in Paris, practiced law, and was early connected with the Department of Justice. From 1876 to 1882 he was Norwegian member of the International Tribunal in Egypt, and thereafter he was Governor of Nordlands Amt for a year; justice of the Supreme Court (1884-89); Minister of State at Stockholm in Stang's ministry (1889-91); and again on the Supreme Court bench. In 1892-93 he was member of the international court of arbitration in Paris for the settlement of the Bering Sea Controversy (q.v.); from 1893 to 1898 he was again Minister of State at Stockholm in the cabinets of Stang and Hagerup. He became Governor of the diocese of Hamar, and Governor of Hedemarkens Amt. Appointed in 1900 to serve for six years as member for Norway of the Court of Arbitration at The Hague, he was again called to this post in 1912 to serve until 1918. In 1903 he was referee in a case of arbitration between Germany, France, and England on one side and Japan on the other regarding taxes for legation houses at Tokyo; in 1904 he became a member of the Institut de Droit International; and in 1909 was appointed to the court of arbitration between Norway and Sweden for the settlement of reindeer questions.

GRAMINEÆ, grā-mīn'ē-ē (Lat. nom. pl., pertaining to grass, from *gramen*, grass). The great family of grasses, which is one of the largest and probably one of the most useful groups of plants, as well as one of the most peculiar. It is world-wide in its distribution and is remarkable in its display of individuals, often growing so densely over large areas as to form a compact turf. If the grasslike sedges be associated with the true grasses, there are about 6000 species, representing nearly one-third of all of the monocotyledons (q.v.). Here belong the various cereals, sugar canes, bamboos, and pasture grasses, all of them eminently useful plants. They are for the most part perennial herbs with profusely branching rootstocks which creep horizontally in the soil and give rise both to sterile shoots in the form of tufts of leaves and also to fertile shoots. The characteristic leaf of the group consists of a blade and a prominent sheath, at the junction of which appears the outgrowth called the ligule (q.v.).

The inflorescence of the grasses consists of spikes, racemes, or panicles, and is always composed of an aggregation of secondary inflorescences called spikelets. Each spikelet usually bears several flowers and also a number of bracts. The two lowest bracts (sometimes three) of each spikelet are sterile, i.e., they do not have flowers in their axils, and are known as glumes. Above these are a varying number of bracts subtending flowers, called flowering

glumes (formerly outer or inferior paleæ). It is these flowering glumes which are often prolonged into the bristle-like tips known as awns. Opposite each flowering glume on the short

ALOPECURUS PRATENSIS.

a, the cylindrical spike; b, a single flower with its glumes; c, flowering glume with its awn; d, the pistil.

flower stalk there is a bractlet known as the palea (formerly superior or inner palea), which is always awnless. Upon this same short flower stalk there often appear also two minute scales, known as lodicules, whose morphological character has caused considerable discussion. The flower consists usually of three stamens, each with an oblong or linear anther attached below the middle to the apex of the slender filament (versatile), and a single ovary bearing a style with two, rarely three, stigmatic branches. The various glumes are set so close together upon the axis of the spikelet that they overlap and are only partly visible, completely protecting the flowers. At the time of pollination the glumes separate and the dangling anthers and feathery stigmas become visible. After fertilization the pericarp (ripened ovary wall) adheres so closely to the seed that it seems to be an outer skin, forming the characteristic fruit (the grain) of the group. The embryo is peculiar in that it lies close to one side of the seed, so that it is com-

BROMUS MOLLIS.

pletely exposed by the splitting of the thin skin which covers it. In this case the single very large seed leaf, cotyledon, does not escape in germination, but remains as a broad, shieldlike absorbing organ, with its back against the starch-containing tissue (endosperm). This peculiar shield-shaped absorbing cotyledon is called the scutellum.

The grasses appear in the most varied situations and numbers. Their chief display, however, is in meadows and pastures, where they form the principal vegetation. The meadow grasses occur almost everywhere; the most important of the cereal grasses grow in temperate regions; certain cereals, as rice, etc., are cultivated in the tropics and subtropics; the arborescent grasses, such as the bamboo and its allies, form extensive groves in the tropics, and the small forms grow in the shade of the primitive forest. For forms of economic interest, see GRASSES.

GRAMMAR (OF., Fr. *grammaire*, from Lat. *grammatica*, from Gk. *γραμματικός*, *grammatikos*, pertaining to writing, from *γράμμα*, *gramma*, letter, from *γράφειν*, *graphein*, to write; ultimately connected with Ger. *graben*, Eng. *grave*). That branch of linguistic science which investigates the forms of speech in a language or group of languages and treats of the mutual relations of those forms. Grammar may be divided into normative or didactic, historical, and comparative. Normative grammar deals with the phenomena of a given language at a single period, establishing the linguistic usage for that epoch, any deviation from the standard there set being considered "bad grammar." As examples of normative grammar may be cited the ordinary treatises on the Latin of the Ciceronian period, the Attic Greek of the Periclean age, and most grammars of modern French, German, English, and the like. Historical grammar, as its name implies, discusses the historical development of a given language, usually from the earliest traces of the language in question down to the present time. Here no norm is set. The purpose of such a work is merely to present facts, not, as in the normative grammar, to lay down canons of usage. For instance, normative grammar of modern English states that two negatives are equivalent to an affirmative. Such a sentence as "he didn't hear nothing" as equivalent to "he heard nothing" is stigmatized as "bad grammar," i.e., as deviating from the norm. On the other hand, historical grammar observes that at present two negatives are equal to an affirmative. In early English, however, as in the Proverbs of Hendyng (thirteenth century), this is not true, for we have such constructions as:

*Gef þou art riche & wel ytold,
Ne be þou noht þarefore to bold,
Ne waa þou noht to wild.
(If thou art rich and well accounted,
Be thou not therefore too bold,
Nor wax thou not too wild.)*

In like manner we find in Anglo-Saxon of the best period, as in Alfred's translation of Boethius, such sentences as *on nānum menn nytton nāne ðre* (lit., they don't show no honor to no man; i.e., they show honor to no man). Historically there is no inherent correctness in the use of one negative or more than one. The best usage forms the only law. Historical grammar

may, however, explain the origin of a usage without transcending its limits. Thus, in the example before us the double negative is based on a desire for emphasis (if one negative is good, two are better), the use of the single negative, on a sense of logic (one negative annuls another). Comparative grammar, which is usually historical rather than normative in type, groups different languages together for a comparative study of their forms and the relations of such forms. We thus have comparative grammars of Romance, Germanic, Indo-Germanic, Dravidian, or Semitic languages, and the like. Here the discussion will be only of normative and of historical grammar, the subject of comparative grammar being treated under the title PHILOLOGY (q.v.).

History of Normative Grammar. Until the nineteenth century the history of grammar is confined to the normative type. Only with the introduction into Europe of the knowledge of Sanskrit did the impulse come to study language comparatively and historically. The few attempts made along those lines before had all proved abortive for lack of material and method, and grammarians contented themselves with recording linguistic phenomena of given periods. In the Orient grammatical study began in India with the Nirukta of Yaska (fifth century B.C.), although the first formal grammar of which we have any knowledge was that of Panini (q.v.), probably about 300 B.C. In some 3000 sections comprised in eight books he summarized and fixed the rules for classical Sanskrit. He enumerates 64 predecessors and was himself the forerunner of a long line of grammarians. His rules, which are couched in formulas almost algebraic in type and abounding in arbitrary designations (e.g., *aṭ* = the group of vowels, semivowels, and *h*; *am* = the same group together with the nasals; *lañ* = imperfect tense; *luñ* = aorist tense; *liṭ* = perfect tense; *lut* = periphrastic future, etc., where *l* denotes all personal endings, *t* a primary tense, *ñ* a secondary tense, etc.), formed the basis of many commentaries such as the *Vārttikas* of Katya-yana (probably third century B.C.) and Patanjali's *Mahābhāṣya* (probably a half century later). About the middle of the seventh century A.D. the first complete commentary on Panini was composed, entitled *Kāśika Vṛtti*, or *Benares Commentary*, by Jayaditya and Vamana. Of the non-Paninean school of Sanskrit grammar the most important is Hemacandra of the twelfth century, the eighth book of whose *Siddhahemacandra* is the main source for native Prakrit grammar. The oldest grammarian in Prakrit (q.v.) is Vararuci, said by native tradition to have been a contemporary of Kalidasa (q.v.). Here, too, there is a long series of grammarians of minor importance. The Sanskrit term for grammar, *vyākaraṇa*, analysis, is indicative of the Indian method. Systematic and exact with their passion for minute division and subdivision, the work of the Hindus in this branch of learning reached its acme in the wonderfully exhaustive work of Panini, with which no grammar can be compared till modern times. The grammar of India was of indigenous origin. It discussed phonology, etymology, and inflection, but there is almost no mention of syntax. Of the other Oriental peoples only the Arabs and the Jews developed grammatical works. Arabic grammar was founded shortly after the Hejira. Abu 'l As-

wad ad-Du'il (died 688 A.D.) is considered the first Arabic grammarian, and he classified the parts of speech as nouns, verbs, and particles. This branch of literature in Arabic is an enormous one, no less than 2500 writers on grammar, lexicography, and philology being enumerated. The earlier grammarians are the most important, such as al-Farahidi, and his pupil, Abu 'l Hasan al-Basri, more usually known as as-Sibawaih (latter part of the eighth century). The source of Arabic grammar is involved in obscurity. It is, however, a significant fact that many of the Arabic grammarians, like more than one of their greatest historians, were Persians by birth. Through the medium of the Syrians Greek culture penetrated Persia, and doubtless some knowledge of Greek grammar came through the same channel, so that it does not seem unwarranted to suppose that Arabic grammar, which is treated with exactness and comprehensiveness, was ultimately influenced by Greek. It is at least certain that Syriac grammars, of which that of Elia of Sobha (eleventh century) is an excellent example, were based on Greek models. The Jewish grammarians had originally the same purpose as those of Arabia, the preservation of their sacred books. In a certain sense their grammar commences with the Massorites, although it was not until the Jews came under the influence of fully developed Arabic culture that they wrote formal grammars. The oldest extant Hebrew grammatical work is a lexicon by David ben Abraham (tenth century), but the greatest is that of Ibn Janah (Rabbi Jonah), of the early eleventh century. His work, divided into 46 chapters, leaves scarcely a problem of Hebrew grammar untouched, and though after him there were many native Hebrew grammarians, none attained to his standard.

There was but one people of the ancient world except India which evolved an independent system of grammar. This was Greece. The contrast between the two beginnings is significant of the trend of thought of the two nations. In India the impulse was given by religion, in Greece by philosophy, especially by the Sophists (q.v.), such as Protagoras and Antisthenes. Many of the technical terms still used in grammar were coined by philosophers before formal grammar was known. On the other hand, there is a certain analogue between the two peoples, for the Indians applied grammar first to the *Rig-Veda* as the Greeks to the text of the Homeric poems. It was therefore the critics of Alexandria and Pergamum who were the first Greek grammarians. Of these the pioneer was Dionysius Thrax, who taught at Rome in the first century B.C., although the *Cratylus* of Plato, which is of great historic interest in grammar (see ETYMOLOGY), contains some general statements on grammatical topics. Following Plato Aristotle in the course of his philosophical works distinguished between nouns, verbs, and "connectives" (Gk. *σύνδεσμοι*, names, *ῥήματα*, sayings, *σύνδεσμοι*, bonds, including pronouns), and he also recognized the category of case (Gk. *πρόσωπον*, fall). The Stoic philosophers made important contributions to grammatical knowledge. Thus Posidonius of Rhodes (first century B.C.) gave to the five cases of the Greek noun the names which they still have. The work of Dionysius Thrax, to which allusion has been made, was, however, the most important from a formal point of view. Summing up the work of his predecessors, he set forth a gram-

mar so complete that it formed a model for all succeeding Greek and Latin works on the subject, was the standard, moreover, for grammars of other languages, as, e.g., of an Armenian grammar said by tradition to have been composed in the fifth century, and commented upon by Yohan Erznkaceli in the fourteenth century, and still influences in form even the most modern and scientific grammars. While the Sanskrit grammarians, as we have seen, neglected syntax almost entirely, the Greeks paid special attention to this branch of grammar. This is the new contribution in the works of Apollonius Dyscolus (second century A.D.), one of the greatest grammarians who has ever lived. The grammatical work of the Romans was but an imitation of their Greek models. The two names deserving special mention are those of Varro (110-c.28 B.C.), whose work on the Latin language is of great value and has some sections on etymology, the weakest side of Græco-Roman grammar, as it is one of the strongest of the Sanskrit, and Priscian (about the close of the fifth century A.D.), whose *Grammatical Commentaries*, in 18 books (the first two on phonology, two more on word formation, then 12 on inflection, and two on syntax), was the standard authority through the Middle Ages. Mediæval times show no progress in grammatical work. It is true that nonclassical languages received attention owing to the spread of Christianity, which offered the Scriptures in the vernaculars of the peoples to whom the new religion was carried. The only grammar in the technical sense of the word, however, of this period is the Welsh one, entitled *Desparth Edeyrn Aur*, written, as its name implies, by Edeyrn the Golden-Tongued, in the thirteenth century. With the revival of learning came a change. Latin still exercised its influence over all grammar, and the earliest Renaissance treatises are devoted to Latin in its relation to the vernaculars. One of the first works of this type was the anonymous *Tractatus dans modum teutoniscandi casus et tempora* (Münster, 1451). A single sentence shows its quaint character: *Uñ eyn verbum neutrum edder neutrale hech darumme also, dat yd noch wercken edder lydent bedudet* (and a verbum neutrum or neutrale is thus called because it expresses neither action nor passivity). The first Greek grammar of this period was that written by the Byzantine exile Constantine Lascaris (Milan, 1476). To give a history of the many classical grammars which appeared from the beginning of the Renaissance to the new epoch inaugurated by the study of Sanskrit would lead too far afield. Suffice it to say that there was no real progress made in scientific grammar of any language until the exclusive devotion to Latin and Greek gave way at the opening of the nineteenth century to the broader study of other languages as well. The first grammars of the various nonclassical languages are as follows: Spanish by Elius Antonius Nebrissensis (1492); Arabic by Peter of Alcalá (1505); Hebrew by Reuchlin (1506); Old Church Slavic, anonymously (1516); German by Ickelsamer (?) (1527); Hungarian by Erdösi (1539); Ethiopic by Victorinus (1548); French by Estienne (Stephanus) (1557); Syriac by Widmanstadt (1558); Polish by Stoienski (Statorius) (1568); Bohemian, anonymous (1567); Basque, anonymous (1587); Tagal by Santo Josepho (1610); Modern Greek by Portius (1638); Canarese by Estevano (1640);

Danish by Pontoppidan (1648); Annamese by Rhodes (1651); English by Wallis (1653); Lithuanian by Klein (1653); Chinese by Kircher (1667); Portuguese by Pereira (1672); Malay by Raimonds (1674); Swedish by Wallen (1682); Lettish by Adolphi (1683); Gothic, Anglo-Saxon, and Icelandic by Hickee (1689). The geographical discoveries of this period resulted linguistically in the publication of numerous grammars, including those of Aztec (1555); Chiapa (1560); Quichua (1560); Mixteca (1593); Tupi (1595); Aymará and Araucanian (1603); Huron (1631); Guarani (1639); Massachusetts (1666); Chayma (1680). The eighteenth century was rich in grammatical contributions. We have grammars of Tamil by Ziegenbalg (1716); Hindustani by Schultze (1741); Fanti and Accra by Protten (1764); Bengali by Halhed (1778); Marathi, anonymous (1778). The American languages also received much attention. Thus, Moxan was treated by Marbau (1701); Tarsaca by Quixas (1714); Koran by Ortego (1732); Lulen by Machoni (1732); Totonacan by Bonilla (1752); Eskimo by Egede (1760); Otomi by Neve y Molina (1767); Abipone by Dobrizhofer (1784); Mohican by Edwards (1788). The latter half of the century was marked by a steady growth of interest in comparative grammar, which was soon to revolutionize the study and the methods of the science. (The history of these branches of linguistics is treated more properly under *PHILOLOGY*.) Since the opening of the nineteenth century the history of grammar in its normative aspect has been modified to some extent by the comparative method, which is also responsible in great part for the historical mode of treatment. The trammels of Latin are less felt, although the simple normative grammar of any Indo-Germanic language is almost of necessity written along the old familiar scheme. The inadequacy of such a treatment is less apparent, however, in this group of dialects than in those of other language families. Many tongues which have no case, verb inflection, or the like corresponding to the Latin must be distorted before they can be forced into the conventional mold. Such incorporating languages as American Indian are cases in point. This difficulty is, it must be confessed, almost unavoidable. The mind of the linguist is, unhappily, so fixed by the forms of his own vernacular and its kindred languages that it is almost a psychic impossibility for him to escape their influence, especially when presenting the facts of a language in the form of a grammar.

Method of Normative Grammar. While normative grammars vary somewhat according to the special requirements of the languages of which they treat, or according to the class of readers to whom they are addressed, they should be written in general according to a uniform outline. The comprehensive definition of the language considered by the grammar in question is given, the dialectic subdivisions are described and localized, and their mutual relations to each other are presented. The orthography, pronunciation, and main principles of accent are next considered, and then the phonology is taken up systematically, preferably in the order of vowels, semivowels, nasals, liquids, mutes (gutturals, palatals, dentals, and labials), and spirants. After the phonology comes the noun formation, followed by the inflection of nouns and adjectives

according to their various declensions, then pronouns and numerals, and finally adverbs, prepositions, conjunctions, and interjections. Next comes the section on verb formation, followed by the verb inflection arranged according to the different conjugations of the language under consideration. The division of syntax follows that of inflection. Here several arrangements are possible. The simplest method is to repeat the order observed in the inflectional part. The concluding portion of the syntax may often be devoted profitably to a discussion of the word order of the language, and a sketch of the metres found in the poetry should conclude the work. Comparisons of the dialects of the language with its literary form may often be introduced in their proper places. It must be borne in mind that this is the outline of a technical scientific grammar. Special grammars, as those for beginners and schools, will frequently deviate for practical purposes more or less from the outline here given. Any arrangement which seems best for the special object of such a grammar may be adopted. The various lessons into which school grammars are frequently divided are often provided with vocabularies of new words, and with sentences for translation from and into the language treated by the work. It is not unusual to append a chrestomathy of the languages containing extracts from some of its most important literary works and to follow this with a glossary.

Parts of Speech. In a discussion of grammar it is necessary to enumerate the relations of the various parts of speech to each other and to state what is comprised under each of these parts. The parts of speech are usually considered to be eight in number: nouns, adjectives, pronouns, verbs, adverbs, prepositions, conjunctions, and interjections. Under these several titles will be found more full accounts of their functions. The noun is conventionally described as the name of a concrete or abstract object; the adjective modifies the meaning of a noun or pronoun; the pronoun is a word standing in place of a noun; a verb expresses action or state of being; an adverb modifies a verb, adjective, or other adverb; a preposition shows the relation between one noun or pronoun and another; a conjunction connects clauses or words; the interjection is an expression of emotion standing in no grammatical relation with the rest of the sentence. While this division is sufficient for practical purposes, it is far from satisfying scientific accuracy. The noun and adjective are particularly closely allied, so that their functions often overlap, and there is in some instances no real distinction between the two. It seems probable that in the earliest period of the Indo-Germanic languages (q.v.) there was but one group for the two, the noun, and that from the collocation of nouns, one affecting the meaning of the other, the adjective was derived as a subdivision of the noun. Similarly the adverbs, prepositions, and conjunctions are shown by comparative philology to be in most instances stereotyped case forms of nouns. The pronouns, although in many cases, as in the demonstrative, interrogative, or relative classes, they are inflected like adjectives, form, in reality, a class distinct from the nouns. The cardinal numerals beyond four were originally nouns; below four they were in the adjective group. Verbs also form a

separate class, although in the infinitive and participle they overlap the noun-adjective group. The old view that in their primitive inflection pronominal elements entered seems on the whole doubtful, although arguments may be alleged in its favor. The most primitive interjections are merely reflex emotive vocal actions and admit of no linguistic classification. They are perhaps the most primitive forms of speech, shared, like gesture language (q.v.), by man with the animals. The developed interjections are synopated sentences. Scientifically, then, the parts of speech are four—nouns, pronouns, verbs, and interjections. Nouns and pronouns have normally gender, number, and case. Gender may be natural, indicating male, female, and sexless, or grammatical, as German *der Tisch* (masc.), table; *die Gabel* (fem.), fork; *das Weib* (neu.), woman. Here gender has nothing to do with sex. Number shows whether the word denotes one (singular), two (dual), or more than one or two (plural). Case expresses the relations of a noun or pronoun to the word with which it is most closely related in the sentence. The number of cases varies widely in different languages. The verb, like the noun, has number and, in some languages, gender. It also has person, mood, tense, and voice. Person denotes generally either the person speaking, the one addressed, or some other individual. Here again many non-Indo-Germanic languages have various deviations from this scheme. Moods are actual (indicative) or contingent, the most familiar examples of the latter being the subjunctive (will), optative (wish), and imperative (command). Tense expresses the time of action. Originally tense was merely present or past, the present serving as a future also, but there were later developed various subdivisions of tense, as the future and the perfect tense (present, past, and future perfect), and the like. Voice denotes whether the person is the agent (active), or is acted upon (passive), or acts in a way which affects himself (middle). The passive voice is much later in development than the active or than the middle, which has disappeared in the modern Indo-Germanic languages. All these grammatical categories are modified in various ways by different languages, and very many dialects have much more complex systems than the normal one for the Indo-Germanic group, which is here outlined.

GRAMMAR SCHOOLS. In the Middle Ages, when the existing schools were entirely under control of the monastic or the secular clergy, a distinction was drawn between the singing schools, or those in which instruction was limited to the elements of reading, writing, and singing, and the grammar schools, in which attention was directed to the study of language and literature, usually of a religious character. These grammar schools were, in fact, a survival or revival of the old Roman grammar schools, or schools of the grammatists. In England the term was in turn applied to the secondary schools that were established on independent foundations and were free from direct ecclesiastical control. Such schools were also called public schools. The earliest of these was Winchester, founded in 1378 by William of Wykeham, Bishop of Winchester. During the troubles incident to the Reformation in England many of these schools were swept away, but some of them were afterward restored. The most important of these schools, and hence often called the nine great public or grammar schools of England, are Winchester, Eton, Rugby, Charterhouse, St. Paul's, Harrow, Westminster, Merchant Taylors, and Shrewsbury. These schools were devoted wholly to the study of Greek and Latin grammar and rhetoric, and hence the title "grammar schools." The English colonists carried this type of school to America. Such an establishment was attempted in 1621 at Charles City, Va.; but, owing to the troubled character of the times, it had no permanency. In 1635 the Boston Public Latin School was established in Boston, and it has had a continuous existence to the present time. Many such schools were established in Massachusetts, and in 1647 a general school law was passed which contained the following provision: "It is further ordered, that where any town shall increase to the number of 100 families or householders, they shall set up a grammar school, the master thereof being able to instruct youth so far as they may be fitted for the university." Similar schools flourished in most of the Colonies until near the close of the eighteenth century, when a type of secondary school, called academies, took their place.

Towards the middle of the nineteenth century the term "grammar school" again came into common use in the United States to indicate a type of intermediate school devoted for the most part to the study of English grammar with some attention to geography, advanced arithmetic, and history. Previous to this time the only school inferior to the Latin grammar schools and the academies was the elementary school, devoted to the study of the elements of reading, writing, and arithmetic. The system of grading was gradually introduced about the middle of the century in the larger towns of Massachusetts. The elementary and the (English) grammar school were divided into from two to four, usually three, grades each, and were amalgamated into a system under one administration—that of the superintendent of schools. The term "grammar school" is now commonly

used to designate the upper grades, ordinarily the fourth to the eighth, inclusive, of the common school, in which not only grammar, but also arithmetic, geography, history, elements of natural science, usually drawing, some form of manual training, and sometimes elementary algebra or geometry, with a foreign language, enter into the curriculum. See COMMON SCHOOLS; EDUCATION; GYMNASIA; MONASTICISM; NATIONAL EDUCATION, SYSTEMS OF; SCHOOLS; and the several grammar schools enumerated.

GRAMMA'TEUS. See SCHREIBER.

GRAMMICHELE, grām'mé-kā'lā, or **GRAN-MICHELE**. A city in the Province of Catania, Sicily, 35 miles southwest of the town of Catania (Map: Italy, E 6). It has stone and clay quarries and markets grain, wine, cotton, fruit, and cattle. It was founded in 1693 by the Prince of Butera to take the place of the neighboring Occhialà, destroyed by an earthquake. A cave devoted to the worship of Ceres has been discovered east of the town. Pop. (commune), 1901, 15,075; 1911, 17,463.

GRAMMONT, grām'mōn' (Flem. *Gcoertsbergen*, *Gcoerdsbergen*). A small town of Belgium, in the Province of East Flanders, situated on both banks of the Dender, 22½ miles by rail south of Ghent (Map: Belgium, B 4). It has an episcopal college and manufactures of lace and textiles. The town is chiefly noteworthy on account of the Charter of Grammont granted here in 1068, which may be described as the Magna Charta of Flanders. Pop., 1900, 11,999; 1910, 12,619.

GRAMMONT, ORDER OF. See GRANDMON-TAINS, ORDER OF.

GRAMMYSIA, grām-mis'y-ā (Neo-Lat., from Gk. γράμμη, *grammē*, line + *mūs*, *mys*, mussel). A fossil pelecypod shell of clamlike form, with strong concentric folds, and one or more radial furrows extending from the umbones diagonally to the ventral margin of the shell. The genus appears in the Silurian rocks, but is especially abundant in the Middle and Upper Devonian marine formations, of which it is quite characteristic. The type species is *Grammysia hamiltonensis*, about 3 inches in length.

GRAMONT, grām'mōn'. The name taken by the younger branch of the family of Aure, noblemen of Navarre.—PHILIBERT (?-1580) married (1567) Diane d'Andouins (1554-1620), mistress of Henry IV.—Their son, ANTOINE II (?-1644), was Viceroy of Navarre and was made Duke de Gramont. Of his four sons, two are well known.—ANTOINE III (1604-78), Marshal of France, took part in the wars in Holland, Italy, and Germany, fought in the battle of Freiburg, was taken prisoner at Nördlingen, but was exchanged immediately and was prominent at the battle of Lens (1648). During the wars of the Fronde he was on the side of the court. In 1657 he went to Spain to arrange for the marriage of Louis XIV with the Infanta Maria Theresa. He married Françoise de Chioré, a niece of Richelieu. His *Mémoires* were published in 1617. The more important members of the family are treated separately.

GRAMONT, ANTOINE ALFRED AGÉNOR DE, DUC DE GUICHE, PRINCE DE BIDACHE (1819-80). A French diplomat. He was born in Paris, was educated at the Ecole Polytechnique, and prepared himself for the diplomatic service. His opportunity for entering diplomatic life did not come until after the coup d'état of Dec. 2, 1851. In 1852 Napoleon sent him as Minister Pleni-

potentiary to Cassel. In the two years following he was transferred to Stuttgart and then to Turin, each transfer being in the line of promotion. In 1857 he was named Ambassador at Rome and in 1861 became the representative of the French Empire at Vienna. There he remained until January, 1870, when he was called to Paris to become Minister of Foreign Affairs in the Ollivier cabinet. In this position he played a prominent part in the events that led up to the Franco-German War and was probably responsible for the precipitancy with which France rushed into the conflict. On July 15 he gave to the Chambers a distorted version of the conduct of Prussia with regard to the Benedetti affair, thereby committing France to the declaration of war which followed on the 19th. On August 9, after the first reverses to the French arms, he resigned with the rest of the Ollivier cabinet, amid a storm of abuse from the French press. He spent the remainder of his life in retirement, writing apologies and explanations of his conduct, in which he tried to shift the blame for the catastrophe upon others. His principal work was *La France et la Prusse avant la guerre* (1872). Consult L. Thouvenel, *Le secret de l'empereur, correspondance . . . échangée entre M. Thouvenel, le duc de Gramont, et le général comte de Flabant, 1860-1863* (Paris, 1889), and Emile Ollivier, *L'Empire libéral*, vol. xii (ib., 1910).

GRAMONT, PHILIBERT, COUNT DE (c.1621-1707). A celebrated French courtier. He was the son of Antoine, Duke de Gramont, who he claimed was a natural son of Henry IV. While still very young he served as a volunteer under Condé and Turenne, and distinguished himself by the most chivalric bravery. At the court of Louis XIV, with this reputation added to his youth, noble birth, a handsome person, fine talents and accomplishments, a lively wit, and good fortune at play, he had the audacity to aspire to be the rival of the King in the affections of one of his favorites. This caused him to be banished from France in 1662. He found a refuge at the court of Charles II of England. Here, after many adventures, he married Eliza Hamilton, sister of Anthony, Count Hamilton. He then went to France (1664) and served in the Low Countries. His wife became one of the ladies at the court of the Queen Maria Theresa. He had two daughters, one of whom was married to Henry Howard, Marquis of Stratford, and the other became Abbess of Poussay in Lorraine. The famous *Mémoires du Comte de Gramont* were written by his brother-in-law, Anthony, Count Hamilton (q.v.), trans. in "Bohn's Library" (London, 1846; new ed., New York, 1905).

GRAM'OPHONE. An apparatus for recording and reproducing sound, invented by Emile Berliner (q.v.) and publicly demonstrated in 1888 in Philadelphia. It is now marketed under such trade names as the Victor Talking Machine, Disk Graphophone, and Columbia Phonograph. It differed from the original phonograph and graphophone (qq.v.) in employing for its record, instead of a cylinder, a disk on which a horizontal zigzag record of even depth is cut, whereas in the other machines mentioned the record is of uneven depth or is made vertically in a line of one direction. Furthermore, with the gramophone no feed screw is required for propelling the stylus, as the record not only causes the reproducing point connected

with the diaphragm to vibrate but also propels it. The difference, it must be understood, is not one of principle but of mechanism. Records for the gramophone were first made either by photo-engraving a sound tracing, or by direct etching in zinc or copper, and later by cutting the zigzag line into a wax surface. The original record is used to make a die or matrix by electrolyzing, and from the latter impressions can be made in celluloid, rubber, or composition. The first successful duplicate record for the gramophone was made in celluloid by pressing the reverse of an original into that material while softened by heat, but this was given up in favor of hard rubber disks prepared by pressing accurately electrolyzed reverses or matrixes from the original zinc record. This led to the commercial success of this disk machine by 1895, yet the rubber disks were not altogether satisfactory and for them was substituted a shellac composition which was harder than hard rubber and reproduced sounds louder and more crisp. Various other substitutes have been tried, and one of the most successful has been a fibrous die faced with a thin layer of shellac on both sides. These disks are lighter in weight, less affected by climatic conditions, and can withstand rough usage. At first the gramophone was driven by hand, but a noiseless clock-work motor was developed by Eldridge R. Johnson which in addition possessed great regularity of speed. With the expiration of the graphophone (q.v.) patents of Tainter and Bell, the etching process was abandoned for the wax-cutting process, but horizontal recording was retained, and, in short, all the good features of the graphophone were incorporated. With recording in wax the development of the range and brilliancy of the gramophone was inaugurated. Opera singers and orators, musicians and orchestras, were soon in demand for records for reproductions, and these records, as well as the utterances of the world's greatest men and women, are kept preserved in copper or steel matrices for the use of all posterity. See TALKING MACHINES. Consult Berliner, in the *Journal of Franklin Institute* (Philadelphia), June, 1888, and August, 1913.

GRAMPIANS. A short and low Australian mountain range extending north and south in southwestern Victoria (Map: Victoria, B 5). From its west slope flow the Glenelg and its affluents. The loftiest peak of the range, Mount William, is 4500 feet above sea level.

GRAMPIANS. The principal mountain system in Scotland, separating the Highlands from the Lowlands (Map: Scotland, E 3). They run from northeast to southwest, forming the well-known high grounds of Aberdeenshire, Kincardineshire, Forfarshire, and Perthshire. The average elevation of this main range is from 2000 to 3000 feet; the highest elevation is Ben Nevis (4406 feet), at its western extremity. An outlying branch of the Grampians extends northward from near the head of the valley to the Dee and comprises among its chief summits Ben Machdhuì (4296 feet) and Cairngorm (4048 feet). Southward to the west extremity of the Grampians are situated numerous groups and chains of greater or less extent. Among these the chief summits are Ben Cruachan (3693 feet), Ben Lomond (3192 feet), Ben More (3845 feet), Ben Lawers (3984 feet), and Shichallion (3547 feet). The Grampians present towards the Lowlands a bold aspect, but in places they slope

gradually into the fertile country below, offering excellent pasturage, and are everywhere intersected by beautiful valleys. On the north side the mountains are more rugged and are difficult to traverse. The mountains contain the finest deer forests in Scotland. Three railroads cross them in the wildest parts—one through the Pass of Lerry and Glenogle, and another by way of the Pass of Killiecrankie and Glengarry. The name "Grampians" applied to this mountain system by modern writers represents the Graupius (changed by an error to Grampius) Mons of Tacitus, a mountain (or range), the scene of the defeat of Galgacus by Agricola, the location of which has not been determined. Consult Kiepert, *Lehrbuch der alten Geographie* (Berlin, 1878), and P. MacNair, *Geology and Scenery of the Grampians* (Glasgow, 1908).

GRAMPUS (older form *grampasse*, from Sp. *gran pec*, grampus, great fish, from *gran*, great, and *pez*, fish). A genus of large dolphins (Delphinidae), having a spindle-shaped body, thicker in proportion than that of the porpoise, from which this animal differs also in the greater height of its dorsal fin, in the upper jaw projecting a little over the lower, and in the smaller number of teeth, which are wanting in the upper jaw of adults, and are from 6 to 14 in the lower jaw. The color is slaty gray more or less streaked with white. The genus is nearly related to that of the caaing whale (q.v.). Several species are known in the northern oceans and in the Mediterranean Sea. The common grampus, or cowfish (*Grampus griseus*), is sometimes 20 feet long and is a slow-moving, wholly inoffensive animal. It feeds on squid, swimming mollusks, and small fish. The name "grampus" is popularly applied to almost any cetacean which is too large to be called a porpoise and too small to be called a whale.

GRAN. A town of Hungary. See ESZTERGOM.

GRAN, GERHARD (VON DER LIPPE) (1856-). A Norwegian critic, born at Bergen and educated at Christiania. After teaching in secondary schools at Bergen for nearly 20 years, in 1900 he became professor of northern literatures in the University of Christiania. He was editor and founder (1890) of *Samtiden*, a monthly devoted to literature and politics; in 1904 became an editor for Norway of *Nordisk Tidsskrift*; contributed important critical biographies to *Nord-mænd i det 19. Aarhundrede* (24 parts, 1903-07); edited *Henrik Ibsen; Festskrift* (1898); wrote *Norges Dæmring* (1899); *Björnstjerne Björnson, Hørdingen* (1910), and a great work on Rousseau (1910-11; Eng. trans. by M. H. Janson, New York, 1912).

GRANACCI, grā-nā'chè, FRANCESCO (1477-1543). A Florentine painter of the Renaissance. He was a pupil of Credi and then of Ghirlandaio and was influenced in turn by Botticelli, Michelangelo, Fra Bartolommeo, and Portonno. He assisted Ghirlandaio in his frescoes and after the latter's death completed much of his unfinished work. He is widely known because of his youthful friendship for Michelangelo, whom he induced to take up painting; but when he was afterward sent to Rome to assist the great master in his Sistine frescoes, the latter would not even receive him. He is best represented in the collections of Florence and the surrounding country; but his work may be also studied at Berlin and Munich.

GRANADA, grā-nā'dá, Sp. pron. grā-nā'ná.

The capital of the Department of Granada, Nicaragua, on the northwest shore of Lake Nicaragua at the foot of the extinct volcano of Mombacho (Map: Central America, E 5). It is in a cacao-growing district and carries on trade in goldsmith's work, dyewoods, cacao, and hides. It is the northern terminus of the lake steamship line and is connected by rail with Managua and Corinto on the Pacific coast. Pop., 1908, 17,000. Granada was founded by Francisco Fernández de Córdoba in 1524 and was formerly the capital of the country. The city was taken by the filibustering expedition of William Walker in 1855.

GRANADA. A former kingdom of Andalusia, Spain, situated along the south coast, and bounded on the north by Cordova and Jaén, on the east by Murcia, on the south by the Mediterranean, and on the west by Seville. It comprises the modern provinces of Malaga, Granada, and Almería, with an aggregate area of 11,128 square miles. It is mountainous throughout, its eastern half being traversed by the snow-clad Sierra Nevada, reaching in the Cerro de Mulhacén a height of 11,420 feet. The principal river is the Jenil, a tributary of the Guadalquivir, whose valley, the "Vega of Granada," is a veritable garden. Mining and agriculture are the chief resources of the inhabitants—the former producing lead, zinc, iron, silver, and coal; the latter sugar, flax, fruit, grain, and, above all, wine and oil. There are some manufactures of textiles and bricks and some oil and flour mills. Communications are still in a backward state. A railroad connects Almería with Malaga and through Jaén and Cordova with Madrid. Pop. of the present province of Granada, 1910, 503,898. Capital, Granada (q.v.).

History. There has been considerable dispute concerning the etymology of Granada. There is no foundation for the statement that the city of Granada owes its name to its resemblance to a ripe pomegranate. As the Saracens, who expelled the Vandals from the southern part of Spain early in the eighth century, were by no means a homogeneous race, it was found necessary to allot various portions of the conquered territory to the different elements among the conquerors. In the rich Vega (valley) of the Elvira were settled the Syrians of Damascus, and these were the nucleus around which the Moorish Kingdom of Granada was afterward built up. Beginning in 1228, under the rule of Mohammed Al Ahmar, Granada increased in power, as it was a refuge for the Moors who had been driven from the central section of Spain. Al Ahmar was a great soldier and legislator, but still better is he remembered as the builder of the magnificent red pile on the slopes of the hills near the city of Granada. About 1273 Al Ahmar was succeeded by his son Mohammed II. The latter began war almost immediately against Castile. As long as he was aided by Yusuf, the ruler of Morocco, his armies were victorious, and after the battle of Ecija in 1275 advanced even to the gates of Seville. But in the following year Yusuf withdrew his aid and even gave a subsidy to the King of Castile. Moslem progress was checked, and when Mohammed II died, in 1302, the Moorish power depended only upon the dissension prevailing among the Christians. For several years Granada was a prey to disorder and anarchy. During the reign of Yusuf

(1333-54) was fought the great battle of Salado (1340) in which Alfonso XI was completely successful. In 1362 Peter the Cruel of Castile (1350-69) lured King Abu Said to Seville and killed him with his own hand. From then on, the intrigues of the harem dictated the governmental policies, and as a result Granada was kept in a state of turmoil.

In 1482 Ferdinand and Isabella entered upon a war for the purpose of driving the Moors from Spain. They were aided by the civil wars which raged in Granada. (See BOADDIL.) On Nov. 25, 1491, the city of Granada, the last stronghold of the Moslems, capitulated, and in January, 1492, the sovereigns of Castile and Aragon made their entry into the far-famed Moorish capital. At the height of its power the Kingdom of Granada is said to have contained 3,000,000 inhabitants. See GRANADA (city).

Consult: Burke, *History of Spain* (2 vols., London, 1895); Lane-Poole, *The Moors in Spain* (ib., 1907); Calvert, *Granada. Present and Bygone* (New York, 1908); Müller, *Die letzten Zeiten von Granada* (Munich, 1863); Irving, *A Chronicle of the Conquest of Granada* (Philadelphia, 1829).

GRANADA. A city of Spain, capital of the former Moorish kingdom, and of the modern Province of Granada, about 225 miles south of Madrid, on the river Jenil, near the centre of the province, and on the Madrid, Granada, and Algeciras Railway (Map: Spain, D 4). It is situated about 2200 feet above the sea, at the base and on the slope of the Sierra Nevada. It overlooks on the west the fertile Vega (plain) de Granada, while on the southeast are the peaks of Veleta (11,148 feet) and Mulhacén (11,421 feet), the latter being the highest mountain in Europe aside from the Alps and Caucasus. Granada consists of several parts, the little river Darro forming a natural division between the suburbs of the Albaicín and San Lorenzo and the greater part of the modern city on the north, and the Alhambra and the ancient suburbs of Churra and Antequeruela on the south. The Albaicín, once the residential quarter of the Moslem nobility, is now in ruins, inhabited principally by gypsies. Granada enjoys a delightful climate under a clear blue sky and rises picturesquely among the terraced hills covered with luxuriant vegetation and surmounted by the towers of the Alhambra. Though a "living ruin," it is still a city of remarkable beauty and distinction, retaining in a large measure its Moorish character. On the north are remains of the walls that surrounded the city of old, the last towers having been destroyed by the French in 1812, though some of the gates are still in existence. The streets, with the exception of those in the modern suburbs, are crooked and narrow, and the houses of Oriental architecture. Many old gardens with Moorish fountains have been preserved, and there are several fine plazas. The Plaza del Triunfo, extending from the Puerto de Elvira to the Plaza de Toros, is the largest in the city and has a central monument, gardens, and a magnificent promenade; the Plaza de Bibarrambla, or la Constitución, was the scene of many factional conflicts in the time of the Moors, and of various Moslem and Christian festivals, tournaments, etc.; the Plaza Nueva, laid out on a Roman bridge over the Darro, is the lower terminus of a street leading

to the Alhambra. The beautifully shaded Alameda is continued along the Jenil by the attractive Paseo del Salón and Paseo de la Bomba, while on the opposite bank is the Paseo del Violón.

Preëminent among the architectural features of Granada is the Alhambra (q.v.). The Generalife, the summer palace of the Moorish princes, is next in interest among the ruined splendors of the Moslem power. Other examples of the Moorish style are still extant, and a number of the Christian churches of to-day are constructed on Moorish foundations, some of them incorporating parts of the mosques which they supplanted. Besides the cathedral (begun 1529, finished 1703), there are many notable churches, that of San Jerónimo having an historical interest, since it contains the tomb of Gonsalvo de Córdoba, "the Great Captain," whose remains, however, were desecrated by a mob and thrown to the winds. The cathedral, begun by Diego de Siloe, is richly decorated with marbles and has numerous statues and paintings by Spanish artists, and the tombs, among others, of Ferdinand and Isabella in the Royal Chapel, which was founded by them. Granada is an archiepiscopal see. It is the seat of a university, founded by Charles V in 1531, with four faculties and about 1000 students, occupying the old monastery of the Compañía de Jesús (Jesuits), and has a theological seminary and several other colleges, a normal school, and a school of fine arts. There are the provincial and university library with over 45,000 volumes and valuable manuscripts, a botanical garden, the museum of the Alhambra, and archeological and art museums. The charitable institutions include several hospitals and orphanages, an insane asylum, a maternity hospital, an asylum for the poor, etc. The imposing fortress (Torres Bermejas), built as a protection against the rebel Mozarabs, or Christian partisans of the Moors, has been converted into a prison. Industrially Granada is comparatively unimportant: it has, however, manufactures of textiles, paper, leather, liqueurs, hats, soap, flour, starch, macaroni, chocolate, etc. There is considerable commerce with the adjacent provinces, the trade being confined largely to the agricultural products of the Vega de Granada, celebrated in history as the scene of contest between the Moorish and Christian chivalry, but known also for its fertility. Pop. (municipality), 1900, 75,900; 1910, 77,425.

Granada arose near the site of the ancient *Illiberis*, the *Eliliberi* of the Iberians. It is mentioned in the accounts of the early Arabian authors. Occupied by the Saracens in the eighth century, it became in the thirteenth century the capital of the extensive Kingdom of Granada and developed under the Moorish rule into a renowned centre of wealth, learning, and power, at its zenith having, it is said, between 400,000 and 500,000 inhabitants. The last stronghold of the Moorish power, it was invested by the armies of Ferdinand and Isabella, and after a 12 months' siege, famous for heroic exploits on both sides, it surrendered at the close of 1491, and in January, 1492, the Christian sovereigns made their entry into the city. There were numerous tumults and revolts occasioned by the events leading up to the final expulsion of the Moors in 1609; meanwhile Granada was slowly declining. The city was taken by the French in 1810 and in 1823, and in most of

the revolutionary movements of the nineteenth century it played a part, being known as a liberal stronghold. Earthquakes caused some damage in 1884-85, and a fire in 1890 broke out in a portion of the Alhambra, but did no material damage.

GRANADILLA (Sp., diminutive of *granada*, pomegranate). The edible fruit of certain species of passion flower (q.v.). The common granadilla (*Passiflora quadrangularis*) is extensively distributed over tropical regions and much cultivated. The plant is a luxuriant and very ornamental climber, often employed to form

GRANADILLA (*Passiflora quadrangularis*)

arbors and covered walks. It has large, beautiful, and fragrant flowers and oblong, fragrant fruit, often six inches in diameter, with a sweet and slightly acid pulp, very gratefully cooling. The apple-fruited granadilla, or sweet calabash (*Passiflora maliformis*), is plentiful in the woods of Jamaica. It is a very agreeable fruit, about two inches in diameter, with a gelatinous pulp and a rind so hard that it is sometimes made into snuffboxes and toys. The laurel-leaved granadilla (*Passiflora laurifolia*), sometimes called water lemon in the West Indies, has very long tendrils and bears red and violet flowers, and a fruit about the size of a hen's egg. The pulp, which is of a delicious, slightly acid flavor, is so watery that it is usually sucked through a hole in the rind. Several kinds of granadilla are occasionally cultivated in hothouses. In the south of Europe, Florida, and southern California they grow in the open air. *Passiflora alata*, a native of Brazil, by some botanists considered identical with *Passiflora maliformis*, produces an edible fruit about five inches long that is considered one of the best of the granadillas. Many of the other species have edible fruits. *Passiflora incarnata*, called maypops, is common in the southern United States, where its fruits are eaten. See Colored Plate of PASSION FLOWERS.

GRANARD, GEORGE FORBES, third EARL OF (1685-1765). An English sailor and diplomat, born in Ireland, son of Arthur Forbes, second Earl of Granard, and Mary Rawdon. He entered the navy when he was 17, and was under Rooke at the taking of Gibraltar. After serving at Malaga (1704), in the Channel, capturing French privateers (1705), and at the siege of Ostend (1706), he was transferred to the cavalry, but left it after a year (1708). On the recommendation of Queen Anne he was put in command of the *Grafton* (1709). After a splendid, half-piratical encounter with the Genoese, he joined the Allies and was slightly wounded at Vilaviciosa (1710). His capture of the Genoese fleet was disowned by the British government, but Forbes received £6000 for his share of the booty. After the Peace of Utrecht he com

manded a fleet in the Mediterranean, and in 1719 was sent to Vienna to carry out the scheme of Charles VI to establish a great naval power in Naples or Sicily or on the Adriatic, but this came to nothing. He defended Gibraltar (1727); became governor of the Leeward Islands (1729); and in 1730 had a project to lead a colony to Lake Erie to act as a block against French invasion or encroachment from Canada, but it was not acceptable to Walpole. His last naval service was in 1731 in the Mediterranean. Two years later he was sent as Minister to Russia, and made a commercial treaty with that power. In 1742 he retired from the navy because of a quarrel with the Ministry. In 1741 he had entered the House of Commons and had led the opposition to Robert Walpole; but he soon afterward retired to private life. Consult Forbes, *Memoirs of the Earls of Granard* (London, 1858).

GRAN'BERY, JOHN COWPER (1829-1907). An American clergyman of the Southern Methodist Episcopal church, born at Norfolk, Va. He graduated at Randolph Macon College in 1848, entered the Methodist ministry, and acted as chaplain in the Confederate army. After preaching in Washington, Richmond, and Petersburg he became professor of moral philosophy and practical theology in Vanderbilt University in 1875, and seven years later was elected Bishop in the Southern Methodist church. His publications include: *A Bible Dictionary* (1882); *Twelve Sermons* (1896); *Experience, the Crowning Evidence of the Christian Religion* (1901).

GRAN'BURY. A town and the county seat of Hood Co., Tex., 40 miles southwest of Fort Worth, on the Brazos River and on the Fort Worth and Rio Grande Railroad (Map: Texas, D 3). It has cotton gins, a flour mill, cotton-oil mill, and ice plant, and is surrounded by a farming district. Pop., 1900, 1410; 1910, 1336.

GRAN'BY. A town of Shefford Co., Quebec, Canada, on a tributary of the Yamaska River, 54 miles southeast of Montreal, on the Central Vermont Railroad (Map: Quebec, F 5). It has a college, a Roman Catholic convent, and an academy. Its industrial establishments include an electric-light plant, saw mills, a foundry and machine shops, a grist mill, brickyard, and manufactories of rubber goods, rattan goods, chairs, furniture, cigars and cigar boxes, tobacco, blinds, sashes and doors, carriages, celluloid goods, plumbing supplies, elastic webbing, ice creepers, sap evaporators, and sap spouts. Pop., 1901, 3773; 1911, 4750.

GRANBY, JOHN MANNERS, MARQUIS OF (1721-70). An English general, the eldest son of the third Duke of Rutland. Educated at Eton and at Trinity College, Cambridge, he was in 1741 elected member of Parliament for Grantham, was reelected in 1745 and 1747, and from 1754 until his death was a member from Cambridgeshire. In the rebellion of 1745 he raised a regiment of infantry, and accompanied the Duke of Cumberland into Scotland. He was made a major general in 1755 and a colonel of the Royal Horse Guards (Blues) in 1758, was dispatched to Germany the latter year, and was promoted to the rank of lieutenant general in February, 1759. For his meritorious conduct after the battle of Minden (Aug. 1, 1759) he was appointed to succeed George Sackville as commander in chief of the British troops, a post which he held during the remainder of the Seven Years' War, in which he distinguished

himself in various engagements. In 1760, during his absence with the army, he was appointed a member of the Privy Council. After the peace of 1763 he was constituted master general of the ordnance, and in 1766 commander in chief of the army. He died at Scarborough, Oct. 18, 1770. Consult Manners, *Some Account of the Military, Political, and Social Life of . . . the Marquis of Granby* (London, 1899).

GRAN CANARIA, grān kā-nā'rē-ā. One of the Canary Islands (q.v.), among which it ranks third in size and second in population, situated 74 miles from the northwest coast of Africa (Map: Spain, G 5). It is almost circular in shape, with an area of 644 square miles. It is of ancient volcanic origin, with a number of extinct craters, none of which have been active within historical times. It is rugged, mountainous, and picturesque. The coasts fall in most places abruptly to the sea, and in general the land rises in terraces to the interior. At Los Pechos it reaches to a height of 6430 feet. The climate of the island is delightful, and one of the most healthful in the world, ranging from 60° in winter to 80° in summer. The vine is one of the principal plants cultivated, and some coffee is grown, but the chief occupations of the inhabitants, who in 1910 numbered 162,601, chiefly concentrated around the capital, Las Palmas (q.v.), are fishing, commerce, and the care of tourists, who annually number from 80,000 to 70,000. It was not until 1483, 78 years after the first landing of Béthencourt, that the brave islanders were finally subdued by the Spaniards.

GRAN CAPITÁN, kā'pē-tān', EL (Sp., The Great Captain). A surname of the famous Spanish soldier Gonsalvo de Córdoba.

GRAN CHACO. See CHACO, EL GRAN.

GRAND, SARAH. The assumed name of Frances Elizabeth Clarke, an English novelist. She was born in Ireland of English parents, and married, at the age of 16, Lieutenant Colonel McFall of the English army, whom she accompanied in his travels in the East, visiting India, China, and Japan. At the age of 26 she wrote *Ideala*, which was followed by *The Heavenly Twins* (1893). The latter book, to which she owes her reputation, was completed at a much earlier date, but could not find a publisher for several years. She is also the author of a collection of stories entitled *Our Manifold Nature* (1894); *The Beth Book* (1897); *The Modern Man and Maid* (1898); *Babs the Impossible* (1900); and *Adam's Orchard* (1913).

GRAND ALLIANCE. A league formed in 1689 and again in 1701 in opposition to Louis XIV of France. That of 1689 was entered into by the German Emperor, the Netherlands, and England to restore the conditions of the treaties of Westphalia and the Pyrenees, and was joined by Savoy in 1690. That of 1701 was entered into by England, the Netherlands, and the German Emperor to prevent the union of the crowns of France and Spain under the Bourbon dynasty; it was subsequently joined by Prussia, Portugal, and Savoy.

GRAND ARMY OF THE REPUBLIC. An American patriotic society organized in Decatur, Ill., on April 6, 1866. Its existence is primarily due to Dr. B. F. Stephenson and Chaplain W. J. Rutledge, of the Fourteenth Illinois Infantry, who, in February, 1864, conceived the idea of its formation. The principal objects of the order are to maintain and strengthen the fraternal

feelings which bind together the soldiers, sailors, and marines who united to suppress the Rebellion; to perpetuate the memory and history of those who have died; and to lend assistance to the needy and to their widows and orphans. The society admits to membership any soldier or sailor of the United States army, navy, or marine corps, who served between April 12, 1861, and April 9, 1865, and was honorably discharged, and also members of State regiments who were called into actual service and were subject to the orders of the United States and general officers. The official badge consists of a miniature strap and ribbon showing the national flag, from which is hung the bronze star of the membership badge. This star shows a medallion, on which in relief are a soldier and sailor clasping hands in front of a figure representing "Liberty," while in the foreground are two freedmen; the entire design being supported on the sides by the national banner. The Grand Army is organized into departments, representing the States and Territories, and numbered in 1906 5942 local camps. The membership in 1890 reached a total of 409,487, but this number has steadily decreased since, and in 1913 was 180,224. The annual death rate was in 1914 about 12,000. Annual meetings, called encampments, are regularly held in the leading cities of the Union. The members wear on official occasions a dark-blue uniform and black slouch hat. To this organization is due the establishment of Memorial Day. Because of its large membership, its close organization, and its nearly unanimous adherence to Republican policies, the Grand Army has necessarily exerted a powerful, if often indirect, influence upon national politics and the choice of national candidates. Every Republican President from Grant to McKinley served in the Civil War, and polled practically the entire Grand Army vote. In 1869 the Grand Army laid down the rule that the organization should in no way be used for partisan purposes, partisan discussion, or political nominations. But while the letter of this law was kept, the Grand Army has no doubt influenced the cause of pension legislation. The Disability Act of 1890, doubling the pension roll, was due to it; so were earlier and later laws in some part, and so was the insistence upon a liberal interpretation of the laws. The Army has been also, and beneficently, active in the care and education of the orphans of deceased comrades and in the establishment of soldiers' homes. Consult R. B. Beath, *History of the Grand Army of the Republic* (New York, 1889), and O. M. Wilson, *The Grand Army of the Republic under its First Constitution and Ritual* (Kansas City, Mo., 1905).

GRAND ASSIZE. A valuable early form of the jury, instituted by Henry II for the purpose of trying the title to land. It was available only to the tenant or defendant in a proceeding originated by a writ of right, who was offered the choice of defending his title by wager of battle or by the grand assize. The jury was composed of "lawful knights, girt with swords" (instead of, as was the case with the petit jury, "good and lawful men" of the vicinage), appointed by a body of four knights, chosen by the sheriff. It consisted of 12 or 16 men, it is uncertain which, though it would seem that the four electors were entitled to add themselves to the 12 chosen by them. The institution of the grand assize was one of the great reforms in

legal procedure, as it marked the decay of the barbarous method of trial by battle and the establishment of the system of trial by jury. It survived until abolished along with real actions by Act of Parliament in 1834 (3 and 4 Wm. IV, c. 42). See ASSIZE; JURY. Consult Thayer, *Preliminary Treatise on Evidence at the Common Law* (Boston, 1898), and Pollock and Maitland, *History of English Law* (2d ed., ib., 1899).

GRAND BANK (the Newfoundland Banks). An elevated submarine plateau of triangular shape in the Atlantic Ocean, an extension of the continental shelf stretching for 200 miles along the coast of Newfoundland, and extending towards the southeast for over 500 miles towards the coast of Europe. It has an average depth of 40 fathoms, ranging from a minimum of 10 fathoms to a maximum of 160 fathoms. It is supposed to be composed of deposits of solid matter brought from the Arctic seas by icebergs, which gradually melt by contact with the warm current of the Gulf Stream in these latitudes. The British and French submarine cables lie along this elevation. Near the American coast the Grand Bank teems with marine life, and is noted as the favorite resort for codfish. Some 100,000 fishermen of British, American, and French nationalities, in specially equipped vessels, styled "bankers," ply their vocation amid the many dangers of storm, fog, and icebergs incidental to the region.

GRAND BANK. A town and port of entry in the Burin district, Newfoundland, on the south side of Fortune Bay (Map: Newfoundland, E 5). The chief industries are connected with the fisheries, and an important trade is carried on with the French island of St. Pierre. Pop., 1901, 1427; 1911, 1605.

GRAND CANAL, THE (It. *Canale Grande*). The chief waterway of Venice, a canal 30 to 60 yards wide, which winds through the city in the shape of the letter S. On it are situated many of the famous palaces of Venice, still distinguished by the posts painted with the owner's heraldic colors. It is crossed by the famous Rialto bridge.

GRAND CANARY. See GRAN CANARIA.

GRAND CAÑON OF THE COLORADO. See COLORADO RIVER.

GRAND CAPE, *kā'pē* (Lat. *cape*, take, from initial words of the writ). In English law, the name of an ancient writ whereby, in an action of dower, on the failure of the defendant to appear in answer to the summons, a third part of his lands is attached to await the decision of the court. If the defendant do not appear on the return of the writ of grand cape, judgment is given in favor of the widow, who is thereupon entitled to take possession of the lands in satisfaction of her dower.

GRAND'-COMBE, *grān'-kōnb'*, LA. A town in the Department of Gard, France, 31 miles northwest of Nîmes (Map: France, S, J 4). It has glass works, and in its vicinity are productive mines of coal, zinc, lead, copper, and iron. Pop., 1901, 11,484; 1911, 11,547.

GRAND COUTUMIER (*grān kū'tu'myā'*) OF NORMANDY. A collection of the ancient customary law of Normandy, supposed to have been compiled about the middle of the thirteenth century. It is one of the most important of a large number of similar collections made in France and Germany at that period. There is no ground for the belief that the *Grand coutu-*

mier was carried over from Normandy to England or that it was ever regarded as English law. It was originally written in Latin, but was early translated into French. The best recent editions are those of De Gruchy (Jersey, 1881) and Tardif (Rouen, 1896).

GRAND CYRUS, grän sé'rus', LE (Fr., The Great Cyrus). The subtitle of Scudéry's *Artamène*, and an obvious parody on the name of Le Grand Condé. The hero of the story is a caricature of that historic personage.

GRANDE CHARTREUSE, gränd shür'trèz'. See CHARTREUSE, LA GRANDE.

GRANDE ÉCAILLE, grän dá'ki'y' (Fr., great scale). The tarpon (q.v.), so called by French-speaking fishermen along the coast of the Gulf of Mexico (often locally corrupted into "grandkyke").

GRANDEES, grän-dèz' (Sp. *grandes*, great men). The name by which the most highly privileged class of the nobility of Castile were known after the thirteenth century. The honors of the grandees were hereditary; they held lands from the crown, were exempted from taxation, could not be imprisoned for debt or subjected to torture, and could not be summoned before a civil or criminal tribunal without a special warrant from the King. They were entitled to decide private feuds by an appeal to arms, and had a right to leave the kingdom, and even to enter the service of a foreign prince at war with Castile, without incurring the penalties of treason. Gradually the grandees monopolized the high offices of state, and even invaded the King's Council. Besides these privileges, which were common to them with the rest of the higher nobility, the grandees possessed several which were peculiar to themselves, or which they shared only with the so-called *titulados*—the counts and dukes. Of these, the chief was the right, in all public transactions, of remaining covered in the presence of the King. The King addressed a grandee as *mi primo*, "my cousin-german"; whereas any other member of the higher nobility he called only *mi pariente*, "my relative." In the national assemblies the grandees sat immediately after the prelates and before the *titulados*. They had free entrance into the palace and into the private chambers of the monarch, and on the occasion of religious solemnities they had their place in the royal chapel next to the altar. Their wives shared their dignities, the Queen rising from her seat to greet them. Under Ferdinand and Isabella, Cardinal Ximenes succeeded in checking the power of the feudal nobility by ignoring their time-honored privileges and rewarding men of low birth with important offices. Charles V and Philip II continued the policy of Ferdinand and Isabella, and succeeded in making the grandees a dependent court nobility. Gradually three classes of grandees arose out of this merely nominal nobility. It was the privilege of the first class to be commanded by the monarch to be covered before they had begun to address him. At the coronation of Charles V at Aix-la-Chapelle, the princes of the empire refused to assist at the ceremony if the grandees were allowed to be covered, and for once the grandees renounced the privilege. After the accession of Joseph Bonaparte in 1808, the dignities and privileges of the grandees were entirely abolished, but they were partially reestablished after the restoration in 1814.

GRANDE MADEMOISELLE, gränd má'di-

mwä'zél', LA. A title given to Anne Marie Louise d'Orléans, Duchesse de Montpensier, for her beauty, wealth, and valor. See MONTPENSIER.

GRANDES CHRONIQUES DE FRANCE, gränd krö'nèk' de fräns (Fr. Great Chronicles of France). An historical prose compilation begun by a monk of Saint-Denis in 1274, and continued by the members of that community until the reign of Charles V, after which it was continued by lay authors to the time of Louis XI.

GRAND FALLS. A magnificent cataract of the Grand River (q.v.), Labrador, in lat. 53° 30' N., long. 63° 50' W., 250 miles from the sea. In a distance of 12 miles the river drops over 760 feet, culminating in a vertical drop of 316 feet over a rocky platform 200 feet wide. The roar of the falls can be heard at a distance of 20 miles. The cañon through which the river falls is 25 miles long, with an average depth of 400 to 500 feet. The first European to see the cataract was Mr. McLean, a Hudson's Bay Company official, in 1839. Accounts of its existence had become mythical until it was rediscovered by two separate expeditions in 1891, and officially surveyed by the Canadian Geological Survey in 1894.

GRAND FALLS. A town and port of entry of Victoria Co., New Brunswick, Canada, 95 miles southwest of Chaleurs Bay, on the Canadian Pacific Railroad (Map: New Brunswick, B 1). It is at the head of navigation on the river St. John, with which it has steamboat communication. Its industrial establishments include lumber mills, woodworking factories, a power company, and saw, grist, and planing mills. It is a favorite tourist and sporting resort on account of its fine scenery, cool climate, partridge and duck shooting. The falls, estimated at from 50 to 100 feet high, are very picturesque; a good view of them is obtained from a suspension bridge over the river. Pop., 1911, 1230.

GRANDFATHER'S CHAIR. Two series of tales for children by Nathaniel Hawthorne, published respectively in 1841 and 1842. The stories are about famous persons and events in early American history.

GRAND FORKS. The chief town in southeast Yale District, British Columbia, Canada, on the forks of the Kettle River and on the Canadian Pacific, the Great Northern, and the Kettle Valley railways. 95 miles southwest of Nelson by rail, and about 25 miles west (direct) of Rossland (Map: British Columbia, E 5). It is a customs port and railway divisional point, with roundhouse and machine shops, and possesses federal and provincial government buildings, courthouse, and an opera house. Its industrial establishments include important smelting works, iron works, nurseries, a foundry, cement-block works, breweries, and a saw mill. It is situated in a fine fruit-farming district, and has electric lighting and water works. Pop., 1911, 1577.

GRAND FORKS. A city and the county seat of Grand Forks Co., N. D., at the confluence of Red Lake River with the Red River of the North, about 180 miles (direct) northeast of Bismarck, the State capital, on the Great Northern and the Northern Pacific railroads (Map: North Dakota, H 3). The University of North Dakota, opened in 1884, is situated at University, two miles away. Grand Forks is the seat of St. Bernard's Academy (Roman Catholic) and contains a Carnegie library, several hospitals,

and an extensive system of city parks. It is the distributing centre of a large agricultural and lumbering district, has extensive jobbing interests, and carries on an important trade in wheat, flour, lumber, live stock, etc. Its industrial establishments include flour and lumber mills, grain elevators, brickyards, a foundry, boiler works, and manufactories of awnings, art goods, culverts and road machinery, furniture, gasoline engines, harness, rugs and carpets, candies, etc. Grand Forks was settled in 1871, and was incorporated 10 years later. The water works are owned by the city. Pop., 1900, 7652; 1910, 12,478; 1914 (U. S. est.), 14,827; 1920, 14,010.

GRAND HAVEN. A city, port of entry, and the county seat of Ottawa Co., Mich., on Lake Michigan, at the mouth of the Grand River, 35 miles by rail west-northwest of Grand Rapids, on the Grand Trunk, the Grand Trunk, Grand Haven, and Muskegon, and the Pere Marquette railroads (Map: Michigan, C 5). It has a Carnegie library, Akeley College for girls, United States customhouse, and a county courthouse. Highland Park and Spring Lake, both popular summer resorts, are in the vicinity. There is a fine harbor, with steamboat lines to the principal lake ports, and an important trade is carried on. Grand Haven is the centre of extensive fishing, and fruit and celery growing interests, and has manufactures of engines, refrigerators, furniture, printing presses, leather, machinery, pianos, brass novelties, barrels, baskets, shoes, etc. First settled in 1835, Grand Haven is governed by a mayor, elected annually, and a city council. The water works and electric-light plant are owned and operated by the municipality. Pop., 1900, 4743; 1910, 5856.

GRANDIDIER, grān'dé'dyā', ALFRED (1836-1921). A French explorer, born in Paris. He studied natural history and geography. When about 20 he made his voyage to South America with his brother, Ernest Louis Marie, the collector, and M. Janssen. After traveling extensively in the Americas he went to India (1863), Ceylon, and traveled along the east coast of Africa. In 1865 he first visited Madagascar. In several succeeding visits he collected the material for his *Histoire physique, naturelle et politique de Madagascar*, a work comprising 40 volumes, the first of which appeared in 1876, and which is the authority on the island. His other works include some valuable maps, and *Madagascar et ses habitants* (1886); *Histoire de la géographie de Madagascar* (1893); *Les voyageurs français à Madagascar pendant les trente dernières années* (1894).

GRAND INQUEST. See GRAND JURY.

GRAND ISLAND. A city and the county seat of Hall Co., Neb., 154 miles by rail west by south of Omaha, on the Union Pacific, the Burlington Route, and the St. Joseph and Grand Island railroads (Map: Nebraska, F 4). It is the seat of Grand Island College (Baptist), opened in 1892, and has a Carnegie library, St. Francis Hospital, and the Nebraska Soldiers' and Sailors' Home. There are several wholesale and retail establishments, a large beet-sugar factory, canning, windmill, cement-block, candy, and wire-fence factories, brickworks, a flouring mill, two broom factories, a creamery, and railroad shops of the Union Pacific. The city carries on an extensive live-stock trade. Settled in 1857, Grand Island was incorporated in 1872. Under a charter of 1901, the government is administered by a mayor, elected every

two years, and a city council. The water works and lighting plant are owned and operated by the municipality. Pop., 1900, 7554; 1910, 10,826; 1914 (U. S. est.), 11,505; 1920, 13,860.

GRANDISSIMES, grān'dé'sēm', THE. A novel by George W. Cable (1880), the story of an old New Orleans family.

GRAND JUNCTION. A city and the county seat of Mesa Co., Colo., 250 miles (direct) southwest of Denver, at the junction of the Grand and Gunnison rivers, and on the Denver and Rio Grande, the Colorado Midland, and the Grand Junction and Grand River Valley railroads (Map: Colorado, A 2). It is one of the most important towns in west Colorado, and is the centre of a fertile agricultural region, served by a large irrigation canal, and is especially noted for its fruits. There are extensive coal interests, and machine shops, lumber yards, large railroad shops, brickyards, flour and planing mills, and a beet-sugar factory. Noteworthy features are the Carnegie library, Unaweep Cañon, and the National Monument Cañon. Grand Junction adopted the commission form of government in 1910. The water works are owned by the city. Pop., 1900, 3503; 1910, 7754.

GRAND JURY. The assembly of good and sufficient men, summoned by order of the sheriff to attend every session of the peace, and every commission of oyer and terminer and general gaol delivery in England, for the purpose of inquiring into alleged criminal offenses, and of returning to the court their delivery thereon. The institution of the grand jury dates back to the earliest period of English history, having been in use among the Saxons. It would seem from a law of Ethelred that the number of the grand jury was originally 12; but we learn from Bracton that, in the time of Henry III, it was the practice to return four knights for every hundred, who elected 12 other knights, or else 12 *liberos et legales homines*, to take part with them in the inquest. Towards the latter part of the reign of Edward III, in addition to the inquest for the hundred, the sheriff was required to return a panel of knights for the whole county. This jury was called *le grande inquest*, and made inquiry for the county, while the jury for the hundred inquired for its own district only. After the establishment of the *grande inquest*, the practice of summoning a jury of the hundred gradually went out of use; but until 6 Geo. IV, c. 50, it was deemed necessary that some of the grand jury should be summoned for every hundred. At the present day, the grand jury must consist of no fewer than 12 nor more than 23 members. A grand jury is summoned for every assize, and for the quarter sessions in counties and boroughs. After having the oath administered, and receiving a charge from the judge, the grand jurors retire to their room, and the various indictments, which are called bills, are laid before them. The duty of the grand jury is simply to inquire whether there is sufficient *prima facie* evidence to require a trial. For this purpose they may require the same evidence, written and parol, as may be necessary to support the indictment at the trial. But in practice, having ascertained that the crown has a sufficient *prima facie* case, they return a true bill, the evidence in behalf of the accused being reserved for the trial. Witnesses are sworn on their examination before the grand jury by an officer appointed by the court. When the jury

have come to a conclusion, the clerk indorses on the indictment *A true bill* in case the jury, or a majority of 12, are satisfied that the case is sufficiently strong. In case they are not satisfied, the indictment is indorsed *Not a true bill*. The foreman, accompanied by one or more of the jurors, then carries the indictments into court, and presents them to the clerk, who states to the court the nature of the charge and the indorsement of the jury.

In the United States the grand jury is also summoned by the sheriff, and, as in England, its function is, upon such evidence as the attorney of the State may present, to determine whether persons accused of crime shall be indicted and tried therefor and to inquire into such other matters as may be confided to them by the court or may come to their knowledge. They may accordingly make presentment of any matter requiring remedial action by the courts or the legislature, as the general prevalence of crime, the inefficiency of the law or of its administrative agents, the neglect of their duty by public officials, and the like. In inquiring into the commission of a particular criminal charge they do not examine witnesses for the defense; for it is not their duty to find a verdict, but only to decide if there is *prima facie* evidence of guilt such as to warrant a trial. In all essential particulars this institution is the same in the United States as in England, but upon minor points there are in practice some differences. The number of men required to constitute a grand jury is not the same in every State, but varies from 12 to 23. The court may, in its discretion, select the foreman or allow the jurymen to do so.

The importance of the grand jury in our legal system is not due to any general impression of its value in the ordinary administration of the criminal law, but to the great rôle which it has played as a bulwark against royal aggression. The crown in England has always enjoyed the right of instituting criminal prosecutions by information (q.v.), and the abuse of this prerogative was one of the principal grounds of the popular uprising against the Stuarts in England and against George III in America. It is to this feeling, that only the people should have the power of instituting criminal prosecutions, that we owe the provision in the American Constitution guaranteeing the institution of the grand jury. Most of the State constitutions have similar provisions. Consult Edwards, *The Grand Jury, Considered from a Historical, Political, and Legal Standpoint* (Philadelphia, 1906). See JURY.

GRAND LAKE, or **LAKE CHETIMACHES**, *shet'é-másh'*. A shallow lake of southern Louisiana, surrounded by the parishes of St. Martin, Iberville, Iberia, Assumption, and St. Mary (Map: Louisiana, C 4). It is about 30 miles long and has a maximum width of about 9 miles. The waters of the Atchafalaya River and Lake Feusse Point flow into it at the north, and the Grand River at the south. The Myrtle Bayou drains the lake into Atchafalaya Bay, Gulf of Mexico.

GRAND LAR'CENY. See LARCENY.

GRAND LEDGE. A city in Eaton Co., Mich., on the Grand River, 12 miles west of Lansing, on the Pere Marquette Railroad (Map: Michigan, E 6). It is a popular summer resort and has manufactures of sewer pipe, flour, chairs, conduits and tile, foundry products, etc.

Coal and fire clay are found in the vicinity. Pop., 1900, 2161; 1910, 2893.

GRAND MAL, *grán mál*. See EPILEPSY.

GRAND MANAN'. An island of Charlotte Co., New Brunswick, Canada, off the Maine coast, at the entrance to the Bay of Fundy (Map: New Brunswick, C 4). It has an area of 36,352 acres, with abundance of timber and excellent facilities for shipbuilding. Fishing is the leading occupation of the inhabitants; porpoise fishing in particular is the specialty of a small settlement of Quoddy Indians at Indian Beach, on the north. The island is traversed with good roads and is a favorite summer resort, on account of its varied and picturesque scenery, angling, and shooting, and cool and bracing climate. The United States is represented by a consular agent. Pop., 1901, 2671; 1911, 2444.

GRAND MASTER. The title borne by the heads of the great military orders of the mediæval ages, such as the Hospitallers, the Templars, and the Teutonic Knights, and now applied to the highest officials of numerous orders and fraternal organizations.

GRAND MÈRE, *grán' mâr'*. A town in Champlain Co., Quebec, Canada, situated on the north side of the St. Maurice River and on the Canadian Northern and Canadian Pacific railways, 21 miles north of Three Rivers (Map: Quebec, F 4). It has a Roman Catholic convent. Its industrial establishments include pulp and paper mills, an electric-power plant, and manufactories of sashes, doors, shirts, stoves, and boots. Pop., 1901, 2511; 1911, 4783.

GRAND MONAD'NOCK. See MONADNOCK, GRAND.

GRAND MONARQUE, *grán mō'närk'*, LE. One of the many titles of Louis XIV of France.

GRANDMONTAINS, *grán'mōn'tân'*, **GRANDMONTINES**, *grán'mōn'tinz'*, or **GRAMMONT**, ORDER OF. A religious order in France, founded in 1077 by St. Stephen of Thiers (died 1124), who, according to the current legend, after receiving his education in Italy, returned to France and became a rigorous and solitary ascetic. He remained for a long time in a lonely retreat in the Glen of Muret, a short distance east of Limoges; but as the fame of his piety spread his retreat attracted many visitors, and finally a community was formed whose mode of life was characterized by the most severe rules of fasting, silence, and the mortification of the flesh. The order changed its abode to Grandmont, or Grammont, several miles farther to the east, and from this locality it took its name, although its members were popularly known as the "Good Men." By 1170 there were 60 monasteries of this order in France. The severity of its discipline was relaxed by Innocent IV and Clement V in the thirteenth and fourteenth centuries. There was a brief period in which the order flourished, and it continued in existence until the time of the French Revolution. The founder, Stephen of Thiers, was canonized by Clement III in 1189. The annals of the order were published at Troyes in 1662. Consult Heimbucher, *Orden und Kongregationen der katholischen Kirche*, vol. ii (Paderborn, 1907).

GRANDMOUGIN, *grán'mōō'zhân'*, CHARLES (1850-). A French man of letters, born at Vesoul, Haute-Saône. He studied law and was in the office of the War Minister; but his tastes inclined to poetry, and he published his

first volume, *Les siestes*, at the age of 23. Five years later his chief work appeared, *Prométhée*, a drama in verse, and another drama, *Orphée*, was performed in 1887. Besides contributing prose and verse to periodical literature, Grandmougin wrote lyrics and librettos for musical composers—Godard, Massenet, Lefèvre, and others—and was himself one of the first French appreciators of Wagner. He also published *Contes d'aujourd'hui* (1887) and assisted in the literary part of the revival of the old passion plays. His *Sang du Calvaire* (1905) and *La mort de Carthage* (1907), two dramatic compositions, have been well received, though they did not add much to his literary reputation.

GRAND OLD MAN. A popular name for William Ewart Gladstone (q.v.).

GRAND PENSIONARY. In the days of the Dutch Republic, the State Secretary for the Province of Holland. Until the time of Olden Barneveldt (q.v.), the Grand Pensionary was also Advocate-General for the same province. He had no vote in the Assembly of the Estates and could only bring forward subjects for discussion. He, however, collected the votes, wrote the decrees, read the letters addressed to the States, conducted negotiations with foreign ambassadors and ministers, and took charge of the revenues of the province, of its rights and privileges, and whatever else pertained to its welfare. He was a perpetual member of the States-General of the United Netherlands, and thus, as first magistrate of Holland, the most important of the United Provinces, he acquired immense influence over all the Netherlands and might be considered Premier of the Dutch Parliament. The Grand Pensionary held his office for five years, but was in most cases reelected. The office was abolished in 1795, after the conquest of the Netherlands by the French.

GRAND-PIERRE, grān'pyār', JEAN HENRI (1799-1874). A French Protestant pulpit orator. He was born at Neuchâtel, Switzerland, was educated there and at Tübingen, became pastor of the French church at Basel (1823), and was an intimate friend of Vinet. In 1827 he went to Paris, became president and professor of languages in the theological seminary, and was soon recognized as one of the most eloquent of pulpit orators. His last 20 years were passed as pastor of L'Oratoire, the greatest of the Protestant churches in the French capital. After the death of Adolphe Monod (1856) he was leader of the orthodox branch of the Reformed church. Louis Philippe granted him letters of naturalization, and Louis Napoleon made him a member of the Legion of Honor. He visited the United States twice and in 1850 published *A Parisian Pastor's Glance at America* (Eng. trans., Boston, 1854). He died in Paris, 1874. His sermons on *The Doctrines of the Christian Religion* appeared in London (1844).

GRAND PRÉ, grān prā. A village in King's Co., Nova Scotia, Canada, on the Dominion Atlantic Railroad (Map: Nova Scotia, E 3), 15 miles northwest of Windsor by rail, and separated from Minas Basin by the Grand Pré Dike and Long Island. Pop., 1901, 874; 1914 (local est.), 400. It is notable as the central scene in Longfellow's poem *Evangeline*.

GRAND PRIX DE PARIS, grān prē de pā'rē' (Fr., great prize of Paris). The most important event in the French racing calendar. It was first contested in 1863 and corresponds to the English Derby in point of interest and

monetary value. The distance is 1 mile, 7 furlongs. The race is run about the middle of June each year and takes place on the famous race course at Longchamp, near Paris. Under the Empire the prize was paid for by the city of Paris; but since 1871 two railroads have paid 25,000 francs each, the city of Paris 50,000, and the sum total of the prize in other ways brought up to a total value of 250,000 francs. Of the first 23 races, about half were won by English horses, but thereafter French horses made a better showing. American horses won in 1881 (Foxhall Keene's Foxhall) and in 1908 (W. K. Vanderbilt's Northeast). In 1899 American methods and jockeys were introduced. The race marks the beginning of the summer season in the fashionable world, after which the regular migration to the seaside or country takes place.

GRAND PRIX DE ROME. See PRIX DE ROME.

GRAND RAPIDS. A city and the county seat of Kent Co., Mich., 30 miles from Lake Michigan and 60 miles (direct) west by north of the State capital, Lansing, on the Grand River, at the head of steam navigation, and on the Michigan Central, the Lake Shore and Michigan Southern, the Pere Marquette, the Grand Rapids and Indiana, the Grand Trunk, and other railroads; there is direct steamboat connection with Chicago, Milwaukee, and other cities (Map: Michigan, D 6). Grand Rapids was settled in 1833, on the site of an abandoned Indian village, was chartered as a city in 1850, and reincorporated in 1905. It is the seat of Roman Catholic and Protestant Episcopal bishoprics. It has a number of charitable institutions, among them the Butterworth Hospital, Union Benevolent Association Home and Hospital, Women's Home and Hospital, City Home for the Treatment of Contagious Diseases, St. Mary's Hospital, Blodgett Home for Children, Emerson Home, Home for the Aged, Holland Union Benevolent Association Home, and St. John's Orphan Asylum. Here are also the State Soldiers' homes, and, among other prominent structures, the city hall, the county and Federal buildings, Masonic Temple, Pythian Temple, Knights of Columbus Hall, and Elk Hall. The city has also a public library, the Kent Scientific Museum, Reed's Lake, and several public parks.

Grand Rapids is the centre of a region interested largely in agriculture and fruit growing, has extensive gypsum quarries in the vicinity, and is an important commercial city, doing a considerable jobbing business, and carrying on a large trade in pine and hardwood lumber and in manufactured products, particularly furniture. The manufacturing industry is facilitated by the water power furnished by the Grand River, which enters Lake Michigan 40 miles below, and at Grand Rapids it falls about 18 feet, forming the rapids from which the city derives its name. Among the more important manufactures are furniture, lumber products, school seats, flour, carpet sweepers, gypsum products, window-sash pulleys, fly paper, knit goods, refrigerators, calcined plaster, foundry and machine-shop products, carriages and wagons, and agricultural implements.

The government is vested in a mayor, chosen biennially, a unicameral municipal council, and subordinate administrative boards—police, fire, public works, health, poor, and assessors—ap-

pointed by the executive. The highway commissioners and building inspector are elected by the council; and the city clerk, city attorney, treasurer, comptroller, and marshal are chosen by popular election. The annual income and expenditures of the city in 1912 amounted to \$5,130,000 and \$5,557,000 respectively, the principal items of expense being \$80,000 for the operation of water works, \$147,000 for the police department, \$203,000 for the fire department, and \$608,000 for education. The city owns its water works and electric-light plant. Pop., 1850, 2686; 1870, 16,507; 1890, 60,278; 1900, 87,563; 1910, 112,571; 1914, 123,227; 1920, 137,634.

GRAND RAPIDS. A city and the county seat of Wood Co., Wis., 91 miles north by west of Madison, on the Wisconsin River, and on the Chicago, Milwaukee, and St. Paul, the Minneapolis, St. Paul, and Sault Ste. Marie, the Chicago and Northwestern, and the Green Bay and Western railroads (Map: Wisconsin, D 4). A fine bridge across the river connects the east and west sides of the city. There are several parks, a hospital, and a public library. The city has a foundry and machine shop and manufactures of lumber, pulp and paper, furniture, hubs and spokes, boxes, wagons, ice machines, flour, etc. The manufactures are promoted by good water power. The local electric, telephone, and water-supply systems are owned cooperatively by the citizens of the city. Pop., 1900, 4493; 1910, 6521.

GRAND REMONSTRANCE. A manifesto presented to Charles I of England by the House of Commons in 1641. The outbreak of the Irish rebellion and the rumored intrigues of the King with the Scottish Earl of Montrose had convinced the leaders of the Puritan party that the hour had come when he must be called to account. Accordingly, on November 22, while Charles was absent in Scotland, the Commons, after a final stormy debate lasting from noon till midnight, adopted a Grand Remonstrance by a majority of 11. The Remonstrance is in character a severe indictment for a long series of acts of alleged misgovernment extending over the King's whole preceding reign. Some of the charges were exaggerated or untrue. The document, of which John Pym was the main author, which was presented December 1, consists of 204 sections, and in it the forced loans and ship money, the billeting of soldiers and the imprisonment of members of Parliament, the enlargement of the royal forests and the abuse of commercial monopolies, the excesses of the courts of Star Chamber, High Commission, and that of the President and Council of the North, with many other grievances, are minutely set forth. As in the Petition, a request is made for the appointment of ministers in whom the Parliament may have confidence, and it is asked that the reform of the Church may be left to a "synod of the most grave, pious, learned, and judicious divines"; but the parliamentary plan contains no suggestion of toleration for those who shall not conform. When first received from the deputation of the Commons, Charles criticized and ridiculed the Remonstrance. On December 10 he issued a proclamation on religion, which he evidently intended as an indirect reply, and on December 23 he issued a lofty and evasive "Answer" to the Petition which accompanied the manifesto. He seemed blind to the supreme danger of his position, and on Jan. 3, 1641-42, sent his Attorney-General to im-

peach the leaders of the opposition before the House of Lords. For the text of the Grand Remonstrance, consult Gardiner's *Constitutional Documents* (2d ed., Oxford, 1899), and for a discussion, his *History of England*, x, 59-64, 71-79, 88, 108-109 (new ed., New York, 1893-95).

GRAND RIVER. One of the head streams of the Colorado River (q.v.). It rises on the west slope of the Front Range of the Rocky Mountains, in the northern part of Colorado, and flows in a general southwest course for about 350 miles, joining the Green River in southeastern Utah to form the Colorado (Map: Utah, E 4). Its main tributaries are the Gunnison and Dolores rivers, both from the south.

GRAND RIVER. A river of Missouri formed by the confluence of its West, Middle, and East forks in Gentry County in the northwestern part of the State. It flows in a generally southeasterly direction and enters the Missouri River at the intersection of Carroll, Chariton, and Saline counties (Map: Missouri, C 2).

GRAND RIVER. A tributary of Lake Michigan. Its head stream, the Portage River, rises in Jackson County and flows nearly due north to Lansing. There the main stream turns to the west and flows generally in that direction to Lake Michigan, which it enters at Grand Haven (Map: Michigan, D 6). It is about 280 miles long and is navigable by steamers 40 miles from its mouth to Grand Rapids, above which place the river falls 18 feet in a mile, furnishing good water power.

GRAND RIVER, or HAMILTON RIVER. A river of Labrador, British America (Map: Canada, S 6). It leaves Lake Petitskapow in lat. 54° 35' N. and long. 64° 50' W., flowing south through a chain of lakes and over the Grand Falls (q.v.), then continuing east until it enters the Atlantic Ocean through Hamilton Inlet.

GRAND SERGEANTY, sār'jen-ti (ML. *magna serjeantia*). The most honorable of the ancient feudal tenures. According to Lyttelton, tenure by grand serjeanty is where a man holds his lands or tenements of his sovereign lord the King by such services as he ought to do in his proper person to the King, as to carry the banner of the King, or his lance, or to lead his army, or to be his marshal, or to carry his sword before him at his coronation, or to be his carver, or his butler, or one of his chamberlains of the receipt of his exchequer, or to do other like services. This tenure must be held directly of the King. Where lands were held of a subject on condition of performance of similar services, the tenure was not grand serjeanty, but knight's service. Tenants holding by grand serjeanty were free from escuage, which usually appertained to knight's service, and in general could only be called upon to perform their services *infra quattuor maria* (within the four seas), i.e., on English soil. They were, however, subject to the more burdensome incident of tenure by knight's service, such as wardship and marriage (qq.v.). The services in grand serjeanty were to be performed by the tenant in person, where he was able to do so. The office of attendance on the sovereign's person was esteemed so honorable that no one below the dignity of a knight could perform it. This tenure by grand serjeanty was by 12 Charles II, c. 24, in common with

other military tenures, reduced to common socage (q.v.), except so far as regards the honorary services, which continue to be observed to this day.

In Scotland grand serjeanty was not known as a separate tenure—i.e., lands held on condition of honorary services rendered to the sovereign were not attended with any privileges other than those attaching to lands held in a similar manner of a subject superior, i.e., a mesne lord. In that country a tenure by honorary service was known as a blanch holding. See FEUDALISM: TENURE.

GRAND TOUR. The term applied in the eighteenth century to the tour of France, Germany, and Italy, which formed a part of the education of young men of wealth and fashion.

GRAND TRIANON, tré'a'nôn'. See TRIANON.

GRANDVILLE, grân'vêl' (1803-47). A French illustrator and caricaturist. His name was properly JEAN IGNACE ISIDORE GERARD. He was born at Nancy and was a pupil of his father, a painter and miniaturist. At 20 he went to Paris; in 1828 he published the first of a series of humorous sketches, entitled *Les métamorphoses du jour*, representing human beings with the heads of animals, and in 1840-42 another series, entitled *Les animaux parlants*. After the revolution of 1848 he participated with Daumier and Decamps in *Le Caricature*. His *Convoi de la liberté*, his *Basse cour*, *Mât de cocagne*, etc., as pictures of the politics and manners of the times, are of great and lasting value. When the September laws put an end to political caricature, Grandville used his pencil to satirize the follies and vices of mankind. He also contributed illustrations to new and splendid editions of the *Fables* of Lafontaine and Florian, the *Adventures of Robinson Crusoe*, *Gulliver's Travels*, Hugo's *Vie de Napoléon*, Raybaud's *Jérôme Paturot*, etc. Grandville is remarkable for depth and delicacy of observation and criticism and accuracy in portraiture. Consult Blanc, *Grandville* (Paris, 1855).

GRANE, WILLIAM LEIGHTON (1855-). An English clergyman, born in London and educated at Caius College, Cambridge. He was ordained deacon in 1879 and priest in 1880 of the Church of England, was curate and rector of several parishes, and in 1903 became vicar of Cobham, Surrey. He was select preacher at Cambridge in 1904-05 and Hulsean lecturer in 1913-14. He published: *The Word and the Way* (1894); *Hard Sayings of Jesus Christ* (1899; 2d ed., 1901); *The Passing of War* (1912; 3d ed., 1913).

GRANELLA, VICTOR. The pseudonym of the German theologian Wilhelm Tangemann (q.v.).

GRANET, grâ'nâ', FRANÇOIS MARIUS (1775-1849). A French painter of architectural interiors. He was born at Aix in Provence, and was a pupil of the landscape painter Constantin and of David. In 1802 he went to Italy and remained in Rome until 1816. While he attempted historical subjects at times, Granet was distinctly a painter of architectural interiors, enlivened by small historical or genre figures. His paintings are characterized by remarkable treatment of light effects, which he renders with striking truth. In 1826 he was made custodian of the paintings at Versailles, and in 1830 a member of the Institute. At his death he left his fortune and fine collections to found a museum at Aix. His art is

best represented in this museum and in the Louvre, which possesses "Interior of the Coliseum," "The Painter Sodoma Taken to the Hospital," "Interior of the Lower Church of St. Francis of Assisi," "Ransom of Prisoners in Algiers by Redemptorists," and the artist's portrait. Many other French provincial museums possess his works.

GRANGE, grânj (from Fr. *grange*, barn, from Lat. *granum*, grain). The name popularly applied to the Society of Patrons of Husbandry, but in fact denoting the constituent and subsidiary divisions of that organization, as the term "lodge" is used in other fraternal orders. The Patrons of Husbandry is a secret association of farmers, founded at Washington, D. C., Dec. 4, 1867. The chief founder of the society was Oliver Hudson Kelley, a Minnesota farmer, who was deputed by the government in 1866 to make a tour of inspection through the Southern States and to report upon their agricultural conditions and the best means of improving them. The widespread demoralization of the farming population there, as a result of the great Civil War which closed the year before, convinced Kelley that organization was vitally necessary, as well for the farmers' self-protection as for their advancement by the use of scientific methods of cultivation and the enactment of laws favorable to them. Being a Northern man, he was not very warmly received by the people of the South, except by brother Freemasons, which suggested to him the idea of a secret fraternity of farmers. Upon his return to Washington he submitted his plan for a farmers' society to a few friends, who coöperated with him in establishing the National Grange of the Patrons of Husbandry. Kelley and six of his most active associates—William Saunders, J. R. Thompson, A. B. Grosh, John Trimble, W. M. Ireland, and F. M. McDowell—were later officially recognized as "the seven founders of the order." The organization was secret, and membership limited to those actually engaged in agriculture. It was at the suggestion of Miss Carrie A. Hall, a niece of Kelley and a Boston school-teacher, that women were admitted on an equality with men; and this feature, novel at the time, had much to do with the society's rapid growth and permanence.

The constitution provided for local or subordinate, district or Pomona, State, and national granges for the conferring of degrees and for the transaction of the business of the order. Chiefly through the efforts of Kelley, who was a zealous promoter, the society after a few years gained rapidly in members and influence. In 1873 there were 13,000 subordinate granges, and in 1875 the total membership reached 1,500,000. At about this time the Grange became prominently identified with legislative matters, both State and national, intended to curb railroads and monopolies, to prevent discrimination in rates and prices, and to advance the farmers' interests educationally, socially, and financially. The Grange is a nonpolitical order and makes its appeals to legislatures and Congress in the interest of agriculture, in a spirit of fairness, and for the common welfare. It was largely instrumental in securing the passage of the Interstate Commerce Act, the oleomargarine law, the Hatch Act founding experiment stations, the law making the head of the Department of Agriculture a cabinet officer,

rural mail delivery, postal-savings-bank law, the parcel-post law, and many other State and national laws which show a broad-minded statesmanship. The Grange also endeavored to gain control of elevators, warehouses, and terminal facilities, and instituted coöperative buying and selling on a large scale for the benefit of its members. The public, not easily distinguishing the official acts of the Grange from the efforts and purposes of the farmers generally, came to designate the whole class as Grangers, and their legislative ends and all efforts at farmer organization as the *Granger movement*. In 1873-74 many legislative efforts were made to regulate and control freight and passenger rates on the railroads, which assumed special importance in Illinois, Iowa, Minnesota, and Wisconsin, in which the Grange was a considerable factor; and "it is not too much to say that the fundamental principles upon which American regulation of railroads by legislation has developed were first worked out by the Granger States of the Northwest during the decade of the seventies." It is from this legislation that some of the railroads of the Northwest are still referred to as Granger railroads.

From a number of causes, none of them very clearly defined, the Grange began to decline the last months of 1873, and by 1876 and following the closely contested political campaign of that year and the unsettled condition preceding the settlement of the contest in favor of President Hayes, the Grange reached a condition of rapid disintegration. With a strong, well-disciplined leadership in many States and the National Grange, it survived through the decade of the eighties. About 1890 it began to take on new life and once more took an active part in every movement for agricultural betterment. Many dormant granges were reorganized, and slowly but surely it has gained in numbers and influence for the last 20 years. On June 30, 1914, there were strong State granges in 32 States, with a paid-up membership of approximately 600,000, with probably as many others more or less delinquent. The National Grange now has a permanent invested accumulation of more than \$100,000, which gives it a guarantee of financial soundness. In recent years it has been an important factor in securing much State and national legislation in the interest of agriculture. Its social and educational aspects have been greatly magnified, and its legislative and coöperative policies readjusted in accord with sound economic principles; and it promises, though with a smaller membership than it once had, to remain a permanent institution. Consult: *Popular Science Monthly*, vol. xxxii (New York, 1888); *Annals of the American Academy of Political and Social Science*, vol. iv (Philadelphia, 1893); *New Jersey Labor Statistics* (1886); Buck, *Granger Movement* (Cambridge, Mass., 1913).

GRANGEMOUTH, gränj'müth. A seaport town and police burgh in Stirlingshire, Scotland, on the Firth of Forth, at the mouth of the Carron, 2½ miles northeast of Falkirk (Map: Scotland, E 3). It has a fine harbor with good docks covering 121 acres and carries on a large continental and coasting trade. Its imports consist of iron ore, timber, and pig iron, while its exports include produce, coal, and worked iron. There are shipbuilding and supplemental industries, iron, brick, and tile works, and coal mining. The town owes its

existence to the construction of the Forth and Clyde Canal, opened in 1789, of which it is the eastern terminal. Pop., 1901, 3386; 1911, 9840.

GRAN'GER, grän'jër, FRANCIS (1792-1868). An American politician, born at Suffield, Conn., the son of Gideon Granger (q.v.). He graduated at Yale in 1811 and in 1814 began the practice of law with his father in Canandaigua, N. Y. In 1825 he was elected from Ontario County to the State Legislature and with William H. Seward, Thurlow Weed, and others, took a prominent part in the Antimasonic movement. In 1826 he was reelected to the Legislature and in 1827 was a delegate to the famous Protectionist convention at Harrisburg, Pa. In 1828 he was nominated by the Antimasonic party for Governor, but declined, as he had accepted the nomination of the Adams Democrats for Lieutenant Governor on their ticket. He was one of the most active promoters of the new Whig party in 1834 and in the State convention of that year was one of its candidates for the nomination as Governor, which, however, was secured by Seward. In the fall of the same year he was nominated and elected to Congress. Granger was reelected to the Twenty-sixth Congress in 1838 and in March, 1841, entered Harrison's cabinet as Postmaster-General, the office his father had held under Jefferson and Madison. He was confirmed after some objection on the part of the Southern senators, who suspected him of anti-slavery proclivities; but after Harrison's death and the break between Tyler and the Whigs, he resigned. He again served in Congress in 1841-42, but at the end of his term retired and never again held public office. He continued to take an active interest in politics, however, supported Webster in his stand on the compromise measures of 1850, and headed the revolt in the Whig convention at Syracuse, N. Y., in that year, the participants in which are said to have taken their name of Silver Grays (q.v.) from the flowing white locks of Granger and some of his conservative companions. He was in sympathy with the Know-Nothing movement in 1853-56 and is said to have advised its leaders, but he never supported it openly. In 1861 he was a member of the Peace Convention at Washington.

GRANGER, GIDEON (1767-1822). An American politician, for 13 years Postmaster-General of the United States. He was born at Suffield, Conn., graduated at Yale in 1787, studied law and was admitted to the bar, and was elected to the Connecticut Assembly, where he became one of the most influential Anti-Federalist leaders in the State. He is said to have originated the Connecticut school fund. When Jefferson was elected to the presidency, he recognized the necessity of revolutionizing the Federalist character of New England and with this end in view in 1801 appointed Levi Lincoln Attorney-General, Henry Dearborn Secretary of War, and Gideon Granger Postmaster-General. The last was not then a cabinet officer, but his patronage was exceedingly large, and there was no requirement that his appointments be confirmed by the Senate. Granger's position enabled him to keep in touch with political affairs in every part of the country, and his principal services to Jefferson were of a personal nature in apprising him of the machinations of the politicians and the trend of popular feeling. It was he who in 1804 scented Burr's

conspiracy with the Federalists. In the same year, while retaining his Federal office, he became agent for the New England Mississippi Company and openly lobbied for the compromise of the Yazoo Claims on the floor of the House. Granger continued to hold office under Madison until 1814, when his alliance with the Giles-Leib faction, and his appointment of Leib as postmaster at Philadelphia, in the face of the President's opposition, led to his removal from office. Later he settled in New York, where he served several terms in the Legislature and became a follower of De Witt Clinton.

GRANGER, GORDON (1821-70). An American soldier, born in Wayne Co., N. Y. He graduated at West Point in 1845 and was an officer in General Scott's army during its campaign from Vera Cruz to the city of Mexico. He was given the brevet rank of captain for his services during the Mexican War and at its conclusion was assigned to duty on the southwestern frontier. At the outbreak of the Civil War he was sent to Ohio to muster in volunteers, but soon afterward was ordered to southern Missouri, where he was engaged in several actions. During the early part of April, 1862, he commanded the Third Brigade of the Army of the Mississippi at the capture of Island Number 10, and during the following campaign he commanded the cavalry in the Army of the Mississippi. At the battle of Chickamauga the next year he commanded the reserve. He commanded the Fourth Corps in the battle of Missionary Ridge and was then sent to the relief of Knoxville. During the last two years of the war he was engaged in the military operations in the Gulf States, which finally terminated in the capture of Mobile. On Jan. 15, 1866, he was mustered out of the volunteer service with the rank of major general of volunteers and the brevet rank of major general in the regular army, and in the following July he was commissioned colonel of the Twenty-fifth Infantry.

GRANGER, JAMES (1723-76). An English biographer, print collector, and preacher. He was entered at Christ Church, Oxford, in 1743, but took no degree. Having taken orders, he received the living of Shiplake, Oxfordshire. He was liberal in politics and brought on himself the wrath of Dr. Johnson for a Whig in orders. In 1773, with Lord Mountstuart, later Earl of Bute, he toured Holland and made great addition to his store of portraits. He died of apoplexy, which seized him while he was administering the sacrament. His main work is *Biographical History of England . . . Adapted to a Methodical Catalogue of Engraved British Heads, with a preface, showing the utility of a collection of Engraved Portraits* (1769; last ed., 1824). This work, continued from Granger's manuscripts by the Rev. Mark Noble (1806), gave rise to the mutilation of books containing engraved portraits for the purpose of superillustration and to the terms "grangerism" and "grangerize" therefor. Two of Granger's sermons were published, *An Apology for the Brute Creation* (1772) and *The Nature and Extent of Industry* (1775). Granger's letters, "composing a copious history and illustration of the biographical history of England," were edited by J. P. Malcolm (1805).

GRANGER, ROBERT SEAMAN (1816-94). An American soldier, born in Zanesville, Ohio. He graduated at West Point in 1838 and served in

the Seminole and Mexican wars, in which he attained the rank of captain. On April 27, 1861, he was captured by the Confederates with Major Sibley's command on the coast of Texas was released on parole, and was not exchanged until August, 1862. On Oct. 20, 1862, he was made brigadier general of volunteers. In 1864 he took part in the capture of General Roddy's camp near Courtlund and later aided in driving General Wheeler from middle Tennessee. In October of the same year he was engaged in protecting that district during Forrest's raid and in the defense of Decatur against Hood's army. He was brevetted major general in the regular army on March 13, 1865, and soon afterward was commissioned lieutenant colonel of the Eleventh Infantry. In 1871 he was promoted to the rank of colonel and in 1873 was retired from active service upon his own application.

GRANGER CASES. A series of cases decided by the Supreme Court of the United States in 1876 and reported in 94 United States Reports at pp. 113-187, inclusive. Their several titles are as follows: *Munn v. Illinois*; *Chicago, Burlington, and Quincy Ry. v. Iowa*; *Peik v. Chicago and North Western Ry.*; *Chicago, Milwaukee, and St. Paul Ry. v. Ackley*; *Winona and St. Peter Ry. v. Blake*; and *Stone v. Wisconsin*. In his dissenting opinion Mr. Justice Field designated the entire group as the "Granger cases"—a name which has clung to them ever since, although neither the Patrons of Husbandry, nor any grange or lodge of that association, nor any of its members or grangers, had any connection with these litigations.

The general principle deducible from these decisions has been stated in these words: "Whenever any person pursues a public calling, and sustains such relations to the public that the people must, of necessity, deal with him, and are under a moral duress to submit to his terms, if he is unrestrained by law, then, in order to prevent extortion and an abuse of his position, the price he may charge for his services, or use of his property, may be regulated by law." Applying this principle to the cases then before the court, it was held that a statute of Illinois was constitutional which prescribed maximum rates for the storage of grain in elevators, and prescribed penalties for charging higher rates than those named in the law. In the various railroad cases the court held that railroad companies are engaged in a public employment; that their property is thereby "affected with a public interest, and no longer *juris privati* only"; that it has been devoted by them to a use in which the public has an interest; that by such conduct they have in effect granted to the public an interest in that use, and must submit to be controlled by the public for the common good, to the extent of the interest thus created; that they may withdraw their grant by discontinuing the use, but that so long as they maintain the use they must submit to the control.

The doctrine of these cases has been approved by many State courts. In Maine it was applied in sustaining the constitutionality of a statute prescribing the maximum tolls to be charged by the owner of a public grist mill. The court in that case said: "In the absence of government aid, the individual proprietor, not pretending to serve the public, might maintain such mills as private mills, free from legislative interference, precisely as he might maintain a

store, shop, or other private business: but when he makes his mill public and attempts to serve the public, then he dedicates his mill to public use, and it becomes subject to public regulation and control."

It is admitted by all courts that the doctrine of the Granger cases does not authorize the legislature to destroy or confiscate property, even when it is affected with a public use, under guise of regulating rates or tolls. Statutes imposing unreasonable regulations, or having the object of taking private property for public use without compensation, have been declared unconstitutional. Consult Hare, *American Constitutional Law* (2 vols., Boston, 1889).

GRANGERISM. See GRANGER, JAMES.

GRANGERS. See GRANGE.

GRANICUS (Lat., from Gk. Γράνικος, *Gránikos*). The ancient name of a small river in Troas, in the northwestern part of Asia Minor, flowing from the northern side of Mount Ida to the Propontis and now known as the Kodja-su. The Granicus is celebrated as the scene of the first victory gained by Alexander the Great (q.v.) over the Persians after he crossed the Hellespont 334 B.C. and of a victory by Lucullus over Mithridates in 74 B.C.

GRANIER DE CASSAGNAC, grá'nyà' de ká'sá'nyák', ADOLPHE (1808-80). A French Bonapartist and journalist, born in Aviron-Bergelle. He went to Paris in 1832. His first work was as a literary critic. He enthusiastically espoused the cause of the Romanticists, and his attack on Racine stirred up all Paris. He abandoned literature for politics in 1840, in which year he made a political voyage to the Antilles. In 1845 he started the ultra-Orleanist Journal *L'Epoque*. After the revolution of 1848 he left Paris. He returned in 1850 as a Bonapartist and became editor of the *Pouvoir*. During the Empire he was a Bonapartist member of the French legislative body and a passionate Conservative. In 1857 he founded with Barbey d'Aureville the short-lived *Le Réveil*. He was connected with other journals in the interest of Napoleon, becoming in 1866 the editor in chief of the violent *Le Pays*, with his son Paul as assistant. His polemical career during this decade was marked by sensational duels, lawsuits, affairs with the police, and other evidences of indiscreet zeal. After the fall of the Empire he started *Le Drapeau* in Brussels. In 1876 he was once more chosen as an anti-Republican national deputy. He died Jan. 31, 1880. His works include two mediocre novels, also travels (*Voyage aux Antilles*), and his *Souvenirs du Second Empire*. His most noteworthy compilations are his histories: *Histoire des classes ouvrières et des classes bourgeoises* (Paris, 1837); *Histoire du Directoire* (1851-63); *Histoire des Girondins et des massacres de septembre* (1860); etc. They lack calm judicial qualities and the result of impartial study and investigation, but are characterized by journalistic vigor and graphical power.

GRANIER DE CASSAGNAC, PAUL (1843-1904). A French author and journalist, born in Paris, son of the preceding. He began his literary life by writing for *Le Pays*. He took part in the War of 1870-71 and then returned to journalism. In 1874 *Le Pays* was suspended on account of M. de Cassagnac's violent articles. In 1876 he was elected to the Chamber of Deputies and served in that body continuously till 1893 and again after 1898. He was known as

one of the bitterest opponents of the existing order of things in France. After the death of the Prince Imperial. In 1879, De Cassagnac supported Prince Victor Napoleon, and to assist his Imperialistic ideas founded a new journal, *L'Autorité*. His aggressive temperament and caustic pen involved him in numerous duels. He wrote, in collaboration with his father, *Histoire populaire abrégée de Napoleon III* (1874-75). His own works include *Empire et royauté* (1873), *Mémoires de Chislehurst* (1873), and the posthumous *Principaux articles et discours* (1905).

GRANITE (It. *granito*, granite, grained, from *granire*, to reduce to grains, from *grano*, Lat. *granum*, grain: connected with Goth. *kairn*, Icel., OHG. *korn*, Ger. *Korn*, grain, AS., Eng. *corn*). An igneous rock or family of rocks characterized by acid composition and granitic texture (see IGNEOUS ROCKS), composed of feldspar (microcline, orthoclase, albite, or their mixtures) and quartz, with usually mica (biotite or muscovite) or hornblende, rarely pyroxene. Other minerals are usually present in less abundance, as lime-soda feldspar, magnetite, ilmenite, sphene, zircon, apatite, etc. The range of composition of granite is as follows:

SiO ₂	66.28-77.68	CaO.....	12-3.75
Al ₂ O ₃	11.63-16.38	Na ₂ O.....	2.85-5.16
Fe ₂ O ₃00-2.73	K ₂ O.....	1.87-5.16
FeO.....	.09-1.88	TiO ₂	tr.-.54
MgO.....	.04-1.63	P ₂ O ₅	tr.-.30

In texture granite is an even granular to porphyritic rock. Feldspars form the phenocrysts in some. When the granite takes on a foliated or banded structure after its crystallization, it is called a *granite gneiss*.

Granites are classified into muscovite granite, muscovite-biotite granite, hornblende granite, and augite granite, the first portion of the name generally indicating the mineral or minerals which with quartz and potash feldspar make up a large part of the rock's substance. *Albite* is a name formerly applied to granites poor or lacking in mica, and now used for fine-grained, muscovite granites, occurring in dikes. *Pegmatite* is a variety of granite, usually coarse-textured, and containing quartz, feldspar, and mica, with frequently rarer minerals, occurring in dikes or veins. *Graphic granite* is a pegmatite in which the quartz and feldspar are intergrown in such a way as to resemble cuneiform characters on the cross fracture. By loss of the constituent mineral quartz granite grades into syenite (q.v.); by reduction of the amount of potash feldspar and gain in the proportion of lime-soda feldspar it passes into diorite (q.v.), an intermediate variety being known as *grano-diorite*. Augite diorites by a similar change pass into gabbro. These transitions are mentioned, not alone to show the relationships which exist between the different families of igneous rocks possessing granitic texture, but because they indicate transitions frequently observable within the same rock mass. Important variations in the relative proportions of the several mineral constituents of a rock within the same mass are, in fact, the rule rather than the exception, so that it is difficult to delimit with any sharpness the several types.

In an earlier period of development of the science of geology, the question respecting the origin of granites was debated with great warmth by the rival schools of England and Germany. Hutton (q.v.) and his followers maintained

that granites were formed from fusion and consolidation, whereas Werner and the Freiberg school of geologists, with even greater assurance, advocated the chemical precipitation theory of its formation. Time has shown the correctness of the view held by Hutton, though his theory has been modified in important ways. Granites are plutonic rocks that have cooled at great depths below the surface. They form large irregular masses, known as batholiths, also as rounded exposures in other rocks (stocks or bosses), and as dikes. Granite is usually some shade of gray, but pink and red are not uncommon colors. The specific gravity ranges from 2.63 to 2.75. The absorption is small, usually under 1 per cent, and crushing strength from 15,000 to 20,000 pounds per square inch.

Granite is an important building stone. It is much harder to quarry and tool than sandstone, limestone, and marble, but has greater strength; the best grades are extremely resistant to weathering. Consult: Merrill, *Stones for Building and Decoration* (New York, 1903); Kemp, *Handbook of Rocks* (ib., 1906); Pirsson, *Rocks and Rock Minerals* (ib., 1908); Iddings, *Igneous Rocks* (ib., 1909); Ries, *Building Stones and Clay Products* (ib., 1912). See BUILDING STONE.

GRANITE CITY. A city of Madison Co., Ill., near the Mississippi River, opposite St. Louis, Mo., on the Chicago and Alton, the Chicago, Peoria, and St. Louis, the Cleveland, Cincinnati, Chicago, and St. Louis, the St. Louis Merchants' Bridge Terminal, the Wabash, and other railroads (Map: Illinois, D 8). It produces iron, steel, tin plate, and granite ware, and has a large corn-products refinery, bridge works, and an extensive sheet-lead mill. The city contains a public hospital. Settled in 1892, it is governed under a charter of 1896 by a mayor and council elected every two years. Pop., 1900, 3122; 1910, 9903; 1914 (U. S. est.), 13,647; 1920, 14,757.

GRANITE STATE. New Hampshire. See STATES, POPULAR NAMES OF.

GRANITIC TEXTURE. See IGNEOUS ROCKS.

GRANIUS LICINI'ANUS. A Roman historian of the second century A.D., who wrote on the Republican period. Fragments of his works were found in 1853 on a Syrian palimpsest by Paul de Lagarde. It was deciphered and published by Pertz, as *Grani Liciniani quæ supersunt* (1857), and again in 1858 by seven professors at Bonn, as the *Editio Philologorum Bonnensium Heptas*. The work, though uncritical, was used by later Roman authorities. Consult Dieckmann, *De Grani Liciniani Pontibus et Auctoritate* (Berlin, 1896), and Teuffel, *Geschichte der römischen Litteratur*, vol. iii (6th ed., Leipzig, 1913).

GRAMMICHELE, grān'mē-kā'lā. See GRAMMICHELE.

GRANNY KNOT. See KNOTTING AND SPLICING.

GRAN REUNIÓN AMERICANA, grān rā-ōō-nē-ōn' ā-mā-rē-kā'nā, or **LOGIA AMERICANA**, lō'ryā ā-mā-rē-kā'nā. A secret society modeled on Masonic lines and founded in London, about 1797, for the purpose of revolutionizing and securing the independence of Spanish America. Little is known respecting this society, but it is generally supposed to have been founded by Francisco de Miranda (q.v.), who was its Grand Master and moving spirit. Analogous and possibly affiliated organizations

existed in Paris, known as the Junta de las villas y provincias de la América del Sur, and in Spain, especially at Cadiz, in Buenos Aires and possibly in other parts of South America, under the name Logia de Lautaro or Caballeros racionales. The membership of the Gran Reunion was made up of Spanish-American creoles in Europe, who swore to work for independence and made a profession of republican doctrines. Its period of activity lasted until 1812, when Miranda returned to Venezuela actively to put in force the doctrines of the society there. Among its members, who took the oath before the precursor of Spanish-American independence, were many of the revolutionary leaders, including O'Higgins of Chile, Montúfar and Rocafuerte of Quito, Manteagudo of Peru, Servando Teresa Mier of Mexico, Bolívar of Venezuela, and San Martín, Alvear, and Zapiola of Buenos Aires. These last three were, in 1812, the founders of the Logia de Lautaro in Buenos Aires, which exercised a notable influence on the revolutionary movement in the provinces of La Plata.

Bibliography. W. S. Robertson, *Francisco de Miranda* (Washington, 1909); J. Mancini, *Bolívar et l'émancipation des colonies espagnoles* (2d ed., Paris, 1912); B. Mitre, *Historia de San Martín* (Buenos Aires, 1907); id., *Historia de Belgrano* (5th ed., ib., 1902).

GRAN SASSO D'ITALIA, grān sās'sō dē-tā'lyā (It., Great Rock of Italy). A group of mountains in central Italy, the highest of the Apennines, having their greatest height in Monte Corno (9580 feet), commanding an extensive view (Map: Italy, D 3). The Gran Sasso can be ascended without great difficulty in summer and autumn from Aquila, and less conveniently from Teramo, but in spring the snow makes climbing difficult. At Campo Pericoli (7220 feet) is a refuge, built by the Italian Alpine Club. Consult Abbate, *Guida al Gran Sasso d'Italia* (Rome, 1888), and Crugnola, *La Vegetazione al Gran Sasso d'Italia* (Teramo, 1894).

GRANT (OF. *grant*, *graunt*, *creant*, *crant*, from Lat. *credere*, Skt. *śradhdhā*, to trust: probably influenced by folk etymology with OF. *garantir*, to guarantee). In English and American law, the conveyance of real property by deed, or the instrument by which such conveyance, or transfer of title, is effected. Originally the term "grant" was confined to the conveyance of incorporeal hereditaments, such as easements, profits à prendre, and future estates (q.v.), which, not being of a tangible character, i.e., not based upon the possession of the land, were not capable of being transferred by the common-law mode of livery of seisin, by which corporeal interests were conveyed. The former were accordingly said to "lie in grant," whereas the latter lay "in livery." (See FEOFFMENT; LIVERY OF SEISIN.) In order to complete the conveyance of a reversion or remainder by grant, it was necessary that the tenant of the particular estate should acknowledge the grantee by attornment (q.v.). A grant was always effected by a deed. The deed of grant was the simplest of all deeds. When conveyance by livery of seisin was abolished, the grant was generally substituted as the mode of creating or conveying real estate, whether corporeal or incorporeal. This tendency to the substitution of a simple deed for the more ceremonious forms of conveyance of the older law was favored by the provision of the Statute of Frauds, which required all con-

veyances of land to be in writing. At the present time the deed of grant, as a mode of conveying interests in real property, is generally authorized by statute in England and the United States, though it is usually provided that deeds of bargain and sale and of lease and release may also be used. See CONVEYANCE; DEED.

GRANT, SIR ALEXANDER (1826-84). An English writer and principal of Edinburgh University, eighth Baronet of Dalvey. His father had married while in the West Indies, and Sir Alexander was born in New York, but was sent to England for his education. He distinguished himself at Harrow and Oxford and studied for the bar, but began literary work with a textbook, *The Ethics of Aristotle* (1857). Two years later he married the daughter of Professor Ferrier, of St. Andrews, and went to India, where he made his mark as an educator, eventually becoming vice chancellor of Bombay University and director of public instruction for that presidency. In 1868 he returned to Britain and was elected principal of the University of Edinburgh, which at once felt the influence of his energetic public spirit. His largest work is *The Story of the University of Edinburgh during its First Three Hundred Years* (1884); but a number of his lectures have been published, and he wrote articles upon educational subjects for the leading reviews.

GRANT, ANNE (MACVICAR), best known as "Mrs. Grant of Laggan" (1755-1838). A Scottish writer. She was born in Glasgow, the daughter of Duncan Macvicar, a British officer, who was stationed in 1758 at Albany, N. Y. There she became a favorite with the Schuylers and other prominent families and remained until 1766, when her father settled on a grant of land in what is now Vermont. Three years later they returned to Scotland, secure as they supposed in the possession of the American estate. This, however, was confiscated during the Revolution, and the family was dependent upon the father's pay as barrack master at Fort Augustus. Anne married the Rev. James Grant, chaplain of the fort, and subsequently minister of Laggan. Left a widow in destitute circumstances, she published, by subscription, a volume of *Poems* (1803), and *Letters from the Mountains* (1803), which was exceedingly popular. In the United States she is best known by her *Memoirs of an American Lady, with Sketches of Manners and Scenes in America* (1808; reprinted, New York, 1903), which was republished with a memoir by J. G. Wilson in 1876. It gives an interesting account of manners and customs in northern New York before the Revolution. She published also *Essays on the Superstitions of the Highlands* (1811). In 1826 Scott, Mackenzie, and other friends procured for her a pension of £100 a year. Consult *Memoir and Correspondence of Mrs. Grant of Laggan*, ed. by her son, J. P. Grant (3d ed., Edinburgh, 1853).

GRANT, ASAHEL (1807-44). An American foreign missionary. He was born at Marshall, N. Y., Aug. 17, 1807, studied medicine at Pittsfield, Mass., and practiced in Utica, N. Y. In 1835 he went as missionary of the American Board of Persia, settled at Urumiah, and did much work as physician and founder of schools among the Nestorians there and elsewhere. He died in Mosul, Turkey, April 24, 1844. He published *The Nestorians* (1841). For his life, con-

sult Lathrop (New York, 1847), and Laurie, *Grant and the Mountain Nestorians* (Boston, 1853).

GRANT, CHARLES, LORD GLENELG (1778-1866). A British administrator. He was the son of Charles Grant, a director of the East India Company, and was born at Kidderpore in Bengal, Oct. 26, 1778. He went to England in 1790, was educated at Magdalene College, Cambridge, and in 1807 was admitted to the bar, but never practiced. In 1811 he was elected to Parliament from Inverness and remained a member of the House of Commons till 1835, when he was raised to the peerage as Baron Glenelg. He was one of the Lords of the Treasury from 1813 to 1819 and was Secretary for Ireland from 1819 to 1823. From 1823 to 1827 he was Vice President of the Board of Trade, in 1828 he became President of the Board of Trade and Treasurer of the Navy, and from 1830 to 1834 he was President of the Board of Control of the East India Company. In 1835 he was made Colonial Secretary and held this office until 1839, displaying, however, such remarkable inefficiency as to arouse the opposition of even his fellow ministers, whose insistence led to his resignation. The disturbed condition of Canadian politics during this period, culminating in the rebellion of 1837 (see CANADA), was attributed largely to his vacillating policy. Grant was, nevertheless, an accomplished speaker and in the management of Irish and Indian affairs had shown much ability. He died at Cannes, France, April 23, 1866.

GRANT, DIBBY. A society villain, in Albery's *The Two Roses*; a rôle often successfully played by Henry Irving.

GRANT, FREDERICK DENT (1850-1912). An American soldier, a son of Gen. Ulysses S. Grant, born in St. Louis, Mo. As a child of 12, he was with his father during several battles of the Civil War and was wounded at Vicksburg. He graduated at West Point in 1871 and was assigned as second lieutenant to the Fourth Cavalry. For a time, on leave of absence, he was a civil engineer with the Union Pacific Railway. In the expeditions against the Indians, from 1873 to 1879, he served under General Sherman; in 1881 he resigned from the army. He was appointed United States Minister to Austria by President Harrison in 1889 and was police commissioner of New York from 1894 to 1898. At the beginning of the Spanish-American War he reentered the army as colonel of the 144th New York Volunteer Infantry, in 1898 was appointed brigadier general United States Volunteers, and during the war served in Porto Rico and in the Philippine Islands. Afterward he was put in command of the Military District of San Juan, Porto Rico, and for almost two years was in command of the District of Cavite and Northern Luzon, Philippine Islands; in 1902 was placed in command of the Department of Texas, later of the Department of the Lakes, and the Department of the East; and became major general in 1906. He died April 12, 1912, of cancer, the same disease to which his father succumbed.

GRANT, GEORGE MONRO (1835-1902). A Canadian author, orator, and educationist, born at Albion Mines, Nova Scotia. He graduated at Glasgow University (1857), entered the ministry of the Presbyterian church in 1860, and occupied a pastorate in Halifax, Nova Scotia, from 1863 to 1877. It was during this

time that he wrote his first book, *Ocean to Ocean* (1873), the narrative of his journey overland to British Columbia with Sir Sandford Fleming (q.v.). In 1877 he was made D.D., and left his Halifax church to be principal of, and professor of theology in, Queen's University, Kingston, Ontario. Already famed as a preacher and as an advocate of the union of British America into the Dominion of Canada, he became a forcible and eloquent speaker upon both ecclesiastical and national politics and used his great influence in promoting the union of the Presbyterian churches and in propagating the Imperialist sentiment among the rising generation. He wrote, in the same cause, *Advantages of Imperial Federation* (1889) and *Our National Objects and Aims* (1890). In 1880 he became moderator of the General Assembly of the Presbyterian Church in Canada. In 1891 he was elected president of the Royal Society of Canada. He was a delegate to several Pan-Presbyterian councils. His *Religions of the World in Relation to Christianity* (1894) evidences his breadth of mind. He published also: *New Year Sermons* (1865-66); *Reformers of the Nineteenth Century* (1867); *Our Five Foreign Missions* (1887); *The Religions of the World* (1895); *French-Canadian Life and Character* (1899); and he edited *Picturesque Canada* (1882), the best illustrated work printed in Canada up to that year.

GRANT, HUGH JOHN (1858-1910). An American public official and capitalist, born in New York City. He was educated in Berlin, at St. Francis Xavier College, New York, and at the Columbia Law School. He was a Tammany alderman in 1883 and 1884, but attracted attention by his opposition to the fraudulent granting of street railway franchises by the board of aldermen. Defeated for the mayoralty in 1884, he was elected in 1888 and reelected in 1890, but in 1894, when again a candidate, was defeated by William L. Strong. While in office he compelled the street railways to take down their overhead wires and place them in subways; when companies refused to obey his order, he set gangs of laborers to cut down the poles and wires. Grant had large business interests to which he devoted himself after 1894.

GRANT, JAMES (1720-1806). A British soldier, born at Ballindalloch, Banffshire, Scotland. He obtained a commission in the English army in 1741 and participated in campaigns in Flanders (1747-48) and later in Ireland. At the outbreak of the French and Indian War he came to America as a major. He was defeated in an attempt to reconnoitre Fort Duquesne in 1758; he was made Governor of East Florida in 1760; again in 1761 he conducted a campaign against the Cherokee Indians, in which there was friction between him and the South Carolina militia. During the Revolutionary War he participated in the battles of Long Island, Brandywine, and Germantown. By successive promotions he rose to the rank of general in 1796.

GRANT, JAMES (1822-87). A Scottish author, born in Edinburgh. After a six years' life in Newfoundland, where his father had a military command, he returned to England in 1839 and in 1840 became an ensign in the Sixty-second Regiment. In 1843 he left the service and spent several months in the office of an architect. His literary tastes soon led him to writing, and in 1845 appeared his first novel,

The Romance of War. His industry was unflagging, and, besides his historical writings, he published more than 50 works of fiction. They have all a military or an historical setting and are full of color and movement. He founded and was the secretary of the National Association for the Vindication of Scottish Rights and attained a reputation for wide military knowledge which often led to consultation with government authorities. His works on history include: *Memoirs of the Castle of Edinburgh* (1850); *Memoirs of Montrose* (1858); *The Cavaliers of Fortune, or British Heroes in Foreign Wars* (1859); *British Battles on Land and Sea* (1873-75); *Illustrated History of India* (1876); *Old and New Edinburgh* (1880); *History of the War in the Soudan* (1885-86); *Scottish Soldiers of Fortune* (1889). His most recent novels are: *Playing with Fire* (1887); *Love's Labor Won* (1888).

GRANT, SIR JAMES ALEXANDER (1830-1920). A Canadian physician. He was born in Inverness-shire, Scotland, but was brought by his parents to Canada when he was only one year old. Educated at Queen's University, Kingston, and at McGill, where he graduated in medicine in 1854, he began the practice of medicine at Ottawa, rose rapidly in his profession, and in 1865 became consulting physician to the Governor-General, Lord Monck, a position which he continued to hold under Lord Monck's successors until 1905. Although an active medical practitioner, he became interested in politics and was an influential Conservative member of the House of Commons in 1865-73 and in 1892-06. During his first parliamentary term he introduced the original bill for the construction of the Canadian Pacific Railway. He early advocated the acquisition of British Columbia and the Northwest Territories of Canada. In 1895 he supported a parliamentary motion for the extension of the Dominion franchise to women. He was elected president of the Ontario Medical Council in 1868 and later president of the Canada Medical Association. Grant received many other honors in recognition of his eminence as a physician, among them being the gold medal of the Associazione dei Benemeriti Italiani of Palermo and membership in the Italian Legion of Honor, the American Academy of Medicine, and the British Medical Association. In 1887 he was vice president of the Medical Congress of the World at Washington, D. C., and in the same year he was made a K.C.M.G. He was also president of the Royal Society of Canada. He made many contributions to medical periodical literature and also wrote on geological subjects. He published *Tuberculosis and the Simpler Life* (1906) and *How to Live a Hundred Years* (1908).

GRANT, JAMES AUGUSTUS (1827-92). An African explorer, born at Nairn, in Nairnshire, Scotland. He was educated at Marischal College, Aberdeen, and in 1846 entered the army in India, where he saw active service and was wounded during the relief of Lucknow. He met John H. Speke (q.v.) in 1847, and, the similarity of their tastes drawing them to each other, Speke cordially accepted Grant's offer to accompany him when he set out on his second African journey in 1860. Speke retained undivided command of the expedition, so that to him the credit due a commander must be given; but Grant's loyalty, unselfishness, and enthusiasm contributed in large measure to its success,

and his notes and collections proved of the greatest value. In 1868 he took part in the Abyssinian expedition, and in May of the same year retired from the army with the rank of lieutenant colonel. Grant's gazelle, one of the largest and handsomest of that family in Africa, was named in his honor. He published the record of his experiences under the title *A Walk across Africa* (1864).

GRANT, SIR JAMES HOPE (1808-75). A British soldier, born in Perthshire, Scotland. He served through the first Chinese War and then went to India, where he took part in the Sutlej campaign of 1845-46 and the Punjab campaign of 1848-49. During the Sepoy Mutiny (1857-58) he bore a conspicuous part in many of the more important engagements, notably the battle of Cawnpore, the storming of Delhi, and both the first and the second reliefs of Lucknow—services which earned him the rank of major general. At the outbreak of the second Chinese War, in 1860, he was given command of the British forces and, in spite of the lack of coöperation on the part of the French, brought the struggle to a successful conclusion by the capture of Peking. The next year he was raised to the rank of lieutenant general and in 1862 was made commander in chief at Madras. In 1870 he was appointed commander of the camp at Aldershot, where, in spite of bitter opposition, he succeeded in introducing the Prussian system of army manœuvres. He was a patron of Lord Wolseley, whose ability he was one of the first to recognize, and to whose radical schemes he often lent his influence.

GRANT, SIR PATRICK (1804-95). A British soldier. He was born in Scotland, entered the military service of the East India Company in 1820, and served for many years with distinction in India. In 1856 he was appointed commander in chief of the Madras army, and in 1857, at the outbreak of the mutiny, he was temporarily placed in command of all the British forces in India. It was he who sent Havelock to the relief of Cawnpore and Lucknow. He was Governor of Malta from 1867 to 1872, was appointed governor of Chelsea Hospital in 1874, and in 1883 was promoted to be field marshal.

GRANT, PERCY STICKNEY (1800-1927). An American Protestant Episcopal clergyman. He was born in Boston and was educated at Harvard University (A.B., 1833; A.M., 1836) and at the Episcopal Theological School in Cambridge (B.D., 1836). He was assistant minister of the church of the Ascension (1836) and minister of St. Mark's Church (1837-93), both at Fall River, Mass., and was also rector at Swansea, Mass., in 1890-93. In 1893 he became minister of the church of the Ascension of New York City. He became known for support of Socialism and for his "forum" for the expression of views on labor and living conditions. His writings include: *Ad Matrem* (1905); *The Search of Belisarius* (1907); *Observations in Asia* (1908); *Socialism and Christianity* (1910); *The Return of Odysseus* (1912).

GRANT, ROBERT (1814-92). A Scottish astronomer, born at Grantown-on-Spey, Morayshire. He studied for a short time at King's College, Aberdeen, became connected with a London counting house, and from 1845 to 1847 was in Paris attending the lectures of Leverrier and Arago and making researches preparatory to his *History of Physical Astronomy from the Earli-*

est Ages to the Middle of the Nineteenth Century (London, 1852), a work for which the gold medal of the Royal Astronomical Society was awarded in 1856. In 1859 he was appointed professor of astronomy and director of the observatory in the University of Glasgow. He accompanied the Himalaya expedition of 1860 to Spain to observe the total solar eclipse. His further publications include a valuable *Catalogue of 6415 Stars for the Epoch 1870* (1883), with a *Catalogue of 2156 Stars* (1892), in supplement; and translations of the *Notices biographiques* (as *Biographies of Distinguished Scientific Men*, 1854), and *Sur les comètes* (as *Popular Treatise on Comets*, 1861), of Arago. From 1852 to 1860 he also edited the *Monthly Notices of the Royal Astronomical Society*, of which he was elected fellow in 1850.

GRANT, ROBERT (1852-). An American novelist and essayist, born in Boston. He graduated at Harvard in 1873, received the doctorate of philosophy in 1876, and graduated from the Harvard Law School in 1879. In 1893 he was appointed judge of the Probate Court and of the Court of Insolvency for Suffolk County, Mass. His early literary work was trivial or juvenile, e.g., *The Confessions of a Frivolous Girl* (1880) and *The Lamb* (1882), a book of verse. His later work includes: *The Carletons* (1886); *An Average Man* (1883); *The Knave of Hearts* (1885); *A Romantic Young Lady* (1886); *Face to Face* (1886; 2d ed., 1901); *The Bachelor's Christmas, and Other Stories* (1895); *Uncavened Bread* (1900); *The Undercurrent* (1904); *The Orchid* (1905); *Law Breakers and Other Stories* (1906); *The Chippendales* (1909; 2d ed., 1913); *The Convictions of a Grandfather* (1912). Essays on social topics are gathered under the titles: *The Opinions of a Philosopher* (1893); *Reflections of a Married Man* (1892); and *The Art of Living* (1895).

GRANT, ULYSSES SHERMAN (1867-). An American geologist, born at Moline, Ill. He graduated from the University of Minnesota in 1888 and from Johns Hopkins University (Ph.D.) in 1893; was assistant State geologist of Minnesota in 1893-99; and taught geology at the State university in 1897-98; and in 1899 became professor of geology and curator of the museum at Northwestern University. He served on several State, as well as the national, geological surveys, from 1897 to 1906 was associate editor of the *American Geologist*, and published: *Preliminary Report on the Copper-Bearing Rocks of Douglas County, Wisconsin* (1900; 2d ed., 1901); *Report on the Lead and Zinc Deposits of Wisconsin* (1906); *Copper and Other Mineral Resources of Prince William Sound, Alaska* (1906; 1910); *Glaciers of Prince William Sound and Kenai Peninsula, Alaska* (1910-13).

GRANT, (HIRAM) ULYSSES SIMPSON (1822-85). A celebrated American general and the eighteenth President of the United States. He was born at Point Pleasant, Clermont Co., Ohio, April 27, 1822, and was the eldest child of Jesse R. Grant, a tanner and farmer, and Hannah Simpson Grant. On his father's side he was remotely of Scottish ancestry, being a descendant of Matthew Grant, one of the founders of Dorchester, Mass., in 1630, and of Windsor, Conn., in 1635, and a man of importance in the latter Colony, which he served as surveyor for more than 40 years. Ulysses' great-

grandfather, Noah Grant, held a military commission in the French and Indian War, and his grandfather, also named Noah, served in the continental army throughout the Revolutionary War, afterward emigrating to Westmoreland Co., Pa., and thence to Deerfield, Ohio. His maternal grandfather, John Simpson, had likewise emigrated to Ohio from Pennsylvania.

Jesse Grant, who had worked as a tanner for the father of the afterward noted Abolitionist, John Brown, started in business for himself at Ravenna, but removed to Point Pleasant, and in 1823 to Georgetown, about 40 miles from Cincinnati, where Ulysses was brought up, working on his father's farm in summer and attending school in winter. Jesse Grant, desirous that his son should have a better education than he himself had had, procured for him in 1839 an appointment to West Point, and at this time there was a change in name from Hiram Ulysses to Ulysses Simpson, Congressman Hamer in asking for the appointment having added to the name by which the boy was usually called the name of his mother's family, and all attempts of Ulysses to have the error corrected were in vain. Ulysses graduated, in 1843, twenty-first in a class of 39, and was then commissioned brevet second lieutenant in the Fourth Regiment of Infantry, stationed at Jefferson Barracks, Mo. In May, 1844, his regiment was ordered to Louisiana and in September, 1845, to Texas, to join the army of General Taylor. In the Mexican War Grant took part in the battles of Palo Alto and Resaca de la Palma and was present at the capture of Monterey, was then made quartermaster of his regiment in 1847, participated in the battles of General Scott's campaign, and for his bravery at Molino del Rey, Sept. 8, 1847, was made first lieutenant, and for his conduct at Chapultepec, September 13, was brevetted captain. In the summer of 1848 his regiment returned, to be stationed first at Detroit and then at Sackett's Harbor. In the same year he was married to Miss Julia T. Dent, of St. Louis, sister of one of his classmates at West Point, who survived him many years, dying in 1902. In 1852 he accompanied his regiment to California and Oregon, and on Aug. 5, 1853, was commissioned full captain; but on July 31, 1854, resigned and removed to the neighborhood of St. Louis, Mo., where he cultivated a farm and engaged in the real-estate business. His lack of knowledge of business methods, however, and his carelessness in money matters involved him heavily in debt and caused him in 1860 to give up and move to Galena, Ill., where he was employed in his father's store at \$800 a year. Here he was living when the Civil War broke out in 1861. He immediately recruited and drilled a company of Galena volunteers and accompanied them to Springfield, where he was employed in the Adjutant General's department as a mustering officer. He offered his services to the national government, but, receiving no reply, accepted on June 17 the colonelcy of the Twenty-first Illinois Volunteer Infantry and served with his regiment under General Pope in Missouri until August 7, when he was commissioned a brigadier general of volunteers. In this capacity he served in Missouri, was later placed in charge at Cairo, Ill., and early rendered important service by the seizure, on Sept. 6, 1861, of Paducah, Ky., at the mouth of the Tennessee, and on the 25th of Smithland, at the mouth of the Cumberland,

two important strategic points. His next move, a month later, was to check the advance of a large force under Gen. Jeff Thompson, this being successfully accomplished by two battles—one at Fredericktown, Mo., the other at Belmont. The District of Cairo was now enlarged, and General Grant was placed in command. In February, 1862, he moved from Paducah with 15,000 men, aided by Commodore A. H. Foote (q.v.), with a fleet of gunboats, for the purpose of capturing Fort Henry, on the Tennessee, and Fort Donelson, on the Cumberland. The former surrendered February 6, its reduction, however, being the work of the gunboats; the latter was taken on the 16th, only after a severe battle in which the land forces were engaged. (See FORT HENRY AND FORT DONELSON.) Buckner, who was in command of the fort after the withdrawal of his superior officers, proposed the appointment of commissioners to settle the terms of capitulation, to which General Grant replied: "No terms other than an unconditional and immediate surrender can be accepted. I propose to move immediately upon your works." The capture of this fort was the first important and brilliant victory of the Federal arms, and it made a great impression upon the country. General Grant was at once made a major general of volunteers, his commission being dated as of the day of the battle; and by a play upon his initials he became widely known as "Unconditional Surrender Grant." The battle of Shiloh (q.v.), or Pittsburg Landing, was next fought. The Federal troops at that point were attacked April 6 by a large Confederate force under Gen. A. S. Johnston (q.v.) and suffered heavy loss. General Grant arrived on the field at the critical moment and reformed the broken lines, and, heavy reinforcements under General Buell having arrived, the battle was renewed on the 7th, and the Confederates, now under the command of General Beauregard (Johnston having been killed), were driven back to Corinth. In this battle General Grant was slightly wounded. He was second in command in the movement against Corinth, which was occupied by the Federal troops on May 30. When, in July, General Halleck was called to Washington to take command of the armies of the United States, General Grant was assigned to the command of the Department of the Tennessee, with headquarters at Corinth. In September he fought the Confederate General Price at Iuka and defeated him. He then removed his headquarters to Jackson, leaving Rosecrans with 20,000 men to hold Corinth, which he did successfully. In October General Grant's department was enlarged by a portion of Mississippi, including Vicksburg, the forces under his command being designated as the Thirteenth Army Corps. After several efforts by different plans to capture Vicksburg, he was finally enabled, as a result of his brilliant movements, to invest the city, May 18, 1863, and on July 4 General Pemberton surrendered with about 30,000 men. General Grant was now appointed a major general in the regular army, and in October was placed in command of the Military Division of the Tennessee, comprising the departments commanded by Sherman, Thomas, Burnside, and Hooker. General Grant was next called upon to conduct the operations against the Confederate General Bragg at Chattanooga. On November 24 the Federals stormed Lookout Mountain, and on the 25th they carried the heights of Missionary Ridge. General Hal-

leek, in his annual report to the War Department, said that, in view of the strength of Bragg's position and the difficulty of storming his intrenchments, "the battle of Chattanooga must be considered the most remarkable in history. Not only," he continued, "did the officers and men exhibit great skill and daring in their operations on the field, but the highest praise is due to the commanding general for his admirable dispositions for dislodging the enemy from a position apparently impregnable." Congress at its next session passed a vote of thanks to General Grant and his army and ordered a gold medal to be struck in his honor. The grade of lieutenant general was revived, General Grant was nominated by President Lincoln for the position, and the nomination was promptly confirmed by the Senate. On March 17, 1864, he issued his first order as commander in chief of the armies of the United States. His headquarters thereafter were with the Army of the Potomac. The battles of the next campaign, which had for their object the capture of Richmond, in front of which the main army of the Confederates was concentrated for a last and desperate resistance, were among the bloodiest of the whole war.

The first movements of General Grant, though unsuccessful as to his main design, resulted in crippling the enemy and so preparing the way for final victory; but they were attended with terrible loss of life. The great battle of the Wilderness (q.v.) was fought against General Lee on May 5-May 6 and was followed by the bloody engagements at Spottsylvania Court House. On June 3 Lee repulsed a tremendous assault of the Union forces at Cold Harbor. General Grant, having failed in his flanking movements, saw at last that his only hope of seizing Richmond depended upon his first taking Petersburg, and to this object he now addressed himself with his usual pertinacity. Lee attempted to create a diversion by sending Early on a raid across the Potomac. Sherman soon after forced Hood to evacuate Atlanta and then started on his famous "march to the sea." Sheridan's victory at Five Forks, March 31-April 1, 1865, destroyed the last hope of a successful defense of Richmond. On April 2 Petersburg was abandoned, and on the 3d the Federal forces entered the Southern capital, the Confederates fleeing as they advanced. Grant pursued the fleeing army, overtook and surrounded it, and forced it to surrender at Appomattox Court House on April 9. Lee was captured, and the Confederacy overthrown.

The assassination of Lincoln and the accession of Andrew Johnson quickly followed, and then came the excitement of the period of Reconstruction, in which General Grant, for whom Congress had created the rank of general of the army, bore a loyal and honorable part. During the administration of Johnson he was drawn into the struggle between the President and Congress. On the removal of Stanton, Secretary of War, by President Johnson, Grant was asked to fill the office ad interim, and held it from August, 1867, to January, 1868. Having become prominent in national politics, he was soon recognized as an available candidate for the presidency, his military services making it evident that whatever party nominated him would receive a large independent support. He was approached by members of both parties, but his views were more nearly in accord with

those of the Republicans. In May, 1868, a convention of soldiers and sailors at Chicago indorsed his contemplated candidacy, and on May 20 the Republican Convention on the first ballot nominated him for the presidency unanimously, naming for the vice presidency Schuyler Colfax, of Indiana. Although the Democratic candidate, Gov. Horatio Seymour, carried his own State of New York, he secured only seven other States, with a total of only 80 electoral votes against 214 electoral votes cast for Grant. The new administration was marked by a studied independence of congressional politicians and by a disregard of various political traditions of the national government. The apparent influence of a military coterie, coupled with the President's marked reticence as to his views and plans, and his want of tact in dealing with civilians, produced an unfortunate lack of cordiality in his relations with Congress and gave rise to a few incidents of discord. During the campaign he had been conspicuously reticent and inactive, and it was impossible to learn in advance his intentions with regard to matters of public moment. However, he had the confidence of the people at large, and this was increased by the negotiation of the important Treaty of Washington (q.v.) and by the steps which were thus taken for the early settlement of the Alabama Claims (q.v.). The President made foreign relations an important feature of his first administration by his persistent efforts in favor of the annexation of Santo Domingo, the treaty for which, however, was rejected by the Senate, largely through the opposition of Charles Sumner, whose attitude in this matter led to his exclusion, by the friends of the administration, from his influential post as chairman of the Senate Committee on Foreign Relations. A policy of friendly supervision of the South American states was also followed, and much interest was manifested in the war of independence which was being waged in Cuba, and the danger of intervention seemed imminent, especially for a brief period during the excitement caused by the seizure of the *Virginius*. The political condition of the South continued to present serious problems, although most of the actual work of reorganization had been accomplished; the vindictiveness of the extreme Republicans was abating; and the President was inclined to lessen the direct control of Southern administration at the hands of the national government and to look forward to the moral regeneration of the newly organized political bodies through their own initiative unaffected by external influences. (See RECONSTRUCTION.) The scandals attaching to the *Crédit Mobilier* (q.v.) were looked upon by the President's opponents as sources of weakness; but neither these nor other seeming irregularities had any material effect in the campaign of 1872, when Grant was re-elected with the unprecedented number of 286 electoral votes, and with a popular vote exceeding by more than 700,000 that given to his chief opponent, Horace Greeley (q.v.). The collapse, as it seemed, of the movement of the new Liberal-Republican party (q.v.) left the President in full authority, with very little opposition and with very few problems of really national importance to be settled. Financial affairs, the control of the Indians, and minor matters of ordinary significance occupied the greater portion of his second term, which was marked also by various irregularities, such as

ULYSSES S. GRANT

the scandal of the "Whisky Ring" (q.v.), in which high Federal officials were concerned, but in which the President himself was in no way implicated, save in so far as he obstinately stood by friends whose guilt was beyond doubt. In 1874 he rendered one of his greatest civil services to his country by his veto of the bill passed by Congress for the inflation of the paper currency, and he encouraged the passage of the Resumption Act in the following year.

At the close of his second term, in 1877, he made the tour of the whole civilized world, visiting especially the great countries of Europe and Asia, and receiving, as a soldier and civilian and the first citizen of the United States, all the honor which rulers and people could bestow. As the unofficial representative of his country, his bearing was such as to win universal admiration and respect. On his return home in the spring of 1880 a large and influential portion of the Republican party sought to make him a candidate for the presidency once more; but the movement was defeated, by a narrow margin, on account of the formidable opposition to the bestowal of the office upon any man, however eminent or able, for more than two terms.

After his long journey General Grant made his home in New York. He became a partner in a financial firm which came to grief and involved him in pecuniary ruin, but the only blame that attached to him was that he bestowed too much confidence upon those who misused it. Every token of respect was shown to him in the city of his residence, and Congress, by a special enactment in 1884, placed him on the retired list of the army, as General, with full pay—a position he had resigned to become President.

In the summer of 1884 General Grant entered upon a long period of suffering from a cancerous affection of the throat, and he died at Mount MacGregor, near Saratoga, N. Y., July 23, 1885. Until a few days before his death he was diligently engaged in writing his memoirs, in order by their sale to make provision for his family. His body found its final resting place in a magnificent tomb in Riverside Park, New York City, overlooking the Hudson River. See *Plate of New York*.

Memoirs of General Grant's career are numerous. Soon after the Civil War Gen. Adam Badeau, his aid near the close of the war, wrote his *Military History* in three octavo volumes (New York, 1897-81). Grant's *Personal Memoirs* (New York, 1885) were a great literary success.

Bibliography. There is a short and excellent biography by Col. W. C. Church (New York, 1897); another by Gen. James Grant Wilson (ib., 1897); a study of the ancestry of General Grant by E. C. Marshall (ib., 1869), and a story of his tour around the world by John Russell Young (ib., 1879). Other works are Garland's *Grant: His Life and Character* (New York, 1898); Helen Nicolay's *The Boy's Life of Ulysses S. Grant* (ib., 1909); *Letters of Ulysses S. Grant to his Father and Youngest Sister, 1857-78* (ib., 1912), ed. by his nephew, Jesse Grant Cramer; Hosmer, *The Appeal to Arms* (ib., 1907) and *Outcome of the Civil War* (ib., 1907); Rhodes, *History of the United States* (ib., 1896-1906); *The Reminiscences of Carl Schurz* (ib., 1907-08). Among the eulogies of General Grant, that by Henry Ward Beecher, in

Boston, Oct. 22, 1885, deserves special mention. See *UNITED STATES*.

GRANT, SIR WILLIAM (1752-1832). A British jurist and politician, born at Elchies on the Spey. He was educated at King's College, Aberdeen, and at Leyden University, and was called to the bar in 1774. He was appointed Attorney-General of Canada in 1776, but a few years later returned to England, where he at first met with small success. In accordance with Pitt's advice he entered Parliament in 1790 and soon attained great prominence in that body. He held a number of political offices, notably that of Solicitor-General in Pitt's administration, which procured him the honor of knighthood. In 1801 he was appointed Master of the Rolls, an office which he held for more than 16 years, and in the discharge of which he made an enviable reputation as a judge. Consult Townsend, *Lives of Twelve Eminent Judges* (2 vols., London, 1840), and Brougham, *Statesmen of the Time of George III* (ib., 1859).

GRANTA. An English river. See *CAM*.

GRANTHAM, grānt'am. An ancient market town in Lincolnshire, England, on the Witham, 23 miles south-southwest of Lincoln (Map: England, F 4). It is an important railroad junction on the Great Northern Railway, whence branch lines proceed to Lincoln, Boston, and Nottingham. It is connected with the river Trent by a canal 30 miles long. It has neighboring iron mines and considerable trade in malting and manufactures of iron, leather, paper, brick, agricultural implements, and coaches. The restored church of St. Wulfram, founded in the thirteenth century and surmounted by an elegant spire, 279 feet high, ranks as one of the finest parish churches in England. The town also gives its name to a suffragan bishop of the Lincoln diocese. Its other notable buildings are the thirteenth-century Angel Inn, where King John held court and Richard III signed Buckingham's death warrant; the free grammar school, founded in 1528, where Sir Isaac Newton was educated; the guildhall with its spacious assembly room; the town hall, the two exchanges, the literary institute, and the library. A bronze statue of Sir Isaac Newton graces St. Peter's Hill. The town owns the markets. Grantham was incorporated in 1463 by Edward IV and is represented by one member in Parliament. Here, on May 13, 1643, Oliver Cromwell fought his first successful battle. Pop., 1901, 17,600; 1911, 20,074. Consult Turner, *History of the Town and Soke of Grantham* (London, 1806).

GRANTLEY, BARON OF. See *FURNESS, CHRISTOPHER FURNESS*.

GRANT'S GAZELLE. See *GAZELLE*.

GRANTS PASS. A city and the county seat of Josephine Co., Oreg., on the Rogue River, 297 miles south of Portland, on the Southern Pacific Railroad (Map: Oregon, B 5). It has extensive manufactures of lumber in various products and carries on a large trade as the centre of an agricultural, lumbering, and mining district. There are also railroad machine shops, brickyards, and other industrial plants, and the city contains a public library. Crater Lakes and the Oregon Caves, near here, are of great scenic interest. Pop., 1900, 2290; 1910, 3897.

GRANULAR LIDS. See *CONJUNCTIVITIS*.

GRANULATION. A process of healing in wounds whose bleeding surfaces cannot be

brought together. In wounds that can be closed, healing often takes place by "first intention." (See WOUND.) In an open wound about the seventh day there appears in its depths a mass of bright reddish material arising from all sides, composed of small papillæ. The surface of this new growth is pebbled or granular, and it consists of a number of cells, together with new connective tissue provided with many looping arteries. The surface is bathed in pus. These papillæ are called granulations. In most cases, where the successive layers of granulations reach the level of the surface of the wounded part, the integument shoots forth from the margins, finally meeting in the centre, and the wound skins over. In other cases the granulations grow above the surface in heaps and are then termed exuberant granulations, or "proud flesh." Sometimes after granulation has commenced in a wound its surfaces may be brought together and adhere, presenting an instance of union by "second intention." Granulation tissue is a protection against the invasion of bacteria. The wall-like aggregation of leucocytes, new connective-tissue corpuscles, and new blood vessels presents no open lymph spaces through which alone the microorganisms gain entrance.

GRANULITE. A type of metamorphic rock, characterized by a schistose arrangement of the minerals which consist largely of quartz and feldspar. The grain is fine, and except for its schistosity the rock resembles an igneous felsite or aplite. Granulites are quite common among the older gneiss areas, such as those of the Adirondacks and the New England States, and have been described in Germany, Austria, and the Scandinavian countries.

GRANVELLE, grăn'vêl' (Sp. **GRANVELLA**, grăn-vêl'yá), ANTOINE PERRENOT, LORD OF (1517-86). A Spanish cardinal and statesman. He was the son of Nicholas Perrenot, Lord of Granvelle, Secretary of State under Charles V and one of that Emperor's most influential ministers, and was born at Besançon, Aug. 20, 1517. He pursued the study of law and theology at the universities of Padua, Paris, and Louvain, and at the age of 23 was made Bishop of Arras. Through his father's influence he speedily came to play an important part in the political affairs of the Empire. His defense of Charles's policy delivered at the opening of the Council of Trent (1545) gained him the permanent good will of the Emperor, who employed him in his negotiations with the Protestant princes of Germany in 1547, and who in 1550 made him Secretary of State on the death of the elder Granvelle. As one of the shrewdest diplomats probably of his time, he participated in the negotiations leading to the Peace of Passau (1552) and was instrumental in bringing about the marriage of Philip II with Mary of England. In 1559 he was made Chief Minister to Margaret of Parma, Regent of the Netherlands, and became in turn Archbishop of Malines (1560) and Cardinal (1561). As a stranger and a churchman who represented the rigorous absolutism of the Spanish court, Granvelle succeeded in arousing the bitter hatred of the Flemings. Margaret of Parma, William of Orange, the Counts Hoorn and Egmont, united in demanding the removal of the unpopular Minister, and finally, in 1564, Granvelle was recalled at his own request. He took up his residence at Besançon and occupied his leisure in literary and scientific studies. He subsequently acted as Spanish representative at

the papal court and brought about the formation of the Holy League against the Turks by Venice, the Pope, and Philip II, whose united fleets crushed the Ottoman sea power at Lepanto (1571). After holding the post of Viceroy of Naples for some time he was made in 1575 head of the Spanish Council of State and in this capacity forwarded the incorporation of Portugal with Spain. In 1584 he became Archbishop of Besançon. He died at Madrid, Sept. 21, 1586. More than 80 manuscript volumes of his papers have been preserved, only part of which have ever been published. Consult: Weiss, *Papiers d'état du Cardinal Granvelle* (9 vols., Pons, 1841-52); Motley, *Rise of the Dutch Republic* (3 vols., New York, 1883); Poulet and Piot, *Correspondance du Cardinal Granvelle, 1565-86* (12 vols., Brussels, 1878-98); *Cambridge Modern History*, vol. iii (New York, 1904).

GRANVILLE, grăn'vêl'. A fortified seaport town and watering place at the mouth of the Bosq, on the English Channel, in the Department of Manche, France, 85 miles southwest of Cherbourg and 28 miles southeast of the island of Jersey, with which it has regular steamship communication (Map: France, N., D 4). The town consists of an upper and a lower part built on a promontory, surmounted by a citadel. The church of Notre Dame is an interesting fifteenth-century Gothic edifice. The tidal harbor is well sheltered, has extensive piers and a dry dock, and a good trade in building stone, oysters, eggs, vegetables, fish, and codliver oil is carried on. It has also a small shipbuilding trade. A fishing fleet is yearly equipped to visit the Newfoundland and other grounds. Granville is a popular summer and sea-bathing resort. It is the seat of a hydrographic school. It dates from an English fort built early in the fifteenth century, which the French captured in 1450; in 1641 the French again took the fortifications, which the English had built the year previously. In 1695 and in 1803 it was bombarded by the English and in 1793 was almost totally destroyed by the Vendean troops. Pop., 1901, 11,667; 1911, 11,347.

GRANVILLE. A village in Washington Co., N. Y., 66 miles north-northeast of Albany, on the Delaware and Hudson Railroad (Map: New York, G 4). It is the centre of an important roofing-slate industry and has manufactories of shirts, condensed milk, gloves, and infants' clothes. The water works are owned by the village. Pop., 1900, 2700; 1910, 3920.

GRANVILLE. A village in Licking Co., Ohio, 6 miles west of Newark, on Raccoon Creek and on the Toledo and Ohio Central and the Ohio Electric railroads (Map: Ohio, E 5). It is the seat of Shepardson College for Women, of the Doane Academy, the Fannie Doane Home for Missionaries' Children (Baptist), and of Denison University (q.v.). The village owns its electric-light plant. Pop., 1910, 1394.

GRANVILLE, GEORGE. See LANDSDOWNE, LORD.

GRANVILLE, GEORGE LEVESON-GOWER, second EARL (1815-91). An English statesman. The eldest son of the first Earl, he was born in Mayfair, London, May 11, 1815. He was educated at Eton and at Christ Church, Oxford. In 1836 he was attaché to his father in the Embassy to France; in the same year he entered Parliament for Morpeth, and was reelected in 1837. From 1841 to 1846 he represented Lichfield. In the Commons he was a Liberal and

free trader. At his father's death, in 1846, he became a peer, was made Vice President of the Board of Trade in 1848, and went into the cabinet in 1851, at the close of that year succeeding Palmerston in the Foreign Office. He retired with the Russell ministry. He was President of the Council (1852-54, 1855-58, 1859-66), Secretary of State for the Colonies (1868-70), and Secretary for Foreign Affairs (1870-74). During Gladstone's temporary retirement (1878-80) Lord Granville acted as leader of the Liberals. When Gladstone became Premier again, in 1880, Lord Granville once more was made Secretary of State for Foreign Affairs, going out of office with Gladstone in 1885. In 1886 he became Secretary for the Colonies. The chief events of his career were the establishment of Afghanistan as a neutral zone between India and Russia, the suppression of Arabi Pasha's Egyptian revolt, and the consequent establishment of British predominance in Egypt. Lord Granville was esteemed by men of all parties for his urbanity and unflinching tact, but he lacked virility as Foreign Secretary. From 1856 until his death (March 31, 1891) he was chancellor of London University. Consult Fitzmaurice, *Life of Granville G. Leveson-Gower* (2 vols., London, 1905), and Spencer Walpole, "Lord Granville," in *Essays Political and Biographical* (ib., 1908).

GRANVILLE, JOHN CARTERET, EARL. A British statesman (1690-1763). See CARTERET, JOHN.

GRAPE (from OF. *grape*, cluster, from OHG. *crapfo*, Ger. *Krapfen*, hook). The fruit of any species of the genus *Vitis*; also, in the United States and Canada, any plant of this genus. In other English-speaking countries the plant is designated the "vine." Grapes grow wild in Egypt, Arabia, Turkey in Asia, and in the Mediterranean countries of Europe; more than 20 species are found in America, from Canada to Florida and westward. The cultivated vines of Europe and the Orient all belong to the single species *Vitis vinifera*.

The cultivation of the grape and the making of wine are of the most remote antiquity, as appears from the Scripture history of Noah and from many passages of the most ancient authors, e.g., Vergil and Columella, who both gave instructions in vine cultivation. The mythological fable of the marches of Bacchus relates to the extension of the culture of the vine from Asia into Europe. The vine was probably introduced into the south of France and into Italy by the Phœceans about 600 B.C., and its cultivation was early coextensive with civilization in all the Mediterranean regions. In Italy so much of the land was occupied by vineyards that the Emperor Domitian, fearing a scarcity of grain, issued a restrictive or prohibitory edict (81 A.D.), which remained in force long afterward through fear that an abundance of fine wine might tempt the barbarians of the north to invade the country. The vine was introduced into England by the Romans. After the Norman Conquest the vineyards which seem to have existed in the south and southwest soon disappeared, having had only occasional successors until the nineteenth century, when vine culture in gardens and on walls mainly for fresh fruit increased in this region. The vine does not, in ordinary seasons, ripen its fruit well in Great Britain farther north than Yorkshire, although grapes have occasionally ripened in

the open air in Scotland. On the Continent the cultivation of the vine for wine is an important industry as far north as Coblenz on the Rhine; but in some countries, particularly in Greece and the Ionian Islands, the product of the vineyards is converted into raisins. By the Spaniards and Portuguese the vine was introduced into the Azores, the Madeira and Canary Isles, and America. The first vines were carried to the Cape of Good Hope by the Dutch in 1650; but while the wines of Madeira and those of the limited district of Constantia at the Cape of Good Hope have long enjoyed a high celebrity, and those of Canary and Teneriffe have been exported in considerable quantities, it is only of late that much attention has begun to be paid to vine culture in the other parts of Cape Colony. Good wines are being made in Australia.

The grape is a perennial, deciduous, woody, climbing vine, which makes itself fast to its support by strong persistent tendrils, opposite or alternate with the large angular, lobed, toothed, and generally hairy leaves. The stems are numerous, very long, branching, of rapid growth, and with many swollen joints; the outer bark readily splits and peels; the woody tissue abounds with vessels of large size, from which at the seasons of active vegetation the sap pours in prodigious quantity if the branch be wounded. The fruit stalks, which are much branched modified tendrils, are borne on wood of the present season's growth, opposite the leaves. The flowers are small, greenish white, and fragrant. The fruit is a round or oval berry, two-celled and four-seeded, which varies in size from about one-fourth of an inch in diameter, as in the Corinth or "currant" grape, to nearly an inch in some of the improved American varieties. The color, which is entirely in the outer skin, may be green, red, yellow, purple, or in some cases variegated. Although the pulp of the grape is wholesome, nutritious, and gently laxative, the skin is astringent and indigestible. Some of the ovules may be abortive, or even all of them in the fruit of old vines of some varieties, as in the seedless Ascalon or Sultana raisin. The stems sometimes reach a diameter of 18 inches, and the wood, which is very hard and durable, is occasionally employed in making furniture, statues, etc. It attains also a very great age: specimens may remain fruitful for 300 or 400 years. In the Old World *Vitis vinifera* is the basis of all viticultural interests; in America several native species and hybrids between them and *Vitis vinifera* are utilized. The grapes upon which the vineyards of the eastern United States are founded are contributions of that region to the economic plants of the world. Of the species involved, *Vitis labrusca* has furnished more cultivated varieties, either pure breeds or hybrids, than all the others put together. All early attempts at viticulture were based upon the Old World grapes. As early as 1621 an unsuccessful attempt was made to introduce the European vine into Virginia, and from that time forward numerous other attempts were made. The undertaking of John J. Dufour in 1798 is especially worthy of note. But, like all other undertakings in which European vines were used, Dufour's Kentucky Vineyard Society, with \$10,000 capital, was unsuccessful, although great care was exercised in the execution of every detail in the work. Later a partial success came as a result of the introduction of the so-

called "cape grape," which is now known to have been an offshoot from the fox grape (*Vitis labrusca*). True success came with the introduction by John Adlum of the *Catawba*, "the first truly American grape." This variety still ranks as one of the leading wine and table grapes of the northeastern United States. The culture of the grape in the eastern United States has grown remarkably since 1860 and has reached its greatest perfection, both as regards methods of culture and marketing, in New York, New Jersey, Ohio, Maryland, and Virginia, where thousands of acres are devoted to the cultivation of table grapes, although there is a considerable output of wine and brandy in each locality. In the East the end sought is dessert fruit; in the West, wine and raisins.

The early Spanish and French missionaries planted the European vine on the Pacific slope. Here the conditions are more congenial than in the Eastern States, and the industry has flourished from the beginning. With the exception of the famous vineyards of Europe, California leads in the production of wine and raisins from *Vitis vinifera*. The largest vineyards in the world are to be found there, and the output of raisins has so increased that the importation of the fruit has greatly diminished, despite the enormous increase in the country's population. Until 1820 the Mission variety was the only European vine planted in western America, but the list has increased to more than 50 varieties, including those most prized in Europe. The repeated failures with the European grape in eastern America were due not so much to the climate, as to the ravages of the phylloxera, which found a congenial and very susceptible food plant in the introduced vines. Native vines are able to resist its attacks, but the European vines possess no such power, and when this pest was accidentally transported to France on some native American vines it spread havoc among the European vineyards. It was even thought that vine culture in Europe was doomed. Little wonder that varieties failed in the eastern United States. A remedy was hard to find, but the interest of the French government in rescuing from destruction its great vineyards and wineries stimulated research, which led to the utilization of the resistant American vines as stocks upon which to graft the European vine, even in its native clime. The success of this plan is evident from the fact that the most remunerative vineyards of Europe have roots of American species. The wine and raisin industry of the United States is being rapidly extended; and numerous successful experiments have been conducted in the southeastern United States with the European vines grafted upon resistant American stocks. Two important works on the development of American grapes are Hedrick et al., *The Grapes of New York* (Albany, 1908), and Munson, *Foundations of American Grape Culture* (New York, 1909).

Vine culture varies greatly in different countries. Success seems to depend chiefly upon sunny exposure, congenial soil, control of diseases, intelligent manuring, and cultivation. New varieties are grown from seed, but the ordinary mode of propagation is by cuttings. The cuttings are made during the dormant period, preferably in the autumn, from ripe wood of the past season's growth, and usually carrying two or three buds. These are heeled in or buried until the following spring, when they

are set in nursery rows; one year later the young plants are ready for planting in the vineyard. A soil of medium fertility and gravelly texture is preferred; but certain varieties will thrive upon light soils, others upon heavy, if not too wet. Vines will endure more moisture than most other fruit-bearing plants, yet they must have drained land to give the best results. The grape is usually set in the vineyard at one year from the cutting, 8 × 8 feet or 8 × 10 feet being the popular distances for American vines. During the first year the land is given clean culture, with or without hoed crop; the second year the trellises or supports are partially constructed, and the new growth tied up out of the way of cultivation. The third year the trellises are completed, some bearing wood left, and each vine may be allowed to bear a few clusters of fruit. After the first year no other crop should be allowed to encumber the vineyard. Clean culture should be given until midsummer, after which time means should be taken to check growth and ripen the wood. Pruning the vine is based entirely upon the fact that the fruit is borne upon wood of the present season's growth, which arises from the buds of the last season's growth. All wood for fruiting purposes must therefore be one year old. All systems of pruning are either renewal or spur systems. Renewal systems seek to maintain the fruit production near the root or main trunk; spur systems renew on shoot spurs arising at intervals along a permanent arm. For description of various systems, consult Bailey, *Cyclopedia of American Horticulture* (4 vols., New York, 1900-02).

Besides the manufacture of wines, brandies, raisins, and the use of grapes for dessert purposes, unfermented grape juice is a valuable and popular product. This is made by expressing the juice, sweetening, heating to the boiling point, or Pasteurizing, and sealing while still hot in cans or strong bottles. See also WINE; BRANDY; RAISINS; CURRANT; VITACEÆ.

GRAPE.

Wild American, source of the Catawba, Isabella, etc.

Grape Diseases. Few plants are subject to as many and as serious diseases as the grape, and few plant diseases have been more fully investigated. Diseases of the grape are caused by improper conditions of soil and moisture, but more frequently by fungi and bacteria, which are often carried from diseased to healthy plants by insects. The diseases due to fungi can be successfully controlled in most cases by the thorough use of fungicides (q.v.). A few of the more destructive and widely spread diseases

may be briefly considered here. *Downy mildew* (*Plasmopara viticola*) produces yellowish spots upon the upper surface of the leaves and a downy-frosty appearance beneath. Later these spots appear as light-brown discolorations. The same fungus occurs upon the fruit, when it is known as "brown rot" or "gray rot," according to the nature of the attack. The brown rot of the fruit is first manifested by purplish discolorations, soon after the appearance of which the pulp becomes soft and forms depressions, over which the skin is tightly drawn. The gray rot which attacks the young berries and their pedicels resembles the downy growth mentioned as occurring on the leaves. Downy mildew and black rot, next to be discussed, are the two most serious general grape diseases. Black rot (*Guignardia bidicellii*) attacks the leaves, producing at first reddish-brown circular spots; later a number of spots may coalesce and form irregular blotches. Upon the fruit the first sign of attack is the appearance of small brownish discolorations, which soon enlarge, the whole berry gradually becomes brown or black, withers, and finally dries up, usually remaining attached to the stem. *Grape* (q.v.) *anthracnose* (*Sphaceloma ampelinum*) attacks leaves, stems, and berries. Upon the leaves it appears as dark spots surrounded by well-marked darker bands of color. The centres later turn gray, and frequently the diseased areas fall out, giving the leaves a ragged appearance. Upon the shoots the disease manifests itself in much the same manner. On the fruit the disease is often termed "bird's-eye rot," from the peculiar appearance of the spots. The centres become gray, with an outer band quite dark and sometimes a zone of vermilion color between them. When the young fruits are attacked, they turn brown, and pink pustules appear over the surface. The tissues of the berry with this rot become hard and leathery. Other diseases resembling the above are often called anthracnose. *Bitter rot*, or *ripe rot* (*Glomerella rufomaculana*), attacks the stems and fruits, especially the latter, which becomes bitter, whence the name. In this disease the berries turn brown, become thickly dotted with purplish-black pimples, and ultimately fall at the least disturbance. The best preventive measure for these diseases is thorough spraying with Bordeaux mixture. *Powdery mildew* (*Uncinula necator*) is troublesome in grape houses and in the vineyards of France, but less in the vineyards of the United States. It covers the leaves, young shoots, and fruits with a powdery, meal-like growth. Upon the leaves and fruits it forms patches of various size and shape on the upper surfaces. Soon the berries shrivel, the skin cracks, and other agents of decay complete the destruction. For the prevention of the disease sulphur is perhaps the best remedy. It may be dusted over the vines in the open, or it may be evaporated without ignition in the grape house. A disease variously known as shelling, rattling, etc., is sometimes common, in which the berries fall from the clusters as ripening approaches. This is due to a lack of nutrition and may be remedied by the use of fertilizers, especially those containing potash. Crown gall, due to *Bacterium tumefaciens*, often destroys vines, the bacteria causing large hard swellings just below the surface of the ground. Two serious root rots are rather common, due to the fungi *Dematophora necatrix* and *Armillaria mellea*. For the control of crown

gall and root rot the vines should be dug out and burned. Stains on grapes, resulting from the use of copper fungicides, may be removed by dipping the bunches in a dilute solution of vinegar and water. See FUNGI, ECONOMIC; DISEASES OF PLANTS; FUNGICIDE. Consult: Tubeuf, *Diseases of Plants Induced by Cryptogamic Parasites*, trans. by W. G. Smith (New York, 1897); Pierce, "Grape Diseases on the Pacific Coast," in *United States Department of Agriculture, Farmers' Bulletin 30* (Washington, 1901); Duggar, *Fungous Diseases of Plants* (New York, 1909); Stevens and Hall, *Diseases of Economic Plants* (ib., 1910); Stevens, *The Fungi which Cause Plant Diseases* (ib., 1913); and the authorities referred to under FUNGICIDE.

GRAPE ANTHRACNOSE. A disease of the grape, sometimes called bird's-eye disease, because of the appearance of bird's-eye spots upon the berries, stems, and leaves. The spots upon the berries are first brown, and as these enlarge the centre becomes sunken, and between the lighter centre and the brown border a reddish band appears. It is a disease very difficult to control when it becomes epidemic. See GRAPE.

GRAPE CURE. A method of treatment of some diseases and conditions with a diet of which grapes form a very large part. This treatment is in vogue to some extent in France, but to a much greater extent in Germany and in Hungary, in which countries, as well as in Austria and Switzerland, there are sanitariums at which the grape cure is administered. According to Carrière, the cure formerly consisted of an exclusive diet of grapes, taken to repletion. It was usual to commence with a pound and rapidly increase the amount to eight pounds a day. The first meal, consisting of a large amount of grapes, was eaten early in the bedroom. The second meal was taken in the vineyard, at breakfast time. The third meal, at noon, after the morning walk, consisted of bread and water. The fourth meal was taken early in the evening and consisted of grapes only. It was soon found, however, that an exclusive diet of grapes causes emaciation; while if meats and other food be added the patient gains. The modified grape cure now in vogue therefore includes a large quantity of grapes before breakfast, with bread, if preferred; a breakfast, an hour later, of bread, tea, or coffee, or cocoa, and a broth; grapes again an hour before the midday meal, and again an hour before the evening meal.

Grapes differ much in composition; but Smith gives the following percentage for ripe, medium-sized grapes:

SOLUBLE

Grape sugar.....	13.8
Tartaric acid.....	1.12
Nitrogenous matter.....	.8
Gum, fat, etc.....	.5
Salts.....	36
Water.....	79.8

INSOLUBLE

Skins, stones, etc.....	2.6
Pectose.....	.9
Mineral matter.....	12

The experiments of Bichof and Voigt showed that a diet of 400 grams of meat and 300 grams of grape sugar caused a gain of 92 grams in weight in one who had lost 23 grams under a diet of 500 grams of meat and 200 grams of grape sugar and had lost 230 grams under a diet

of 500 grams of meat and 100 grams of grape sugar. Therefore about 4 pounds of grapes daily, with nourishing meats and some bread, form the proper diet at a grape-cure establishment. The grape cure has been of advantage in diarrhoea, dysentery (non-amoebic), hemorrhoids, engorgement of the spleen, and plethora of the portal system, and has caused improvement in cases of tuberculosis, gout, and some skin diseases. Undoubtedly regular habits of life, sufficient sleep, out-of-door life, climate, and water play a significant part in all improvement secured from a grape cure. See DIET.

GRAPE EATER. See WHITE-EYE.

GRAPEFRUIT (so called because borne in clusters like a bunch of grapes). A common term in the United States and the West Indies for the round-fruited forms of *Citrus decumana* or *grandis*. The pear-shaped forms of this genus are discussed under SHADDOCK (q.v.). The grapefruit, or pomelo as it is sometimes called, ranges in size from that of a large orange to about six inches in diameter. It has a slightly bitter acid pulp and is valued primarily by Americans as a breakfast fruit. It is also used for salads and desserts. It appears to have been brought to Florida by the Spaniards in the sixteenth century, and many desirable varieties have been originated there.

The commercial production of grapefruit is comparatively recent, but the industry has developed rapidly. Florida now (1916) produces over 2,000,000 boxes annually as compared with 12,000 boxes in 1899. The industry is being extended in the West Indies, and also slowly in California and Arizona, where more difficulty has been experienced in securing varieties adapted to the region. At present California ships about 150,000 boxes out of the State. A hybrid form, the tangelo, recently developed from a cross between the tangerine orange and the grapefruit, is being planted to some extent. The grapefruit is more susceptible to cold than the orange and reaches its best development where frosts are not frequent or severe.

The tree is relatively free from most citrus diseases, but more susceptible than oranges or lemons to citrus canker, a very infectious disease somewhat similar in appearance to the citrus scab, which was discovered near Miami, Fla., in 1913 and has spread over a large area in southern Florida. No remedy has been found for this disease, and infected trees are being burned to check its spread.

For other diseases of grapefruit see ORANGE DISEASES, and for cultural requirements see ORANGE. For illustration see Colored Plate of CITRUS FRUITS.

GRAPE HYACINTH (so named from the flower clusters in some species resembling small clusters of grapes), *Muscari*. A genus of 40 or 50 species of bulbous-rooted, spring-blooming plants, of the lily family, nearly allied to the hyacinth, but differing in the globose or subcylindrical perianth, contracted at the mouth. The species are natives chiefly of the Mediterranean region and the warmer temperate parts of Asia. Some of them are frequent in our flower borders. The musk hyacinth (*Muscari moschatum*) has a smell of musk. *Muscari racemosum* is a somewhat doubtful native of the south of England, sparingly escaped in the United States. The common grape hyacinth (*Muscari botryoides*), a native of the Mediterranean region, has es-

caped from cultivation in various parts of the United States. It has pale-blue flowers and is extensively cultivated. Numerous varieties of this and other species are known to the horticultural trade.

GRAPE MILDEW. There are two diseases of grapes called mildews. The powdery mildew is a superficial parasite, the light-colored mycelium covering the leaves and sometimes the flower clusters. The downy mildew is a much more injurious disease, because it spots not only the leaves, but also the green grapes. It is a disease of American origin, and its most susceptible host is the wine grape, *Vitis vinifera*. For this reason the wine grape cannot be cultivated in the eastern United States, but the absence of the powdery mildew from Europe and California has made possible the development of wine vineyards in those regions. However, the disease has reached both Europe and California, fortunately after methods of control had been developed. See GRAPE.

GRAPESHOT. A number of small projectiles held together in a canvas bag or by an iron pin and a series of iron plates containing holes in which the shot rested. The shot scattered when discharged from the gun. Formerly a very effective form of projectile, but now superseded by shrapnel. See ARTILLERY; CANNISTER; ORDNANCE; PROJECTILES; SHRAPNEL.

GRAPHIC GOLD. See SYLVANITE.

GRAPHIC METHOD. The method of repre-

FIG. 1.

sending relations between magnitudes by a diagram. In arithmetic comparisons of statistics may often be represented graphically; e.g., the curve in the above figure represents the sums paid by the United States government for pensions in various years as follows (in millions of dollars): 1862, 0.8; 1863, 1; 1864, 5; 1865, 8; 1870, 29; 1880, 57; 1890, 106; 1891, 117; 1892, 139; 1893, 157; 1894, 140; 1895, 140; 1896, 138; 1897, 140; 1898, 145; 1899, 138; 1900, 138; 1901, 139; 1902, 138; 1903, 138; 1904, 141; 1905, 141; 1906, 139; 1907, 138; 1908, 153; 1909, 162; 1910, 160; 1911, 158; 1912, 154; 1913, 175.

In algebra the graphic method of representing equations may be illustrated thus: To represent the equa-

FIG. 2.

tion $y = x - 1$, x may have the values: $-1, 0, 1, 2, \dots$. In which cases y will have the values $-2, -1, 0, 1, \dots$. Plotting the corresponding values of x and y as rectangular coordinates (see COÖRDINATES), the line PQ is called the graph of the equation $y = x - 1$. Similarly the graph of the equation $2x^2 - 3y^2$

FIG. 3.

$= 10$ is as shown in Fig. 3, the corresponding values of x and y being

$$x = \pm\sqrt{5}, \pm\frac{1}{2}\sqrt{26}, \pm\sqrt{11}, \pm\frac{1}{2}\sqrt{74}, \pm\sqrt{29}, \dots$$

$$y = 0, \pm 1, \pm 2, \pm 3, \pm 4, \dots$$

GRAPHIC STATICS. Calculations on the mutual relations of forces acting upon a body, or on the relation between such (external) forces and the stresses within the body, may be solved either by arithmetic or by the methods of *graphic statics*, i.e., by drawing diagrams in which lines of measured length and definite direction represent the forces. This science is practiced extensively in the design of bridges, dams, retaining walls, and other engineering structures. Problems in graphic statics usually involve only forces in a common plane; spatial problems can be handled graphically by projecting points and forces on two coördinate planes. The two chief expedients of graphic statics are noted below.

Force Polygon. A force is represented by a line whose length represents the amount of the force to some scale (e.g., 1 inch = 1000 pounds), drawn through the point of application of the force (or through its representation on a correct scale drawing) and in the direction of the force. Two force lines which intersect have a *resultant* represented by the third side of a triangle whose other two sides are the original forces. Thus, the water pressure against the vertical face of a dam being represented by a horizontal line through the centre of pressure, and the weight of the dam by a vertical through its centre of gravity, the pressure of the dam on its foundation is found by determining the resultant: its line of action passes through the intersection of the horizontal and vertical force lines, and its amount is found by the triangle rule stated. More than two forces acting on a single point may be combined as a polygon in place of the triangle, the missing *closing side* of the polygon being the resultant. If the force polygon closes, the resultant is zero; hence the forces are in equilibrium.

Funicular Polygon. In finding the result-

ant of several forces not acting on the same point it is usually, and in the case of parallel forces always, necessary to get the location of the resultant force by a special method, based on introducing two fictitious equal forces of opposite direction having a common line of action. The force polygon is first drawn, as for forces acting on a single point; its closing side gives the amount and direction of the resultant. Then a point *pole* is chosen some distance away from the force polygon, and from it *rays* are drawn to the corners of the force polygon. Between the lines of action of the forces, lines (*strings*) are drawn parallel to the successive rays, forming a *funicular polygon* whose terminal strings, parallel to the two rays drawn to the closing side of the force polygon, intersect at a point which is in the true line of action of the resultant force.

Rotative moments, or *force couples*, may be combined like forces by the force polygon, if each moment is represented by a line parallel to its axis of rotation and of length corresponding to the amount of the moment.

Beam diagrams used in solving girder problems consist generally of areas so laid off above the drawing of the beam that the vertical height of the area from the beam is a scale representation of the amount of a particular stress function (e.g., bending moment, shear, or deflection) at that point of the beam. From the bending-moment diagram the deflection curve can be obtained by Mohr's method.

Influence lines, now much used in analyzing bridge trusses, are lines drawn above the span of the beam or truss to represent the variation of one particular effect at a given point of the structure (e.g., the stress in the end post of the truss) as a one-pound load moves across the span.

GRAPHITE, grăf'it (from Gk. γραφή, *graphē*, writing, from γράφειν, *graphein*, to write), BLACK LEAD, or PLUMBAGO. A dark steel-gray to black mineral, having a black streak, hardness of 1, and specific gravity of 2.1 to 2.3. It crystallizes in the hexagonal system and may occur in foliated form, massive, or even in hexagonal crystals, but its greasy feel, softness, and black streak enable it to be easily distinguished. While black lead is the popular name, it is misleading, for graphite is nearly pure carbon, with only 1 or 2 per cent of impurities, as can be seen from the following analyses:

ANALYSES OF GRAPHITE

	Carbon	Ash	Volatile
Ceylon.....	98.817%	.28%	.90 %
Brougham, Can.....	97.626	1.78	.594

Although widely distributed, graphite rarely occurs alone in large deposits, but is usually mixed with other minerals, so that it requires special treatment after mining to separate it from the accompanying rock. Graphite shows a varied mode of occurrence, being found as irregular nests or pockets (E. Siberia); in bedded deposits (Styria and Mexico); veins (Ceylon, some Canadian, etc.); disseminations (some New York deposits). The gangue minerals are variable. Mica and chlorite are hard to separate, and pyrite is also bad. It is usually found in crystalline metamorphic rocks, such as lime-

stones, gneisses, or schists, and especially those of pre-Cambrian age; still deposits are known to occur in the Carboniferous. It has also been found in small quantities in meteorites. Two forms of graphite are recognized, viz., the crystalline or true graphite, and the amorphous or pulverulent form. Graphite may be of organic or inorganic origin. When in igneous rocks, intercrystallized with other minerals, it is, no doubt, of igneous origin, and its occurrence in meteorites bears out the possibility of this view. Where the igneous rock is associated with carbonaceous sediments, the magma may have absorbed the carbon from these. The veinlike deposits of crystalline graphite have undoubtedly been formed in fractures, probably at considerable depth, but not necessarily at very high temperatures. Various theories have been advanced to explain these, and in the case of the Ceylon veins Weinschenk believes that the graphite is of volcanic origin, and due to the reaction between carbon dioxide and cyanogen compounds. In some limestones which have been subjected to contact metamorphism the carbonaceous matter has been changed to graphite.

Many commercially important amorphous graphite deposits were coal beds that have been converted into graphite by intrusions of igneous rock, as in Sonora, Mexico, and Turret, Colo. The disseminated deposits in quartzite, limestone, and schist may be carbonaceous sediments altered by dynamic metamorphism.

The chief commercial sources of graphite are Ceylon and Austria-Hungary, smaller amounts being produced in Bavaria, Italy, Siberia, Mexico, Japan, Canada, and the United States. The Ceylon deposits, which are worked entirely by natives, are of great extent, and masses of solid graphite weighing several hundred pounds are sometimes found. The Canadian graphite occurs in Laurentian rocks, notably in the vicinity of Brougham, and has been obtained in lumps of large size. In the United States crystalline graphite is mined near Hague, N. Y., and to a considerable extent in Chester Co., Pa. At the former locality it occurs in a bed of quartzite inclosed between gneiss. Other localities in the United States are Alabama, Wyoming, North Carolina, and Rhode Island. That obtained from the last locality and Sonora, Mexico, is amorphous graphite.

Graphite is used in the manufacture of lead pencils, lubricants, stove blacking, paint, refractory crucibles, and foundry facings. For lubricants either amorphous or crystalline graphite may be used and should be free from grit. For the manufacture of crucibles, the Ceylon flake graphite is the most valuable, for amorphous graphite is not a success. The graphite for this purpose has to be mixed with clay and sand. Recently the substitution of a mixture of graphite and grease for red lead has met with much success. Pencils cannot be made from crystalline graphite alone, and are manufactured chiefly from amorphous graphite, the bulk of the American demand being supplied by the Sonora, Mexico, deposits. Most of the graphite used in paint is of the amorphous variety. Since graphite, as it occurs in nature, is always mixed with other minerals, the material after being mined is crushed and then put through some kind of cleaning or concentration process. The separation is done either by means of water or an air current, preferably the latter.

In 1898 the manufacture of artificial graphite from coke was begun at Niagara Falls, and in the year of its discovery 200,000 pounds of carbon rods were graphitized in the electric furnaces, while in 1912 the production had risen to 12,896,347 pounds. It is said that the artificial product is fully equal to the natural material in its electrical conductivity, for use as a lubricant and in the manufacture of stove polish or lead pencils.

Although the production of graphite in the United States has been increasing almost every year, still the amount produced is far from sufficient to supply the domestic demand. The imports therefore continue to be large. In 1913 the imports were 28,879 short tons, valued at \$2,109,791. The production of the United States for 1913 was 4775 short tons of natural graphite (\$293,756) and 6817 short tons of manufactured graphite (\$973,397).

GRAPHOPHONE (from Gk. *γραφῆ*, *graphē*, writing + *φωνή*, *phōnē*, voice). A machine for recording and reproducing sound, invented by Charles S. Tainter and Chichester A. Bell. Its principle was essentially that of the phonograph (q.v.), but it differed from Edison's original instrument in substituting a wax cylinder into which the record of the sound waves was cut for the tin foil, which was merely indented by the stylus. It was the first phonograph to use a wax cylinder. With the expiration of the Tainter-Bell patents (see GRAMOPHONE) the graphophone contributed to the disk machine the use of wax for recording, and it was found that for reproduction of music and records designed for frequent repetition with exactness the disk was by many considered more suitable than the cylinder, but the graphophone equipped with the latter became singularly useful as a dictograph, where the correspondence of an office may be dictated to such a cylinder and then be reproduced by a typist who with ear tubes connected with the reproducing machine is able to transcribe the words of the speaker. The term "graphophone," however, has been rather supplanted by that of "phonograph" for cylinder machines and by "gramophone" for disk machines.

It should be stated, however, that there are modern disk machines where the record is vertical, or the path of the needle varies in depth instead of horizontally as in the gramophone. This, however, requires a feed screw for propelling either disk or sound box, as such a groove cannot guide the needle. See TALKING MACHINE.

GRAPHOTYPE (from Gk. *γραφῆ*, *graphē*, writing + *τύπος*, *typos*, type). A process once employed for producing illustrations using an

engraved or high-relief surface, from which printing could be effected on an ordinary press. It was invented by A. H. Wall. Drawings are made on a zinc plate thickly covered with finely powdered French chalk, brought to a hard, firm surface by great pressure. The picture is drawn with a camel-hair brush and an ink made of glue and lampblack. The uninked portion is then rubbed away and an electrotype made of the picture. This method was only partially successful and has been superseded by other and more modern processes.

GRAPNEL. See ANCHOR.

GRAPTIER'S CEMENTS. See CEMENT.

GRAPTOLITE, grăp'tô-lit (from Gk. γράπτός, *graptos*, written, marked + λίθος, *lithos*, stone). A class of extinct animals, allied to the hydrozoa, fossil remains of which are found in the Lower Paleozoic rocks, especially in those of Upper Cambrian, Ordovician, and Silurian age. The group derives its name from the likeness of its members to pencil markings on the rocks. They are found most abundantly in black shale formations, and they are of great importance to the geologists because of their numerous species, that follow each other in rapid evolutionary series through successively higher formations. Because of these lines of descent and the wide distribution of the species, graptolites are ideal horizon markers or index fossils in the Lower Paleozoic rocks.

The graptolites are delicate hydroid-like colonies growing from a minute embryonal polyp that was incased in a chitinous theca, or cell, called the "sicula." From this sicula grew, by budding, a series of zooids, or individuals, the form of which is still recognizable in that of their fossilized chitinous coverings, the thecae. Refined methods of isolation and decoloration of the graptolite colonies have been developed by Holm and Wiman and have enabled these observers to remove the colonies bodily from the inclosing rock and section them in a microtome after much the same methods employed in histology. In this way the structure of the graptolite colonies has been shown to be much more complicated than had been suspected. This is especially true of the first group, the Dendroidea, to which belong sessile colonies with the forms of miniature trees (*Dendrograptus*) or of woven baskets (*Dictyonema*) (q.v.). In these Dendroidea three different forms of thecae have been found, viz., thecae proper, or nourishing individuals; alternating canals, considered by Wiman as gonangia, or reproductive individuals; and gemmating, or budding, individuals. Other authors, as Frech, held the alternating canals to have been nematophores. See HYDROID.

The second group, Graptoloidea, consists of the older Dichograptidae and the younger Diplograptidae. In the former there grow, by successive forkings, from the sicula, or embryonal cell, which is centrally situated, more or less numerous branches, each of which grows distally (at its extremity) and consists of a single series of thecae proper. This family, which begins in the Upper Cambrian and does not extend beyond the Ordovician, exhibits a most remarkable evolution from irregular many-branched forms (*Ocnograptus*) to symmetrical forms with eight branches (*Dichograptus*), then to four-branched forms (*Tetragraptus*), and finally to biramous species (*Didymograptus*), with which last the family becomes extinct. An aberrant side line from this family is the genus *Phyllograptus*, in which

the four branches of *Tetragraptus* become united along their dorsal sides to form colonies with cross-shaped sections.

The younger Diplograptidae, of which the type genus is *Diplograptus*, possess a central disk which apparently was a "float," and which bore a circle of reproductive sacs (gonangia), containing siculae and numerous stipes (hydro-rhabds). The latter are biserial in *Diplograptus*, each being borne on a long stem (hydrocaule), with a sicula at its farther end, from which the cells grow backward along the stem. The latter forms hence an axis within the stipe, wherefore *Diplograptus* and its allies have been separated, as *Axonophora*, from the preceding forms (Dichograptidae) without axes, as *Axonolipa*. *Diplograptus* begins in the Middle Ordovician and extends a short distance into the Silurian. It is succeeded by forms possessing the same general structure of the colonies, but with only uniserial arrangement of the cells, the Monograptidae. These flourished in the Silurian, where their colonies attained a great variety of form. Only the genus *Dictyonema* passes with a few species into and beyond the Devonian system.

The systematic position of the graptolites is uncertain. They are usually classed with the Hydroidea, as they show a general resemblance to some of the members of that group, viz., the Sertularians. The rapid evolution of the graptolites and the different aspects of the faunules of successive beds has permitted the recognition of numerous graptolite zones in the Ordovician and Silurian rocks. In the Swedish Silurian alone 15 zones have been distinguished. Some of the graptolite zones exhibit an astonishingly wide geographical distribution: a like succession of graptolite faunas has been found in Scandinavia, Great Britain, France, North America, and Australia. This extensive distribution, which gives the graptolites great importance for the correlation of geographically widely separated Paleozoic formations, is due to their having been pelagic animals, which were either free-floating or fastened to seaweeds floating in the open ocean. They are in sharp contrast to the great majority of the fossils, corals, mollusks, and crustaceans, which were littoral animals, living in the shallow waters near the shore. For this reason the graptolites are nearly always found separated from other fossils, in a facies or peculiar rock phase of their own, the graptolite shales, mostly dark gray and black carbonaceous shales, upon the bedding planes of which they are crowded in immense numbers.

GRAS, grà, BASILE (1836-1901). A distinguished French military officer and inventor. He was born at Saint-Amans de Pellaga (Department of Tarn-et-Garonne) and was educated at the Ecole Polytechnique and the Ecole d'Application at Metz. His *fusil modèle* (or "Gras rifle"), as it was universally known, was adopted by the French government, and in 1874 the infantry troops were armed with it. It was subsequently displaced by the discovery and introduction of the magazine principle, the Lebel rifle taking its place in the French army. Gras became a professor at the School of Gunnery at Châlons and was appointed a permanent member of the government commission on firearms at that place. In 1888 he was appointed general inspector of the manufacture of small arms, receiving also the rank of general of division. He was a recognized authority in gunnery and small arms and was the author of many important papers and treatises in service magazines.

GRAS, FÉLIX (1844-1901). A writer of the modern Provençal language. He was born at Malemort, Vacluse, May 3, 1844. After completing his studies at Béziers, he settled in Avignon, where he was for many years a justice of the peace. It was also in this city that he became associated with the founders of the modern Provençal revival. Joseph Roumanille, the so-called father of the Félibrige, was his brother-in-law. He expressed his Republican sentiments in a kind of operatic piece, *La Carmagnole*, the performances of which were stopped by the authorities. His first verses in Provençal appeared in the *Armana Prouvengau* (Provençal Annual), in 1867. In 1876 he published *Li Carbounié*, a narrative poem in 12 cantos, and six years later *Tolosa*, a more successful poem, also in 12 cantos, treating of the Albigenian crusade. His best work in poetry is the *Roman-cero Provençal*, a collection of songs and short pieces. A volume of stories called *Li Papalino*, treating of the days of the popes in Avignon, appeared in 1891. All these writings were published in Provençal with a French translation. In 1891 he succeeded Roumanille as *Capoulié* (chief) of the Félibrige, which position he held until his death. In 1898 appeared his historic novel *The Reds of the Midi*. Singularly enough, it was first published in New York, in the English translation of Mrs. Catharine Janvier. A year later he wrote *The Terror* and *The White Terror*, a sequel to *The Reds of the Midi*; these were published in Provençal, French, and English, the English version being made by Mrs. Janvier. Consult Des Essarts, *Poètes Contemporains: le félibre Félix Gras* (Clermont-Ferrand, 1900). See FÉLIBRIGE.

GRASBERGER, gräs'bér-gér, LORENZ (1830-1903). A German classical philologist, born at Hartpennig. He was appointed a professor at the University of Würzburg in 1867. His most important works are a comprehensive history of education in antiquity, *Erziehung und Unterricht im klassischen Altertum* (1864-81), and *Studien*

zu den griechischen Ortsnamen (Würzburg, 1888).

GRASHOF, gräs'hóf, FRANZ (1826-93). A German engineer, born at Düsseldorf and educated at the Industrial School in Berlin. In 1852 he became an instructor and in 1863 professor of applied mechanics, at the Polytechnical School, Karlsruhe, and director of the department of machine construction in that institution. For more than 35 years he was president of the Society of German Engineers, which society upon his death erected a monument to his memory at Karlsruhe. Besides numerous contributions to periodicals and editions of Redtenbacher's *Resultate für den Maschinenbau* (1870 and 1875), he wrote the independent works entitled *Theorie der Elasticität und Festigkeit mit Bezug auf ihre Anwendungen in der Technik* (2d ed., 1878) and *Theoretische Maschinenlehre* (in three parts, 1875, 1883, 1890).

GRASLITZ, gräs'lits (Bohemian *Kraslice*). One of the most important manufacturing towns of Bohemia, situated on the Zwdau, 20 miles north of Eger (Map: Austria-Hungary, C 1). It has a school for teaching the making of musical instruments and a museum. Noteworthy among its many manufactures are musical instruments, embroidery, lace, linens, ready-made articles of dress, toys, and mother-of-pearl buttons. In the neighborhood are copper mines. Pop. (town), 1890, 10,009; 1900, 11,803; 1910, 13,825 (district), 1900, 33,333; 1910, 39,216.

GRASMERE, gräs'mér. A village near a lake of the same name in Westmoreland, England, 4 miles northwest of Ambleside. It is famous as a favorite residence of the Lake school of poets (Map: England, C 2). Pop., 1901, 781; 1911, 876. The village, picturesquely situated at the head of the lake, contains the ancient church of the *Excursion*, and in the churchyard are the graves of Wordsworth and Hartley Coleridge. The lake, oval in form, with its "one green island," is $1\frac{1}{4}$ miles long, $\frac{1}{2}$ mile broad, and 130 feet deep. It is girdled by high mountains and forms one of the most beautiful scenes in England, nearly every point of which is celebrated in Wordsworth's poetry.

GRASS. See GRAMINEÆ; GRASSES.

GRASS (AS. *gras*, Goth., OHG. *gras*, Ger. *Gras*; ultimately connected with Eng. *green*, *grow*, and with Lat. *gramen*, Gk. *χορρός*, *chorros*, grass). The herbage or vesture of the soil (*vestura terra*). It is a part of the soil or land in which it grows and passes, like standing trees and houses, with the freehold. It may be cut by a tenant for life or years without impeachment of waste, but it does not come under the description of an emblement (see EMBLEMENTS), not being an annual crop which a tenant at will may, after the termination of his lease, gather as the fruit of his labor. The right to take grass from another's land, either by entering, cutting and removing it, or by pasturing one's cattle thereon, is an incorporeal property right of the kind known as a *profit à prendre* and as such may be alienated by the person entitled thereto. See also COMMON; INCORPOREAL; HEREDITAMENT; PASTURE; PROFIT.

GRASS BASS. See CALICO BASS.

GRASS CLOTH. A name often, although erroneously, given to certain beautiful fabrics manufactured in the East from different kinds of fibres, none of which are produced by grasses. One of these fabrics is made from the fibre of *Bahmeria nivea*, popularly called *ramie* (q.v.),

or China grass; another, also known as *piña muslin*, from the fibre of *Bromelia pigna* (*pinguin*). (See *BEHMERIA*; *BROMELLACEÆ*.) The kinds of cloth really made from the fibre of grasses are extremely coarse.

GRASSE, gràs. The capital of an arrondissement in the Department of Alpes-Maritimes, France, 18 miles west of Nice, and overlooking the Mediterranean, 8 miles distant (Map: France, S., L 5). It is picturesquely situated, and on account of its mild climate a much frequented winter resort. Public buildings of historic and artistic interest are the hospital chapel, with its paintings by Rubens, the parish church, an ancient cathedral, dating from the twelfth and thirteenth centuries, the city hall, a former bishop's palace, and a library of 18,000 volumes. Grasse is one of the largest perfume and essence manufacturing centres of France, and about 60,000 acres in its vicinity are covered with flower gardens. The annual yield is 3,300,000 pounds of roses and 4,400,000 pounds of orange flowers. Considerable quantities of essence of flowers are exported to Cologne and other places. It has also marble quarries and manufactures oil and conserves. The town dates from its settlement by Sardinian Jews in the sixth century. Pop. (commune), 1901, 15,429; 1911, 19,704.

GRASSE, gràs, EDWIN (1884-). An American violinist, born in New York City. Although he had lost his eyesight in infancy, he took up the study of the violin, under Carl Hauser of New York until 1898 and then under Cesar Thomson at Brussels, Belgium. He won the first prize of the Royal Conservatory, Brussels, in 1900. In 1902 he made his début at Berlin, where he gained immediate success, and afterward he appeared in the principal cities of Europe and America. As a composer, he made himself known through a symphony, a suite for orchestra, a violin concerto, and some chamber music.

GRASSE, gràs, FRANÇOIS JOSEPH PAUL, MARQUIS DE GRASSE-TILLY, COUNT DE (1722-88). A French admiral, who commanded the French fleet at the siege of Yorktown during the American Revolution. He was born at Bar in Provence and began his naval career at 15 in the service of the Knights of Malta and served against the Turks. Entering the French navy in 1740, he was promoted to be a lieutenant in 1754 and a captain in 1762. He distinguished himself at Tobago (1781). In this year, with the rank of admiral, he was placed in command of the new French fleet sent to America, which was intended both to reinforce the French in the West Indian waters and to cooperate with Rochambeau on the North American continent. After touching first in the West Indies, the fleet of 29 sail reached Chesapeake Bay on August 30, where De Grasse blockaded the James and York rivers, and on September 5 repulsed an attack of the English fleet under Graves. After rendering invaluable assistance at the siege of Yorktown (q.v.) by preventing the British fleet from relieving Cornwallis and thus permitting him to escape, he sailed away to the West Indies again, where his operations for some time were crowned with great success. Finally, off Santo Domingo, on April 12, 1782, he met the English fleet under Rodney, who signally defeated him and carried him a prisoner to London. Charges of incapacity and even treason were brought against him, and

although after a thorough examination he was exonerated by the Council of War, he never again held a naval command. He wrote in his own defense a *Mémoire justificatif* (1782). Consult: *The Operations of the French Fleet under De Grasse in 1781-82*, in "Bradford Club Series," No. 3 (New York, 1864); *Magazine of American History*, vol. vi (ib., 1811); Winsor, *Narrative and Critical History of America*, vol. iv (London, 1886-89).

GRASSERIE, gràs'rê' (Fr.). A disease of silkworms, not contagious and not hereditary and apparently produced by a lowering of the temperature of the rearing room. Affected worms crawl slowly and have a stretched, thin skin. A liquid exudes through the skin, soiling the food and the neighboring worms. Proper regulation of the temperature is the remedy. See *SILKWORM*.

GRASSES (*Gramineæ*). A family of plants, which contains more than 350 genera and 4700 species. Its members vary in size from moss-like specimens less than an inch in height to gigantic bamboos 100 feet or more tall. They are distributed over nearly the whole world: some are characteristic of the hottest tropical regions, others of the far north and south, in the vicinity of almost perpetual snows. In number of specimens they are most abundant in the north temperate zone, where they clothe with verdure immense tracts of prairie, meadow, and steppe, and may be found growing or may be made to grow on almost every kind of soil. Some species are peculiar to dry, sterile soils; others will flourish only in rich soils with abundant moisture. Some grow in marshes, stagnant water, or slow streams, and others only along the seacoast. None are truly marine. Some are annual, others perennial. The roots of all grasses are fibrous. Many have more or less thickened underground rootstocks or rhizomes, which are not true roots; but modified stems, from which roots are sent out and from which new plants may arise under conditions favorable to propagation. The stems, which usually branch more or less at their bases, are round or slightly flattened, jointed, and hollow between the joints except in maize, sorghum, and a few other species. The parts of the stem between the joints, or nodes, are called the internodes. The stem elongates by growth at the base of the internodes. From the nodes, or joints, arise the leaves and branches. In some grasses roots are put out from the joints when near or lying upon the ground. If a stem is bent or broken so as to lie upon the ground, growth at once begins in the lower side of the stem and is rapidly continued until the stem again assumes an upright position. In most grasses the stems are herbaceous; in the bamboos and some other species they are woody. The leaves consist of two parts, the sheath and the blade. The sheath, which is split on the opposite side from the blade, invests the stem and protects the lower growing portion of the internode. At the top of the sheath is usually found a thin membranous prolongation, called the ligule. The leaf blade is usually long and narrow, with nearly parallel longitudinal veins.

Many grasses are provided with peculiar adaptations to protect them against drought and hot winds. Between the veins on one side or the other are large, thin-walled cells that keep the leaf expanded when normal conditions are pres-

ent. When dried by hot winds, they collapse and cause the leaf to roll its margins inward, thus protecting it against too great evaporation. When rain comes, the cells swell out and cause

PAMPAS GRASS.

the leaf to return to its normal shape. The position of the leaves upon the stem in grasses is opposite and two-ranked—a character by which grasses may be distinguished from sedges, which have three-ranked leaves. Lawn and meadow grasses have leaves that grow constantly from their bases, so that when cut they quickly elongate instead of remaining in the shorn condition. Grass flowers possess only the essential organs, i.e., stamens and pistils; the scales and bracts surrounding them are reduced and modified leaves. The flowers of some grasses have both stamens and pistils; others have the staminate and pistillate flowers upon different parts of the plant, as in the case of maize, in which the tassel consists of staminate flowers and the silk of the ears of the pistillate flowers. Still others have them upon different individuals. The usual number of stamens in the flower is three, but the number varies from one to six, and in some genera they may be from 20 to 30. The anthers, which are usually conspicuous, are generally attached by the middle of their backs to the slender filaments, so that they

BUFFALO GRASS.

sway in the winds. The pistils consist of the ovary and usually two plumose stigmas, which may be sessile or raised upon styles. The ovary contains a single ovule, which ripens with the

ovary wall, or pericarp, into a true caryopsis. The flowers are arranged in spikelets, which contain one or more flowers. At the base of each flower is a bract, or reduced leaf, called the flowering glume, and at the base of each spikelet are commonly found two empty glumes. The axis, or stem that carries the glumes, is called the rachilla. Between the rachilla and the individual flower there is a small, nerved, membranaceous bract called the palea, or palet. The glumes, which vary exceedingly in different species, may have awns (bristle-like appendages, as the "beard" of wheat) or may be sharp-pointed or rounded, entire or toothed, at their apexes.

All of these characters are of importance in determining the species of grasses. The arrangement of the spikelets in the head, as it is often improperly called, is varied. They may be sessile along the axis, as in wheat, forming a spike; they may all be arranged on one side of the axis, or rachis, forming a raceme, or the rachis may branch widely into a panicle, as in oats, blue grass, etc., and there are many intermediate forms between these. According to their most common uses grasses may be divided into lawn, pasture, and hay grasses. Among the more common grasses suited to lawns are blue grass, Rhode Island bent grass, redtop, Bermuda grass, St. Augustine grass, and buffalo grass. Pasture grasses include redtop, blue grass, bent grass, fescue, orchard grass, brome grass, Bermuda grass, grama grass, rye grass, blue stem, and mesquit. Hay grasses include timothy, orchard grass, redtop, blue grass, brome grass, Johnson grass, tall oat grass, meadow fescue, meadow foxtail, rye grass, Guinea grass, crab grass, crested dog's tail, etc. In addition many grasses are especially suited to binding sands and embankments. Grass seed as usually obtained consists of the grain, with more or less chaff closely enveloping it. The seed proper consists of a small embryo, which lies at the base and nearly outside of the starchy endosperm, and the endosperm with its adhering pericarp. Upon the nature of the endosperm depends the great importance of some of the grasses in supplying various food grains to man.

FEEDING VALUE OF GRASSES

Grasses of many kinds are used for pasturage, for soiling, and for hay. They constitute a very important group of feeding stuff for all farm animals. The feeding value of grasses commonly used for forage is shown by the average percentage composition of the following kinds: *Kentucky blue grass* contains: water, 65.1 per cent; protein, 4.1 per cent; fat, 1.3 per cent; nitrogen-free extract, 17.6 per cent; crude fibre, 9.1 per cent; ash, 2.8 per cent. *Fescue* contains: water 69.9 per cent; protein, 2.4 per cent; fat, 0.8 per cent; nitrogen-free extract, 14.3 per cent; crude fibre, 10.8 per cent; ash, 1.8 per cent. *Timothy* (a hay grass) contains: water, 61.6 per cent; protein, 3.1 per cent; fat, 1.2 per cent; nitrogen-free extract, 20.2 per cent; crude fibre, 11.8 per cent; ash, 2.1 per cent. It will be seen that the three examples selected do not differ markedly in composition, and other grasses resemble them more or less closely.

Experiment has shown that about 64 per cent of the total dry matter, 48 per cent of the protein, 66 per cent of the nitrogen-free extract, and 56 per cent of the crude fibre of timothy is digested.

GRASSES

1. TIMOTHY
2. SWEET VERNAL

5. ROUGH LEAVED GRASS

3. KENTUCKY BLUE GRASS
4. GRAMA GRASS

Similar results have been obtained with other grasses. It may therefore be said that, judged by palatability, composition, and digestibility, grass fully deserves the high opinion in which it is held as a green fodder.

Like most green feeds, grasses have a high water content. Their feeding value depends largely upon the carbohydrates present (both nitrogen-free extract and crude fibre), though they also furnish an appreciable amount of protein. Like other succulent feeds, grasses have a value other than that derived from their composition; viz., they stimulate the appetite. The improvement often observed in the appearance of cattle when turned out to pasture in the spring is probably due in large measure to the fact that the appetite is increased by the succulent and agreeable flavor of the green feed, and thus the total amount of nutritive material consumed in a day is greater than when they are fed dry feeding stuffs. If pasturage is abundant, cattle and sheep will not need other feed. If such is not the case, owing to drought or other causes, pasturage should be supplemented by other feeds. Generally speaking, grass increases in nutritive value until the seed is nearly ripe; i.e., the plant continues to elaborate nutritive material until it has perfected its seeds. The plant then "ripens"; i.e., it ceases to form new nutritive material and by the action of rain, dew, sunlight, etc., loses more or less of that already formed. There may also be transfer of nutritive material from the stalks to the root. Some grasses, such as Bermuda grass, continue to grow throughout the season. Other grasses, e.g., buffalo grass, cure in their natural habitat without appreciable loss of nutritive material. Most pasture, lawn, and hay grasses make new growth if cut or eaten off by stock. See PASTURE, PASTURAGE; SOILING, SOILING CROPS.

Y., 1912).

GRASS FINCH. One of the most widespread and familiar sparrows of North America (*Poæetes gramineus*). It lives in the fields and grassy opens, making its nest between the grass stems and feeding upon seeds and insects. Its

habit of singing pleasantly in the early evening led Wilson Flagg to bestow upon it the name "vesper sparrow." It had earlier been known as the "bay-winged bunting" on account of the rufous wing coverts. It may be recognized among its brown and streaked congeners by the white outer feathers of its tail displayed in flight. See GRASSQUIT; and Plate of SPARROWS.

GRASS FROG. The common European brown frog (*Rana temporaria*), which is highly variable in color and possesses great power of color adaptation (metachrosis). It is essentially terrestrial in habits and manifests many very interesting traits. Its range is extensive, covering all central Europe and Asia to Japan, and rising to the height of 10,000 feet in the Italian Alps. It may become a most interesting and intelligent pet in captivity. "Next to man," says Gadow, "there is no animal which has been studied so minutely, and has had so many primers and textbooks written upon it: in spite of all this, it is very little understood, thanks to its rather aberrant and far from generalized structure." One of the best and most easily accessible memoirs is Mivart's *The Common Frog*, a volume of the "Nature Series" (New York, 1874). The best account of habits, etc., is by Gadow, *Amphibia and Reptiles* (London and New York, 1902). See FROG.

GRASSHOPPER. A popular term applied to certain orthopterous insects of the families Acridiidae and Locustidae. The English (including the English colonists) call the Acridiidae "locusts," and the Locustidae "grasshoppers." Americans use the term "grasshopper" for both—the Acridiidae including the short-horned grasshopper, and the Locustidae the long-horned grasshoppers. The common grasshoppers of the fields, which are rather stout-bodied, with large hind thighs and strong powers of flight, belong to the Acridiidae. They are frequently very destructive to crops; the Rocky Mountain grasshopper (*Melanoplus spretus*) damaged the grain crops of Colorado, Nebraska, and neighboring States in the years 1874 to 1876 to an extent of hundreds of millions of dollars and reduced thousands of families almost to starvation.

GRASSHOPPER.

A female red-legged grasshopper depositing her eggs in the ground.

Allied species have done similar damage in the Argentine Republic, in South Africa, and in Algeria in recent years, and in southeastern Europe in former times. The best remedial measures in use at present consist in late fall plowing, to break up the egg clusters; in dragging specially constructed coal-oil pans through

the fields to collect the young grasshoppers; and in poisoning the insects by means of a bait consisting of moistened bran and arsenic.

The commonest species in the eastern United States is the red-legged grasshopper (*Melanoplus femur-rubrum*), which quite closely resembles the destructive Western species, but which has shorter wings. Its eggs are laid in the autumn in a compact pod beneath the surface of the ground, and the young, which are hatched in the spring, molt four or five times and reach the full-grown winged condition in late July or August. Some of the eggs in the North may hatch in the autumn, showing a tendency towards a second generation, which probably develops in the southern part of the range of this insect. The red-legged grasshopper sometimes occurs in such great numbers as seriously to damage pasture lands in the restricted localities. See LOCUST.

The long-horned grasshoppers (family Locustidae) include those slender green forms with long antennae called the "meadow grasshoppers," and the interesting group ordinarily called "katydids" (see KATYDID), as well as the dark-colored wingless forms found under stones and in the woods and in caves and which are known as the "cricket-like" grasshoppers, or "cave crickets." Another group belonging to this family contains certain hard-bodied insects of strange appearance, known as the "shield-backed" grasshoppers, "Western crickets," or "sand crickets." One of the latter, belonging to the genus *Stenopelmatus*, is in the West supposed to be poisonous, although, as a matter of fact, it is perfectly harmless.

Fossil grasshoppers of the family Acridiidae are known in fragmentary condition from rocks of as early age as the Lias of Switzerland and the Oolite of England, and members of the family Locustidae have been found sparingly in the Jurassic limestones of Solenhofen, Bavaria. Several species of each family are known from the Tertiary rocks of North America and Europe, but none of either have been found in the amber. Nearly all the more important subdivisions of the two families mentioned are included among the Tertiary fossils. See ORTHOPTERA.

See also the bibliography under ORTHOPTERA.

GRASSHOPPER LARK. See GRASSHOPPER WARBLER.

GRASSHOPPER SPARROW. Any of two or three of the smaller American sparrows which live in grassy fields, and whose rattling notes resemble those of a locust or a "grasshopper." The commonest one is the yellow-winged sparrow (*Ammodramus savannarum australis*), which is about 5 inches long, pale brown and streaked in color, with the front edge of the wing conspicuously yellow, and which conceals

itself most of the time in the field and roadside herbage. See SPARROW.

GRASSHOPPER WARBLER. A European warbler (*Locustella naevia*), common in Great Britain. It haunts the reedy banks of streams, where it conceals itself and its nest with great skill among the herbage. Its notes are almost the same as those of a locust. It appears erroneously in many books as "grasshopper lark," but is of the family Sylviidae and not at all related to the larks. Consult Howard, *The British Warblers* (London, 1907-14).

GRASSI, gràs'sé, BATTISTA (1855-). An Italian zoölogist. He was educated at Como and at the University of Pavia, and became professor of comparative anatomy at the University of Rome, and director of the Institute of Comparative Anatomy. He was made a senator of the Kingdom of Italy. Several years were devoted by him to the bionomics and life history of the white ants (Termitidae). He discovered (1893-96) that the young are all born alike, and that the differences between the workers, etc., when heredity or selection does not operate, result from differences in the food. He also proved that an individual can by change of food be made into a soldier after it has visibly undergone one-half or more of its development into a winged sexual form. He, with Calanduccio, proved in 1887-96, what had already been suspected in 1864 by Gill, that a minute fish, *Leptocephalus*, is the larva of the eel, and that females of eels can mature only in depths of at least 500 meters. For these discoveries he was elected a foreign member of the Royal Society of London. His researches, made in 1898-1900, on the sporozoon malarial parasite of the mosquito (see SPOROZOA) are of great scientific and practical value. He independently proved that the mosquito (*Anopheles*) transmits malaria, and that, by the use of wire gauze as a covering for windows, doors, and chimneys of houses, the worst malarial regions of Italy can be rendered as healthy as any other part of the country. He also proved the transmission of filariae of the blood by the same *Anopheles* (*Anopheles claviger*), which is the host of this microparasitic worm. His publications are devoted to a discussion of his researches.

GRASSLANDS. One of the three great climatic landscape types—deserts, forests, grasslands—into which Schimper, in his work on plant geography, divides the world. It is not yet clearly known what determines the presence of trees or of grasses in a given locality. Schimper, perhaps, has the most tenable hypothesis for the origin of grasslands, viz., that they occur in regions where dry winter winds preclude the presence of forests. Since grasses are shallow-rooted, they do not require a moist subsoil, such as trees do, and since they are of low stature, they are protected from the desiccating influence of wind. The greatest development of grasslands is in the temperate zone and commonly in continental interiors. Ecologically speaking, the pure climatic grasslands of the world are essentially similar, though the species found in them vary with the country. In different lands, as is well known, they have various names, of which those that have come to be of most importance to students of phytogeography are prairie, steppe (qq.v.), and pampas. One speaks of the pampas of Argentina, the prairies of North America, and the steppes of Europe and Asia. In all these, however, the

general life conditions are similar, and there is no essential reason for more than one title. A type of formation which differs essentially from that just described is the savanna (q.v.), which is intermediate between forest and grassland and is located in a transitional climate. Many of the llanos and campos of northern South America are true savannas, while others are essentially grasslands. In general, savannas are as characteristic of tropical regions as pure grasslands are of temperate. Again, there are edaphic grasslands, e.g., river meadows and swamps of lake origin. Through the influence of man many artificial grasslands are to be found, e.g., pastures and most meadows. Perhaps edaphic river savannas are to be classed here also. See DISTRIBUTION OF PLANTS.

GRASSMANN, gräs'mán, HERMANN GÜNTHER (1809-77). A German mathematician and Sanskrit scholar, born at Stettin. He was a son of JUSTUS GÜNTHER GRASSMANN (died 1852 at Stettin), who was well known for his work in crystallography. The young Grassmann devoted his attention at first to theology and philosophy, which he began studying in Berlin in 1827. He then turned his energies to mathematics, which he taught successively at the industrial school in Berlin, at the Ottoschule in Stettin, and at the Stettin Gymnasium. He is known chiefly for his work *Die Wissenschaft der extensiven Größen oder die Ausdehnungslehre* (1844 and later editions). The obscure style of this treatise was such as to cause the first edition to pass practically unnoticed, and it was not until the theory of quaternions (q.v.) began to be recognized that Grassmann's allied theory attracted attention. In later life he took up the study of Sanskrit and published a *Wörterbuch zum Rigveda* (Leipzig, 1875), which is a remarkable example of a combined dictionary and concordance and is still indispensable to all Sanskrit scholars, and an *Uebersetzung des Rigveda* (2 vols., 1876-77), which is based on the principles of the so-called linguistic school of Vedic interpretation and is likewise a work of much value. Grassmann was also the discoverer of one of the most important laws of comparative linguistics, which is still known as Grassmann's law (q.v.). His other works include the following: "Neue Theorie der Elektrodynamik" (Poggendorff's *Annalen*, vol. lxiv); "Theorie der Farbenmischung" (same journal, vol. lxxxix); *Geometrische Analyse, geknüpft an die von Leibniz erfundene geometrische Charakteristik* (1847); *Lehrbuch der Arithmetik für höhere Lehranstalten* (Berlin, 1861); *Lehrbuch der Arithmetik und Trigonometrie* (1861-65). A collection of his works on mathematics and physics was published at Leipzig in 1894. Consult Schlegel, *H. Grassmann, sein Leben und seine Werke* (Leipzig, 1878).

GRASSMANN, ROBERT (1815-1901). A German mathematician, brother of Hermann Grassmann. He was born at Stettin. After devoting himself to the profession of teaching in 1841-48, he went into journalism and became editor of the *Stettiner* and the *Pommersche Zeitung*. His researches, especially those on the theory of arithmetic, are important and reveal considerable originality. He also wrote a number of works on special sciences, including: *Die Formenlehre oder Mathematik* (1872); *Die Weltwissenschaft oder Physik* (2 vols., 1862-72); *Die Lebenslehre oder Biologie* (1872); *Die Wissenschaftslehre oder Philosophie* (1876); *Das Weltleben oder die Metaphysik* (1881); *Das*

Pflanzenleben (1882); *Das Gebäude des Wissens* (10 vols., 1882-90).

GRASSMANN'S LAW. A phonetic law, formulated by Hermann Grassmann (q.v.) in 1863, regarding the aspirated mutes or explosives of the Indo-Germanic consonant system. This law he defined thus: If an Indo-Germanic root had originally two aspirated mutes, only one aspirate was retained in Indo-Iranian and in Greek. There seems to be no law as to which aspirated mute shall be retained. Examples of the phenomenon explained by the law are very numerous. Thus there may be cited Skt. *kumbha*, Gk. *κύβος*: Av. *xumba*, pot; Skt. *gabhasi*, arm; Lat. *habere*, to have; Lat. *pingere*, to form; Goth. *deigan*, to knead; Skt. *dāhu*: Gk. *πῆχυς*, arm; Skt. *dadhna*, Gk. *πυθμήν*: Lat. *fundus*, bottom; Skt. *sahatē*, Gk. *ἔξω* for Gk. **ἔκ-σεν*: *ἔξω*, to have; Gk. *θρήξ*: pl. *τρήξες*, hair; Skt. *dulītar*: Gk. *θυγατήρ*, Goth. *daūhtar*, daughter; and many others. The law appears very clearly in the reduplication of Sanskrit and Greek verbs which have an initial aspirate mute. Thus, Skt. *chandati*, pleases: perfect *cachanda*; Skt. *bhavati*, Gk. *φύει*, becomes: perfect *babhūca*, *πέφυκα*; Skt. *dhujati*, Gk. *φεύγει*, bends, flees: perfect *bubhōja*, *πέφeyγα*; and the like. By the operation of onomatopoeia, inflection, assimilation, and so forth, many words violate the principle involved in Grassmann's law, as Skt. *jharjāra*, drum, *kumbhābhis*, with pots, Gk. *λιθωθήνα*, to be stoned, *θρήξ*, aunt, besides the literary *τρήξ*. The Sanskrit grammarians were already familiar with this principle, and the Greek scholar Buttman (q.v.) also had made such explanations as *τρέφειν*, *θρέψεν*, from **θρεφ-*, before Grassmann, who, however, by his exact enunciation of the law, is rightly accredited with the full discovery of the principle. See PHONETIC LAW.

GRASS MOTH. A family (Crambidae) of small moths, of which the species are numerous, inhabiting pastures, where they are often seen to rise in great numbers when disturbed and soon to settle again on the blades of grass. Their form, when their wings are closed, is long and narrow, pointed at the head, abruptly cut off at the opposite end. They are often brown and white, sometimes silvery and golden.

GRASS OIL, LEMON GRASS OIL, better known as CITRONELLA. A pale yellow to greenish aromatic oil of the terpene class, distilled from various fresh grasses, such as *Andropogon nardus*, *Cymbopogon nardus*, etc., which are extensively cultivated in Ceylon, Java, and the Straits Settlements. The plants yield from 0.5 to 1 per cent of oil. Citronella has a specific gravity varying from 0.885 to 0.910; a rotation of 0 to -21 degrees, and a refractive index of 1.465 to 1.482. The oil consists largely of citronellal and geraniol, with smaller proportions of camphene, dipentene, and limonene, besides traces of borneol, methyl eugenol, etc. The composition for the standard varieties of citronella has been given as follows:

	Java oil	Ceylon oil
Geraniol.....	26-44%	27-39%
Citronellal.....	23-50%	5-10%

(Schimmel's Report, Leipzig, April, 1914.)

The lemon-like odor is due to the aldehyde citronellal. Of late years Ceylon citronella has been adulterated with Russian petroleum up to

15 per cent. At one time it was claimed that this falsification could be detected by the solubility test with 80 per cent ethyl alcohol, but later experiments show the test to be unreliable, and it is being largely replaced by the acetyl value. Citronella is extensively used in perfuming low-priced soaps and is much depended upon by manufacturers to overcome the disagreeable odor of rosin in household laundry soaps. As an adulterant of high-priced perfumery oils, e.g., verberna, its use is too extensive.

GRASS OWL. A typical owl (*Strix candida*) of India and eastward, resembling the barn owl and almost invariably found in long grass.

GRASS PARRAKEET. See PARRAKEET.

GRASS PICKEREL. The common small pike (*Lucius reticulatus*) of the eastern United States. See PICKEREL.

GRASS'QUIT' (from *grass* + *quit*, apparently imitative of the note). A diminutive finch or seed eater (q.v.) of the genus *Sporophila* (or some closely allied genus), abundant in the warmer parts of America and in the West Indies. The grassquits are only about 4 inches long, and are not bright-colored, black, white, olive, and gray being the predominant shades. They feed on seeds and have very little power of song. But they are interesting and sociable little birds and are frequent around houses. They build large domed nests, and lay five or six speckled eggs. They are also called pygmy finches and grass finches.

GRASS SNAKE (so called from its home).

1. One of the garter snakes (see GARTER SNAKE). The name especially of the unstriped greenish-brown variety of *Eutania sirtalis*. This is usually taken as the typical form and divided into four or more subspecies. The typical yellow and black longitudinal stripes are nearly or quite wanting; but three series of small, square, dark blotches run along each side. The abdomen is greenish white, with black spots near each end of the abdominal scales. The green snake is sometimes called grass snake.

2. The common European species of water snake, so called in Great Britain, where it is the only serpent except the adder. See WATER SNAKE.

GRASS SNIPE. A name among American gunners for several shore birds frequenting grassy places, most commonly perhaps for the pectoral sandpiper, or jack snipe (*Tringa*, or *Pisobia*, *maculata*). See SANDPIPER; PECTORAL SANDPIPER; JACK SNIPE.

GRASS SPONGE. A commercial name for several North Indian sponges (allied to the sheep's-wool and velvet sponges), which grow upon hard bottoms among the eel grass and are marked outwardly by vertical ridges. One is *Spongia graminea*; another, *Spongia equina*, exhibits a puzzling number of varieties. All of the grass sponges are of inferior quality.

GRASS STAGGERS. Cerebro-spinal meningitis. See MENINGITIS.

GRASS TREE (so called from the grasslike foliage), *Xanthorrhoea*. A genus of the family Liliaceae, natives of Australia, Tasmania, and New Zealand, which constitute a very peculiar feature in the vegetation of that part of the world. There are about a dozen species, of which the widest known are *Xanthorrhoea arborea*, *Xanthorrhoea pumilo*, *Xanthorrhoea tateana*, and *Xanthorrhoea hastilis*. They have upright stems, which bear tufts of long narrow foliage at the summit, somewhat resembling

small yuccas; a long cylindrical spike of densely aggregated flowers surmounts the centre of the tuft of leaves. The base of the inner leaves of some species is edible, and forms, particularly when roasted, an agreeable article of food. The centres contain as much as 5 per cent of sugar, which has been utilized to some extent. All the species abound in a resinous juice, which on exposure to air hardens into a reddish-yellow, inodorous substance, with a shining fracture, soluble in alcohol, and useful as a tonic in dysentery, diarrhoea, and other intestinal maladies; used also by the natives of Australia for uniting the edges of wounds, and with a clayey earth for caulking their canoes, and as a cement for various purposes. This substance, usually called grass-tree gum, burns brightly and has been used for candles. If treated with nitric acid, it is almost completely transformed into picric acid, and it was thus employed before the process of making picric from carboic acid had been discovered. Grass-tree gum has also been used for making varnishes. The common grass tree (*Xanthorrhoea hastilis*), also called "black boys" in Australia, has a stem about 4 feet high, but sometimes a foot in diameter. It is of very slow growth and is supposed to be several centuries old when it has reached such dimensions. Several species are found growing between the coastal ranges and the sea in eastern, southern, and southwestern Australia.

GRASS-TREE GUM. See GRASS TREE.

GRASS VALLEY. A city in Nevada Co., Cal., 65 miles by rail north by east of Sacramento, on the Nevada County Narrow Gauge Railroad (Map: California, D 3). It has a public high school, library, Mount St. Mary's Academy, and Grass Valley and St. Patrick's orphan asylums. The city is in the richest gold-quartz-mining region of California and has extensive fruit-growing and mining interests and quartz mills. Grass Valley was settled in 1849 and incorporated in 1861. It owns its water works. Pop., 1900, 4719; 1910, 4520.

GRASS WARBLER. One of the small insect-eating birds of the genus *Cisticola*, most of the species of which inhabit Africa. These birds resemble finches in their ground-keeping habits and metallic notes, from which they receive the name "pinc-pinc." The group is allied to the tailor birds, and all the species build remarkable nests. See FANTAIL.

GRASS WORM. A common insect of the southern United States, which injures the grasses and small grains. It is the larva of a noctuid

GRASS WORM.

moth (*Lophygma frugiperda*) and is therefore allied to the cutworms (q.v.). It frequently occurs in enormous numbers and marches in armies, from which habit it is sometimes called the Southern army worm in contradistinction to the Northern army worm (*Leucania unipuncta*). See ARMY WORM.

GRATE (from ML. *grata*, variant of *crata*, grating, crate, from Lat. *cratis*, hurdle; connected with Gk. *κάρη*, *kyrtē*, fishing basket, Skt. *kart*, to spin). The iron bars constituting the floor of a fire box or furnace, on which the fuel rests, and through which it receives its supply of oxygen for combustion. The iron cage which holds fuel, especially coal, in a fireplace is also called a grate. See FURNACE; STOKER, AUTOMATIC; BOILER.

GRATEFUL SERVANT, THE. A comedy by James Shirley licensed in 1629, under the title of *The Faithful Servant*, and printed in 1630.

GRATLÆ, grā'shi-ē. See CHARIS; CHARITES; GRACES.

GRATIAN. The name of two Roman emperors. See GRATIANUS; GRATIANUS AUGUSTUS.

GRATIAN, grā'shi-an (Lat. *Gratianus*). The collector of the well-known body of canon law commonly cited under the title of *Decretum Gratiani*. In spite of the fact that he was the most celebrated canonist of the Middle Ages and was styled "the master" and was regarded as the founder of canon law, little is known of his life. He lived in the first half of the twelfth century, was a monk in the monastery of St. Felix at Bologna, and probably a teacher of canon law at Bologna. The *Decretum* is his only known work. The many details which have been added to this bare outline of his life are legendary. Although he was uncritical in the use of his sources, his ability is clearly apparent in his works. No other private compilation has exercised so great and so enduring an influence. The official *editio Romana* of the *Decretum* (1582) was prepared after the Council of Trent by a committee of cardinals; there is a critical edition by Friedberg in his *Corpus Juris Canonici* (Leipzig, 1879). See CANON LAW.

GRATIANO, grā'shi-ā'nō. 1. The stock "bore" of Italian comedy. 2. The friend of Bassanio and lover of Nerissa in Shakespeare's *Merchant of Venice*. 3. The brother of Brabantio and uncle of Desdemona in Shakespeare's *Othello*.

GRATIANOPOLIS. See GRENOBLE.

GRATIANUS, grā'shi-ā'nūs (?-407). A Roman general, whom the Roman legions in Britain proclaimed Emperor in opposition to Honorius. At the end of four months he was put to death by his soldiers, in the year 407.

GRATIANUS AUGUSTUS (359-383 A.D.; Roman Emperor 367-383 A.D.). Eldest son of Valentinian I. by his first wife, Severa. He was born at Sirmium in Pannonia. While he was still *nobilissimus puer*, or heir apparent, he was created consul, and in 367 was elevated by his father to the rank of Augustus (joint Emperor) at Ambianum (Amiens), in Gaul. In the following year he accompanied his father in his expedition against the Alemanni (q.v.), in order that he might be accustomed to warfare. On the death of Valentinian, Gratianus became senior ruler of the Western Empire, with his half brother Valentinian II (q.v.) as his colleague. Gaul, Spain, and Britain fell to Gratianus' share; and, as Valentinian was only four years old, Gratianus was practically the sole ruler in the West, fixing his residence at Treviri (now Treves), while the East continued to be ruled by his uncle, Valens (q.v.). During the first part of his reign Gratianus carried on fierce warfare against the tribes who possessed the Danubian Provinces and Illyricum; and he was on the point of marching into Thrace to

assist Valens against the Goths when he was suddenly called upon to defend his dominions against the Lentienses, a tribe of the Alemanni. After the invaders had been defeated (378), Gratianus advanced towards the Eastern Empire, but while on the way he learned that his uncle Valens had been defeated and killed by the Goths (q.v.) near Adrianople (Aug. 9, 378). The sovereignty of the Eastern Empire then devolved upon Gratianus, but, feeling his inadequacy to the task of ruling the whole Empire, he recalled Theodosius (q.v.) from Spain and appointed him his colleague on Jan. 19, 379. Gratianus possessed some admirable virtues, but his character was yielding and pliant, and he was often led to the commission of acts of cruelty and tyranny. In Gratianus' reign orthodox Christianity for the first time became dominant throughout the Empire. But his persecution of the pagans and afterward of heretic Christians alienated the affections of his subjects generally, while his fondness for frivolous amusements and unworthy associates excited the contempt of the army, so that when Maximus (q.v.) was proclaimed Emperor by the legions in Britain crowds of the disaffected flocked to his standard. Gratianus was defeated by him near Paris and afterward fled to Lugdunum (Lyons), where he was overtaken and killed by Andragathius, whom Maximus had sent in pursuit of him, on Aug. 25, 383. For the reign of Gratianus, consult Gibbon's *Decline and Fall of the Roman Empire*, as edited by Burry (London, 1912), and *Cambridge Mediaeval History*, vol. i (New York, 1911).

GRATIEN, HENRI. See BERTRAND.

GRATING, DIFFRACTION. See DIFFRACTION AND DIFFRACTION GRATINGS; DIVIDING ENGINE; LIGHT.

GRATIOLOLA (Neo-Lat., from Lat. *gratia*, grace). A genus of plants of the family Scrophulariaceæ. *Gratiola officinalis*, sometimes called hedge hyssop, is found in meadows and on the margins of ponds and river banks in most parts of Europe, where it is said to render some of the meadows useless as pastures on account of its extreme bitterness and its violent action as a purgative, diuretic, and emetic. In overdoses it is an acrid poison. Formerly it was so highly esteemed as a medicine that the name of *Gratia Dei* (grace of God) was given to it, and for the same reason it is known in France as *herbe du pauvre homme* (poor man's herb). It is said to be the basis of the famous gout medicine called *eau médicinale*. *Gratiola peruviana*, a South American species, has somewhat similar properties. These properties are supposed to depend upon a bitter resinous principle called gratioline. A number of species are common in the United States, but none appear to be of economic importance.

GRATRY, grā'trē, AUGUSTE JOSEPH ALPHONSE (1805-72). A French Roman Catholic theologian, born at Lille. He was educated at the Ecole Polytechnique, became director of the Collège Stanislas, Paris, in 1842, and five years later almoner of the Superior Normal School. In 1852 with others he reconstituted the Oratory of the Immaculate Conception, a society devoted to the instruction of youth. He became vicar-general of Orléans in 1861, and professor of ethics in the Sorbonne two years later, and in 1867 was made a member of the Academy. Père Gratry was a warm friend of Père Hyacinthe, but did not share in the latter's

extreme views on Church questions. During the Council of the Vatican he published four letters in opposition to the opportuneness of defining papal infallibility. These acts brought about his retirement from the Oratory in 1869, but when the dogma was promulgated he accepted it. His works are: *Cours de philosophie* (6 vols., 1855-57); *Les sophistes et la critique* (1864); *Jésus-Christ* (1864), addressed to Renan; and *La morale et la loi de l'histoire* (1868). Consult Perraud, *Le Père Gratry* (Paris, 1900), and Chauvain, *Life of Abbé Gratry* (ib., 1901).

GRATTAN, grát'an, HENRY (1746-1820). An Irish statesman and orator. He was baptized at Dublin, July 3, 1746. His father was recorder of Dublin and member of Parliament for that city until his death, in 1776. In 1763 Grattan entered Trinity College, Dublin, and four years later took his bachelor's degree, became a student at the Middle Temple in London, and in 1772 was admitted to the Irish bar. Politics, however, rather than the law, attracted Grattan, and in 1775 he was returned to the Irish Parliament as member for the borough of Charlemont. He became the leader of the popular cause, demanding free trade for Ireland; and when this had been obtained temporarily, he demanded that the laws made by the Irish Parliament should no longer be subject to the revision of the English Parliament. On April 19, 1780, he made his famous speech in favor of this measure, and two years later it was granted. He lost his popularity, however, when he opposed Flood's demand that a final renunciation of the principle of Irish dependence should be demanded, and only regained popular favor after he opposed Pitt's commercial measures. He spent thereafter many years urging the removal of all disabilities as regards Catholics, but was unsuccessful. When in 1797 Ulster was put under martial law, and Grattan's protests were unavailing, he withdrew from Parliament. He returned to Parliament in 1800 with the express purpose of opposing the proposed union between Great Britain and Ireland. His speeches were most eloquent, but they availed nothing. In 1805 he was persuaded to accept a seat in the Parliament in London, and labored there also for Catholic emancipation until his death, which occurred in London on June 6, 1820. Grattan's public and private character was unimpeachable, and as an orator he stands in the first rank, his style being rapid, and rich in antithesis and poetic suggestiveness. Consult: Henry Grattan (son), *The Speeches of the Right Honorable Henry Grattan in the Irish and in the Imperial Parliament* (4 vols., London, 1882); *Memories of the Life and Times of Henry Grattan* (new ed., London, 1849); Dunlop, *Life of Henry Grattan* (Philadelphia, 1899); Zimmern, *Henry Grattan* (London, 1902); Lecky, *Leaders of Public Opinion in Ireland* (New York, 1903).

GRATTAN, THOMAS COLLEY (1792-1864). An Irish author. He was born in Dublin, but lived mostly abroad. Because of his brilliant articles to the London *Times* from Brussels, he was appointed (1839) British Consul at Boston, Mass., where he remained until 1846. He took an important hand in the Ashburton Treaty (1842). His many romances in verse and prose met with considerable success; but he was mainly known by *Highways and Byways* (three series, 1823-29), an account of his travels, written at the suggestion of Washington Irving.

His *Beaten Paths* (1862) is largely autobiographical.

GRATTIUS FALIS/CUS. A Roman poet, contemporary of Vergil, and author of a poem upon the chase entitled *Cynegetica*. Of the poem 541 hexameters have come down through one manuscript, discovered in France in the beginning of the sixteenth century. In 1654 it was translated into English verse by Christopher Wase. Consult Bährens's *Poetæ Latini Minores* (vol. i, Leipzig, 1879; vol. ii of the same work, as revised by Vollmer, ib., 1911); Curcio, *Poeti Latini Minori* (Acireale, 1902).

GRATZ. See GRAZ.

GRAU, grou, MAURICE (1849-1907). An operatic manager, born in Brünn, Moravia, but a resident of the United States after 1854. He was educated in the schools of the city of New York, and afterward graduated from the College of the City of New York, then known as the Free Academy. He entered the service of his uncle, who was a well-known operatic and dramatic manager; and made his own first venture as an impresario by bringing Aimée to the United States in 1872. The following year he organized the Kellogg English Opera Company, and also instituted a series of dramatic performances, starring Salvini and acting as Rubinstein's manager. In 1891 the Maurice Grau Opera Company was formed and incorporated, and he became the manager of the Metropolitan Opera House, New York, which position he resigned in 1903. He was also appointed manager of the Royal Opera in Covent Garden, London, being succeeded, however, in 1901 by André Messager.

GRAU, MIGUEL (1834-79). A South American naval officer, born at Piura, Peru. He studied in the naval school at Callao, entered the Peruvian navy as midshipman in 1852, and was appointed to the command of the turret ship *Huascar* in 1871. Subsequently he was a deputy in the Peruvian Congress, and director of the Naval Academy. In 1879, upon the outbreak of the war with Chile, he entered active service as captain and was raised to the rank of rear admiral in recognition of his services. With the ironclads *Huascar* and *Independencia* as the chief part of his fleet for a time he maintained a successful warfare against the Chilean navy. The loss of the *Independencia* by foundering in an attack on the blockading vessels at Iquique was a severe blow, but he still held the Chileans in check. Later, in the *Huascar*, he was attacked by two Chilean ironclads off Point Angamos, where the Peruvians made a heroic and desperate defense. He was killed by the explosion of a shell, and the *Huascar* was compelled to surrender. A memorial to Grau was erected by the nation at Lima.

GRAU, RUDOLPH FREDRICH (1835-93). A German Lutheran theologian. He was born at Heringen-on-the-Werra, and was educated at Leipzig, Erlangen, and Marburg, where he became a member of the faculty in 1865. In 1866 he accepted a chair in the University of Königsberg. His numerous works, chiefly on race influence in religion, the importance of faith, and kindred subjects, include: *Semiten und Indogermanen in ihrer Beziehung zu Religion und Wissenschaft* (2d ed., 1867); *Bibelwerk für die Gemeinde* (with several other Lutheran clergymen, 2d ed., 1889); *Die Judenfrage und ihr Geheimnis* (1881); *Luthers Katechismus erklärt aus biblischer Theologie* (1891); *Zur In-*

spirationslehre und zum ersten Kapitel der Bibel (1892). Several of his works on faith, such as *Der Glaube die wahre Lebensphilosophie* (1881), were translated into English.

GRAUBÜNDEN, grou'bun'den. The eastern-most canton of Switzerland. See GRISONS.

GRAUDENZ, grou'dents. A fortified town of Prussia, in the Province of West Prussia, situated on the right bank of the Vistula, 60 miles south of Danzig (Map: Germany, H 2). It is commanded by a citadel, erected in 1772-76 by Frederick the Great, and is surrounded by a wall. It is a well-built town with infantry, artillery, and cavalry barracks, a museum, a Gymnasium, two seminaries, and other educational and charitable institutions. The chief manufactures are machinery and other iron products, cigars, shoes, vehicles, lumber, flour, meal, and brushes. There is trade in wool and cattle. Pop., 1900, 32,727; 1910, 40,325. Graudenz, under the name of Grudenc, received municipal rights in 1291. It came into the possession of Poland in 1466, was occupied in 1655-59 by the Swedes, and annexed to Prussia in 1772. In the European War which broke out in 1914, Graudenz was the scene of some severe skirmishing and was seriously threatened by the first Russian advance, which almost rolled the entire German army east of the Vistula, upon Königsberg. Its fortifications were hastily strengthened, but it was only the transference of two army corps from the western battle line that saved it from capture.

GRAUL, groul, KARL (1814-64). A German missionary, born at Wörlitz near Dessau. After conducting the Lutheran mission at Dresden he went to India in 1849, where he studied the Tamil language, and devoted himself to missionary labor until 1853. His principal publications are: *Unterscheidungslehren der verschiedenen christlichen Bekenntnisse* (11th ed., 1884); *Bibliotheca Tamilica* (1854-65). He believed in the adaptation of Christianity to Oriental social conditions, and to this end urged the necessity of broad and liberal culture on the part of the missionary. Consult Richter, *History of Missions in India* (New York, 1908), for his mission work and principles.

GRAUN, groun, KARL HEINRICH (1701-59). A German composer, born at Wahrenbrück, near Torgau, Prussian Saxony. When Frederick the Great came to the throne of Prussia he appointed Graun royal musical director, and commissioned him to organize an opera at Berlin, the singers for which were secured in Italy. For a long period the operas of Graun—about thirty in number—were performed at Berlin, to the exclusion of almost all others, excepting those of Hasse. Even more celebrated was the oratorio on the Passion, entitled *Der Tod Jesu*, which, until quite recently, was given annually in Berlin on Good Friday. Among his most noteworthy compositions are the following: *Ifigenia in Aulide* (1731); *Artaserse* (1743); *Semiramide* (1754); *Montezuma* (1755); the splendid *Te Deum* (1756); and numerous cantatas, motets, concertos, etc. Graun is represented as musical director upon the famous monument of Frederick the Great in Berlin. Consult C. Mennicke, *Hasse und die Brüder Graun als Symphoniker* (Leipzig, 1906).

GRAVE (AS. *græf*, *graf*, Goth. *graba*, OHG. *grab*, Ger. *Grab*, from AS. *grafan*, Goth., OHG. *graban*, Ger. *graben*, Eng. *grave*, to dig). The place where a dead body is interred. It is pro-

tected by the common law from violation by removing or disturbing the dead body, or stealing the coffin or grave clothes, such violation being punished as a misdemeanor, under the description of *grave robbing*, or *body snatching*. The common-law rule has been reinforced by statutory provisions in some States. See CEMETERY LAWS; CORPSE; BURIAL; MORTUARY CUSTOMS.

GRAVE (It., heavy). In music, an Italian term denoting a very slow tempo of serious character. It is employed very much like the *largo* (q.v.).

GRAVE, CASWELL (1870-). An American pisciculturist. He was born at Monrovia, Ind., graduated from Earlham College, Richmond, Ind., in 1895, and studied at Johns Hopkins University (Ph.D., 1899), where he taught after 1901, becoming associate professor in 1906. He also served as an assistant on the United States Fish Commission in 1899-1900, as director of the United States Fisheries Laboratory, Beaufort, N. C., in 1902-06, and as shellfish commissioner of Maryland in 1906-12. After 1912 he directed the course in invertebrate zoology at the Marine Biological Laboratory, Woods Hole, Mass. He was secretary-treasurer of the American Society of Zoologists in 1913, and is author of contributions on zoology. He is an authority on oyster culture and on the embryology of echinoderms.

GRAVE, THE. A didactic poem of nearly 800 lines in blank verse, by Robert Blair. It was published in 1743 and in 1808. William Blake made a series of designs illustrating the poem, among his best and most successful work.

GRAVE-DIGGER. A common name in India for the ratel or honey badger (see BADGER), which has the reputation of digging into men's graves in order to feed on the corpses—a belief for which there is no justification in fact. Persians make the same accusation against their badger.

GRAVEL. See CALCULUS.

GRAVEL (OF. *gravele*, *gravelle*, *grevelle*, from *grave*, *greve*, Fr. *grève*, sand; connected with Welsh *gro*, Corn. *grov*, MBret. *grouaenn*, sand; ultimately connected with Skt. *grāvan*, stone). The name given to aggregations of water-worn and rounded fragments of rocks, varying in size from a pea to a walnut. When the fragments are smaller the deposit is sand, when larger it is called shingle. Gravel deposits are formed by the action of running water, and are usually limited in size, occurring with more extensive strata of sand. They are found in the formations of every age. By infiltration of silica, lime, or iron oxides, the pebbles may be firmly cemented together, and form a hard rock called conglomerate (q.v.). Quartz, owing to its resistance to abrasion, is the most common mineral found as gravel. See GEOLOGY; SOIL.

GRAVELINES, gräv'lén' (Flem. *Gravelinghe*, Ger. *Gravelingen*, count's canal). A small fortified town of France, in the Department of Nord, on the Aa, 10 miles southwest of Dunkirk, and a mile from the North Sea (Map: France, N., H 1). It has an active shipping trade, builds ships, and manufactures beer, paper, and sugar. There are large cod and herring fisheries. Ships of 18-foot draft can use the harbor. Pop. (commune), 1901, 6202; 1911, 5898. The town was founded about 1160 by Theodoric of Flanders, and after 1405 was in possession of the house of Burgundy. It is noted as the scene of a victory gained July

13, 1558, by the Spanish troops under Count Egmont over the French under Marshal Thermes, a victory which compelled the French to accept the severe terms of the Treaty of Cateau Cambrésis (1559). In 1658 Gravelines was taken by Turenne, and was incorporated with France by the terms of the Treaty of the Pyrenees (1659).

GRAVELOTTE, grāv'lôt'. A village in Lorraine, about 7 miles west of Metz, which has given its name to the most important battle of the Franco-German War, fought on Aug. 18, 1870, between the Germans under King William of Prussia and the French under Marshal Bazaine (Map: Germany, A 4). It was the third of the battles around Metz, following on Bazaine's attempt to retreat from the Moselle to Châlons and to effect a junction with the army of MacMahon. The battles of Colombey-Nouilly (August 14) and Mars-la-Tour (August 16) prevented the execution of this plan, and Bazaine, in fear of being cut off from Metz, fell back upon that fortress on August 17, taking up an exceptionally strong position on a ridge of hills to the west of the city, and fronting westward, with his line extending from Rancourt and Saint-Privat on the north through Amanvillers and Chatel to Rozérieulles. In German headquarters, where great uncertainty prevailed as to the exact position of the French, it was determined to attempt a flanking movement against the enemy's right, which was supposed to be at Amanvillers; at the same time the French left and centre were to be assailed to insure the success of the attack on their right. As it turned out, however, the French right extended some three miles to the north of Amanvillers, and the execution of the flanking movement was thus delayed. A premature attack on the French centre and left which was begun about noon at Vernéville was checked by a withering fire from the French, the irregular nature of the terrain making the advance of the German infantry exceedingly difficult. An ill-advised charge by the First Cavalry Division was repulsed and served only to throw the German right for a time into confusion; and though by nightfall the Germans had succeeded in carrying the heights of Moscou, Saint-Hubert, and Point-du-Jour, the fighting in that quarter attained no decisive point. The outcome of the battle was decided on the French right, where the flanking manœuvre of the Germans, though delayed, was finally carried out. Saint-Privat was carried by the Guards and Saxon troops at seven o'clock in the evening, and the French right was driven from its position with immense loss. In the night Bazaine fell back upon Metz, abandoning all hope of joining MacMahon. The German forces engaged, which consisted of the armies of Steinmetz and Prince Frederick Charles, and which were commanded by King William in person, numbered about 205,000 officers and men, and suffered a loss of more than 20,000 in killed and wounded. The French out of 130,000 engaged lost nearly 600 officers and more than 13,000 men. The battle is often known as the battle of Saint-Privat. Consult: F. E. H. Erb, *L'Artillerie dans les batailles de Metz, 14-18 août* (Paris, 1908); C. Bleibtreu, *Die Schlachten um Metz* (Metz, 1910).

GRAVELROOT. A North American medicinal plant. See **EUPATORIUM**.

GRAVENBERG, WIENT VON. See **WIRNT VON GRAVENBERG**.

GRAVENHURST, grā'ven-hūrst. A town in Muskoka District, Ontario, Canada, situated at the foot of Muskoka Lake, and on the Grand Trunk Railway (Map: Ontario, E 4). It is a well-known summer resort, and two miles distant on the shore of Muskoka Bay are three sanitariums for consumptives. Its industrial establishments include lumber and saw mills, a foundry, and manufactories of soda water, steel chairs, cabinets, carriages, boats, interior fittings, and crushed stone. It possesses electric lighting, water works, and electric power. Pop., 1911, 1624.

GRAVENREUTH, grā'ven-roit, KARL, BARON (1858-91). A German traveler in Africa. He was born in Munich. He entered the army in 1877. In 1885 he founded the station of Korogwe in Usambara for the German East Africa Company. Afterward he took an active part in subjugating the Arab revolt at Bagamoyo, and in 1890 was appointed commander of an exploring expedition through southern Kamerun, where he met his death in an encounter with the natives. In recognition of his valor and of his valuable services to the government, a monument was erected to him at Kamerun.

GRAVER. See **BURIN**.

GRAVES, ALFRED PERCEVAL (1846-). An Irish poet, born in Dublin, the son of the Bishop of Limerick. He was educated at Trinity College, Dublin, held important positions in the civil service, and was made inspector of schools in 1874. He contributed to the periodicals and did much for Irish song and music. Among his volumes are: *Songs of Killarney* (1872); *Irish Songs and Ballads* (1879); and subsequently *Songs of Irish Wit and Humour* (1884), with Dr. C. Wood; *The Irish Song Book* (1894); *Irish Folk Songs; Songs of Erin*, with Dr. C. V. Stanford; *Rhoscen Dhu*, a dramatic monologue; *The Postbag: A Lesson in Irish*, an operetta (1901); *The Absentee* (a play produced in 1908); *Welsh Poetry, Old and New*, in *English Verse* (1912).

GRAVES, CHARLES LARCOM (1856-). An Irish author, son of the Bishop of Limerick. He was educated at Marlborough and at Christ Church, Oxford; wrote with E. V. Lucas several clever pamphlets (*Wisdom while you Wait*, *Signs of the Times*, etc.) satirizing the "American invasion" in English newspaper and publishing business; composed light verse and was a well-known musical critic; became assistant editor of the *Spectator* in 1899; and in 1902 was a recognized contributor to *Punch*. Among his books are biographies of Sir George Grove (1903) and Alexander Macmillan (1910); *The Blarney Ballads* (1893); *The Harwarden Horace* (1894); *The Diversions of a Music Lover* (1904); *Humors of the Fray* (1907); *Musical Monstrosities* (1909); *Party Portraits* (1910); *Post-Victorian Music* (1911), essays from the *Spectator*; *The Brain of the Nation* (1912).

GRAVES, JOHN TEMPLE (1856-1925). An American newspaper editor and publicist, born at Willington Church, Abbeville Co., S. C. He studied at the University of Georgia. He was editor of several Florida and Georgia papers before becoming editor in chief and coproprietor of the *Atlanta Daily Georgian* in 1905. In 1907 he was appointed editor in chief of the *New York American*. He was presidential elector from Florida in 1884 and from Georgia in 1888, and in 1908 was candidate of the National

Independence party for Vice President of the United States. Graves became known as one of the most progressive and patriotic leaders in the South and as an advocate of international peace. He published a *History of Florida To-Day, Speeches and Selections for Schools, The Negro*, and edited *Eloquent Sons of the South* (2 vols., 1909).

GRAVES, RICHARD (1715-1804). An English novelist, born in Gloucestershire. He graduated at Pembroke College, Oxford, in 1736, was elected a fellow of All Souls, and studied medicine in London. In 1749 he became rector of Claverton, near Bath, where he remained till his death. Of his verses and numerous sketches and novels, only one has survived, *The Spiritual Quixote* (1772), an amusing burlesque.

GRAVES, ROBERT JAMES (1797-1853). An Irish physician, famous as a clinician, lecturer, and original investigator. His name, with that of Basedow (q.v.), is known to modern students of medicine in connection with exophthalmic goitre; but it was his work in the treatment of fevers, especially typhus, which was most important. He came of a Dublin family of divines and scholars and studied medicine at Trinity College. After a brilliant university career Graves pursued his medical studies in London, Berlin, Göttingen, Hamburg, and Copenhagen. Returning to Dublin in 1824, he established, with some others, the private medical school known as the Park Street School. At this time clinical or bedside teaching was practically unknown, students getting their knowledge from formal lectures and private study, and to Graves is due the credit of thoroughly incorporating the clinical method into elementary medical education. As early as 1819 he began his experiences with typhus fever, when he was sent by the government to take charge of an extensive district in the west of Ireland where the fever was raging. In the successive epidemics which visited the country from 1819 to 1848 he was actively engaged. He recognized the contagiousness of typhus and introduced a tonic and supportive treatment in place of the starvation and purging method which then obtained. His efforts had much to do with stamping out the disease in Ireland. In 1827 he was elected professor of the institutes of medicine to the King and Queen's College of Physicians. His contributions to scientific literature were many. He was one of the editors of the *Dublin Hospital Reports*, was associated with Sir Robert Kane in the editorship of the *Dublin Journal of Medical Science*, and wrote much for the *Transactions of the Royal Irish Academy* and the *Edinburgh Philosophical Journal*. His book, *Clinical Lectures on the Practice of Medicine* (1843), was used in every medical school in Europe.

GRAVES, THOMAS, LORD (c.1725-1802). An English naval officer. He was present as a lieutenant at the action off Toulon (1744) and in 1755 was placed in command of the frigate *Sheerness*. By 1779 he had attained the rank of rear admiral and in 1780 was sent with six ships of the line to North America to reinforce Arbuthnot. He succeeded Arbuthnot in command July 2, 1781, was subsequently joined at New York by Sir Samuel Hood with 14 ships of the line from the West Indies, and on August 31, in command of the combined fleet, sailed from New York for the Chesapeake to prevent the union of the French squadron under De

Barras, from Newport, with the fleet under De Grasse. But suffering more injury than he inflicted in an encounter with De Grasse on September 5, he offered no opposition to De Barras on his arrival a few days later, and on September 10 he went back to New York. On October 19, with 25 sail of the line and two ships of 50 guns, he left New York for the relief of Cornwallis. On the same day Cornwallis surrendered, and Graves, upon his arrival on the 24th, found himself unable to accomplish anything. He thereupon relinquished the command to Rear Admiral Robert Digby and went to Jamaica in the *London*. In 1782 he was ordered to the command of a squadron of nine vessels destined for England and largely consisting of the prizes obtained by Rodney in the battle with De Grasse off Dominica (April 12, 1782). Only two of the unseaworthy craft got to England. Graves became vice admiral in 1787 and admiral in 1794. During the war with France in 1793-1802 he distinguished himself in Lord Howe's naval victory of June 1, 1794.

GRAVESANDE, grä'və-sän'de, (CHARLES) STORM VAN 'S (1841-). A Dutch etcher. His art was formed under the influence of Félicien Rops at Brussels. He is known chiefly as an etcher of marines, in which he attains the grandeur of style of the best modern Dutch marine painters. He has depicted the sea in all of its aspects, in storm and in calm. An exhibition of his works was held at Boston in 1887.

GRAVESANDE, WILLEM JAKOB, OR STORM VAN 'SGRAVESANDE (1688-1742). A Dutch mathematician and philosopher, born at Hertogenbosch and educated in law, physics, and mathematics at the University of Leyden. He was made a member of the Dutch Embassy in London, where he was influenced by Newton and other scientists. In 1717 he was appointed professor of mathematics and astronomy at the University of Leyden and in that capacity had much influence upon the development of natural science. He invented the first heliostat and was one of the first scientists to accept Newton's theory of gravitation. His principal productions include *Physices Elementa Mathematica Experimentis Confirmata sive Introductio ad Philosophiam Newtonianam* (3d ed., 1742) and *Philosophiæ Newtonianæ Institutiones* (3d ed., 1742).

GRAVES'S DISEASE, or EXOPHTHALMIC GOITRE. See BASEDOW'S DISEASE.

GRAVESEND, grävz'end. A market town, municipal borough, and river port in Kent, England, 22 miles below London, on the right bank of the Thames (Map: England, G 5). Its prosperity has always depended upon London, of which it is the boundary port, where pilots and revenue officers board vessels ascending the river, and where troops and passengers embark for long voyages. Its extensive fruit and vegetable gardens form an important supply of the London markets; it carries on an extensive trade in fish and in ships' supplies, has boat building, iron founding, brewing, and soap boiling. The town occupies a commanding position on the first rising ground after entering the river and extends for two miles along the water front, the older and lower portion with narrow streets and the upper and newer portion with handsome thoroughfares, squares, and terraces. Its salubrious air and beautiful scenery make it a favorite excursion and summer resort. Its

public buildings are conspicuous and include Milton parish church, a late Decorated edifice of the time of Edward II, and the Gravesend parish church, reërected in 1731, which was the burial place of the celebrated Indian princess Pocahontas in 1616; it contains a memorial pulpit donated in 1904 by the State of Indiana, and two stained-glass windows, the gift of the ladies of Virginia. Among the educational establishments are the free grammar school (founded 1580), Parrock Hall Industrial School, Milton Mount Congregational School for Ministers' Daughters, science and art schools, and a free library. In its western suburbs are Rosherville Gardens, a famous resort of Londoners.

The *Domesday Book* mentions Gravesend as a hythe or landing place. A town soon grew up after the Conquest, and the hythe was the assembling place for early navigators, including Sebastian Cabot and Martin Frobisher. Here the London Lord Mayor, aldermen, and city companies received all eminent foreigners and conducted them up the river in stately procession. The privileges granted by Richard II and Henry IV were confirmed by Queen Elizabeth's charter of incorporation in 1573. The fortified Vaubanian earthworks, constructed in the reign of Charles II to reinforce Tilbury Fort, were strengthened at considerable expense. The municipal borough comprises the parishes of Gravesend and Milton. Pop., 1901, 27,200; 1911, 28,117.

GRAVEYARD. An inclosed area for the burial of the dead. The term is less pretentious than "cemetery" and generally designates something simpler, like a portion of a churchyard in city or country, or like a relatively small detached burying place in a rural district. "Churchyard" is often, and "burying ground" less frequently, used in place of "graveyard." See CEMETERY.

GRAVIER, CHARLES. See VERGENNES, COUNT DE.

GRAVIER, grá'vyá', JACQUES (?-1708). A French missionary in Canada and Illinois. He continued the work of Marquette among the Indians for several years, but was constantly opposed by the medicine men. He was very successful, however, among the Kaskaskia Indians, many of whom he baptized. Dangerously wounded by a hostile native, he sailed for Europe in 1706, returned in 1708, only partially cured, and died at Mobile soon after. He wrote three works on the Indian missions and Louisiana affairs and compiled a grammar of the Illinois tongue.

GRAVIER DE VERGENNES, C. E. J. See REMUSAT, COUNTESS DE.

GRAVINA IN PUGLIA, grá-vé'ná én pŏŏ'lyá. An episcopal city on the Gravina, in the Province of Bari delle Puglie, Italy, 35 miles southwest of Bari, on the Gravina River (Map: Italy, F 4). It has a collegiate cathedral, an episcopal library, a hospital, and several asylums. It markets grain, vegetables, wool, cheese, wine, horses, mules, oxen, and sheep. The annual fair in April is important. It was a favorite hunting place of Emperor Frederick II, who built the castle. Pop. (commune), 1901, 18,685; 1911, 19,900.

GRAVING DOCKS. See DOCK.

GRAVITA'TION (Fr. *gravitation*, from Fr. *graviter*, to gravitate, from Lat. *gravitas*, weight, from *gravis*, heavy). The idea that there is an action between the earth and its moon and the

sun and its planets perfectly analogous to that between the earth and a falling body occurred to many astronomers and students of science previous to the announcement by Newton in 1687 of his famous law of universal gravitation; but it was reserved for Newton to give this law exact mathematical expression. All bodies, when raised into the air and left unsupported, fall to the earth. The force which causes them to do so is termed gravity and, universal experience shows, acts towards the earth's centre; more strictly it acts in a direction perpendicular to the surface of still water. But if a body, such as a stone, be projected obliquely into the air, it describes a curved path, and when it meets the earth in its descent, its direction is not towards the centre, but inclined to it at the angle of projection. (See PROJECTILES.) Observing this, and that the body, if not stopped by the earth's surface, would continue to move in a curve, it is easy to imagine that it might circulate round the earth's centre as the moon does round the earth. (See CENTRAL FORCES.) Observing now the time of revolution of the moon, we can calculate the force with which it tends to leave the path (centrifugal force). This must be balanced by an equal attractive force, or we should lose the moon. But then the question arises, Is this attractive force the same as the force acting on bodies near the surface of the earth? The answer is that it is a force 3600 times less intense. If, then, gravity be the force which really holds the moon to its path, we must explain why it acts upon it so much more feebly than it would were it a body on the earth's surface. The explanation is given at once if we suppose gravity to be a force whose magnitude diminishes with increase of distance, and inversely as the squares of the distances at which it is exerted; for the distance of the moon from the earth's centre is about 60 times that of the earth's surface from its centre, and $3600 : 1 :: 60^2 : 1$. We infer that this explanation is correct from the fact that there is nothing inadmissible in such a diminution of force with increase of distance, and in the argument drawn from the necessity of otherwise supposing some other force than gravity to be employed in deflecting the moon, and the force of gravity to cease at some unknown level. On these views Newton is understood to have at first rested his law of universal gravitation: Every particle of matter in the universe attracts every other particle with a force directly proportional to the mass of the attracting particle, and inversely to the square of the distance between them. Newton, before conceiving the law, had explained the three great Keplerian laws of motion obtaining in the solar system by reference to an attractive force residing in the sun. These laws are: (1) that the planets revolve round the sun in ellipses, having the sun for a common focus; (2) that every planet moves in such a way that the line drawn from it to the sun sweeps over equal areas in equal times; (3) that the squares of the times occupied by the several planets in their revolutions in their elliptic orbits are proportional to the cubes of their mean distances from their common focus, the sun. From the law of equal areas Newton inferred that every planet is retained in its orbit by a force of attraction directed towards the centre of the sun; from the orbits being elliptical, he inferred that in each case this force varies in intensity

according to the inverse square of the body's distance from the sun; while from the third law he inferred the homogeneity of the central force throughout the solar system.

It was then, after being familiar with the notion of terrestrial gravity and its action, through the researches of Galileo, Huygens, and Hooke, and with the notion of a central force acting inversely as the square of the distance through his explanations of the laws of Kepler, that he put to himself the question: Is not the force with which the moon is pulled to the earth the same with gravity?—a question answered affirmatively on the supposition of gravity, like the sun's attraction, being a force diminishing with increase of distance and according to the same law. The result was to bring the whole solar system within the range of the law of gravitation. The phenomena of double stars justify the extension and the statement of the law as we have given it to universal terms. It may be observed, in conclusion, that the Keplerian laws, which may be said to have been the basis of Newton's researches, are, owing to perturbations (q.v.) caused by the mutual action of the planets, etc., only approximately correct, and that these perturbations afford, when examined, a further proof of the truth and universality of the law of gravitation.

Newton's law has been shown to hold also for smaller bodies at less distances apart. Within the range of possible experimental accuracy the law has been verified for bodies whose distances apart are as small as 3 or 4 centimeters. Whether the same law holds for bodies as small as molecules, and at distances as small as molecular distances, or not, cannot be said. Stated mathematically, Newton's law is that the gravitation force between two particles of masses m_1 and m_2 , separated by a distance r , is given by the formula

$$F = \frac{Gm_1m_2}{r^2},$$

where G is a constant expressing the fact that F is proportional to $\frac{m_1m_2}{2}$ and is called the "gravitation constant." The actual mechanical force between two bodies of known masses at a known distance apart has been measured by different observers, first by Cavendish in 1798. Thus G may be determined. It has been shown by Mackenzie and Poynting to be the same for crystalline as for isotropic bodies; and, so far as is known, it is independent of the intervening medium and a true constant of nature. In the C. G. S. system its value, as determined by Boys, is 0.00000066576, or 6.6576×10^{-8} . The same law may be applied to a body falling towards the earth, viz.,

$$F = G \frac{m_1m_2}{r^2}.$$

In this case, if m_1 is the mass of the falling body, $F = m_1g$, where g is the acceleration of such a body, and nearly equals 980 on the C. G. S. system. It was shown by Newton, and later by Bessel, that the value of g is independent of the kind of matter which is falling, and it has been proved to be independent of the mass. g varies of course from point to point on the earth's surface, owing both to its rotation and to its spheroidal shape. Formulas have been calculated for g as a function of the geographical latitude Φ ; one of the best is $g =$

$979.89 (1 + 0.0052 \sin^2 \Phi)$. In the formula m_2 is the mass of the earth, and r is the radius of the earth if it is assumed that the gravitation action of the earth is the same as if it were all concentrated at the centre. (A homogeneous sphere, or one made up of homogeneous spherical shells, would have this action.) Therefore

$$m_1g = G \frac{m_1m_2}{r^2},$$

or

$$m_2 = \frac{gr^2}{G}.$$

If this G is the same as in the previous formula—an assumption for or against which there is no evidence—the three quantities on the right-hand side of the equation are known; and so m_2 , the mass of the earth, may be determined. The average density of the earth, then, is this mass divided by the volume of the earth, which is approximately $\frac{4}{3}\pi r^3$. That is, calling Δ this density,

$$\Delta = \frac{3g}{4\pi rG}.$$

Assuming the above value for G , viz., $G = 6.6576 \times 10^{-8}$, this gives

$$\Delta = 5.5270.$$

For full details as to the law of gravitation, its history and its verification, reference should be made to *The Laws of Gravitation*, in "Scientific Memoir Series," ed. by Mackenzie, vol. ix (New York, 1900).

There have been several theories of gravitation, i.e., attempts to prove that it is a consequence of other properties of matter. One of these, known by the name of Le Sage, explains gravitation as due to the pressure upon the portions of matter produced by the impact of streams of minute particles traversing space in all directions. Naturally any one portion of matter will shield another neighboring portion from these streams, and so the two portions will be driven closer. The fundamental objection to this theory is that, owing to the impact of the stream of particles, there would be thermal phenomena, which are not observed.

A more recent theory has been proposed independently by several physicists—Lorentz, Thomson, Schuster, and others. It is based upon the fact that all atoms of matter contain positive and negative electric charges; and it assumes that the attractive force between unlike charges in two neighboring portions of matter is greater than the repulsive force between the like charges. This theory may be true. Consult Ames, *The Constitution of Matter* (Boston, 1913).

GRAVITY, CENTRE OF. See CENTRE OF GRAVITY.

GRAVITY, SPECIFIC. See SPECIFIC GRAVITY.

GRAY, ASA (1810–88). The foremost botanist of America during his period. He was born at Paris Furnace, N. Y., his father being a tanner. Although not college-trained, he had a literary style remarkable for its lucidity and elegance. He studied medicine in a physician's office and obtained the degree of M.D. in 1831. In New York City he formed the acquaintance of John Torrey, who finally secured for him in 1836 the position of curator of the New York Lyceum of Natural History. This began his career as a professional botanist. Through Torrey also he was appointed botanist to the government

expedition to the southern Pacific under Captain Wilkes; but he gave up this project, tired of waiting for the expedition to sail, and joined Torrey as junior author of the proposed *Synoptical Flora of North America*. In 1836 Gray published his *Elements of Botany*, which was the first of his remarkable series of textbooks. In 1838 he received his first definite and congenial position as botanist, being appointed professor of natural history in the newly organized University of Michigan. However, a leave of absence, obtained so that he might visit European herbaria in connection with his work upon the North American flora, was prolonged, and he never entered upon his duties in Michigan. In 1842 he was appointed Fisher professor of natural history at Harvard University, where he afterward made his great reputation. Because of his work Cambridge became at that time the American centre of botanical instruction and investigation. In 1848 Gray issued the first edition of his *Manual*, which in 1914 was in its seventh edition. His contribution to American taxonomy consists, not only in the numerous monographs he prepared, but also in the organization of the chaotic mass of taxonomic work which preceded him; and he was, besides, one of the first plant geographers, his comparison of the flora of the eastern United States and Japan being a notable contribution to the subject. As the champion of Darwin in the United States, he presented the theory of natural selection and defended it as not contrary to religion. The collection of his very interesting discussions on the subject is entitled *Darwiniana* (New York, 1876). He was an exceedingly keen critic and for years was the medium through which American students kept in touch with European botany. His reviews in the *American Journal of Science* were always important sources of information to American botanists. From 1863 to 1873 he was president of the American Academy of Arts and Sciences and in 1871 was elected president of the American Association for the Advancement of Science. His philosophical papers have been collected and published in two volumes by Sargent, under the title *Scientific Papers of Asa Gray* (Boston, 1888); and a very interesting volume is his *Letters*, edited by Mrs. Gray (London, 1893).

GRAY, DAVID (1838-61). A Scottish poet, born at Merkland, Kirkintilloch, Dumbartonshire. He had been educated for the ministry, but early became a contributor to the *Glasgow Citizen*, and the success of these beginnings made him decide to devote himself to literature. In 1860 he went to London, where he was kindly helped by Monckton Milnes, afterward Lord Houghton. But he could not get his poems printed, and the privations he suffered during those first weeks in London broke his health. He developed consumption and died soon after his return to Scotland. Meanwhile his idyllic poem, "The Luggie," had been accepted, and was published with some other verse in 1862, Milnes himself writing the preface. During the last year of his life Gray composed a series of sonnets called *In the Shadows*. Another edition of his poems was brought out in 1874, edited by H. G. Bell. For further biographical detail, consult the sketch by his friend Robert Buchanan, in *David Gray and Other Essays* (London, 1868).

GRAY, ELISHA (1835-1901). An American inventor, born at Barnesville in Ohio. He at-

tended Oberlin College, supporting himself by working at the trade of a carpenter. In 1867 he obtained his first patent, which was for telegraphic apparatus. Subsequently he received nearly 50 patents, relating principally to the telephone and other electrical apparatus. Claims were advanced in behalf of Gray as one of the inventors of the speaking telephone (q.v.), for which he filed specifications, Feb. 14, 1876; but the patent was awarded to Alexander Graham Bell (q.v.), whose rights were sustained by the Supreme Court. Among his other inventions were a system of multiplex telegraphy, a type-printing telegraph, the telautograph (q.v.), and numerous telegraphic and telephonic appliances and adjuncts. He was for a number of years engaged in the manufacture of telegraphic apparatus in Chicago and Cleveland. He was the author of *Experimental Researches in Electro-Harmonic Telegraphy and Telephony* (1878), a book based upon his experiments.

GRAY, GEORGE (1840-1925). An American jurist and legislator. He was born in New Castle, Del., graduated at Princeton in 1859, studied law at Harvard, was admitted to the bar in 1863, and practiced at New Castle and at Wilmington. He was Attorney-General of Delaware from 1879 to 1885, when he was elected to the United States Senate as a Democrat to succeed Thomas F. Bayard. He was reelected in 1887 and in 1893. Strongly conservative in his political and economic views, he was as Senator a staunch supporter of President Cleveland in his policy of tariff reform and in his opposition to the "free silver" and other financial propaganda of the time. In 1898 he served as a member of the Anglo-American Joint High Commission and on the Paris Peace Commission. In 1899 he was appointed United States Circuit Court judge; in November, 1900, became a member of the international Committee of Arbitration; in 1902 served as chairman of the Anthracite Coal Strike Commission; and in 1910 was a member of the North Atlantic Coast Fisheries Arbitration of The Hague. He resigned his position as Circuit Judge of the United States in 1914.

GRAY, GEORGE BUCHANAN (1865-1922). An English Old Testament scholar, born in Blandford, Dorset, where his father was an Independent minister. Educated at New and University colleges, London, at Mansfield College, Oxford, and at the University of Marburg, he entered the Independent ministry in 1893, and in 1900 (having been tutor since 1891) became professor of Hebrew and Old Testament exegesis at Mansfield College. He received an honorary D.D. from Aberdeen, and wrote, besides contributions to the *Encyclopædia Biblica* and to periodicals, *Studies in Hebrew Proper Names* (1896); *The Divine Discipline of Israel* (1900); editions of *Numbers* in the "Temple Bible" (1902) and the "International Critical Commentary" (1903) and of the early chapters of *Isaiah* in the latter series (1912), and *A Critical Introduction to the Old Testament* (1913).

GRAY, GEORGE ROBERT (1808-72). An English zoölogist, brother of J. E. Gray (q.v.), born at Chelsea and educated at Merchant Taylors' School. In 1831 he was appointed assistant in the zoölogical department of the British Museum. His works, which reveal much patient research, include: *Entomology of Australia* (1833); *Hand-List of the Genera and Species of Birds*, containing about 11,000 species (1869-

72); *Genera of Birds* (3 vols., illustrated, 1844-49), a very useful and valuable work. Gray also contributed on entomology to the works of Cuvier and Agassiz.

GRAY, HENRY PETERS (1819-77). An American genre, historical, and portrait painter. He was born in New York, and after preliminary studies with Daniel Huntington (q.v.), he studied five years in Italy. He was elected a member of the National Academy in 1842, and during the following year executed a number of genre and historical paintings. In 1846 he revisited Europe, staying a short time, and returned again in 1871, when he spent three years in Florence. Between these two visits he was elected president of the National Academy, holding the office from 1869 to 1871. The subjects of many of his paintings are taken from antiquity, and his art shows no particular American characteristic, but rather the influence of Italian, especially of Venetian, masters. The latter portion of his life was devoted chiefly to painting portraits, of which he executed some 250, smooth in finish, mellow in color. The following list includes some of his more important works: "Immortality of the Soul"; "Greek Lovers" and "Wages and War," Metropolitan Museum, New York; "Birth of our Flag" (1875); "Apple of Discord" (1876); portrait of William Cullen Bryant, Historical Society, New York; "Cupid Begging his Arrow," Pennsylvania Academy, Philadelphia; "Cleopatra Dissolving the Pearl," Metropolitan Museum; "Judgment of Paris," Corcoran Gallery, Washington; "Ophelia"; "Normandy Girl"; "Jessica, the Pride of the Rialto"; "Blessed Are the Pure in Heart"; "St. Christopher"; "Hagar and the Angel"; "Portia and Bassanio."

GRAY, HORACE (1828-1902). An American jurist, born in Boston, Mass. He graduated at Harvard College in 1845 and at the Harvard Law School in 1849. After practicing law in Boston he became in 1854 reporter to the Massachusetts Supreme Court, in which position he remained until 1861, compiling and publishing 16 volumes of *Reports*. From 1861 to 1873 he was an associate justice of the same court and was Chief Justice from 1873 to 1882. In the latter year he was appointed by President Arthur an associate justice of the Supreme Court of the United States, to succeed Justice Clifford, and served until shortly before his death. A lawyer of profound and varied learning, as well as of great natural ability, he exercised an important influence on the decisions of the Supreme Court in the important period of constitutional development in which he served. Consult Francis C. Lowell's "Horace Gray," in the *Proceedings of the American Academy*, vol. xxxix (Boston, 1904).

GRAY, JOHN EDWARD (1800-75). An English naturalist. He was born at Walsall and was educated for the medical profession, and in 1821 he assisted his father in the preparation of his *Natural Arrangement of British Plants*. In 1824 he entered the British Museum as assistant in the natural history department and in 1840 was appointed keeper of the zoological collections. This important post he retained till his death, and the British Museum collections are a monument of his persevering activity. The titles of his books and papers number more than 500. His "Catalogues" are not mere lists, but are enriched with synonyms and ample notes, whereby study of particular subjects is greatly

promoted. Gray also assisted in the formation of some of the most prosperous scientific societies of London. He was a vice president of the Zoological Society, assisted in the management of the British Museum, and served on the juries of the international exhibitions of 1851 and 1862.

Gray's principal works are: *Illustrations of Indian Zoology* (2 vols., 1832-34); *The Knolly Menagerie* (2 vols., 1846); *Spicilegium Zoologica* (1828-40); a *Synopsis of the Contents of the British Museum* (1866); *Genera of Birds* (1849); and *Catalogues* of various departments in the British Museum.

GRAY, JOHN HAMILTON (1814-89). A Canadian statesman and jurist. Born at St. George's, Bermuda, in youth he removed to New Brunswick, where he studied law and was called to the bar. He was elected a member of the New Brunswick Legislature in 1850. In 1856 he left the Liberal party and in 1856-57 was Conservative leader and Premier of the province. In 1860 he was appointed to represent the Imperial government on a commission to settle the difficult land question of Prince Edward Island (q.v.). Gray bore a distinguished part in the initial movement towards Canadian confederation. In 1864 he was one of the representatives of New Brunswick at a conference in Charlottetown, Prince Edward Island, to arrange a federal union between the three maritime provinces. Ultimately the conference was enlarged so as to include representatives of Canada and met at Quebec in October of the same year. After confederation Gray was elected in 1867 to the House of Commons for St. John's Co., New Brunswick, retaining his seat until 1872. In the latter year he was appointed a puisne judge of the Supreme Court of British Columbia, which position he filled until his death. In 1884 he was a member of the Royal Commission on Chinese Immigration. He published *Confederation: A History* (1871).

GRAY, JOHN HENRY (1859-). An American economist, born at Charleston, Ill. He studied at the Illinois State Normal University, graduated from Harvard University in 1887 and (Ph.D.) from the University of Halle in 1892, and studied also at Paris, Vienna, and Berlin. In 1887-89 he taught political economy at Harvard, from 1892 to 1907 was professor of political and social science at Northwestern University, and was then called to the University of Minnesota, where he became head of the department of economics in 1913. He was an expert in 1902-03 of the United States Bureau of Labor to investigate restriction of output in Great Britain, and in 1911-14 directed investigations into the regulation of public-service corporations, for the National Civic Federation. He was president of the American Economic Association in 1913-14. He published: *Die Stellung der privaten Beleuchtungsgesellschaften zu Stadt und Staat*; *Die Erfahrung in Wien, Paris, und Massachusetts* (1893); *Regulation and Restriction of Output in Great Britain* (1903); *Commission Regulation* (1913).

GRAY, JOHN PUEBUE (1825-86). A distinguished American alienist, born in Pennsylvania. He graduated at Dickinson College in 1846, studied medicine, and received his medical degree from the University of Pennsylvania in 1848. He was assistant physician at the New York State Insane Asylum at Utica from 1851 to 1853, medical superintendent of the Michigan

State Asylum at Kalamazoo from 1853 to 1854, and medical superintendent of the Utica State Asylum, N. Y., from 1854 to 1886. He was instrumental in securing many improvements in the treatment of the insane and introduced the use of the microscope in study of brain tissue at the asylums. He edited the *American Journal of Insanity* from 1854 for many years and was prominent in many public charities, such as orphanages, hospitals, and societies for the relief of the destitute. He published several articles and addresses. Shot by a lunatic in 1882, he never recovered from the effects of the attack.

GRAY, LOUIS HERBERT (1875-). An American Orientalist, born at Newark, N. J. He graduated in 1896 from Princeton University, where, after receiving the degree of Ph.D. from Columbia in 1900, he was chief cataloguer and instructor in Indo-Iranian (1900-02). He served as American collaborator on the *Orientalische Bibliographie* in 1900-06, revised translations for *The Jewish Encyclopedia* in 1904-05, was associate editor of Hastings's *Encyclopedia of Religion and Ethics* after 1905, and also edited the department of etymology and the modern history of India for the *NEW INTERNATIONAL ENCYCLOPEDIA*. He published *Indo-Iranian Phonology* (1902) and *The Hundred Songs of Kamal ad-Din of Isfahan*, with Ethel Watts Mumford (1904), translated Subandhu's *Vasavadatta* (1913), and is engaged in preparing the *Etymologisches Wörterbuch der alt-indischen Sprache*.

GRAY, MAXWELL (pen name of Mary G. TUTTLET). (?-1923). English novelist, born at Newport, Isle of Wight. She became known by *The Silence of Dean Maitland* (1886). Among her other popular novels are: *In the Heart of the Storm* (1891); *The Last Sentence* (1893); *A Costly Freak* (1893); *House of Hidden Treasure* (1898); *The World's Mercy* (1900); *Four-Leaved Clover* (1901); *The Great Refusal* (1906); *Unconfessed* (1911), a volume of miscellanies, including poems; and *The Desire of the Moth* (1912).

GRAY, ROBERT (1757-1806). An American sailor and discoverer, born at Tiverton, R. I. He served as an officer in the American navy during the Revolution and at the close of the war entered the merchant marine. On Sept. 30, 1787, he sailed from Boston as master of the sloop *Washington*, and under the command of Capt. John Kendrick, of the ship *Columbia*, bound on a trading voyage to the northwest coast of America and to China. Soon after doubling Cape Horn the vessels ran into a violent storm which separated them. Thence he returned home by way of the Cape of Good Hope (1790), the first to carry the American flag around the globe. According to Gen. A. W. Greely, Gray actually entered the Columbia River in August, 1788, during this voyage; but however that may be, he did enter it on May 11, 1792, during a second voyage, and the river was thereafter called in honor of his vessel. It was largely on this discovery that the United States based its claim to the Oregon country. Consult Greely, *Explorers and Travelers* (New York, 1893), and Laut, *Vikings of the Pacific* (ib., 1905).

GRAY, STEPHEN (?-1736). An English electrician. He is described as a pensioner of the Charterhouse, but biographical details are extremely meagre. His researches often went far afield, but he is credited with several interesting

discoveries. He first divided substances into electrics and nonelectrics, in accordance with whether they were or were not found to respond to frictional electricity. The division into conductors and nonconductors is also his, and he demonstrated that nonelectrics could be made electrics by contact with active electrics. He evolved the principles of the communication of electric power from native electrics to other bodies; discovered that electric conductivity depends on material, not on color or any similar quality, and noted the possibility of the insulation of conductors by cakes of resin. He first showed that the human body was a conductor. His investigations aided Charles du Fay in France and contributed to the invention of the Leyden jar by Musschenbroek. Gray was elected a fellow of the Royal Society in 1732.

GRAY, THOMAS (1716-71). An English poet, born in Cornhill, London, Dec. 26, 1716. His father, Philip Gray, a money scrivener, was of a disposition so violent that his wife was obliged for a time to separate from him, and it was mainly through her exertions that the boy was educated at school and college. In 1727 he was sent to Eton, where he formed a close friendship with Horace Walpole, son of the Prime Minister. In 1734 he entered Peterhouse, Cambridge. He disliked the mathematics and philosophy of the curriculum and left without a degree. In 1739 he went abroad, in company with Horace Walpole. They spent more than two years in France and in Italy, visiting places of interest and exploring picture galleries. The two friends quarreled, and Gray returned alone (September, 1741). Three years later the breach was healed. In the meantime Gray's father had died (1741), and his mother had settled at Stoke Poges. To please her, Gray returned to Peterhouse, where he took the degree LL.B. in 1743. Little interested in law, he settled down for six years to a severe study of Greek literature. Henceforth Cambridge was his home, though he spent two years (1750-61) in London, reading in the British Museum. In 1756 he changed his residence from Peterhouse to Pembroke. His holidays he passed with his mother at Stoke Poges, with Walpole at Strawberry Hill, and with other friends. His mother, to whom he was tenderly attached, died in 1753 and was buried at Stoke Poges. In 1757 he received the offer of the laureateship, but declined. Feeling strongly the romantic impulse, he began about 1760 to be interested in early English poetry and then in Celtic and Norse literature. In 1768 he was appointed professor of history and modern languages at Cambridge at a salary of £371, but he never lectured. During his later life he made several tours, the most notable being to Glamis Castle (1765) and to the English Lakes (1769). He died at Cambridge, July 30, 1771, and was buried at Stoke Poges.

Gray was a shy man, given to melancholy; he formed few but close friendships. Having inherited from his father a small fortune, he was able to devote his life to study. He has the reputation of being, after Milton, the most learned of English poets. He wrote but little, yet some of these few poems are of perfect finish. His first English poem to be published was the "Ode on a Distant Prospect of Eton College" (1747), followed the next year by "Ode to Spring" and "On the Death of a Favourite Cat." "The Elegy Written in a Country Churchyard," begun in 1742, finished at Stoke Poges in 1760,

was published in 1751. This poem, which has touched the popular heart, is one of the most perfect in our literature. It was followed in 1758 by the great Pindaric odes, "The Progress of Poesy" and "The Bard." In 1768 he published the first collected edition of his poems, among which were the romantic pieces, "The Fatal Sisters" and "The Descent of Odin." He also wrote good Latin verse. Consult: Gosse, *Thomas Gray*, "English Men of Letters Series" (London, 1882); Arnold's essay on Gray in Ward, *English Poets*, vol. iii (ib., 1880-83); *The Works of Thomas Gray in Prose and Verse*, ed. by Gosse (ib., 1882); Tovey, *Letters of Gray*, "Bohn's Library" (ib., 1900).

GRAYBACK. A sportsman's name for certain sandpipers, more especially the knot (q.v.).

GRAY DUCK. A local name of the gadwall.

GRAYLING. A fish which in external appearance and habits resembles closely a small salmon, but differs sufficiently in structural character to justify its separation as of a distinct family, Thymallidae. The only genus, including about five species, is *Thymallus*. They can readily be distinguished from the Salmonidae by their more slender build, larger scales, and much larger dorsal fin, and in Europe may reach a weight of 4 or 5 pounds; but American specimens rarely exceed 1½ pounds. They are inhabitants of the streams of Arctic or cold regions and are graceful, active fishes. Their habits are much like those of the trout, but they are considered by many sportsmen superior to the trout as game fish as well as for the table.

The common European grayling (*Thymallus thymallus*) is very highly prized both for game and for food. It is found in Scandinavia and southward to Switzerland and Hungary; what is probably the same species also inhabits northern Russia and Siberia. It is common in the Orkney Islands and scattered about England, but is not known in Scotland or Ireland and is believed to have been introduced into England, where very long ago it was called "umber." Efforts have been made by fish culturists to propagate the English grayling and introduce it into new streams; but they have been unsuccessful, and similar efforts with American species have also failed. These fish spawn much after the manner of trout, but in early summer instead of in the autumn, and they are more prolific.

American Graylings. Two species of grayling are known in North America. One, the Arctic (*Thymallus signifer*), called "poisson bleu" by the Canadian fur hunters, inhabits clear streams from the Mackenzie River westward through Alaska. It is distinguished by its large size (18 inches), the great height of the dorsal fin, comparatively dull hues, and the five or six deep-blue spots on the forward part of the belly. The other species is the Michigan grayling (*Thymallus tricolor*), of which an isolated variety (*montana*) inhabits the head streams of the Missouri. Its existence was not known until about 1873, when it was discovered almost simultaneously in Michigan and Montana; and the sportsmen's journals of that and the following few years, especially *Forest and Stream*, of New York, contained a great deal about it. In distribution it is limited to the Au Sable and a few similar streams in northern Michigan, where it was formerly locally abundant, but is rapidly nearing extermination,

by reason of the introduction there by the State authorities of brown trout (see TROUT), which voraciously destroy the graylings. Ichthyologists assert that this species and its Western variety represent detached colonies left from the former or postglacial extension of the range of the Arctic grayling, of which this was once a variety. Graylings are caught by the same tackle and methods of fly fishing as are used for brook trout and are in high esteem with both anglers and epicures. Consult Prith, *The Book of the Grayling* (London, 1888). See TROUT, and Plate of TROUT.

GRAY PIKE. 1. A local name of the sauger (q.v.), and (2) of the common Eastern pickerel; also "green pike."

GRAY'S INN. One of the four great inns of court, or guilds of lawyers, in England. The society of Gray's Inn was instituted about the beginning of the sixteenth century. It had associated with it two inns of Chancery, Barnard's Inn and Staple Inn. See INNS OF COURT.

GRAY SNAKE. A dangerous elapine snake of Australia, of the genus *Diamenia*. Several species are found in large numbers. The most common (*Diamenia reticulata*) is 2 or 3 feet long, uniform gray above and greenish below, with a black and a yellow circle around each eye. This species frequents sandy regions, and its bite is of little account; but some of its larger congeners are deadly.

GRAY SNAPPER. A fish. See SNAPPER.

GRAYSON, WILLIAM (?-1790). An American Revolutionary soldier, born in Prince William Co., Va. He was educated in England, graduating at Oxford, and studying law at the Inner Temple, after which he returned to America and began the practice of his profession in Dumfries, Md. He ardently espoused the cause of the Colonies, was an active worker in the pre-Revolutionary movement, and in August, 1776, was appointed an aid-de-camp on the staff of Washington. In the following year he became colonel of a Virginia regiment, which he commanded with distinction at the battle of Monmouth. He acted, at Washington's appointment, as a commissioner to treat with General Howe concerning the exchange of prisoners and in 1780-81 was a member of the board of war. After the fall of Yorktown he settled in Virginia and resumed the practice of law, soon winning distinction through his scholarship and oratorical powers. He was a member of the Continental Congress from 1784 to 1787. In 1788 he was a delegate to the convention called in Virginia to consider the new Federal Constitution and with Patrick Henry led the opposition to its ratification. In 1789 he was chosen one of the senators from Virginia in the first national Congress, but died in the following year.

GRAY'S PEAK. One of the highest peaks in the Front Range of the Rocky Mountains in Colorado, near the border of Summit County, 12 miles southwest of Georgetown. It is 14,341 feet high, and was named in honor of Dr. Asa Gray, the botanist.

GRAY'S THURBOCK, or GRAYS. A town in Essex, England, on the Thames, 9½ miles southeast of Romford. It has a large trade in building materials. The *Shaftesbury* and *Essexmouth*, industrial training ships of the London County Council, are anchored here. Pop., 1891, 12,400; 1911, 15,998.

GRAY TROUT. A Southern local name for

the squeteague (q.v.); also "shad trout" and "sun trout."

GRAYWACKE, grā'wāk (*gray* + Ger. *Wacke*, projecting rock). A name applied to certain fragmental rocks, usually gray in color, which are cemented by an argillaceous or siliceous paste. The fragmental materials may include quartz, feldspar, slate, and other materials and rocks. The name is falling into disuse, as modern petrographers prefer to classify the varieties of graywacke with slates, sandstones, schists, etc., according to the structure and composition.

GRAY WHALE. A migratory whale (*Rhachianectes glaucus*) of the north Pacific. It is one of the rorquals (Balænopteridæ), is 35 to 40 feet long, mottled gray to blackish in color, and yields about 23 barrels of oil. The baleen is short, light-colored, and of little value. These whales spend the summer in Bering Sea and northward, and in the autumn return southward, where the females enter the bays of southern California to produce their young. It is during this autumnal migration that the whalemen go after them from shore stations. Formerly the animals passed close alongshore in great herds; but soon after this style of fishing began they learned to keep far out from land. Grayback, hardhead, and mussel digger are other local names, the last in reference to the animal's diving and coming up with mud on its lips. It is one of the fiercest fighters, and the hardest to kill, of all whales. A summary of our knowledge of this cetacean may be found in the illustrated monograph by Andrews on the "California Gray Whale," *Memoirs of American Museum of Natural History* (New York, 1914). See Plate of WHALES.

GRAZ, or **GRATZ**, gräts. The capital of the Austrian Crownland of Styria, picturesquely situated in a beautiful region, on both sides of the Mur, about 140 miles southwest of Vienna by rail (Map: Austria-Hungary, D 3). The inner town, on the left bank of the river, connected with the town on the right bank by seven bridges, is built around the Schlossberg, formerly a strongly fortified hill, and since the destruction of the fortifications by the French in 1809 laid out in charming pleasure grounds. The view is famous from the Schlossberg, which is ascended by a cable railway. The city park is located on this hill and is a noteworthy example of the English style. The old bastions of the city have nearly disappeared. Among the more notable buildings are the Gothic cathedral, completed in 1462, and interesting on account of its fine stained-glass windows, altarpieces, and reliquaries (the adjoining mausoleum with an ornate façade contains the tomb of Emperor Ferdinand II); the parish church (1620), in late Gothic, with a fine altarpiece by Tintoretto; an early Gothic church of the Teutonic Knights, dating from the thirteenth century; the splendid Renaissance Landhaus, or Hall of the Estates, the place of assembly of the Styrian Diet, dating from 1569; the arsenal (1644), with a large and excellent collection of ancient weapons, and the Imperial castle, built in the eleventh century. Among the more modern buildings are the German Renaissance Rathaus, the university buildings, the law courts, the museum, and the Joanneum (founded 1811), with an important natural-history collection and other collections, and a library of 188,567 works. There should also be mentioned the

Herz Jesu-Kirche, in early Gothic, finished in 1891, with a 360-foot tower. There are noteworthy monuments to Francis I and Archduke John.

Graz is well supplied with educational institutions, having in addition to the university (see GRAZ, UNIVERSITY OF) a technical high school (over 700 students in the winter semester), several Gymnasias, and industrial and trade schools. The provincial picture gallery includes examples of Tintoretto and Cranach. The charitable institutions are numerous and well equipped, and there are several art and scientific associations. Graz has important and rapidly growing manufactures of steel and iron products (especially steel rails), leather, paper, woolen cloths, hats, perfumery, etc. There are extensive railway shops, an important publishing company, and large savings banks. Owing to its position on the direct railway line between Vienna and Trieste, Graz is favorably situated as an intermediary station for the trade between the Austrian capital and the Adriatic provinces. It is the seat of the superior courts for Styria, Carinthia, and Carniola, and of the Prince-Bishop of Seckau. The environs are delightful, offering fine views and interesting excursions. In population Graz is the sixth city of Austria, being exceeded, in order, by Cracow, Lemberg, Prague, Trieste, and Vienna. Pop., 1890, 112,069; 1900, 138,080; 1910 (census of December 31), 151,781. Of the latter number, 14,200 were foreigners; of the remainder, the vernacular of 135,905 was German. Of the total population, 140,924 were returned as Roman Catholic, 6464 as Augsburg Evangelical, and 1971 as Jewish.

Graz is known to have existed in the ninth century, and it possibly occupies a Roman site. In the fifteenth century it was an Imperial residence and later became a strong centre of resistance to Turkish conquest. It was occupied by the French in 1797, 1805, and 1809. Since 1860 it has developed rapidly. Consult Gaell Fels, *Graz und seine Umgebung* (3d ed., Munich, 1898), and Gründorf, *Grazer Tourist* (2d ed., Graz, 1903).

GRAZ, UNIVERSITY OF. A university of Styria, Austria-Hungary, founded as a Jesuit college in 1573. After a somewhat checkered career, culminating in the eighteenth century, it was reorganized in 1826, 1849, and 1863, and was, in 1913, the fourth in importance among Austrian universities. It comprises faculties in theology, law, medicine, and philosophy. Its library is especially rich. The number of students in 1913 was 2151. Consult A. Schauenstein, *Die ersten 3 Jahrhunderte der K. F. Universität in Graz* (Graz, 1895).

GRAZIE, gräts'ä, MARIE EUGENIE DELLE (1864-). An Austrian dramatist and poet, born in Weisskirchen, Hungary, the daughter of an Italian mining engineer. She was educated in Vienna, traveled in Italy, and began to write when she was only 17. Her dramas were acted with some success: *Schlagende Wetter* (1899; 3d ed., 1905), in the Vienna German Volkstheater; *Saul* (1855), a tragedy; *Der Schatten* (1901; 2d ed., 1902); *Zu spät* (1903), in the Hofburgtheater, Vienna, and at Karlsruhe, Berlin, and St. Petersburg. Her collected works were published in 1903. She wrote: *Gedichte* (1892; 5th ed., 1903); the epics *Hermann* (1883; 3d ed., 1904) and *Robespierre* (1894; 3d ed., 1905), in theme and manner

resembling Hamerling; *Italische Vignetten* (1892; 2d ed., 1903), another collection of poems; a satire called *Moralische Walpurgisnacht* (1896); a novel *Liebe* (1902; 2d ed., 1903); and the romances *Heilige und Menschen* (2d ed., 1910) and *Vor dem Sturm* (1910).

GRAZZINI, grà-tsé'né, ANTONIO FRANCESCO (1503-84). An Italian author, born at Florence and by vocation an apothecary. He was one of the founders of the Accademia degli Umidi, later Fiorentina (1540), and took the name of Il Lasca (the barbel), by which he was always known. Owing to a quarrel, Grazzini was excluded from the academy. In 1550 he was the main organizer of the Accademia della Crusca, which had for its object the purifying of the Italian language. He wrote a number of comedies, such as *La gelosia* (1508) and *La spiritata* (1561), verses, usually celebrating quarrels between himself and his academic brethren, and stories in the manner of Boccaccio. The stories, part of them published as *Le Cene* (1756), are models of prose, and vivid pictures of the Florentine life of his time. A selection from Grazzini's works was made by Fanfani, under the title *Le Cene ed altre prose* (1857) and *Commedie* (1859). Consult Gentile Curti, *Delle commedie di Grazzini* (Pisa, 1869), and Dini Olinto, *Il Lasca tra gli accademici* (ib., 1896).

GREASE (OF. *gresse*, *graisse*, Fr. *graisse*, fem. of *gras*, fat, from Lat. *crassus*, thick). A term formerly applied to mixtures of the three common glycerides—olein, palmitin, and stearin—in such proportions that the result possessed a semisolid or buttery consistency. Since the advent of petroleum the term has also been applied to the softer mixtures of the hydrocarbons derived from this source and used largely as lubricants. Greases from animal and plant sources have long enjoyed deserved popularity as foods, especially among peoples living in the temperate zones. The use of greases in culinary practice is almost as old as the human race. Frying, shortening of pastry, and special food-preserving methods practiced in sausage making, etc., are examples of common application. For any and all of the forementioned purposes the grease must be absolutely pure, sweet (not rancid), indicating the absence of anything but traces of free fatty acid, and of agreeable taste and odor. Such products are known as "edible fats" and are familiar to all as butter, butterine, lard, cottolene, crisco, etc. Greases have also been used for a long time as cosmetics, notably the fatty mixture furnished by the cocoa bean and known as "cocoa butter," and even mixtures of hydrocarbons entitled vaseline, which are very valuable and more reliable for these purposes. An old and well-established practice for extracting delicate perfumes from flowers consists in bedding the perfect blossoms in pure fresh grease. After a lapse of several months the greasy mass is gently heated, strained, and cooled. Such a product is known as pomade. From it the perfume material can be largely removed by pure alcohol and used in compounding perfumes. The greasy residue, still retaining slight traces of the original odor, is much used as a hair dressing.

When used as lubricants for heavy machinery or the axles of moving vehicles, the material may be of mixed composition. Pure greases of animal origin are now rarely employed. Hydro-

carbon mixtures of high melting point, either alone or incorporated with soap and even rosin oil in some cases, are much used at the present time with the object of increasing the tensile strength of the product. They have the advantages of cheapness and chemical stability over animal and vegetable fats. With extended use of the automobile we find a demand for stiff hydrocarbon greases mixed with various grades of purified graphite. Pure hydrocarbon mixtures are frequently sold under the name "non-fluid oils." The most impure forms of grease are largely used to-day in the fabrication of the cheapest forms of soap and soap powders. Trade names by which these products are sold denote their origin—"swill grease," "bone grease," "glue grease," etc. The process by which grease is extracted from the fatty products of animals in the great slaughterhouses is described under **DIGESTER**. Grease is also reclaimed from garbage. See **GARBAGE AND REFUSE DISPOSAL**.

GREASE MOTH. A pyralid moth (*Aglossa pinguinalis*), with the fore wings grayish brown, clouded with a darker hue, and covered by two indented lines. The dark-hued larva feeds on greasy clothing, etc. Another species of *Aglossa* damages leather-bound books.

GREASE WOOD (*Sarcobatus maximiliana*). A plant belonging to the family Chenopodiaceæ, which grows profusely in the western United States, especially on barren and alkaline soils, from the upper Missouri River region to Mexico and west to the Sierra Nevada Mountains. It reaches a height of from 4 to 8 feet. Cattle and sheep eat its leaves and browse off the smaller stems. The plant roots deeply and brings to the surface considerable quantities of alkali. (See **ALKALI SOILS**.) The name is sometimes applied in the West to species of *Gutierrezia*—plants which belong to the family Compositæ. See **PLATE OF DESERT PLANTS**.

GREAT AMERICAN DESERT. This designation for the arid parts of the West, once familiar by its inscription on the maps, has practically dropped out of use except in historical reference. To the early explorer and gold seeker it had a real significance, but with the progress of railroad construction, the development of the abundant mineral resources, and the foundation of permanent agricultural communities in many localities by irrigation of the waste lands, the region as a whole has lost much of the character of a desolate wilderness. There are, however, important stretches of absolute desert, as destitute of water and vegetation as any of the Sahara, and great areas that never can be reclaimed. For variety and ruggedness of topography the region is without parallel elsewhere on the continent; the surface features include alkali plains, extensive lava flows, tracts of shifting sands, mesas, lofty plateaus, mountain barriers, and impassable cañons, with some of the most remarkable scenery in the whole world. It is also notable for some of the very hottest and driest places that are known, yet the climate nearly everywhere is healthful and in many parts enjoyable.

The boundaries of the Great American Desert can be indicated only in a very general way. The outer limits are the Rockies and the continuing ranges in New Mexico and Texas on the east and the Sierra Nevadas and Cascade ranges on the west. It thus includes a country over 700 miles across in the broadest part, and it ex-

tends from British Columbia on the north to the Mexican frontier, where it continues southward so as to cover a large section of that country. Only a part of the area described consists of real arid wastes; these are estimated to cover about 550,000 square miles within the United States and a somewhat smaller surface in Mexico. The remainder of the region is divided between mountains and plateaus, partly forest covered, irrigated lands, and semiarid plains suitable for grazing.

In general the characteristic desert consists of flat plains or valleys partly inclosed between mountain ranges. The latter are usually meridional in trend and rather short. The valleys are smoothly floored, although trenched at intervals by dry watercourses; they terminate abruptly and evenly against the mountain sides, which rise sharply above the valley level and have the appearance of having been partly buried by the upbuilding of the plains. This is actually the condition, for most of the valleys are filled by débris which has accumulated from the work of wind and water upon the rocky uplands. The desert stretches lie at various altitudes. The highest are found in central Nevada, in the Great Basin, where elevations of 5000 or 6000 feet are common. The usual average is from 2000 to 4000 feet. Death Valley in eastern California, one of the most formidable stretches of desert land within the whole region, is a depression which in the lowest part is 276 feet below sea level. Salton Desert in the southern part of that State also lies below the level of the sea. The higher mountains rise 4000 or 5000 feet above the valleys; the extreme elevations are between 10,000 and 13,000 feet above the sea.

One of the most remarkable features within the area is the Colorado Plateau and the cañon that has been carved through it by the Colorado River. The plateau is made up of a series of faulted blocks, of which the Kaibab Plateau stands 8000 to 9000 feet high and contains abundant vegetation and forest growth. Across this table-land the Colorado has incised its channel so that it now flows from 4000 to 6000 feet below the plateau level.

The widest areas of unbroken desert are included within the Great Basin, an area of 210,000 square miles that comprises most of Nevada and parts of California, Utah, Idaho, and Oregon. Few permanent streams exist there, although during the wet season torrents may descend from the higher mountains to wither in the sands. At times they form marshy tracts or shallow lakes which rapidly dry up and expose smooth, sun-baked mud flats (playas) noted for their utter barrenness. The Black Rock Desert in northwestern Nevada is an example of this type; in the winter it is occupied by the waters of Quinn River. The Great Basin in Pleistocene time was covered in part by enormous lakes, the Great Salt Lake and the smaller lakes in western Nevada being the shrunken remnants of those water bodies.

The geological structure of the Great American Desert is extremely varied, as might be concluded from its diverse surface aspects. In regard to area covered the sedimentary strata are most important, and they range in age from the pre-Cambrian beds found in the Grand Cañon to the Tertiary and Pleistocene deposits of the Great Basin. Igneous intrusions and lavas of almost every type are common, some of the

latter being quite recent, although no active volcanoes occur. Well-marked craters are found in the San Francisco Mountains of Arizona, and there are many instances of fumaroles and hot springs. Great disturbances by faulting have taken place in many localities and are often evidenced by precipitous escarpments. The geological conditions have favored the accumulation of mineral deposits, which constitute the greatest single resource of the region and have been the incentive for the early explorations and most of the later industrial developments. Of metallic ores, those of gold, silver, and copper have been principally mined, but lead, zinc, quicksilver, and many of the rarer metals, also, are found in commercial quantity.

Agriculture is of increasing importance, but its possibilities must always be limited necessarily by the scanty rainfall. The annual precipitation over most of the valleys does not exceed 10 inches and in some parts is less than 5 inches. For periods of a year or more no rain whatever may fall in the more arid regions. Evaporation of course is very rapid. The water resources available for irrigation include the Rio Grande in New Mexico and Texas, Gila and Salt rivers in Arizona, the Colorado in southern California, the Humboldt and Truckee rivers in Nevada, the Snake River in Idaho, and the tributaries of Great Salt Lake in Utah, in addition to which there are smaller streams and supplies of underground waters. Great enterprise has been manifest in the development of these resources, especially in recent years. Wherever water is obtainable the soil usually shows good fertility, plant growth being very rapid.

The summer climate is hot, but on account of the dryness of the air the heat is not so oppressive as under ordinary conditions of humidity. The temperatures often rise above 100° for days at a time. The maximum in the northern deserts is around 110°, and in the south it reaches 130°. The character of the winter season depends upon the latitude and elevation, the highlands of the north having a rigorous climate, whereas in southern Arizona and California the winters are very mild.

Plant growth is sparse, but interesting in its types. Various grasses are found on most of the deserts and are collectively known as bunch grass owing to their habit of growing in scattered tufts. Members of the cactus family are very abundant, especially the prickly pear. A striking form is the giant cactus, which abounds in the Mohave and other deserts of the south; it grows to a height of 30 or 40 feet as a single stem from which arms shoot out vertically, the appearance being quite spectral when seen from a distance. Sagebrush is a common plant in the north. The Spanish bayonet, or yucca, and the mesquite are characteristic desert forms. See COLORADO DESERT; DEATH VALLEY; GREAT SALT LAKE; GREAT BASIN.

GREAT AUK. See AUK; GAREFOWL; and EXTINCT ANIMALS.

GREAT BARRINGTON. A town in Berkshire Co., Mass., including the villages of Housatonic and Van Deusen, 25 miles southwest of Pittsfield, on the New York, New Haven, and Hartford Railroad, and on the Housatonic River (Map: Massachusetts, A 4). It is a popular summer resort, being surrounded by remarkably picturesque scenery. It has two public libraries, Sedgwick School, Hallock School, the Hopkins Memorial Manse and several handsome estates.

Many of the town records are inscribed by William Cullen Bryant, who for several years was town clerk. The manufactures include cotton spreads, towelings, and other cotton goods, paper, electrical apparatus, etc. The government is administered by annual town meetings. Pop., 1900, 5854; 1910, 5926. Settled as early as 1725. Great Barrington formed a part of Sheffield until incorporated as a separate town in 1761. On Sept. 12, 1786, during Shays's Rebellion, a notable riot occurred here, and near by, on Jan. 25, 1787, a skirmish was fought between the militia and the insurgents. Consult Taylor, *History of Great Barrington* (Great Barrington, 1882).

GREAT BASIN. An area of inland drainage in the western United States, situated between the Wasatch Mountains on the east and the Sierra Nevada and Cascade ranges on the west. It comprises most of Nevada and portions of Utah, Oregon, Idaho, and California, and has a total area of about 210,000 square miles. The basin has a gradual slope from the north, where the elevation is 4000 feet above the sea, towards the south, forming a tilted plateau whose surface is broken by interrupted groups of mountains with a general north and south trend. The Humboldt River is the only perennial stream of any size rising in the interior of the basin, but on the borders there are numerous short streams, which have their sources in the snow fields of the Wasatch and Sierra Nevada ranges, and which act as feeders to a number of lakes, including Winnemucca, Carson, Owens, Mono, Pyramid, Sevier, Utah, and Great Salt Lake. Many of these lakes were greatly expanded during Pleistocene time. (See LAKE.) There are several large arid wastes within the basin, such as Great Salt Lake Desert, Carson Desert, and Mohave Desert, and the climate of the whole region is dry. Agriculture is confined to irrigated lands, but the mineral resources are of great importance. See GREAT SALT LAKE.

GREAT BEAR LAKE. A lake in the northwestern part of Canada, the most northerly of that chain of fresh-water lakes—Huron, Superior, Winnipeg, Athabasca, Great Slave, Great Bear—which mark extended areas of depression in the middle of the North American continent (Map: Canada, G 3). Great Bear Lake in lat. 65° to 67° N. and long. 117° to 123° W., is irregular in shape, 150 miles long, and has an area estimated at 11,200 square miles, a depth of 260 feet, and its elevation above the sea is over 200 feet. It sends a river of its own name to the Mackenzie. The lake abounds in fish. The surface is often frozen over for nine months of the year.

GREAT BEND. A city and the county seat of Barton Co., Kans., on the Arkansas River, 268 miles by rail west by south of Kansas City, on the Atchison, Topeka, and Santa Fe and the Missouri Pacific railroads (Map: Kansas, D 6). It is the centre of the wheat and alfalfa belts of Kansas and is surrounded by a rich farming and stock-raising region. The city has large flour mills, grain elevators, foundry and machine shops, and an ice plant. It contains also St. Rose's Hospital, a Carnegie library, and an Elks' home. Great Bend adopted the commission form of government in 1913. Pop., 1900, 2470; 1910, 4622.

GREAT BERKHAMPTSTEAD (from AS. *borce*, birch + *hām*, home + *stede*, place). A market town of Hertfordshire, England, 28 miles

north-northwest of London (Map: England, F 5). The father of the poet Cowper was rector of Berkhamptstead, and the poet himself was born here. A few massive fragments of the wall of a castle still remain, to the east of the town. A free grammar school founded in the reign of Edward III still exists, and there is also a charity school founded in 1727. There is a weekly corn market, but the town has practically no industries. Pop., 1901, 6371; 1911, 7302. The town is of Saxon origin, and the kings of Mercia had a palace or castle here. William the Conqueror met the nobles and prelates at Berkhamptstead, and took an oath to rule according to the ancient laws and customs of the country.

GREAT BIBLE. See BIBLE.

GREAT BRITAIN. The largest island of Europe, comprising England, Scotland, and Wales, and constituting, with Ireland, from which it is separated by St. George's Channel, the North Sea, and North Channel, the United Kingdom of Great Britain and Ireland. According to the census of 1911 Great Britain had an area of 88,729 square miles, and its population was 40,819,937. England, Wales and Scotland, 1921, 42,767,530. Estimated population, June 30, 1921 including Ireland, 47,263,530. For data on topography, hydrography, climate, soil, flora, fauna, geology, mineral resources, agriculture and stock raising, manufactures, commerce, banking, etc., see under UNITED KINGDOM, and the articles under the separate countries, ENGLAND, SCOTLAND, WALES, and IRELAND. For the relation of Great Britain to other component parts of the British Empire, see BRITISH EMPIRE. For an account of the part played by Great Britain in the European War of 1914, see WAR IN EUROPE.

GREAT BRITAIN, ROYAL ARMS OF. The arms of the United Kingdom of Great Britain and Ireland are quarterly, first and fourth gules, three lions passant gardant in pale, or, for England; second, or, a lion rampant within a double tressure flory counterflory gules, for Scotland; third, azure, a harp or stringed argent, for Ireland; all surrounded by the garter.

Crest.—Upon the royal helmet, the Imperial crown proper, thereon a lion statant gardant or, imperially crowned, also proper.

Supporters.—Dexter, a lion rampant gardant, or, crowned as the crest. Sinister, a unicorn argent, armed crined, and unguled or, gorged with a coronet composed of crosses pattée and fleur-de-lis, a chain affixed thereto, passing between the forelegs, and reflexed over the back, also or.

Motto.—*Dieu et mon droit* in the compartment below the shield, with the union rose, shamrock, and thistle ingrafted on the same stem. For illustration of Arms of Great Britain, see HERALDRY.

Arms have been ascribed by heralds to the Saxon and Norman monarchs of England in the tenth and eleventh centuries; but as heraldry was unknown till the middle of the twelfth century, the ascriptions must be fabulous.

James I, for the first time, clearly defined the royal supporters, adopting the lion of England and unicorn of Scotland as they have ever since been borne, the unicorn having been allowed the precedence in Scotland up to 1707.

GREAT CATAWBA. See WATEREE.

GREAT CHARTER. See CHARTER; MAGNA CHARTA.

GREAT CIRCLE SAILING. See SAILINGS.

GREAT COMMONER, THE. A popular title of William Pitt, the elder, before he became Earl of Chatham and changed from the House of Commons to the House of Lords.

GREAT-CRESTED FLYCATCHER. See KINGBIRD.

GREAT DANE. A dog. See HOUND.

GREAT DAUPHIN, THE. A name given to the Dauphin Louis, son of Louis XIV.

GREAT DUKE. A title given to the Duke of Wellington.

GREAT DUKE OF FLORENCE, THE. A drama by Massinger, licensed in 1627 and published in 1635.

GREAT EASTERN. At the time of her construction, the largest ship in the world. It was not until 1901, when the *Celtic* was completed, that her equal in size was produced. She was never a financial success, having been built when the trade and conditions suitable to a ship of her size did not exist. In 1852 the Eastern Steam Navigation Company was formed, to maintain an ocean steam route to the East round the Cape of Good Hope. In 1853 the directors came to a conclusion that, owing to the cost of maintaining coaling stations on the way, such a route would not pay unless the ship could carry coal enough for the voyage out and home, besides a large number of passengers and a great cargo. The scheme was for a ship that would accommodate 1000 passengers, 5000 tons of merchandise, and 15,000 tons of coal for fuel. The result was the construction of the *Great Eastern*. Her arrangements (setting aside later alterations) were briefly as follows: length, 680 feet between perpendiculars, or 692 feet upper deck; breadth, 83 feet, or 118 over paddle boxes; depth of hull, 60 feet, or 70 to top of bulwarks. The propelling power comprised both paddle and screw. The paddle engines had 4 boilers, each with 400 brass flue tubes; there were 4 engines, with cylinders of 14-foot stroke and 74 inches diameter; the paddle wheels were 56 feet diameter by 13 deep, with 30 arms or radii. The screw engines had 6 boilers; the 4 engines had cylinders, each 4-foot stroke by 84 inches diameter, with piston rods $7\frac{1}{2}$ inches thick; the propeller shaft was 160 feet long, and in some parts 24 inches in diameter, with a screw propeller 24 feet in diameter. The vast wall-sided compartments of the ship had facilities for conversion into cabins for 800 saloon passengers, 2000 second class, 1200 third class, and 400 officers and crew; or 5000 might have been accommodated in all, if emigrants or troops.

Twenty years of the ship's history presented a singular series of vicissitudes. During 1854-57 its building proceeded at Millwall. By November of the latter year the ship had advanced to the launching condition. Either the ship was too heavy (12,000 tons) or the slope was too gradual, for it required various attempts, between Nov. 3, 1857, and Jan. 31, 1858, and an expenditure of £60,000, to effect the launching. During 1858 and 1859 the work continued as fast as the company could supply money. Uncertain how far the original intention of a trade to and from Australia could be realized, the directors determined on a trial trip across the Atlantic. It was a disaster. The ship left the Thames Sept. 8, 1859. An explosion of steam pipes took place off Hastings; seven persons were killed and several wounded, and the voyage abruptly came to an end at Weymouth. The ship started again on June 17, 1860, from South-

ampton, and crossed the Atlantic in 11 days, reaching New York on the 23th. Continuing on this route during the remainder of 1860 and the greater part of 1861, she made many voyages to and fro, continually losing money for the owners and constantly requiring repairs. In December, when political relations with the United States looked ominous, the *Great Eastern* served as a troopship.

In 1864 negotiations were entered into with the Atlantic Telegraph Company and the Telegraph Construction and Maintenance Company for the employment of the *Great Eastern* as a cable-laying ship, and the arrangement and services of the ship in 1865 and 1866 will be found briefly noticed under ATLANTIC TELEGRAPH. In 1867 the vessel was reconverted from a cable-laying to a passenger ship, in order to provide for the travel to the Paris Exposition, and extensive renewals of machinery were made. The ship started from Liverpool for New York in May; but the speculation proved an utter failure.

In 1868 a new arrangement was made by which the ship was to be permanently chartered by the Telegraph Construction and Maintenance Company. The name, which had been changed to *Leviathan*, then to *Great Eastern*, and then to *Great Ship*, was again changed to *Great Eastern*. Between 1869 and 1874 the *Great Eastern* successfully laid some of the most important telegraphic cables—across the Atlantic, in the Mediterranean, in the Red Sea, etc.; in 1884 became a coal hulk in the harbor of Gibraltar; in 1887 was sold, to be broken up, for \$82,500. For increase in size of steamers since the *Great Eastern*, see STEAM NAVIGATION.

GREAT ELECTOR, THE (Der grosse Kurfürst). A name given to Frederick William, Elector of Brandenburg (1640-88), who, because of his wisdom and labors in behalf of his people, is looked upon as the founder of Prussia's present greatness.

GREAT EXPECTATIONS. A novel by Charles Dickens, originally issued in *All the Year Round* (1860 to 1861), published 1861.

GREAT FALLS. A city and the county seat of Cascade Co., Mont., on the Missouri River, 98 miles northeast of Helena; on the Chicago, Milwaukee, and St. Paul and the Great Northern railroads (Map: Montana, E 2). It is in a productive mining region, and is noted for its great copper, gold, and silver smelting and refining works; besides these metals, lead, iron, zinc, gypsum, hematite, bituminous coal, and sandstone are found in the vicinity. The city has also extensive manufactories of flour and mine machinery, breweries, and coal mines; is a great shipping point for wool; and is the distributing centre for a large and rich agricultural and mineral region. There are two steel wagon bridges 1000 feet long, two railroad bridges, a Carnegie library, a fine courthouse, a city hall, a handsome hotel, and a park system which includes seven parks, aggregating 600 acres. The locality presents great scenic attractions. The Missouri here, in a distance of seven miles, has an aggregate fall of 526 feet. The most notable of its waterfalls are Rainbow and Great Falls, from the latter of which the city derives its name. The water power now developed, at medium low water, amounts to almost 200,000 horse power, and this, together with inestimable mineral wealth, has contributed to the importance of the city as a manufacturing and commercial place. Great Falls was settled

in 1884, and incorporated four years later. The government is administered by a mayor, elected biennially, a unicameral city council, and subordinate officials. The city owns and operates its water works. Pop., 1900, 14,930; 1910, 13,948; 1920, 24,121.

GREAT FISH, or BACK, RIVER. A river of the Northwest Territories, Canada, rising in a small lake near the north shore of Lake Aylmer (Map: Northwest Territories, J 1). It flows through Lakes Berchy, Pelley, and Garry, and enters the Arctic Ocean by a wide estuary, off the entrance to which is King William Land, after a northeast course of about 500 miles. It was explored in 1834-35 by Sir George Back (q.v.), who describes the Ah-hel-Dessy, or Parry Falls, on one of the tributaries, as "surpassing Niagara Falls in splendor of effect." Montreal Island, in the estuary, has a melancholy interest in connection with the discovery of the final relics of Franklin in 1850.

GREAT FISH RIVER. A river in Cape of Good Hope Province, South Africa, rising in the Sneeuwberg, or Snowy Mountains, and, after a generally southeasterly course of 230 miles, entering the Indian Ocean about 5 miles northeast of Port Alfred (Map: Cape of Good Hope, H 9). A bar at its mouth renders it inaccessible to ships. The Midland Railway from Port Alfred and Port Elizabeth skirts its banks upward from Commadagga to Middleburg.

GREAT GRIMSBY. See GRIMSBY, GREAT.

GREAT HARRY. A three-masted vessel built under Henry VII in 1509, at a cost of £14,000, the first double-decker to be built in England and the first war vessel of the British navy. She was burned by accident at Woolwich in 1553.

GREAT HARWOOD. A coal-mining town in Lancashire, England, 3 miles northwest of Accrington. Pop., 1901, 12,015; 1911, 13,815.

GREAT HEAD, JAMES HENRY (1844-96). A British engineer and inventor. He was born at Grahamstown, Cape Colony, and went to England in 1869. While studying engineering under P. W. Barlow, he became interested in the shield method of tunneling and in problems of underground railways for city traffic. In 1869 he constructed a subway under the Thames River near the Tower. He engaged thereafter in independent engineering operations, made improvements in his modification of the shield, patented his "Ejector" fire hydrant, and undertook to introduce the Hallidie cable system into England. In 1886 he drove the tunnels by means of the Greathead shield for the City and South London Railway. He also undertook the construction of the Waterloo and City underground line.

GREAT HEART, Mr. The brave guardian of Christiana and her children, and their guide to the Celestial City, in Bunyan's *Pilgrim's Progress*.

GREAT HORNED OWL. See EAGLE OWL.

GREAT KANAWHA, *ká-ng-wá.* A name formerly applied to the Kanawha River (q.v.) of West Virginia.

GREAT LAKES. A series of inland seas comprising Lakes Superior, Michigan, Huron, St. Clair, Erie, and Ontario. They lie on the frontier of the United States and Canada and are drained by the St. Lawrence River into the Atlantic. Their aggregate area is about 94,100 square miles, exceeding that of any other series of fresh-water lakes in the world. Lake Superior, the largest, has an area of about 32,000

square miles. The Great Lakes occupy depressions that are only separated by low reliefs from the drainage system of the Mississippi and from the depression of Hudson Bay, the entire drainage area or watershed plus water surface amounting to 288,245 square miles. Their elevation ranges from about 600 feet in Lake Superior to 234 feet in Lake Ontario, but from Lake Superior to Lake Erie the fall is 36 feet, so that almost the entire descent is accomplished in the Niagara and St. Lawrence rivers. The Great Lakes exercise a very beneficial influence upon the climate of the country immediately adjacent, particularly by moderating the temperature. This explains the extensive development of fruit culture in parts of the Great Lake region, notably in the vicinity of Lake Erie.

The magnitude and importance of transportation upon the Great Lakes are not generally realized. Vessels representing almost one-half of the gross tonnage in the United States merchant marine are found upon the Great Lakes. A greater tonnage annually passes through the Detroit River than that which enters and clears in the foreign trade of the Atlantic and Pacific coast ports. No other artificial channel in the world equals the canal at St. Mary's Falls in the amount of traffic which annually goes through it, the tonnage even exceeding that of the Suez Canal. With respect to rapidity, economy, and efficiency, the lake traffic excels that of the ocean. The coastal line of the Great Lakes touches eight of the States, whose aggregate population is over one-third that of the Union. The sailing distance from Duluth to Buffalo is 997 miles; from Chicago to Buffalo, 929 miles; and from Duluth to Ogdensburg, 1235 miles. The vast region tributary to the Great Lakes is the richest part of the country in the products of farm, forest, and mine. The bulkiness of these products is such that a water route becomes of especial value in their transportation. The greatest significance of the lakes is due to their relation to the mining of iron ore and the manufacture of iron products. Viewed in this light, lake transportation is found to be an important factor in the modern industrial progress and supremacy of the United States. It is generally admitted that but for the cheapness of the lake transportation the iron-ore resources of the Lake Superior region would have been scarcely exploited. Without the supply of iron ore many vast industries could not have thrived.

The nature of shipping and its development have been closely dependent upon the depth of the channels connecting the different lakes, particularly the passages between Lake Superior and Lake Huron and between the latter and Lake Erie. Prior to 1858 the channel entering Lake St. Clair was only 9½ feet in depth, but by means of appropriations of the United States government one of the entering channels was deepened to 13 feet by 1871 and to 16 feet by 1874, in which state it remained until 1887, when the work of deepening began anew, and it was completed to a depth of 20 feet. The Detroit River was not originally so shallow, and with the improvements provided for during the period from 1874 to 1913 a channel 22 feet deep and with a breadth of 600 feet, known as the Amherstburg Channel, was dredged, while a second channel, known as the Livingston Channel, with a least depth of 22 feet, provides a route

for down-bound vessels and facilitates commerce materially. The Canadian government is now constructing a canal from Lake St. Clair to Lake Erie which will greatly shorten the route. The construction of the first canal at St. Mary's Falls was begun under a land grant of the State of Michigan by a private corporation in 1853 and was opened with a depth of 12 feet in 1855. Under an appropriation of the United States government the canal was deepened between 1870 and 1881 to a depth of 16 feet and subsequently to a depth of 21 feet. Under the Act of 1886 a new lock, 800 \times 100 and 21 feet deep, was built and the canal extended. Then in 1907 and 1912 two new locks and canal sections were provided for, and in 1915 these were under construction. These locks are 1350 feet long, 80 feet wide, and 24.5 feet deep at extreme low water. (See SAINT MARYS CANAL.) Canada has also constructed a canal around these falls, which, while used by fewer vessels than the United States canal, is used by the larger craft and in recent years sometimes has accommodated the greater part of the freight. A new lock of increased length, 1715 feet (1350 between inner gates) and 24.5 feet in depth, has been constructed, but the deepening of the approach channels is also involved. In 1914 the Canadian lock afforded a slightly greater draft for down-bound boats and consequently was employed more by heavily laden craft in this direction. No tolls are charged on either canal. The Welland Canal, connecting Lake Erie and Lake Ontario, has been completed by the Canadian government to a depth which admits the passage of vessels with a draft of 14 feet, and through it must go all vessels built on the Great Lakes and designed for deep-sea service. In 1914 a beginning was made on the new Welland Canal (q.v.), capable of taking boats as long as 800 feet and 25 feet in depth. With each successive deepening of the channels the size and draft of the vessels constructed have been increased, with a resulting cheapening of the rates, which in turn has tended to increase the traffic and stimulate the tributary industries. Over \$25,000,000 has been spent in deepening and improving the channels in the upper lakes and their connecting waters. A number of vessels now in use have a draft of 17 feet. Some of them have a length of over 600 feet and carry 12,000 tons of cargo.

Besides their great length these vessels differ from the ocean type in that they are flat-bottomed, the purpose being to carry the greatest possible cargo on the shallow draft to which they are limited. On no other waters is so great a cargo carried on so small a draft. Many of the larger vessels, besides carrying their own cargo, take one or more barges or sailing vessels in tow. Many of the vessels classed as sailing vessels are little more than barges, their sails being spread only when the wind is especially favorable. Prior to 1883 the tonnage of the sailing vessels exceeded that of the steam vessels, but since that date the tonnage of sailing vessels has remained about constant, while that of steam vessels has almost trebled. In 1897 the gross tonnage of steam vessels was 975,000 tons, the sail vessels a little over one-third that amount, and the barges 55,000 tons. In 1912 sailing vessels had a tonnage of 225,114; steamers, 2,575,914; and barges, 100,688. The total gross tonnage of the lakes increased from about 450,000 tons in 1870 to 690,000 tons

in 1886, 1,370,000 tons in 1897, and to 2,949,924 tons in 1912. The accessibility to resources of coal and iron has given the lake region unequaled advantage in the construction of ships. In 1913 the 166 vessels built on the Great Lakes had a tonnage of 80,079 as compared with 302,490 tons for the 1335 vessels built in other parts of the United States. Treaty provisions prevent the United States from building war vessels on these waters. The increase in lake traffic has been much greater than the increase in tonnage. This is due to the greater rapidity both of sailing and of loading and unloading vessels, especially those carrying ore and coal. The efficiency in the latter respect is not equaled in any other part of the world. A round trip from the head of Lake Superior to the eastern Lake Erie ports is now made in 10 days. Thus an average of 20 round trips in a season can easily be made. Freight rates have fluctuated greatly from year to year, so that the comparison of years may be misleading, but the general downward tendency has been very rapid. In 1914 ore was carried at a rate of 45 cents per ton, and on the return journey coal was carried from Lake Erie to Lake Michigan ports at the rate of 35 cents per ton, which was only a small fractional part of the expense by rail. Wheat was carried from Duluth or Chicago to Buffalo at a rate as low as 3½ cents per bushel in 1913, though in the previous year 5 cents per bushel had been secured—nevertheless, a rate that was cheaper than that current in ocean traffic. The fact that coal constitutes a large product for return shipment makes a much lower rate possible than could otherwise be secured. The movement of freight upon the lakes is characterized by the great predominance of the east-going traffic over the west-going trade (especially the east-going traffic from the Lake Superior region), by the importance of the Lake Erie ports for the exchange of the east-going for the west-going products, and by the fact that the bulk of the traffic centres upon a very few commodities.

Formerly the lower lake region was of greater relative importance, but in consequence of the enormous increase in iron mining in the Superior region, and also the increase in lumbering and grain raising in the tributary region, the increase in the tonnage of lake shipments during recent years has been mainly in the tonnage originating in the Lake Superior region. The lake ore shipments in 1913 aggregated 40,070,478 tons. The concentration of the transfer of the east-going for the west-going traffic on the Erie coast is due principally to the fact that it is through these ports the iron ore must pass to reach the coal and the smelting region, while in turn, in consequence of the nearness of these ports to the coal mines, they are the most convenient points for the loading of the coal, which constitutes the bulk of the west-going freight. Lumber also finds the shortest route to the manufacturing centres through these ports, and grain here makes connection with rail routes or the Erie Canal, whence there is easy transit to the Atlantic coast. It is probable that the latter product will be carried on the St. Lawrence route much more extensively than it is when the Welland Canal around Niagara Falls is deepened so as to admit the passage of the large lake vessels. According to the government reports for 1911, the items of domestic commerce, under shipments from lake ports, were: wheat,

42,292,488 bushels; flour, 1,152,807 short tons; coal, 23,148,301 short tons; iron ore, 31,216,248 long tons; and lumber, 1,164,544 M feet. The ports having a tonnage of more than 4,000,000 were in 1911, in descending order, Superior-West Superior, 8,817,305; Milwaukee, 8,429,839; Chicago-South Chicago, 7,797,128; Duluth, 7,343,435; Buffalo, 6,684,001; Cleveland, 5,225,772; Ashtabula, 5,061,140; in 1912, Duluth-Superior (the two ports are now combined), Buffalo, Cleveland, Two Harbors, and Milwaukee. Chicago fell below the 4,000,000 mark.

The registered tonnage passing through the canals at Sault Ste. Marie in 1913 was 37,989,715; the total freight was 79,718,344 short tons, of which 58,654,733 tons passed through the United States canal. The tonnage passing through the St. Mary's Falls canals was valued at \$334,502,686 in 1904 and \$865,907,000 in 1913. The number of vessels entering the main lake ports in the year ending Dec. 31, 1911, was as follows: Chicago, 6179; Buffalo, 2824; Cleveland, 3134; Milwaukee, 5742; Detroit, 3590; and Duluth, 2680. The bulk of the lake traffic is American.

There are numerous harbors along the coast line of the lakes. Many of these havens are shallow, and constant dredging is required to keep them accessible. The national government has expended large sums on harbor improvements. In late years there has been a serious lowering in the level of the lakes' surface, to the great detriment of the harbors. The mean lake level taken as a basis is that for the period 1860-75 and 581.63 feet above mean tide at New York. In 1913 it was stated that at the highest stage the water level on the eastern shore of Lake Michigan was about $\frac{1}{2}$ foot below mean lake level, this occurring in July and August, while the lowest stage is from $\frac{1}{2}$ to 2 feet below the mean lake level and is experienced from November to April. Any lowering of the water level means less draft in freight steamships and lighter loading, and shipping interests have always resisted any attempt to divert water, by the Chicago Drainage Canal (q.v.) or otherwise, that would bring the level down. A change of 1-foot draft on a big cargo carrier means 10 per cent less load. Different plans have been projected for preventing further lowering of the level, and the United States government attempts to regulate the amount of water that may be diverted for any purpose. The International Waterways Commission in a report (1907) recommended the diversion of more than 10,000 cubic feet per second for the Chicago Drainage Canal which previously had been placed at 5000 cubic feet per second (1899) and in 1901 was fixed at 4157 cubic feet—an amount it was retained at notwithstanding petitions for its increase. Dams have been constructed across the exit channels of the lakes. One of the most serious disadvantages with which the lake commerce has to contend is the winter ice, which stops all traffic. The cessation of general lake traffic begins about the first of December and continues four or five months, about 222 days being the average annual time during which the canals are open. Much has been done to continue the period of traffic by the construction of boats with special provisions for ice crushing. Railroad ferryboats have also been constructed which are able to crush their way through thick ice.

The problem of the further improvement and

increase of lake transportation is one of much significance to the country and has occasioned a great deal of interest and speculation. Schemes have been projected with the view to making the lake ports directly accessible to ocean-going vessels, and through waterways from the lakes to the gulf. In fact, it was proposed to accomplish this in connection with the Chicago Drainage Canal. The interests of Canada as well as those of the United States are involved in all proposed improvements of through waterways, thus occasioning a rivalry between the two nations. For instance, there is an all-United States route from the Great Lakes to the sea in the New York State Barge Canal (q.v.), capable of accommodating 1000-ton barges. An all-Canadian route is also proposed to connect the Georgian Bay with the Ottawa River. A proposed international route includes the St. Lawrence River, Lake Champlain, and Hudson River: but such schemes must be understood rather as referring to self-propelled barges than to ocean steamers.

With the growth of cities on the shores of the Great Lakes the preservation of the purity of the waters became a serious question of interest to both the United States and Canada, as such water is used for domestic consumption. On Jan. 11, 1909, a treaty was signed providing that boundary waters "shall not be polluted on either side of the boundary to the injury of health or property on the other." An international joint commission proceeded to investigate the pollution of these waters with a view to determine in what way it may be prevented or remedied according to the terms of the treaty. This commission was still in session during 1914. It found that while the greater part of the water of the Great Lakes remained in its original purity, yet there were certain zones of pollution where the extent of the evil was indeed serious. Purification methods were considered essential where the untreated water was used, and in most cases such methods are being practiced by the cities along the Great Lakes where there is any chance of pollution by sewage or discharge from vessels. Consult: Channing and Lansing, *Story of the Great Lakes* (New York, 1909); Mills, *Our Inland Seas* (Chicago, 1910); Johnson, *Highways and Byways of the Great Lakes* (New York, 1911); also publications of the United States Coast and Geodetic Survey.

The Great Lakes are valuable for their fisheries. The average annual catch by American fishermen (1899 to 1903) exceeded \$2,500,000 in value. In 1908 it equaled \$3,767,000.

GREAT LAKE TROUT. See NAMAYCUSH.

GREAT MANITOULIN. *mān'ī-tōw'lin*. See MANITOULIN ISLANDS.

GREAT MARLOW. See MARLOW.

GREAT MARQUIS, THE. A surname of the famous Portuguese statesman, the Marquis de Pombal (1699-1782), and also of the noted Scottish statesman, the first Marquis of Montrose (c.1612-50).

GREAT MASTER OF LOVE. A title given by Petrarch to Arnaut Daniel, the troubadour who invented the sestina.

GREAT MOGUL. A diamond. See plate of DIAMONDS.

GREAT MOGUL. See MOGUL.

GREAT MOTHER (Lat. *Magna Mater*). An epithet applied by the Romans to the goddess Cybele or Rhea, as the representative of the pro-

creative powers of nature. Consult Showerman, "The Great Mother of the Gods," in *Bulletin of the University of Wisconsin* (Madison, 1901).

GREATOREX, grăt'ô-rêks, ELIZA (PRATT) (1820-97). An American etcher, born at Manor Hamilton, Ireland. She came to New York in 1840 and in 1849 married Henry W. Greatorex, the organist and composer. She studied art in New York in 1854-56 and in Paris in 1862. At first she produced many landscape paintings, but afterward devoted herself to etching and to pen-and-ink work. In 1869 she was elected an associate of the National Academy. About that time she began a series of sketches of historic buildings and scenes in and around New York. She was in Germany in 1870 and in the following year, where she published *The Homes of Oberammergau*. Returning to the United States, she published *Summer Etchings in Colorado* (1873) and *Old New York from the Battery to Bloomingdale* (1876).

GREAT PACIFICATOR, THE. A sobriquet of Henry Clay, based upon his services in harmonizing conflicting interests through the Missouri Compromise.

GREAT PEDEE (pâ-dê' or pã'dã) RIVER. The name formerly applied to the Pedee River (q.v.).

GREAT RAKES, VALENTINE (c.1628-83). An Irish soldier and "healer," born at Affane, County Waterford. At the outbreak of the Irish Rebellion in 1641 he fled to England and for six years lived in the homes of relatives. From 1649 to 1656 he served in Ireland under Cromwell. About 1661 he felt that he had been given divine healing power and had what seemed to be remarkable success in "touching" for scrofula, ague, and other diseases, though an exhibition before the King proved a failure. Several pamphlets by medical men and other critics were published, attributing his cures to miraculous agencies, and in 1666 Greatrakes published a vindication of himself entitled *A Brief Account*, accompanied by numerous testimonials. He retired soon afterward to his estate at Affane, where he died.

GREAT RIFT VALLEY. The name given to a great depression which extends from Palestine in Asia to the southern end of Lake Tanganyika in Central Africa. The depression is formed really by a series of rift valleys which begins in the north with the Jordan and Dead Sea valleys, extending thence through the Red Sea basin to the strait of Bab-el-Mandeb, and across French Somaliland and Abyssinia to Lake Rudolf in British East Africa. Here the depression divides; one branch runs southward to beyond Lake Manyara, and the other takes a westerly course to Albert Nyanza, where it turns southward to the shores of Lake Tanganyika. The Great Rift Valley owes its origin to long parallel fissures or cracks in the earth's crust between which the strata have subsided, forming narrow, elongated troughs. In Central Africa the valley is frequently limited on either side by bare walls of rock which rise precipitously to the level of the adjoining plateau, 4000 to 5000 feet above the sea. Elsewhere the evidence of faulting is not so apparent. Most of the great African lakes are situated in this valley. The formation of the fissures was accompanied by enormous volcanic activity, of which there are evidences in great sheets of lava, extinct volcanoes, and a few active cones. See **AFRICA**.

GREAT SALT LAKE. An extensive sheet of salt water in northwestern Utah, near which is situated Salt Lake City. It lies in one of the great valleys of the Rocky Mountains on the eastern edge of the Great Basin (q.v.), and is about 75 miles long and 30 to 50 miles wide. There are nine islands in the lake, one of which is 16 miles and another 12 miles in length. The lake occupies a shallow depression, with an average depth of less than 20 feet; the surface lies about 4218 feet above sea level. Owing to the annual variation of rainfall in the region, the lake is subject to great fluctuations in area; in 1850 its area was 1750 square miles, but it had increased to 2170 miles in 1869. During the period 1886-1902 the waters subsided considerably and sank to an average depth of 13 feet, the same as 50 years ago. The lake receives from the south, through the Jordan River, the waters of Utah Lake, which are fresh, and from the north the drainage of Bear River, but it has no outlet. Its water is a natural brine, containing from 14 to 23 per cent of saline constituents, according to the level of the lake. Sodium chloride, or salt, is the principal constituent and is estimated at 400,000,000 tons for the whole basin. The manufacture of salt by evaporation of the lake water is an important industry. Several species of insects and a small shrimp (*Artemia gracilis*) have been found in these waters. The first mention of Great Salt Lake was by Baron La Hontan in 1689, who gathered some information concerning it from the Indians west of the Mississippi. It was first explored and described by Frémont in 1843. A survey was made in 1849-50 by Stansbury, and more elaborate surveys in recent years by the United States Geological Survey. Gilbert has shown that the lake in Pleistocene time covered a much larger area. (See **LAKE**.) Garfield Beach, on the southern shore of Great Salt Lake, is a bathing resort visited by many tourists for the novelty of a bath in the waters, which are so heavy that the body easily floats. See **UTAH**.

GREAT SEAL. The official sign of the royal authority in England. All documents of importance emanating from the crown, as grants, charters, and writs, were formerly required to be authenticated by it. It was called "the key of the kingdom," and was intrusted to the Lord Chancellor, who was also known as the Lord Keeper of the Great Seal. In the reign of Edward I it became customary to issue writs under the privy seal, which might be affixed by any secretary of the King, but this practice was forbidden by statute in 1300. By the Act of Union which united England and Scotland under one government (5 Anne, c. 8), one great seal for the United Kingdom of Great Britain is used for sealing writs to summon Parliament, for treaties with foreign states, and all public acts of state affecting Great Britain. The holder of the great seal is still the Lord Chancellor. A seal is also kept in Scotland for sealing grants and writs affecting private rights there. As regards Ireland, the Act of Union (39 and 40 Geo. III, c. 67) provided that various acts, as to summoning Parliament, etc., should be done under the great seal of the United Kingdom; but in other respects the great seal of Ireland is used in the same manner as before the union.

GREAT SLAVE LAKE. An extensive and irregular sheet of water in the Northwest Terri-

stories, Canada (Map: Canada, H 4). It has an area of 7100 square miles. Its greatest length is about 300 miles, and its greatest breadth 60 miles. It is surrounded, especially on the north, by rugged, precipitous, and barren shores; the west shore and its many islands are well wooded. It is wholly frozen over for six months of every year and is navigable only from July to November. On the north it receives the surplus waters of Lakes Aylmer and Artillery, and on the south those of Lake Athabasca through the Great Slave River. Its own surplus is carried off by the Mackenzie River to the Arctic Ocean.

GREAT SLAVE RIVER. A river of Alberta and the Northwest Territories, Canada. It is the outlet of Lake Athabasca into Great Slave Lake and flows in a northwest direction from the former to the latter (Map: Canada, H 4). It is about 300 miles in length; its banks in many parts are well wooded, and its course in the lower part lies through a fertile alluvial region. With the exception of 13 miles of falls and rapids near Fort Smith, it is navigable for river and seagoing steamers during a part of the year.

GREAT SOUTH BEACH. See FIRE ISLAND.

GREAT STONE FACE, THE. One of Nathaniel Hawthorne's short stories, which appeared in 1852 in *The Snow Image, and Other Twice-Told Tales*.

GREAT TOM. A 17,000-pound bell which hangs in the tower of the Tom Gate of Christ Church, Oxford.

GREAT UNWASHED, THE. A designation applied to the multitude. It was used by Sir Walter Scott and is attributed to Edmund Burke.

GREAT VALLEY. The valley between the Blue Ridge and the Alleghanies (qq.v.).

GREAT WALL OF CHINA. See CHINESE WALL.

GREAT WHITE PLAGUE. See TUBERCULOSIS.

GREAVES, grēvz (from OF. *greves*, from *greve*, shin). Pieces of armor used as a defense for the legs, originally made of leather, quilted linen, etc., and afterward of steel hollowed to fit the legs and fastened with straps behind.

GREAVES, grāvz, JOHN (1602-52). An English mathematician. He was born at Colemore, Hampshire, graduated at Balliol College, Oxford, in 1621, and in 1630 became professor of geometry at Gresham College, London. He traveled in southern Europe and Egypt, collecting valuable manuscripts, gems, and coins, and making measurements of monuments. In 1643 he was chosen Savilian professor of astronomy at Oxford, but five years later was ejected by the Puritans. Among his numerous works were: *Pyramidographia, or a Description of the Pyramids in Egypt* (1646); *A Discourse of the Roman Foot and Denarius* (1649); *Elementa Linguae Persicae* (1649). His collected works were published in 1737 by Dr. Thomas Birch, with a biographical sketch.

GREAVES, LAUNCELOT. The hero of Smollett's novel of the same name.

GREBE (Fr. *grèbe*, from Bret. *krib*, Welsh, Corn. *crib*, comb). A bird of the family Colymbidae, having the feet not webbed in the usual manner, but lobate; i.e., with a separate membrane for each toe, united only at the base. The tarsi (shanks) are so much compressed as to be almost like blades. The claws are large

and flat. The bill is about as long as the head, straight and conical. The wings are short. There is no visible tail. The legs are attached so far back that the birds when on land assume an erect position, like penguins. They walk with difficulty, and all their motions on land are awkward. They sometimes shuffle along on their bellies like seals. But in water they are extremely agile; they swim rapidly, dive with extreme quickness if alarmed, and pass to very considerable distances under water. They feed on fishes, batrachians, crustaceans, and other aquatic animals, partly also on vegetable food. They are said sometimes to carry their young under their wings, and even to take them under water with them in diving to escape from enemies. The geographical distribution of the group is very wide, and some of its species are also very widely distributed. Grebe shooting is a favorite amusement in some places. The grebe is pursued by a boat, while it seeks to escape by diving and swimming under water.

One incentive to this hunting is the demand of fashion for grebe skins. The plumage of the breast is very dense, silky, and warm, and has been in great vogue for women's muffs and for hat and dress trimmings. Thousands of these interesting birds are sacrificed yearly for these trivial purposes—a slaughter which ought at once to be stopped. None of the grebes are bright-colored, black, brown, gray, and white being the usual shades, but a few forms have steel-blue, tawny, or rich reddish-brown markings on the head and neck. When in full breeding plumage some have the head ornamented with handsome tufts. In this condition their appearance is very different from that of the young or the adults in winter. Rather more than 20 species of grebes are known, of which at least half a dozen are North American. The best known of these is the dabchick, which is closely allied to the European little grebe (*Colymbus ruficollis*). The American dabchick, or pied-bill grebe, or hell-diver (*Podilymbus podiceps*), is a common bird from the Argentine Republic northward to Hudson Bay, and it breeds locally throughout its range. It winters from the middle United States southward. It is small, not much more than a foot long, brownish black above, fading into pure white on the belly. The bill is light bluish, encircled by a broad black band. The dabchick is an exceptionally expert swimmer and can swim for some distance with only its bill above water. The nest is made of vegetation in the water, sometimes practically floating on the surface, so that the young can take to the water as soon as they are hatched.

The largest American species is the Western grebe (*Aechmophorus occidentalis*), which is from 2 to 2½ feet long, and has a straight, slender, and acute bill, 3 inches long. There are two very distinct varieties, one much smaller than the other, but both are common in the western United States. The red-necked grebe (*Colymbus holboellii*) is another large species, 19 inches long, found throughout North America, but in the United States only in winter. Two of the commonest American grebes are the horned grebe (*Colymbus auritus*) and the American eared grebe (*Colymbus nigricollis californicus*). The former is found throughout North America, the latter only west of the Mississippi. The smallest American grebe is the Mexican grebe (*Colymbus dominicus brachyp-*

terus), which is found in the warmer parts of America and only as far north as the valley of the Rio Grande. It is less than 10 inches long, the bill is very short, and there are no crests or ruffs. The great-crested grebe of Europe (*Colymbus cristatus*) is a large and conspicuous species, 2 feet long; its occurrence in North America seems to be very doubtful. See Plate of ALBATROSS, AUKS, ETC.

GRECCHETTO, grĕ-kĕt'tō, IL. See CASTIGLIONE, GIOVANNI BENEDETTO.

GRECHANINOFF, grĕ-chā-nĭ'nōf, ALEXANDER TREKHONOVICH (1864-). A Russian composer, born in Moscow. He received his first musical training at the Moscow Conservatory under Safonoff. In 1890 he entered the conservatory in St. Petersburg, where he studied composition for three years with Rimsky-Korsakoff. The following year his string quartet, op. 1, won a prize and attracted considerable attention. Before long he had gained fame as one of the foremost Russian composers of sacred music, although outside of his native land he is best known through his songs and instrumental works. His compositions include two symphonies, two string quartets, incidental music to Ostrovsky's *Snegouruchka*, to A. Tolstoi's *Czar Feodor* and *Czar Boris*, songs, and piano pieces. Two operas, *Dobrynya Nikitich* (1903) and *Scur Béatrice* (1912), exhibit strong dramatic talent.

GRECIAN COFFEEHOUSE. A well-known place of meeting for the wits of the eighteenth century, situated in Devereux Court, London.

GRECIAN DAUGHTER, THE. Arthur Murphy's best-known tragedy, produced in 1772 and played as late as 1830.

GRECIAN GAMES. See GAMES, ANCIENT.

GRECO-. See GRÆCO-

GRECO, EL. See THEOTOCOPOULI, DOMENICO.

GREECE. A kingdom occupying the southern prolongation of the Balkan Peninsula, between the Ægean and Ionian seas. Its mainland extends southward from about lat. 41° 30' N. to Cape Matapan in lat. 36° 23'. On the north, the only land boundary, lie Albania, Servia, and Bulgaria. Greece includes, in addition to the provinces on the mainland, numerous islands, in both the Ægean and Ionian seas. The total area, 41,933 square miles, includes newly acquired (1912-13) territories aggregating 16,919 square miles, made up as follows: Adrianople, 112 square miles; Saloniki, 9300 square miles; Janina, 2801 square miles, and Monastir, 4706 square miles; in other words, the area of Greece is nearly that of England. The above figures of additions of 1912-13 do not include the Ægean islands added by the treaties of London and Athens, of which the details are not yet complete. The area was reduced to the extent of 170 square miles by the Treaty of 1897, ending the war between Greece and Turkey, which added some parts of northern Thessaly to the Ottoman domain.

Topography. The coast waters are shallow and penetrate far into the land, deep gulfs on opposite coasts dividing the mainland into northern and central Greece and the peninsula of Peloponnesus, or the Morea. The Peloponnesus is connected with central Greece by the Isthmus of Corinth, which at its narrowest part is only 4 miles wide, and which is pierced by a ship canal. No other country in the world has so large a proportion of coast to area as Greece. It has a mile of coast for every 10 miles of

surface. The country is nearly cut in two by the gulfs of Corinth and Ægina. In spite of this fact Greece is not rich in good harbors (except in a few central and highly favored parts of the country), owing to a wall of mountains which rises from the shore on long stretches of the coasts. Though the east coast has many fine ports, the harborless shores include the entire east sides of Thessaly and of the long island of Eubœa, and the east side of the Peloponnesus, south of the Gulf of Argolis to the most southern rock mass of Cape Malia. Volo, on the gulf of that name, is the only port of Thessaly. The accession of Saloniki surrounding the Gulf of Saloniki gives Greece a northern seaport. The best harbor facilities are found in the beautiful Gulf of Ægina, where the fine natural harbor of the Piræus is the port of Athens, 6 miles inland. Still farther south the shores of the Gulf of Argolis, penetrating deeply into the Peloponnesus, are rich in harbors. The gulfs of Ægina and Argolis have always been the centre of Greek sea life; and the Gulf of Ægina contributed in no small measure to the influences that made Athens the centre of Greek culture. The south coast of the Peloponnesus is deeply indented by the Laconian Gulf (Gulf of Marathonisi, or Kolo-Kythia) and the Messenian Gulf (Gulf of Koroni). The west coast of the Peloponnesus is flat, low, and but little indented, while the north coast, washed by the waters of the Gulf of Corinth and its entrance, the Gulf of Patras, is high and steep, with a good harbor at Patras near fertile and highly cultivated plains. The west coast north of the Gulf of Patras is swampy in the south, high and mountainous in the north, but of small importance in the sea trade.

In its surface forms Greece preserves the characteristic aspects of the broader mass of the Balkan Peninsula (q.v.) to the north of it. It is preëminently a mountain land, the ranges of the Balkan Peninsula extending into and through the country. The wild chain of the Pindus, which extends from the Albanian frontier southeast to the head of the Gulf of Corinth, a dominating feature, forms the water parting and sharply divides the western from the eastern part of Greece. West of the Pindus the ranges of the Dinaric mountain system, which parallels the shores of the Adriatic farther north, pass through Greece to the south end of the Peloponnesus. These chains are crowded so closely together that the valleys are very narrow, and there is little development of high mountain plains. The mountain chains of eastern Greece, on the other hand, are broadly distinguished from those of the west by the fact that their main direction is east and west. On the whole, the mountains are of only medium elevation, though Parnassus, the best-known summit of the eastern ranges, rises in the very heart of Greece to a height of 8070 feet; and Mount Taygetus, the culminating point of the Dinaric system in the Peloponnesus, is 7903 feet high.

The chains, frequently connected with one another by spurs, make a network of mountains throughout the country. The result is that Greece has no great middle point upon which its highways and activities converge. It is divided into a large number of small districts which are reached with difficulty over the mountain roads. The great bond of union is the sea,

BALKAN STATES
TURKEY, RUMANIA,
BULGARIA, YUGO-SLAVIA,
ALBANIA AND GREECE

whose deep bays and gulfs serve the trade of the interior. Greece is rich in contrasts of color and in picturesque beauty; and the charm of its landscapes is especially emphasized along the coastal indentations where the glowing colors of the bare mountain walls contrast with the deep blue of the sea between them. While there are many small plains among the highlands, the only great plains are those of Thessaly in eastern Greece. They are surrounded by mountains and nowhere reach the sea; comparatively level and woodless, but covered with alluvium, they are very fertile, the granary of the kingdom, the region where landscapes are most smiling and vegetation is most luxuriant. The Thessalian plains are separated by highlands extending northwest and southeast about midway between Larissa and Trikala. There are many small fertile plains in Boeotia, Messenia, Argolis, and along parts of the coast. Macedonia, including Saloniki and Monastir, the extreme north of Greece, contains many fertile hill-girdled plains, yielding grain, tobacco, and, on the coast, olives.

All the Grecian islands are mountainous. They were once a part of the mainland, and the largest island in the Aegean Sea, Eubœa, is still so regarded, as it is separated from central Greece only by the narrow Strait of Euripus, which at Chalcis is little more than 100 feet wide. Eubœa is the prolongation of the coastal mountains of Thessaly. The Grecian islands in the Aegean Sea are of small fertility, though some islands of the Cyclades, particularly Naxos and Santorini, produce excellent fruits and wine. A chain of volcanic islands bounds the Cyclades on the south; and the little group of Santorini, midway between Europe and Asia, is one of the four centres of volcanic action in Europe. The eruptions of 1866 resulted in the appearance of some new small islands. The Ionian Islands near the west coast far surpass the Cyclades in size and fruitfulness. Encircling their central mountains are hilly lands and plains of extraordinary fertility. Corfu (the ancient Corcyra) is the largest of the group, the other important islands being Santa Maura (Leukas), Cephalonia, Ithaca, Zante, and Cerigo (Cythera).

Hydrography. The rivers of South Greece are small, and none of them are important for navigation or water power. As in some other Mediterranean regions, water flows only periodically in most of the river beds, which are dry through the greater part of the year. Only the largest rivers carry water to the sea at all times. Many of the rivers are swallowed up in "sinks" in the limestone regions, reappearing far below and leaving large areas of parched lands which, if water were available, might be made very fertile by irrigation. The most important river is the Achelous, emptying into the Ionian Sea, north of the Gulf of Patras. The chief rivers of the Peloponnesus are the Alpheus and the Iri (Eurotas); of Macedonia are the Kara Su, the Vardar, and the Vizritsa rivers. During the autumn rains floods are very frequent in the rivers, nearly all of which, rising in the mountains, are torrential. Corfu is the only island that can boast of a small perennial stream, the Messongi, which is navigable for a short distance. Lakes are numerous among the mountains. One of the largest, Lake Copais in Boeotia, has been converted into a fertile plain by drainage. Some lakes have no visible

outlet, but the waters are sweet; their outlets are underground conduits leading through the limestone to rivers or directly to the sea.

Climate. While the climate of the main mass of the Balkan Peninsula gradually approaches that of the Mediterranean countries, the Mediterranean subtropical climate prevails in Greece except on the higher elevations. The climate has two peculiarities. One is the extreme heat and cold occasionally recorded. The hot enervating sirocco blasts from Africa make some of the summer days almost unendurable, so that during their prevalence labor in the fields of Thessaly is carried on at night; and winds from the neighboring snow mountains of the north tend to intensify the winter cold. The other peculiarity is the contrasts in climate that neighboring localities present, due to the great diversity of the surface. While the lowlands have hot, dry summers and autumn and winter rains, the mountains are much cooler and have summer rains. There is little frost or snow in the lowlands, but the mountains are covered with snow in winter. The rainfall is considerable among the mountains of the west, while excessive droughts prevail in the east, so that many farm crops cannot be grown without irrigation. The soil is only moderately fertile except where much alluvium has overspread the rocks, as in Thessaly, where the land is very productive. The formation of humus is slow and meagre. Many slopes have been washed bare of soil by winter rains, so that much land once tilled has been abandoned.

Flora. Greece is very poor in timber, not a thirteenth part of the country being woodland; and numerous herds of goats tend to kill the young growths and prevent the rehabilitation of the forest areas, which were once far more extensive. The nature of the flora varies with altitude, three distinct zones being recognized. All the fruits and grains of the Mediterranean lands are raised from the sea level to an elevation of 1500 feet. The tree zone is mainly between 1500 and 5000 feet, the oak and beech predominating in the lower, and conifers in the higher, altitudes. There are still some fine forest areas among the mountains. Alpine conditions prevail above 5000 feet, where only a few wild plants find a foothold in the thin soil. Many of the mountains are almost bare of vegetation; and the natural vegetation on the plains only consists of grasses, scattered clumps of evergreen shrubs, and small patches of woodland.

Fauna. The bear, boar, fox, wildcat, lynx, and jackal are the most conspicuous wild animals. Several varieties of deer, hare, and rabbit, besides quails, partridges, and pheasants, are the game animals.

Geology. West Greece, including two-thirds of the mainland and nearly all the Peloponnesus, is composed of the long, parallel limestone ridges of Tertiary formation, of the Dinaric mountain system, the narrow troughs that separate them being schists and sandstone. This mountain region is a part of the Karst system which extends along the Adriatic; for, farther north, it exhibits the characteristic Karst phenomena of caverns, sink holes, and underground river channels, leaving much of the land dry and relatively barren. Some of the limestone has hardened into the purest marble. The same limestone formation built up the Ionian Islands, once a part of the mainland. The rocks of

northeast Greece are of a different character, being the continuation largely of crystalline. Farther south, the eastern part of central Greece, the island of Eubœa, and the northeastern part of the Peloponnesus are covered with mountain chains of Mesozoic limestone extending in curves from west to east. The crystalline rocks of the Cyclades form the mountains, comparatively low, of these islands. Severe earthquakes often originate among the mountains. Greece is not rich in minerals, though the argentiferous lead mines of Laurion, near the southeastern extremity of Attica, yield about 16,000 tons of lead a year. There is no coal except the lignite found in Eubœa and other parts. The lack of fuel prevents the large exploitation of the copper and iron fields, though important quantities of iron and zinc ores are obtained. Paros and Pentelicus yield fine marble, and emery is obtained in Naxos and other islands. Sulphur (about 600 tons a year) is mined in Melos and Santorini. In Macedonia gold and silver were formerly mined, but the mineral resources are not properly utilized.

Agriculture. As cultivation depends largely upon irrigation, which is very unequally distributed, the tilled lands in most parts of the country resemble oases. Cereals occupy about half of the tilled lands, but wheat is among the imports, the home supply being inadequate. Rice is grown in the lowlands of Elis, and maize, barley, and oats are raised to some extent. The food requirements of the population are so far in excess of production that the imports of cereals average about 30,000,000 francs per annum. The Greek currant (a small seedless grape), grown extensively on some of the Ionian Islands and near the gulfs of Patras and Corinth, is a large crop and the staple of agricultural exports. This industry has passed through a series of vicissitudes in recent years. The falling off in production of grapes in France, due to the phylloxera, led to heavy imports of the Greek currants in a dried state, and, as a result, the production of currants in Greece doubled between 1873 and 1886, the other crops being neglected meantime. As the production of grapes in France returned to nearly normal, the demand for the Greek currants was greatly reduced, and various attempts have been made to retain the industry by the use of the surplus in manufacture of wines and spirits, a limitation of exports and in recent years a limitation of production. About 7000 acres of the currants have been uprooted in accordance with the law limiting production to a certain area and quantity, and a further reduction was still required in 1913. The vine is of first importance in Greek agriculture, the area in vineyards having increased from 125,000 acres in 1860 to 173,000 acres in 1901 and 337,000 in 1906. While currants are the chief crop, the production of wine has increased and the quality has in later times improved. Being rich in alcohol and color, Greek wines are bought by many French merchants to mix with home vintages. As the Greeks live largely on vegetables and fruits, gardening is a great industry, well-tilled areas being very numerous near the towns and on the plains. Flax, hemp, tobacco, cotton, and the mulberry tree supply the industries with raw material. The cultivation of flax and hemp has decreased on account of Russian competition, but tobacco, yielding excellent leaf, is an increasing crop, particularly on the plains of Argolis

and around the Gulf of Corinth. Mulberry plantations abound in the Peloponnesus and Eubœa, where raw silk is produced, both for home industry and export. Cotton is raised in the Peloponnesus, but finds the most congenial soil and climate in Thessaly and Bœotia. During the Turkish domination olive growing steadily declined, as one method of punishing insurrection was to destroy the olive trees. Since 1830, however, the planting has rapidly advanced, and olives are to-day one of the best resources of the Greek peasantry. The trees have increased from 2,000,000 to 15,000,000 since Greece won independence, and the output of olive oil for 1911 amounted to 150,000,000 pounds. Fruit trees are important, above all in the Ionian Islands and the Ægean Archipelago, oranges, lemons, figs, and pomegranates leading in production. The most important domestic animals are sheep, of which the number is about 3,000,000, and goats, from whose milk butter and cheese are made. Goats are raised everywhere, but the large flocks of sheep are found mostly on the plains of Thessaly. Bee culture is important, and the honey of Hymettus is famous. The country abounds with fragrant flowers that give to honey a particularly delightful savor. While agriculture is the chief resource of the people, the prevailing poverty of the soil is a great drawback, and an undue proportion of the peasants are attracted from labor in the fields to the life of the sailor, and the loss of population by emigration is large. The land is largely in the hands of peasant proprietors, though there are some great estates, particularly in Thessaly. Of the total area of Greece, as it existed before the large additions made in 1912-13 as a result of the Balkan wars, there are approximately 5,200,000 acres cultivated and fallow, and 7,000,000 pasture, 2,000,000 forest, and 3,000,000 waste land. The productive power of the land depends largely upon the water supply, and a plan for the creation of hydraulic works for the drainage of certain areas and irrigation of others is under consideration. About one-half of the 58,000 acres occupied by Lake Copias has been reclaimed by drainage and is now extremely productive. The producing power of the land is limited by the custom of allowing about one-half of the arable area to lie fallow in alternating years.

Manufactures. Most of the common articles used in Greece are the product of home industry. Cloths and carpets are woven by peasant women in their houses, and the metal and leather goods industries employ thousands of men in their small shops. The poorer classes derive most of their manufactured articles from the home industries. The development of large industries is discouraged by the fact that Greece has neither coal, wood, water power, nor adequate capital. Since 1870, however, the industrial arts have made important progress, and the government does all in its power to stimulate manufacturing. The cotton cloths now produced in the factories of the Piræus and other centres supply most of the home needs and are even exported to Turkey. The Piræus is the largest industrial centre. It has a number of cotton, silk, and wool factories, many flour mills; it builds ships and makes alimentary pastes. The number of factories in the neighborhood of the Piræus is now over 100. Larissa is also prominent in the cotton and silk industries. Sparta and Athens weave cheap silks, and Patras spins much cotton

yarn. The metallurgic industries are little developed, though some machinery is made at Syra and a few other towns. The principal industries are those which transform agricultural and animal products into manufactured commodities, such as soap works, tanneries, powder and dynamite factories, distilleries, and refineries. Sponge fisheries are actively carried on in the Ægean Sea and along the coasts of Tunis and Tripoli, and the preparation of sponges for market is a considerable industry. As the sea trade is largely developed, ships are built in all the ports, the industry being most active in Syra and the Piræus.

Commerce. The following figures show the average volume of the special trade of Greece (i.e., the commerce exclusive of the forwarding trade):

	1879-83	1891-95	1905	1912
Imports	\$24,500,000	\$22,500,000	\$25,740,000	\$30,793,000
Exports	13,500,000	17,000,000	16,268,000	28,987,000

The chief imports in 1911 were: agricultural products, chiefly wheat, \$10,850,000; cotton, wool, and other fabrics, \$3,950,000; forest products, \$2,410,000; manufactures of metals and minerals, \$5,100,000; drugs and chemicals, \$1,600,000; live stock, \$801,000; animal products, \$1,102,000; and fish, \$1,506,000. Currants are about one-fourth of the exports. The chief exports in 1911 were: agricultural products, mostly currants, \$14,102,000; raw metals and minerals, \$4,601,000; manufactures of metals and minerals, \$151,000; wine and spirits, \$3,498,600; oil, etc., \$1,672,000; animal products, \$1,009,000; and forest products, \$741,000. Great Britain has the larger part both of the import and export trade, usually selling to Greece about one-fourth of her purchases (woven goods and yarns, coal, iron, and machinery), and buying from her about one-fourth of her sales (mainly currants, besides lead, iron, zinc and silver ores, raisins, sponges, and valonia). The convenient communications between South Russian and Greek ports give Russia an equal place with Great Britain in the value of the imports, most of the merchandise drawn from Russia being foodstuffs and petroleum; Austria-Hungary, Turkey, Egypt, Germany, France, and Italy are the other important buyers and sellers. According to the official returns of the United States, which differ materially from those of Greece, the exports to Greece in 1913-14 were \$1,216,205, and the imports from Greece \$3,179,618.

Banks. The Ionian Bank, established in 1839, with headquarters in London, and the National Bank, dating from 1841, with which was incorporated the Epiro-Thessalian Bank in 1900, are the chief institutions of their kind in the country; they issue notes. There are numerous private banks, and since 1899 an agricultural bank has been in operation at Patras with the object of freeing agriculturists from usurious money lenders. The currency of the country is officially stated in 1912 at 5,000,000 drachmas (drachma, 19.3 cents) gold; 3,000,000 silver; and 20,800,000 uncovered paper. Greece entered the Latin Monetary Union in 1868, and her standard coin, the drachma, became equivalent to the franc in value.

Transportation. As the sea is the main highway, both in the domestic and foreign trade, the

completion of the Corinth Canal across the Isthmus of Corinth, in 1893, was a most important addition to commercial facilities. This canal, 4 miles long, connects the Ionian and Ægean seas and gives a much shorter and smoother passage between Italy and Odessa and for all the small vessels plying between the ports of north and central Greece than that around the south end of the country. The narrowness of the canal, the strength of the current passing through it, and the high tolls charged on foreign vessels have prevented its use to the extent expected, especially by the vessels of other nationalities. In 1912 the Greek merchant marine consisted of 379 steamers of 690,573 tons, and 811 sailing vessels of 145,284 tons. More than half the trade is carried through the port of Piræus. The Greek flag is more prominent than any other in the shipping trade of the eastern Mediterranean ports, and there are several thousands of small trading craft. The islands are the great centre of sea life. The little island of Syra, in the centre of the Cyclades, has long been the largest trader in the Ægean, though its importance has for some time been declining. A large part of the shipping of Greece belongs to the Ionian Islands. In 1910, 2741 vessels of 3,762,000 tons entered, and 3005 vessels of 4,100,000 tons cleared at the port of Piræus, which has about three-fifths of the total shipping of Greece. The railroads are as yet very inadequate for the needs of the country, only 850 miles having been in operation in 1911. The railroad northward from Piræus has been completed to the Turkish border with the purpose of connecting with the railway lines of that country; but the Turkish government long refused its assent, and in 1913 plans were entered upon for linking up the Piræus-Larissa Railway with the European system by way of lines in Macedonia, and thus bringing Greece into rail communication with the rest of Europe.

Government. Greece is a constitutional monarchy, the sovereign being entitled "King of the Hellenes." The reigning King (1914) is Constantine I (q.v.), born Aug. 2, 1868; ascended the throne, March 18, 1913, on the assassination of his father George I, who had occupied the throne since 1863. The legislative power is vested in a Chamber of Deputies (the Boule), which meets annually in Athens, the 235 members being elected by popular vote for a term of four years. The suffrage is restricted to males, 21 years old or over. Members of the Boule, and all officials, must be at least 30 years of age. There is also a body designated the Council of State, which has certain veto powers over the decisions and acts found to be contrary to law. The executive functions of the state are in the hands of the six heads of departments, who compose the ministry.

Defense. Military service is compulsory for 2 years in the active army, and for 11 years in the first reserve and 9 years in the second, followed by 7 years in the national guard. The army on a peace footing numbered in 1911 about 25,000, and on a war footing about 85,000. This will, however, be materially increased as a result of the large additions to the area and population of Greece which followed the Balkan wars in 1912-13. A royal decree in August, 1913, directed a reorganization in a manner which would create six army corps, to consist at first of two divisions, each division to include three infantry and one artillery regiments, one battalion of

cavalry, a company of sappers, and the usual departmental troops. Later the number of divisions in each army corps is to be increased to three. It is estimated that the new system will at the end of 21 years give an available military force of over 400,000 men. The navy, reorganized in 1906 and subsequently strengthened, included in 1912-13 4 ironclads, 1 modern cruiser, 14 destroyers, 13 torpedo boats, and 2 submarines, and this was further strengthened in 1914 by the purchase from the United States of two battleships of about 15,000 tons' displacement, at a price of \$12,500,000 for both vessels. The navy is to be further reorganized under the advice of British officers. See NAVIES.

Finance. The average annual revenue was approximately \$28,000,000 in 1912, of which about one-half was from duties and excise, the remainder from monopolies, direct taxes, stamps, and miscellaneous. This will be greatly increased by the additions to area and population noted elsewhere. The debt in 1912 was \$207,000,000. The monetary unit is the drachma, equivalent to the franc. The gold coins of the leading countries are accepted, by royal decree, as legal tender. The metric system of weights and measures was introduced in 1898.

Population and People. The population of Greece was shown by the census of 1907 to be 2,632,000 and estimated at 2,666,000 in 1909. This was, however, greatly increased by the additions of territory as a result of the Balkan wars (q.v.) in 1912-13. The increase of area, amounting to about 80 per cent, caused an equal percentage of increase in the population. With this addition the population was estimated in 1914 to be 4,363,000. These additions to area were chiefly from Macedonia, Epirus, Crete, and other islands, and the population absorbed was largely of Greek stock. There are about 3,000,000 Greeks in Asia Minor, nearly 1,000,000 in European Turkey, about 500,000 in the Ottoman islands, Cyprus, and Crete, and considerable numbers in other parts of the Old World, while about 300,000 have come to the United States. There are also many in Egypt and in the various European countries. Over 200,000 non-Greeks reside in Greece, of whom the Albanians, the most numerous body, are becoming largely assimilated with the native population. The Greeks surpass all the other peoples of the Balkan Peninsula in homogeneity and national unity, and in this way, as well as in commerce and navigation, have shown themselves to be worthy successors of the old Hellenes in spite of the misrule and other misfortunes which for centuries tended to impoverish the soil and decimate the population. Most of the people, as well as their government, are poor. Foreign capital has to a large extent made public improvements and brought about development in manufacturing. Provisional census of 1920, 5,941,077.

Ethnology. In racial characteristics the Greeks belong to the Mediterranean race and are akin to the Iberian of Spain and the Ligurian of Italy. They are above the average in height (1.65 millimeters, or 5 feet, 6 inches), dolichocephalic (index 75.7 to 83 according to mixture), with dark skin, hair, and eyes. The face is a long oval, and the features are most attractive. Where those of shorter skulls or lighter color have crept in, the effect is seen in the population. Slavs, Avars, Turks (Ural-Altaic), and Albanians (Adriatic or Dinaric race) have invaded Greece and added their racial characters

to those of the older population. The Greeks of classic times were of the long-headed Mediterranean type, as the crania that have been recovered show, though their statuary, as is pointed out by Stephanos, is brachycephalic. In speaking of the ancient inhabitants two names stand out prominently for recognition, that of the Hellenes and that of the Pelasgians. Relying chiefly on the testimony of Herodotus, Sergi places the Pelasgians in the great Mediterranean family, where, before Greece was Hellenized, they completed the circle formed else by Iberians, Ligurians, and Libyans. This aboriginal Pelasgian stock was Hellenized afterward, just as the inhabitants of Gaul and Spain were Latinized. Behind the classic age lay the age of bronze and the age of stone. But the scarcity of osteological material renders it impossible to form opinions on the race of the men who peopled them.

In Ætolia, Acarnania, Thessaly, the greater part of the Peloponnesus, and most of the islands, the descendants of the old Greeks are still predominant; but a very large admixture of Albanians (see ALBANIA) prevails in Attica, Boeotia, Phocis, and Argolis, with the islands of Spezzia, Salamis, Hydra, and Andros. The true Greek is easily recognized by his tall stature, slim body, aquiline nose, oval face, and mustache, the beard being worn only in mourning. The Greeks are temperate in both eating and drinking; flesh is seldom eaten, so that the diet is principally vegetable. The Greeks are devotedly attached to their fatherland, and their love of liberty and independence is strong. Though they are loyal to a good ruler, they are easily roused to resistance by the infringement of their rights. Commercial bargains are the delight of the Greeks. Early marriages are common, and the Greek matrons take pride in large families. Two peculiar branches of the Greek race are the Mainotes of the Peloponnesus and the Palikars of the northern highlands. The former, who boast to be the descendants of the ancient Spartans, inhabit principally the mountain fastnesses of Taygetus, where for centuries they defied the power of the Turks. In recent times education, intermixture with other races, and commerce have to a great extent removed their distinctive peculiarities. The red cap, the white shirt, and the golden jacket mark out the Palikars even to the casual observer as a separate class. They go about armed and attended by armed followers; their houses are fortresses, and their servants form a little army. The islanders are almost all seamen or traders; they wear the red cap, a short jacket, and wide Turkish trousers. The Albanians are a strong, hardy race, and engage in agriculture or other severe labor. The Wallachs, of whom there are a considerable number in the region of the Pendus, are a nomad and pastoral race; they sleep on the hillsides with their flocks, which are guarded by ferocious dogs. There are large numbers of Maltese at Athens, and especially the Piræus. The settlers from west Europe are not numerous. There is a considerable Turkish element in Thessaly.

Religion. The predominant religious faith is Orthodox Greek, which is the state religion, though the fullest liberty is given to all sects. The ecclesiastical authority of the Greek church is no longer vested in the Patriarch at Constantinople, but in a council known as the Holy Synod, under the presidency of the Metropolitan of Athens. The Christian sects, other than

Greek, number about 25,000; Jews, 5000; and Mohammedans, 20,000. See GREEK RELIGION (ancient); GREEK CHURCH.

Education. During the fifth and fourth centuries B.C. the education of the Greek boy was divided into three branches: (1) gymnastics (*γυμναστική*), including all forms of physical training, wrestling, running, leaping, etc., taught by a trainer (*παιδοτρίβης*), at a *palæstra*. (2) grammar (*γραμματική*), including reading, writing, and the elements of numbers—in this school the boy learned by heart many of the ancient poets and studied carefully their works; (3) music (*μουσική*), an essential part of a Greek liberal education, including singing and playing on the lyre. This training lasted from about the sixth to the eighteenth year. Further training in philosophy and rhetoric was in the hands of the Sophists (q.v.). The boy was accompanied to and from school, and in his exercise, by a pedagogue, who was not a teacher, but merely a slave, who had general oversight over the boy and could punish him if necessary. In later times other branches, notably geometry, were added to the usual training, and in some places schools were provided by the city for boys and even girls. For the education of the youth by the state, see EPHEBUS.

In modern days education from the humblest school to the university is free to all. In the rural districts, however, the law requiring all children to attend school is not well enforced. Education is upon a somewhat higher plane among the islands than on the mainland. The school system is only partly supported by the government, being largely dependent upon private contributions. Fifteen per cent of the army recruits can only read, and 30 per cent are totally illiterate. The University of Athens, with 3500 students in 1912, attracts over 800 students from Turkey and other Mediterranean countries, chiefly from Turkey. There are also a polytechnic and two agricultural schools, a military academy, and several naval schools.

HISTORY

Ancient History. (See paragraph in this article under *Ethnology*.) The Hellenes, or later inhabitants of Greece, were a branch of the Indo-European, also called Indo-Germanic or Aryan, speech family. (See GREEK LANGUAGE.) They are supposed to have entered the country at a remote period from the north and the northeast in successive waves of migration and were composed of various independent tribes. It was not until after the time of Homer that they received the common name "Hellenes" (q.v.). By Homer they are called Danaans, Argives, and Achæans, while the Hellenes were in his time a small tribe in Thessaly. The name "Greeks" was another tribal name, generalized by the Italians. The early history of the Greeks is one of fable, wherein the achievements of centuries are compressed into single generations, and the movements of whole peoples are described as the adventures of heroes. To this so-called Heroic age belong the deeds associated with such names as Heracles (see HERCULES), Theseus, and Perseus, and the great undertakings known as the Argonautic Expedition (see ARGONAUTS), the Expedition of the Seven against Thebes (q.v.), and the Siege of Troy (q.v.). Much light is thrown upon the civilization of the earliest period by the remains found in Crete, at Mycenæ, Tiryns, and many other places. See the full discussion under ARCHEOLOGY, II, Minoan, or, *Ægean, Period*, and III, *Mycenæan Period*.—In the paragraphs that follow the reader may largely supplement the information there given by referring to the articles on the several countries, cities, men, and institutions (such as *boule*, *ecclesia*) there mentioned.

The first truly historical landmark in the history of Greece is offered by the so-called Dorian migration. (See DORIANS; HERACLIDÆ.) The waves of migration which as early as the Stone age had peopled Greece with the tribes from the north were continued from time to time after the country had been occupied. One such wave was that of the Dorians, who, at some time roughly placed between 1200 and 1000 B.C., descending from their mountainous home in the central part of northern Greece, overran the Peloponnesus and enslaved or drove out the former inhabitants of the land. One of these displaced tribes, the Achæans (see ACHÆA; ACHÆANS), settled on the southern shore of the Corinthian Gulf, expelling the Ionians, who took refuge in Attica. (See IONIA.) The story of these migrations is compressed into a

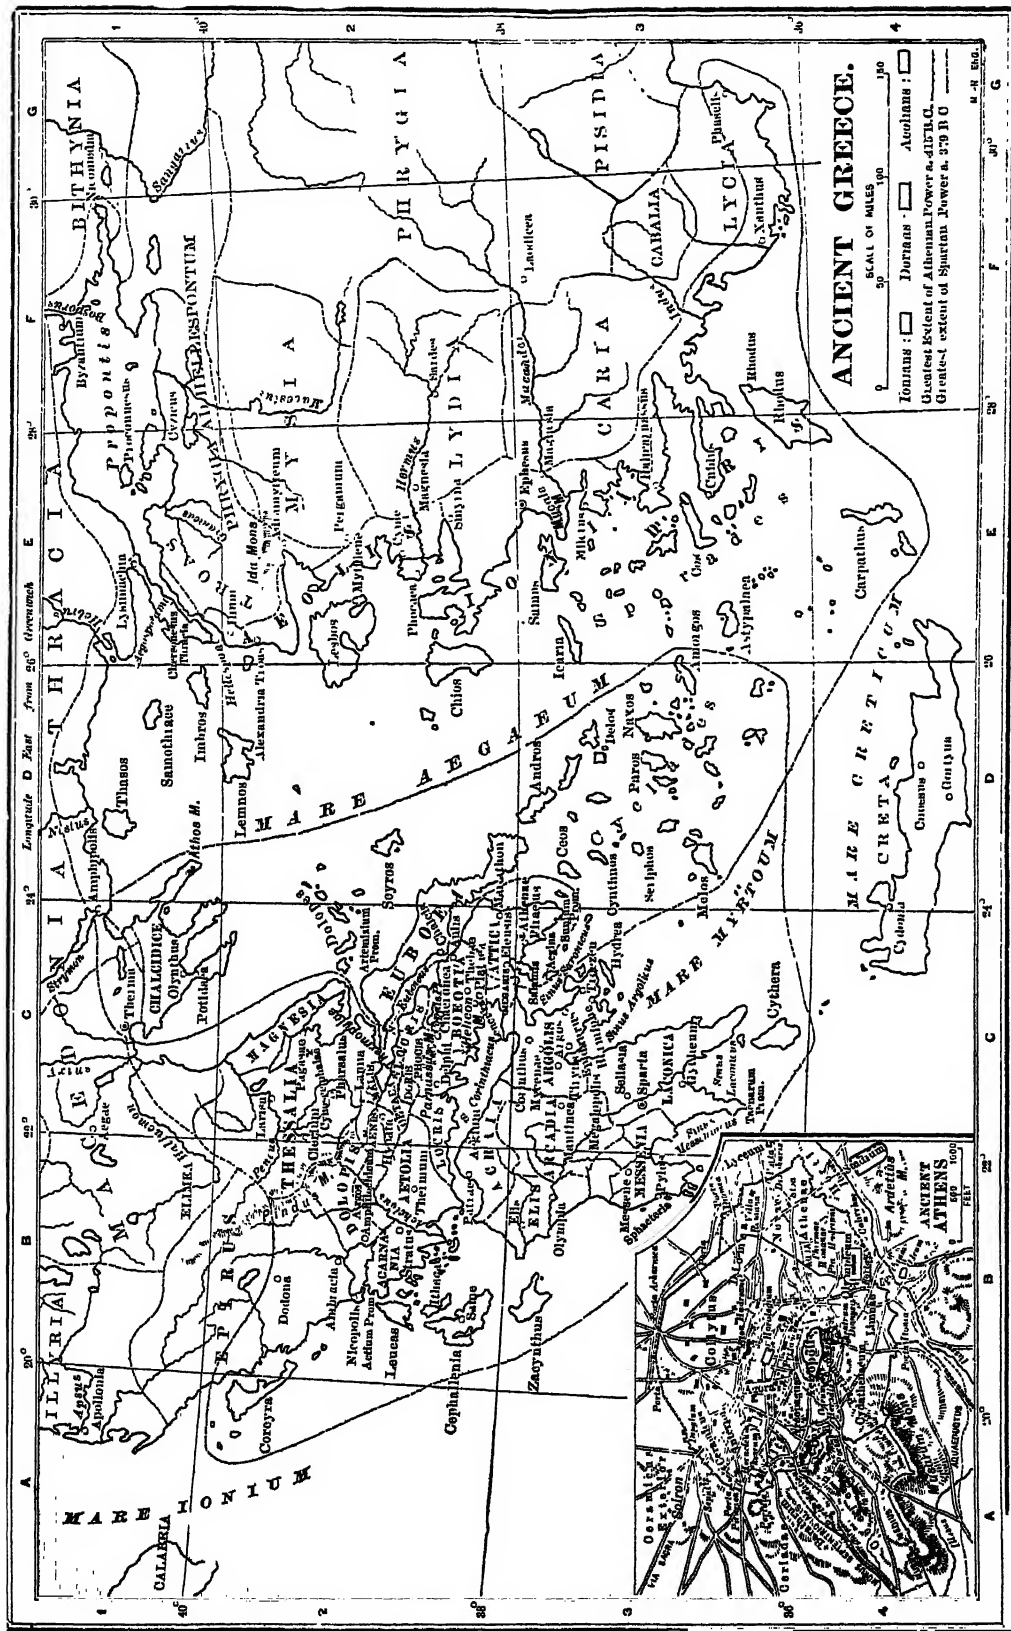

single generation, but it doubtless represents the conquests of at least two or three centuries. One of the effects of the movement was the colonization by Greeks of the lands farther east—the islands of the Ægean Sea and the coast of Asia Minor. The expelled peoples were obliged to seek new homes, and three important streams of colonization poured across the sea: the Æolians (q.v.), so called, who settled the islands and the coastland to the north; the Ionians, who settled the islands of the central Ægean and the middle portion of the Asiatic coast; and the Dorians, farther south, who occupied Crete and other islands and the south-western coast of Asia Minor. Several centuries later, in the eighth and seventh centuries B.C., another great colonizing impulse spread through the Grecian lands; the cause of this impulse, however, was not external pressure, but internal expansion. This movement carried Greek civilization to Sicily, south Italy (Magna Græcia), Africa, and other regions.

The history of Greece is for the most part one of individual states, each fired with the spirit of independence and the desire for freedom, and each seeking to solve the problem of national development in its own way and according to its own impulses. In one work Aristotle (q.v.) described the constitutions of 158 Greek states! The two states which became most prominent, and with which history has principally to do, are Athens (q.v.) and Sparta (q.v.). Sparta from early times held the lead in the Peloponnesus, where Argos was long her rival. In the seventh century B.C. she subdued Messenia (q.v.). Her peculiar political and social institutions are ascribed to the lawgiver Lycurgus, who, according to the common tradition, lived in the ninth century B.C. At the head of the government were two hereditary kings; but their power was limited, and in historical times was confined to certain priestly functions, the command of the army in war and the enjoyment of a position of honorary distinction in the state. The actual power was vested in the ephori (q.v.).

The development of the Athenian political system was carried further than that of the Spartan system. The regular course of political history in the Greek states was this: The kingly form of government, which was prevalent in the Heroic age, gave place at a later time to an oligarchy based on birth; this in turn became transformed into a one-man power, or "tyranny," unconstitutional or extraconstitutional; and the "tyranny" was finally replaced by a government of the people, or democracy. The history of Athens illustrates this course of development, and the names of Solon (archon, 594 B.C.), Cleisthenes (about 508 B.C.), and Pericles (in the latter half of the fifth century B.C.) are landmarks in the development of the Athenian democracy. Pisistratus and his sons (560-510 B.C.) mark the period of "tyranny." The chief officers and bodies of the Athenian democracy were the nine archons, the Areopagus, the Senate, the Ecclesia, or public assembly, and the Helias, or law courts. By the side of Athens, Sparta, and Argos, Corinth early rose to prominence, developing into a great industrial, commercial, and colonizing centre. On the constitution of the Greek states, consult: Gilbert, *The Constitutional Antiquities of Athens and Sparta* (Eng. trans., London, 1895); Gardner and Jevons, *A Manual of Greek Antiquities* (2d ed., ib., 1898); Whibley, *A Companion to Greek Studies* (Cam-

bridge, 1905); Busolt, *Die griechischen Staats- und Rechtsaltertümer* (2d ed., Munich, 1892); Greenidge, *Handbook of Greek Constitutional History* (London, 1896).

The Greek settlements in Asia Minor were conquered by Cræsus, King of Lydia, in the early part of his reign (560-546 B.C.), and brought within the Lydian Kingdom. In 546 Cræsus was overthrown by Cyrus the Great, King of Persia, and the Greek cities in Asia, as well as the islands along the coast, with the exception of Samos, were made subject to the Persians. In 500 B.C. the Ionians revolted against the Persian rule and were assisted by 20 Athenian and five Eretrian ships; Sardis, the capital of Lydia, was taken, sacked, and burned. The ire of Darius, the Persian king, was aroused, and he vowed vengeance both on his revolted subjects and on their supporters from across the sea. In 493 B.C. the rebellion was brought to an end by the subjection of the Ionians (q.v.), and in the following year Mardonius, son-in-law of Darius, was sent to Greece to take vengeance on the Athenians and the Eretrians. Three hundred ships and 20,000 men were lost in a storm off Mount Athos, and Mardonius himself, who led an army by land, was so harassed by the tribes of Thrace that he was obliged to turn back. Two years later, in 490 B.C., a second expedition, consisting, according to ancient authorities, of 600 galleys, 100,000 foot and 10,000 horse, was sent across the Ægean, under the command of Datis and Artaphernes. After taking the city of Eretria the Persians proceeded, under the guidance of the aged Hippas, son of Pisistratus, to the plain of Marathon, 22 miles northeast of Athens. In the battle which there took place, 10,000 Athenians were assisted by 1000 heavy-armed soldiers and a few light-armed troops from Plataea. A messenger had been sent for aid to Sparta, but, from a religious superstition, the Spartans were prevented from marching for five days, and the crisis was then past. The Greeks, led by Miltiades, were overwhelmingly victorious; 6400 Persians were lost, while only 192 Athenians were killed. (For an elaborate discussion of this battle, consult Macan's edition of Herodotus, 4 vols., London, 1895-1908, and How and Wells, *Herodotus*, vol. ii, Oxford, 1912.) In the following year Athens found herself at war with Ægina. This war taught her the necessity of having a navy, and she was induced by Themistocles to construct a fleet of 200 vessels and to add 20 new vessels thereto every year. In the meantime Xerxes, the Persian king, was preparing for an invasion of Greece on a grand scale. Troops and supplies were brought together from every quarter of his Empire, until the largest army of which history has a record was assembled. A bridge of boats was thrown across the Hellespont for the convenience of the land troops, a canal was cut through the neck of the peninsula of Athos for the passage of the ships, and in the spring of 480 B.C. the force was set in motion. The first stand was made by the Greeks at Thermopylae. The pass was heroically defended by Leonidas and his 300 Spartans, but was finally taken through the treachery of a Greek, who pointed out to the Persians a path by which they were enabled to enter the pass from the rear of the Spartans and to destroy them between two fires. Athens was captured and burned, having been, at the approach of the Persians, abandoned by its inhabitants. In the meantime the Persian fleet,

after undergoing severe losses in storms and in battle at Artemisium, off the northern end of the island of Eubœa, proceeded to Salamis in pursuit of the Greek fleet. The number of the Persian vessels at Salamis was about 1200; that of the Greeks less than 400, 200 of which were Athenian. In the battle which took place in the narrow strait between the island and the mainland, and which Xerxes viewed from a golden throne erected on the slope of Mount Egaleus, on the mainland west of Athens, the Persians were completely defeated. Xerxes fled in alarm to Asia, leaving Mardonius to bring the war to a close. In the following year (479 B.C.) Mardonius was overwhelmed by the Greeks, under Pausanias, at Platœa and slain, and on the same day another Persian army was defeated, with loss of its fleet, at Mycale in Asia.

Athens was now, as a result of her patriotism and sacrifices, the first state in Greece, and her position was further strengthened by the events that followed the Persian wars. The treachery of Pausanias, the commander in chief of the combined Athenian and Spartan fleet which was engaged in driving the Persians from the Greek cities in the Ægean and in the neighborhood of the Hellespont, caused the fleet to put itself under the leadership of the Athenian commanders, and in 478 B.C. was formed the Confederacy of Delos, or Delian League, on which the future empire of Athens was to be built. This confederacy was at first a voluntary coalition of Greek states formed for the purpose of prosecuting the war with Persia and driving the Persian power from the Ægean Sea and the lands washed thereby. The delegates were to meet yearly on the island of Delos, and there was also to be the treasury. A fixed contribution in ships or money was assessed on each state. Gradual changes were, as time went on, wrought in the relation of the allies to one another, and the alliance of equal independent members was at length transformed into an empire of dependent states, with Athens at the head.

The period between 479 and 431 B.C., the year of the beginning of the Peloponnesian War, was the most brilliant in the history of Athens. The latter part of this period, called the age of Pericles, saw the complete democratization of the Athenian constitution. The Long Walls (q.v.), connecting Athens with the port of Piræus, were now built, the city was beautified with many public buildings, the Propylæa, the Parthenon, the so-called Theseum, and others, and sculpture, art, and literature flourished. (See GREEK ART, II, *Attic Period*.) But irritation at the oppression of Athenian control, and the old spirit of independence, which always stood in the way of Greek unity, were silently at work: the height of Athenian power is marked by the battle of Cænophyta (456 B.C.) and the conquest of Bœotia; in 447 B.C. Bœotia revolted, and the Athenians were defeated at Coronea. By the treaty which was then made the Athenians engaged not to interfere further in Bœotian affairs, and, by the Thirty Years' Truce, concluded two years later (445 B.C.), they acknowledged the leadership of Sparta in all Peloponnesian matters.

The situation of affairs in Greece at the time of which we are speaking was as follows: On one side was Athens, with her empire of subject and mostly discontented allies, comprising all the coast cities of Asia Minor as far south as Lycia, the cities along the Thracian

and the Chalcidian shores, and nearly all the islands of the Ægean; and on the other, Sparta, with her voluntary confederacy of free and independent states, among which were numbered nearly all the states of the Peloponnesus, some in northern Greece, and those of Italy and Sicily. Athens was a maritime power, with an efficient navy of 300 galleys; Sparta was preëminently a land power. Athens had a full treasury and a large annual revenue; Sparta was financially weak. Athens was democratic and progressive; Sparta was aristocratic and conservative. It was inevitable that the question of supremacy should at some time come to an issue between these two. The struggle was precipitated by the contentions between Corinth and her colony Corcyra, and the revolt of Potidæa from the Delian League. The war which now broke out in 431 B.C., which is known as the Peloponnesian War, lasted until 404 B.C., and resulted in the complete abasement of Athenian pride and the establishment of Spartan supremacy. It may be divided into three periods: (1) from the beginning to the Peace of Nicias (421 B.C.); (2) from the Peace of Nicias to the Sicilian expedition (415 B.C.: see ALCEBIADES; SICILY; SYRACUSE); (3) from the Sicilian expedition to the end (404 B.C.). The most important events of the first period were the surprise of Platœa by the Thebans (431 B.C.), the fall of Mitylene (427 B.C.), the capture of Platœa by the Spartans (427 B.C.), the siege and capture of Sphacteria by the Athenians (425 B.C.), and the defeat of the Athenians by the Spartans at Amphipolis (422 B.C.). The Peace of Nicias, which was a peace in name but not in fact, left the two contending parties in practically the same relative position as before the war. In the second period there was more or less fighting between the different states of Greece, but no great battle. The ill-advised Sicilian expedition (415-413 B.C.) portended the ultimate result of the long contest; it left Athens broken and exhausted. The battle at Arginusæ (406 B.C.) was an Athenian victory, but the capture of the Athenian ships at Ægospotami in 405 B.C. put an end to the war. Athens surrendered to the Spartan commander, Lysander, her walls were demolished, her ships were given up, she was deprived of her foreign possessions, and an oligarchical government was established in the city.

The body which was now set up at Athens consisted of 30 members and was known as the Thirty Tyrants. Similar bodies of 10 were everywhere established by Lysander in the democratically ruled cities of Asia Minor and the islands. It soon became apparent, to those who had chafed under Athenian rule, that the rule of Sparta was destined to be much more harsh and oppressive than that of Athens had been. A change of feeling took place in many quarters. The Athenian exiles, joining under the lead of Thrasybulus, seized the fort of Phyle, a few miles north of Athens, entered the Piræus, defeated in battle the forces of the Thirty, and secured the deposition of the Thirty and the appointment of a Council of Ten in their stead. These were later replaced by another board of 10, and a reconciliation was effected. The democracy was restored (403 B.C.) 16 months after Lysander had taken Athens.

The period of Spartan supremacy extended from the close of the Peloponnesian War to the battle of Leuctra, in 371 B.C. In 399 B.C. war

broke out between Sparta and Persia, and in 397 B.C. Agesilaus, the King of Sparta, was sent to Asia to bring it to an end. He met with success and was about to carry the war into the interior of Asia, when he was called home to oppose a coalition of Greek states which had been formed against Sparta. The struggle that ensued is known as the Corinthian War. In 395 B.C. Lysander, in command of a Spartan army, was defeated and slain by the Thebans at Haliartus. The allies were defeated by Agesilaus at Coronea in 394 B.C., but in the same year the Lacedæmonian fleet was defeated by Conon and Pharnabazus at Cnidus. Conon, returning to Athens, restored the fortifications of the Piræus and the Long Walls. The Corinthian War was continued in a petty way, and with varying fortune, until in 387 B.C. Sparta, with the aid of Persia, imposed upon the Grecian states the disgraceful Peace of Antalcidas (q.v.), in which the interests of the Asiatic Greeks were sacrificed. Five years later, in 382 B.C., Sparta treacherously seized the citadel of Thebes and overcame the Chalcidian city of Olynthus. Thebes was soon freed again by the Theban patriot Pelopidas, and fighting was resumed between Athens, supporting Thebes, and Sparta, which was concluded in 371 B.C. by the Peace of Callias. Thebes refused to sign the treaty, and the Spartans invaded Bœotia. The issue was determined by the battle of Leuctra (371 B.C.), in which the Thebans, led by Epaminondas, thoroughly defeated the Spartans.

The period of Theban supremacy, which now began, lasted nearly 10 years, to the battle of Mantinea, in 362 B.C., and was the supremacy principally of one man, Epaminondas. Democracy was once more predominant. The Peloponnese was invaded, Arcadia was formed into one state, with a new city, Megalopolis, as the head, and Messenia was made independent of Sparta. Athens united with Sparta in resisting Thebes, and in the battle of Mantinea (362 B.C.), though the Thebans were victorious, Epaminondas was killed. Athens now tried to reestablish her empire over her former allies, but without success; the Social War (c.357-355 B.C.) secured the independence of nearly all the states.

In the meantime there was coming into prominence north of Greece a new power, which was destined to absorb within itself all the Grecian lands. This power was that of the Macedonians, a race akin to the Greeks, but looked upon by the Greeks as barbarian. Philip, the son of Amyntas II, became King of Macedonia in 359 B.C., and, after establishing himself firmly on his throne, at once proceeded to annex the Greek colonies on the coast of Macedonia and Thrace. One by one they fell into his hands—Amphipolis, Pydna, Potidæa, Methone, and the others. He next took steps to gain a footing in Greece, and the opportunity was offered him by the Sacred War between Thebes and Phocis, which broke out about 357 B.C. The Amphictyonic Council, influenced by Thebes, inflicted a heavy fine on the Phocians for having tilled certain waste ground belonging to Apollo, and the latter obtained the support of the tyrants of Phœræ in Thessaly. Thereupon the noble Thessalians invited Philip to enter Greece and lend them his aid, an invitation he was only too ready to accept. Entering Thessaly, he went as far south as Thermopylæ, but was there met by an Athenian force and prevented from proceeding farther. Returning to Thrace, and continuing his con-

quests in that direction, he in 347 B.C. took the Chalcidian town of Olynthus, and soon after the whole Chalcidian peninsula fell into his hands. Though opposed by a party at Athens, led by the orator Demosthenes, he advanced almost unchecked, accomplishing as much by bribery and deception as by force of arms. He received at the hands of the Amphictyons the two votes in their assembly to which the Phocians had been entitled, but of which they had been deprived, and also a share in the presidency of the Pythian Games. Being once more invited into Greece, this time by the Amphictyons to take part against the Locrians, he advanced into Bœotia, and was met by the Bœotians and Athenians at Chæronea (338 B.C.); this battle was a victory for Philip and the death knell of Grecian independence. A congress of Greek states, held at Corinth in the next year, recognized Macedonian supremacy in Greece and appointed Philip commander in chief of the Greek forces. Philip immediately began preparations for invading Persia, but was assassinated in 336 B.C., and his son, Alexander, 20 years of age, succeeded him.

At the death of Philip a general rising against the power of Macedonia was threatened, but it was quickly suppressed by the energy of the new king. Having made an example of Thebes, which he razed to the ground, he set out in 334 B.C. on his famous invasion of Persia. The conquests of Alexander in the East extended Greek influence and Greek civilization and language throughout a great part of Asia. He founded Alexandria, which, under the Greek dynasty of the Ptolemies, soon rose to be the greatest centre of civilization in the world. Alexander died at Babylon in 323 B.C., and his empire was divided among his generals. Among those who shared in this partition of power were Perdiccas, Antipater, Crateras, Antigonus, Eumenes, Ptolemy Lagi, Lysimachus, Polysperchon, Cassander, Seleucus, and Demetrius Poliorcetes. Of the states established by the successors of Alexander, the so-called Diadochi, the most important were the Greek Kingdom of Egypt (the realm of the Ptolemies) and the Kingdom of Syria (the realm of the Seleucids). Later the Kingdom of Pontus rose to great power under the Greek dynasty. An effort was made by Greece to throw off the yoke of Macedonia, and the war, called the Læmian War, was ended by the victory of Antipater, Regent of Macedonia, at Crannon in 322 B.C. In the wars of the successors of Alexander, Greece was often the battlefield of the contending forces. Two attempts were made in this period at federation. The Achæan League (see ΑΧΑΪΑ), formed about 280 B.C., included Athens and other cities of north Greece, and Corinth, as well as much of the Peloponnese. The abilities and patriotism of Aratus and Philopœmen (the latter styled the "last of the Greeks") shed lustre upon this confederacy, which for many years maintained the cause of Greek independence (i.e., freedom from Macedonian control) against foreign conquerors. The Ætolian League (q.v.) was formed in central Greece, but was less famous than the Achæan. In 197 B.C. Philip V of Macedon was defeated at Cyncephalæ by the Romans, and in 196 B.C. the freedom of Greece was proclaimed by the victorious Roman general Flamininus at Corinth. In 168 B.C., by the battle of Pydna, and in 146 B.C., with the destruction of Corinth by the Roman general Mummius, Greece passed completely into the hands

of the Romans, who made of it a province, under the name of *Achæa* (q.v.).

Foreign Rule. From the completion of the Roman conquest by the capture of Corinth in 146 B.C. until the outbreak of the Mithridatic Wars in 88 B.C., Greece enjoyed a just and wise administration under the Romans, and the country prospered. The nationalist revolt which followed the first successes of Mithridates against the Romans changed these conditions. Athens was sacked by the forces of Sulla in 86 B.C., and Thebes was reduced in the following year. The hand of Rome fell heavily upon the rebellious cities, and that decline began from which the country never recovered. Under the emperors Greece enjoyed renewed tranquillity, its supremacy in thought and letters was recognized, and there was a partial return to prosperity. The Emperor Hadrian and Atticus Herodes (q.v.), the friend of the Antonine emperors, did much to restore the splendor of the ancient civilization. In the middle of the third century A.D. this condition was disturbed by the Gothic hordes, which overran the peninsula, captured Athens, and laid waste the cities of Argos, Corinth, and Sparta. (See *GOTHIS*.) Christianity, after the third century, spread rapidly in Greece in spite of the opposition it had to meet from the philosophers of Athens, which to the end remained the centre of pagan culture. When the world empire founded by the Romans fell to pieces before the attacks of the northern barbarians, the eastern half, which embraced all that was Greek, continued its existence as the Byzantine, or Greek, Empire. But this Greek Empire, with its seat at Constantinople, which outlived the Western Empire by a thousand years, until it was extinguished by the Turks in 1453, was the mixed Oriental Greece, not that classic Hellas that had been the bulwark of the Western world. (See *BYZANTINE EMPIRE*.) The life of the true Greece was obscured for several centuries, only appearing as the peninsula became an object of conquest or an arena of strife. Before the final division of the Roman Empire the rulers of Rome attempted to Romanize the East by introducing into the language of the period a mingling of Latin and Greek, known as *Romaic*; but they failed to overcome the strong race characteristics of the people. From the sixth to the eighth century Slavic peoples from the north crowded into the Balkan Peninsula. The invaders were merged to some extent with the ancient race and remained in occupancy of Illyria and Thrace, producing a mixture of nationalities which constitutes at the present day one of the chief elements of confusion in the puzzling problems of the Balkan Peninsula. The ambition of the Frankish leaders of the Fourth Crusade and the greed of Venice interrupted the continuity of Byzantine rule, establishing the short-lived Latin Empire of the East (1204-1261), and dividing the Hellenic peninsula into a number of feudal fiefs, of which the Duchy of Athens was the most prominent and the longest lived. Held for a century (1205-1308) by the Frankish house of De la Roche, then for a few years by that of Brienne, the duchy became after the conquest by the Catalan Grand Company (q.v.), in 1311, an appanage of the Kingdom of Aragon. In 1385 it was acquired by the Florentine family of Acciajuoli, under whom it remained until the Turkish conquest in 1456. During this period the court of Athens was one of the most brilliant of the

feudal courts of Europe. Soon after the capture of Constantinople in 1453, Mohammed II turned his attention to the Morea and Attica, and by 1460 they had been completely subjugated. The Turkish conquest, sending thousands of Greeks into exile, spread the intellectual influence of the race through the West and promoted the revival of learning in Europe. (See *RENAISSANCE*.) The Venetians still held many places in the Greek islands, and defended them obstinately in an almost constant series of wars until 1718; but gradually the islands, like the mainland, fell into the hands of the Turks. The great naval battle of Lepanto (*Naupactus*), won by the allied papal, Spanish, and Venetian fleets, Oct. 7, 1571, gave the Christian powers a temporary advantage which they failed to follow up. Venice lost Crete in 1669, but in 1684 the Venetian Admiral Morosini opened a vigorous campaign, which resulted in 1687 in the conquest of the Morea and of Attica. During the siege of Athens (1687) the Parthenon was ruined by the Venetian bombardment. The Peace of Carlowitz in 1699 left the Morea alone in the possession of Venice; and in 1715 this was again conquered by the Turks after a feeble defense, and by the Peace of Passarowitz (1718) the Ottoman Empire remained in full possession of Greece. The country was administered in the usual Turkish fashion. It was divided into pashalics, within which the pashas ruled autocratically, being held accountable only for a certain amount of revenue, which they wrung from the unfortunate people. The same was true of officials of lesser rank, beys and agas, within the districts intrusted to them. Prostrated under an alien and irresponsible tyranny, the country lapsed into anarchy and poverty. All over Greece many of the more vigorous and independent of the people adopted the wild, free life of *klephts*, or brigands, having their lairs in the mountains and waging unceasing warfare against the Turks. Among them the spirit of independence was kept alive, although with a total disregard for authority. Terrible as was the rule of the Turks, they allowed two institutions to exist which acted as powerful forces towards maintaining intact the nationality of the Greeks. One was the Greek church, the other the system of local self-government. In the eighteenth century Russia sought to extend a helping hand to the Greeks, her coreligionists, but little of moment was achieved. Large numbers of Greeks found a field for their activity in commerce and navigation, and they preserved the national life from stagnation and kept the people in touch with the outside world. Those who resided in foreign countries under freer governments, many of whom acquired wealth and influence, remained devoted to the fatherland and fostered the spirit of independence by helping to establish national institutions of learning. At the close of the eighteenth century the trade of the ports of Greece and of the Greek islands assumed great proportions, and the merchant marine became a school whence was to issue a large array of naval heroes.

The War for Independence. At the beginning of the nineteenth century the Greeks everywhere began to plan for a national revival, the chief agent being a great secret association, the *Heteria*, which extended wherever in the world Greeks were to be found loyal to the national cause. The way for such a movement had been prepared by the labors of the patriot scholar Coray (q.v.), who had devoted himself to the

task of restoring the classic language of ancient Hellas, with the conscious purpose of effecting thereby a resurrection also of the old national spirit. In March, 1821, at Jassy, the capital of Moldavia, Alexander Ypsilanti, head of the Heteria, expecting aid from Russia, raised the standard of revolt, and the 10 years' struggle was opened. Ypsilanti's daring deed soon ended in disaster, but it was the signal for a great uprising, which at once began in the Morea. The Porte sought to check the revolt by wholesale massacres and executions, but the rebellion grew in spite of constant defeat. The people revived the memories of the ancient Greeks by their heroic deeds, on land and sea, under the lead of such men as Kolokotronis, Ypsilanti, Mavrokordatos, Bozzaris, and Miaulis. Tripolitza, in the Morea, the capital of that pashalic, was captured by the Greeks, Oct. 17, 1821. At Epidaurus in January, 1822, the first National Assembly framed a constitution. The war was waged with savage ferocity by both sides. The Greeks slaughtered the Turks in Morea, while in March occurred the terrible massacres perpetrated by the Turks on the island of Scio (Chios), when about 25,000 people were slain within a month and thousands more were sold into slavery. In spite of these atrocities, however, the members of the Holy Alliance, at the Congress of Verona in the last months of 1822, called upon the rebellious Greeks to return to their obedience. Among the deeds of the patriots in the year 1822 was the destruction of the Turkish admiral's ship at Chios (night of June 18-19), and of another vessel of the line (in November) by the fire ships of Kanaris, and the victories of Kolokotronis over the invading Turkish army in the Morea. In August, 1823, occurred the brilliant exploit of Marco Bozzaris (q.v.) at Karpenisi, near Missolonghi. Funds to aid the patriots were obtainable only on exorbitant terms, but the generous contributions of wealthy Greeks and of sympathetic foreigners (see *PHILHELLENES*) maintained the long struggle against fearful odds. Among those who stirred up Europe in the cause of Greek independence was Byron. The Sultan at last called in Mehemet Ali (q.v.), who had already made a sinister reputation in Egypt, to suppress the rebellion. An Egyptian army of 11,000 men under Ibrahim Pasha landed in the Morea in February (1825). Navarino was taken in May, Tripolitza in June, and within half a year the entire peninsula had been subjugated. In April, 1826, the Turks took Missolonghi, after an heroic defense of a year on the part of the Greeks, and on August 15 Athens was taken by storm. The misfortunes of the Greeks during this period of the war were due in great measure to the dissensions between the Constitutional party and the supporters of a military dictatorship. A temporary reconciliation between the two parties was effected in 1827, and in March the National Assembly at Træzen amended the constitution so as to provide for a single executive. Count Capo d'Istria (q.v.) was chosen President and assumed the government at the beginning of 1828. Party quarrels, however, broke out again almost immediately. On June 5, 1827, the Greek garrison in the Acropolis of Athens, which had held out after the lower town was taken, capitulated. The Greek cause seemed in a most deplorable condition; but the probable results of Turkish success in strengthening the power of Mehemet Ali in Egypt stirred the European cabinets at last to intervention. The Lon-

don protocol of July 6, 1827, signed by England, France, and Russia, called for an armistice and intervention. The Porte, still supported by Austria, refusing to hear from the Powers on the subject, the allies strengthened their naval forces in the Mediterranean. The defiant action of Ibrahim Pasha precipitated the desperate battle in the Bay of Navarino. October 20, in which the combined Egyptian and Turkish fleet was practically destroyed by a much lighter force. Soon after a French force landed in the Morea, and Ibrahim Pasha found himself compelled to withdraw his army. The onslaught made by Russia upon the Ottoman Empire in 1828-29 finally forced the Porte to accept a settlement proposed by the Powers. In the Treaty of Adrianople (q.v.) between Turkey and Russia, Sept. 14, 1829, the Porte pledged its consent to whatever arrangements the Powers might conclude in respect to Greece. The London Protocol of the Great Powers, in February, 1830, declared Greece an independent kingdom, but with boundaries shrunk from those that had been agreed upon at London in 1829, and was accepted by the Porte. In that country meanwhile the cessation of war had been followed by a period of great unrest. Great dissatisfaction was felt with the course adopted by Capo d'Istria in neglecting to call the popular assembly, and in ruling after the manner of a dictator. Capo d'Istria was assassinated Oct. 9, 1831, in Nauplia, and Greece was for a short time ruled by a regency of seven men. On May 7, 1832, after long negotiations with various foreign princes, Otho, the second son of King Louis I of Bavaria, was made King by the Powers and landed in Greece early in the following year. The reorganization of the country was undertaken under a Bavarian regency, the King being only 17 years of age. A loan of 60,000,000 francs was guaranteed by the Powers. King Otho came of age in 1835, and in the same year the seat of government was transferred from Nauplia to Athens.

Recent History. The Greeks believed in constitutional government and in the principle of popular participation in the political life of the state. This was denied to them under the Bavarian rule, constitutions being frowned upon by the continental Powers at that time. Thus the government was out of touch with the people, and the discontent was increased by the faulty administration of the finances, which burdened the country with unprofitable taxation. England and France urged upon King Otho the advisability of giving the people a constitution, but he delayed until the revolution was already under way. This broke out in a bloodless way at Athens, Sept. 15, 1843, and the King was compelled to dismiss his advisers and to grant a constitution. The new constitution, however, did not restore the local self-government so dear to the Greek nor satisfy the aspirations of the people. At the opening of the war between Russia and Turkey in 1853 Greece invaded Thessaly and Epirus, hoping that the time had come to recover the Hellenic heritage. To prevent any alliance between Greece and Russia, French and English forces landed at the Piræus in 1854 and remained in occupation until 1857. This incident increased the national discontent with the King and his government. The popular feeling, stimulated by the example of a regenerated Italy, took revolutionary form in 1862. In February the garrison at Nauplia revolted, and that of

Athens followed in October. Otho was deposed and, failing to obtain the support of the Powers, was compelled to leave the country. The choice for a new sovereign finally fell upon the second son of the King of Denmark, who became King of Greece as George I. The choice being acceptable to England, that country in 1864 ceded to the new monarch the seven Ionian Islands, which since 1815 had constituted a republic under a British protectorate. This was an important accession, as the islands were prosperous and had constantly desired reunion with Greece. By the constitution of 1864 the legislative functions of government were vested in the Boule, comprising a single chamber, elected by universal suffrage for a term of four years. So demoralizing had been the experience of the country that brigandage was not suppressed until 1870.

Perhaps the greatest national aim of the constitutional kingdom has been the restoration of the historic Hellas; and the dissatisfaction of the people with existing territorial conditions has been a continual disturbing element in the Eastern situation. The Congress of Berlin (q.v.) in 1878 recommended a readjustment of the unfair and unscientific northern boundary; but Turkey refused to make the concessions demanded, and war between the two countries seemed inevitable. Finally, after protracted negotiations, the Powers in 1881 accepted the compromise offered by the Porte, giving Greece all Thessaly south of the northern watershed of the Salammbria, including Larissa and Trikala, and in Epirus running the boundary along the Arta River, leaving Arta to Greece—an addition of 13,000 square kilometers, with a population of 300,000. Greece was not satisfied with this settlement, but accepted it as the best arrangement possible at the time. The island of Crete was regarded by the Greeks as a natural Hellenic possession, and the desire for its union with the kingdom was intensified by sympathy for the Cretans under Turkish misrule. The bloody conflict between the Christians and Mohammedans that broke out in Crete in 1896 led Greece to make an attempt to annex the island. This action brought about the interference of the Powers, who decreed the autonomy of Crete and proceeded to compel Greece to withdraw her forces.

The Cretan disturbances gave the war party in Greece an opportunity to fan the embers of national passion into life and to bring on a war with Turkey, in the hope of arousing Macedonia to revolt and winning much of the desired territory on the north. Greece was wholly unprepared for such a conflict, while the Turkish armies were in a comparatively efficient condition. Yet, in spite of all restraining counsel and without any countenance from the Powers, without whose support such a contest was destined to be futile, the war party precipitated the struggle. Greek irregulars, members of a war secret society, opened the fighting in Macedonia early in April, 1897. On the 17th of April the Porte declared war, charging Greece with being the aggressor. The campaign of 31 days that ensued was inefficiently managed upon the Greek side. The Turks forced one position after another, the Greeks showing an unsteadiness in marked contrast to the discipline and determination of the Turks. The latter threw back the advanced line of the Greeks, who at first had a distinct strategic advantage, invaded Thessaly on April 21, and occupied Larissa on the 25th,

while the Greek army, now a panic-stricken mob, was in headlong flight. Heavy fighting occurred at Velesino April 25, and at Fersala May 5. The plain of Thessaly was occupied by the forces of Edhem Pasha, and in the third week of May the Turks held the line of the Orthrys Mountains and threatened central Greece. Their advance was stopped only when Russia peremptorily demanded an armistice. This was concluded on May 18. Preliminaries of peace were signed September 18, and on December 4 the definitive treaty was signed at Constantinople. Greece was required to pay an indemnity to Turkey amounting to \$18,000,000, the payment to be supervised by an international commission of the mediating Powers, which also undertook to rectify the frontier. In 1898 the Powers compelled Turkey to withdraw her forces from Crete, and Prince George of Greece was installed as Governor of the now autonomous island. The internal political disputes, together with the clash of Christian against Mussulman, proved to be obstacles too great for Prince George to surmount. He resigned in 1906, and the Powers invested the appointment of the succeeding High Commissioner in King George. M. Zaimis, a former Greek premier, was selected, and at the same time Greek officers took charge of the Cretan army. The overthrow of Abdul Hamid in 1908 by the Young Turks was immediately followed by a declaration of union with Greece on the part of the Cretan Assembly. The Powers, however, refused to allow this violation of the agreement made in 1808. During the settlement of this question the cautious policy of the Greek government in not pressing their claims to Crete excited the disapproval of the war party, and an organization termed the Military League really controlled the government during the year 1909, but failed to force Greece into war. Immediately after the outbreak of the Balkan War Cretan delegates were admitted to the Greek Parliament, and by the Treaty of London (1913) Crete was finally ceded to Greece.

Meanwhile Greece was embroiled in the Macedonian situation. The conflicting racial and religious hatreds and political ambitions of Turkey, Bulgaria, Rumania, and Greece disrupted the province and gave rise to a bloody internecine war that was waged in nearly every section of Macedonia. Greece was jealous of the influence of Bulgaria, which had been displayed in the uprising of 1903, and lent assistance to Turkey by encouraging guerilla hands to cross the frontier and attack the Bulgarian and Rumanian elements in the Macedonian population. This excited retaliation on the part of the two latter nations, and the feeling grew so acute that in 1905 diplomatic relations between Greece and Rumania were severed and were not resumed till 1912.

The weakened condition of Turkey led to the coalition of Bulgaria, Servia, Montenegro, and Greece, and the Balkan War (q.v.) began in the fall of 1912. The greatly increased efficiency of Greece in military matters after the disastrous War of 1897 was seen in the splendid performances of the Greek army in their campaign in southern Macedonia, notably in the capture of Saloniki. The navy performed valuable service by preventing the transportation of Turkish troops from Asia Minor to the Balkans, and also in its assistance towards the capture of Turkish islands in the Ægean. King George, while on a

tour of inspection, was assassinated in Saloniki on March 13, 1913. Crown Prince Constantine succeeded to the throne. The war between the allies (see BALKAN WAR) was marked by extreme cruelty, in which it was charged that the Greeks had been the worst offenders. This, however, was denied by the Greek government. The Bucharest Conference apportioned to Greece, as her share of the conquered territory, all of Thessaly, part of Epirus, and the most valuable regions of Macedonia and Thrace, including Saloniki. In addition Crete, so long desired by Greece, was given to her, together with the islands of the Aegean not occupied by Italy. The ambition of the Greeks for a greater Hellas was partially realized by this addition, which nearly doubled the area and population of Greece. At the outbreak of the European War of 1914 Greece announced a policy of strict neutrality. See WAR IN EUROPE.

Bibliography. Consult the histories of Grote, Curtius, Duncker, Thirlwall, Abbott, Holm—though rendered out of date by recent discoveries, they still have value; also Freeman, *History of Federal Government in Greece* (London, 1893); Droysen, *Geschichte des Hellenismus* (Gotha, 1877-78); Kaerst, *Geschichte des hellenistischen Zeitalters*, vol. i (Leipzig, 1901); Cox, *History of Greece* (London, 1874); id., *The Athenian Empire* (ib., 1877) and *The Greeks and Persians* (ib., 1876). The standard history of Greece from 146 B.C. to 1864 A.D. is that of George Finlay, a Scotchman, who took part in the War for Independence and spent much of his life in Greece (new ed., 7 vols., Oxford, 1877). The division of the subject in Finlay's volumes is a convenient guide to the large periods of modern Greek history: I. Greece under the Romans, 146 B.C.-716 A.D.; II. The Byzantine Empire, 716-1057; III. Byzantine and Greek Empires, 1057-1453; IV. Mediæval Greece and Empire of Trebizond, 1204-1461; V. Under Ottoman and Venetian domination, 1453-1821; VI. Greek revolution, 1821-27; VII. Establishment of the Greek Kingdom, 1827-64. Later works are Beloch, *Griechische Geschichte* (3 vols., Strassburg, 1893-1904); Busolt, *Griechische Geschichte* (3 vols., Gotha, 1893-1904), indispensable for its examination of sources and its citation of varying views; it lays special emphasis also on politics and constitutional history. Brilliant and interesting is Meyer, *Geschichte des Altertums*, vols. ii-v (Stuttgart, 1893-1902). Important, too, is Pöhlmann, *Grundriss der griechischen Geschichte nebst Quellenkunde* (4th ed., Munich, 1914; pages 1 ff. deal with works on Greek history). The best one-volume history is that of Bury (London, 1900), which ends with the death of Alexander the Great. Consult also Zimmern, *Greek Commonwealth, Politics and Economics in Fifth Century Athens* (Oxford, 1911), and Phillipson, *International Law and Custom of Ancient Greece and Rome* (London, 1911).

Consult also: Tennent, *The History of Modern Greece, B.C. 146 to A.D. 1820* (London, 1830, 1845); Crousse, *La péninsule gréco-slave, son passé, son présent et son avenir* (Brussels, 1876); Lavisse and Rambaud, *Histoire générale* (12 vols., Paris, 1893-1900). There are also several histories in Greek, among them being those of Trikupis (London, 1860), Pappariopoulos (ib., 1886), and Lambros (Oxford, 1886). On special periods or phases of the subject, the following deserve notice: Phillips, *The Greek*

War of Independence 1821-33 (London, 1897); Isambert, *L'Indépendance grecque et l'Europe* (Paris, 1900); Bérard, *La Turquie et l'hellénisme contemporain* (ib., 1893); id., *Les affaires de Crète* (ib., 1900); Jebb, *Modern Greece* (London, 1901); Martin, *Greece of the Twentieth Century* (ib., 1912); Ferguson, *Greek Imperialism* (Boston, 1913); Garnett, *Greece of the Hellenes* (London, 1914); *Cambridge Modern History* (12 vols., New York, 1902-12).

GREEK APOCALYPSE. See BARUCH, BOOKS OF.

GREEK ART. The importance of Greek art and the universal interest in it are due not only to the high degree of perfection which it attained—the highest, all things considered, that the world has seen—but also to its influence upon the universal development of art. All the art of the western world—Roman, Mediæval Renaissance, and Modern—is descended from it, and it was, besides, a very important factor in the development of the Orient during and after its flower. (See MOHAMMEDAN ART; INDIAN ART; CHINESE ART.) Modern art in the western world has been twice reformed by the study of Greek survivals—at the time of the Renaissance and during the classical revival of the late eighteenth and the early nineteenth centuries. Even at the present time its architectural forms are those most in use, and its sculptures are the models most studied.

The present article is concerned chiefly with the so-called Major Arts—architecture, sculpture, and painting. The important Decorative (or Minor) Arts of Greece are best treated under their respective headings, specified more fully in the distributive paragraph, *The Decorative Arts*, near the close of the present article. A summary, critical treatment of Greek art as a whole is offered in the article ARCHAEOLOGY.

Prehistoric Art in Greece. The art of the pre-Mycenæan and the Mycenæan periods need not be separately treated here, as its influence is chiefly felt in other fields than those of architecture and sculpture, and its Hellenic character is still a subject of discussion. (See ARCHAEOLOGY, *Minoan, or Aegean, Period*; ARCHITECTURE, *The Aegean Style*.) No connection is traceable between the reliefs of Mycenæ and Crete and the rude beginnings of Hellenic sculpture in the seventh century B.C. In building the case is somewhat different, and, though the gap is still a wide one, there can be little doubt that the Doric temple is derived from the Mycenæan house, at least in some of its characteristic features. (See ARCHITECTURE, *Greece*.) The essential element of these early dwellings is the large rectangular room, to which entrance is gained through a vestibule or portico formed by prolongation of the side walls and often partially closed in front by pilasters or columns. The plan is therefore that seen later, fully developed, in a temple *in antis*. The materials used were stone for the foundations; crude brick for the walls, and wood for the roof columns and facings of the ends of the walls, where they were most exposed. The roofs were probably flat and covered with earth, as is common in the East to-day. Between the decline of the Mycenæan period and the earliest extant Doric temple, the Heræum at Olympia (q.v.), is a gap of some centuries, and in that time the adaptation or transformation of the human house into a dwelling for the god has been completed.

GREEK ART

REPRESENTATIVE WORKS

1. ARCHAIC FEMALE FIGURE from the Acropolis, Athens.
2. DISCUS THROWER by Myron, Rome.
3. BUST OF PERICLES, probably a copy of a statue by Ctesias.
4. GRAVE MONUMENT of Hegeso, Ceramieus, Athens.
5. SOPHOCLES, Lateran Museum, Rome
6. THE VICTORY FROM SAMOTHRACE, The Louvre Paris.

ARCHITECTURE

In architecture, especially of religious and civic buildings, the Greek genius expressed itself with a perfection of originality and of execution inferior only to that displayed in Greek sculpture. The origins of this architecture are lost in obscurity, for there appears to be a complete sundering between the forms of the Mycenaean or Aegean architecture and those of historic Greece. The distinctive feature of historic Greek architecture is the column; all important buildings were columnar; and it was the Greeks who developed the colonnade as an essential element of the exterior design. Greek also was the idea of the *order*, i.e., of a definite association of a particular type of column with a particular type of entablature. Whether the Doric order, the oldest and most typically Greek, was developed from wooden prototypes or from prehistoric buildings employing both wood and crude brick or rubble, is uncertain; the entablature shows unmistakable reminiscences of wooden construction. While the original construction of the Heraeum at Olympia long antedated the first Olympiad (776 B.C.), no part of the extant ruins of the superstructure at least is older than the seventh century B.C., and the most ancient example of the order are the ruins of the temple of Apollo at Corinth, dating from about 650 B.C. One of the temples at Selinous (Sicily) is nearly as old. From that date until the Christian era the Doric was really the national style of Greece; and the order, used alike in temples, colonnades, and gateways, underwent little change except in the progressive refinement of its details and proportions. During the sixth century the Ionic order was introduced, as a semiforeign style, probably from Asia Minor. Its slender columns, contrasting with the massive Doric, were indubitably derived from wooden prototypes. In Attica, with its mixed Doric-Ionic population, it found especial favor and was used sometimes alone, as in the Erechtheum (q.v.), sometimes in the interiors of buildings externally of the Doric order, as in the Propylaea of Athens. A variant of this order, still more elegant in its details, which was known as the Corinthian, came into use in the fourth century. (See ORDERS OF ARCHITECTURE.) In the Greek provinces of Asia Minor the Ionic was the national style and reached its most splendid expression there in the Alexandrian age, in such colossal temples as that of Diana at Ephesus (see ARTEMISTUM) and of Apollo at Miletus.

The Temple. Greek architecture, as has been said, was chiefly one of temples and civic buildings, such as arsenals, gates, colonnades, or *stoa*, tombs, etc.; but the temple was preëminent. The Greek temple was the very reverse of the Egyptian; its chief architectural splendor was external; its interior, relatively small, was a shrine, or *naos*, for a superb image of the presiding deity; neither great loftiness, length, nor spaciousness was aimed at. Sculptures, both in relief and free-standing, adorned the exterior, in friezes, pediments, and even at Ephesus, upon the shafts of the columns. The essential elements of the temple were the *cella*, or windowless hall, divided sometimes into two parts—a treasury, or other chamber, and the *naos*, or temple proper; and porches or colonnades, whose various arrangements gave the names to different types: *prostyle* when a single porch stood in front of

the *naos*: *amphiprostyle*, with porches both at front and rear; *peripteral* or *peristylar* when a colonnade wholly surrounded the *cella*; *dipteral* when a double row of columns flanked the *cella* on each side; *pseudodipteral* when the aisle, or *pteron*, along each flank was of double width. According as the number of columns in the end row was two (set between the ends of the projecting side walls), four, six, eight, nine, or ten, the temple is said to be *distyle in antis*, *tetrastyle*, *hexastyle*, *octastyle*, *enneastyle*, *decastyle*, respectively.

Greek architecture, exclusive of the Mycenaean, covers a period of about six centuries, so far as dated remains are concerned, and reaches its culmination in the Periclean age, after the Persian wars. The Parthenon (q.v.) is universally regarded as its supreme achievement, though later temples in Asia Minor were more splendid and far larger. The Parthenon, with the Propylaea, Erechtheum, and temple of Wingless Victory (Niké Apteros), all built between 468 and 408 B.C., present an unequalled group of architectural masterpieces in which simplicity and restraint are combined with the most exquisite refinements of execution. (See REFINEMENTS OF ARCHITECTURE.) During the Alexandrian age (second half of the fourth century), architecture became more florid in detail, more ostentatious but less pure and refined, and a slow decline set in, until it was overwhelmed or displaced by the Roman Imperial architecture.

The Greeks developed no palace architecture; no domestic architecture of any importance, unless the Pompeian be considered as a late phase of it or derivative from it; no type of civic hall; and their theatres, being chiefly excavated, offered little or no opportunity for the display of architecture properly so called. The field of Greek architecture was thus extremely restricted, and to this in part are due the thoroughness with which it was tilled and the perfection of its fruitage. The Greeks were the first builders to strive after an ideal perfection instead of a mere advance on the past. Hence the finality of their achievement in it. See ARCHITECTURE; ORDERS OF ARCHITECTURE; PROPYLAEA; STOA; TEMPLE; THEATRE.

SCULPTURE

Technique. Though wood and clay were sometimes used in sculpture, the common materials were stone and metal. In the early days of sculpture in stone the softer varieties of limestone, especially the so-called *poros*, were frequently employed because of the comparative ease of working. Later the harder marbles were employed, especially the fine white marble of the island of Paros, and from Mount Pentelicus in Attica. The sculptor seems in general to have worked without mechanical copying of a model. For blocking out the statue a pointed instrument, either a punch or a hammer, was employed, and the finer details were worked out with chisels of various shapes. In some of the earlier statues the deep folds of drapery seem to have been cut out by the saw; but later the borer was used, especially after the time of Callimachus (q.v.), who is credited with its invention by Pausanias, though it was almost certainly in use at an earlier date. Frequently the head and other parts of the body were carved separately and of better material. In bronze the earliest works are in hammered metal, with

engraved details; but at an early date casting was introduced, and thus the production of larger pieces became possible. Heretofore such statues had been produced by plating on wood or riveting together metal plates. Solid casting was obviously too wasteful, and we early find examples of hollow casting, though the exact method of preparing the mold and the core is uncertain. In later times the Greek artists used the *cire perdue* process; it is possible this was in use before the end of the fifth century. Bronze was always the favorite material for honorary statues, and the artists in bronze seem to have enjoyed a higher esteem than their brethren who worked in stone.

Polychromy. The plain white of the marble was too dazzling and monotonous for Greek taste; moreover, when poorer materials were used the stone often required color or stucco to conceal its imperfections. Our knowledge concerning the details of the coloring of the temple is not very complete, though it has been much enlarged by the careful attention paid to the subject in recent excavations. In the Doric building the triglyphs seem to have been regularly blue; the metopes vary—at Olympia they were either blue or brown, with the reliefs in contrasting colors, while elsewhere red was also used. The smaller architectural members, such as mutules, regulae, and guttae, were also colored; but the walls, architrave, and columns (except possibly the neck and sometimes the echinus) were plain. In the Ionic order color seems to have been used on the capital, but there is little knowledge of details.

In sculpture the question has been much discussed. It is clearly impossible to lay down general rules, for the practice varied with the time, place, material, and technique. What holds of the relief will not hold of the statue. Color was extensively used on all terra-cotta productions, and, as we have seen in the preceding paragraph, it was also employed on sculptures forming part of a building. In general, the more valuable the material, the more sparing the use of color. In the earlier works in coarse stone a very elaborate and brilliant system is used; later only the details are indicated by color. Except in architectural reliefs, there is very little evidence of the use of color on the nude parts of marble. In statues such surfaces seem to have been treated with wax and oil, thus toning down the surface of the marble and giving it a slight polish. The hair, lips, and eyes were regularly painted. In the garments a distinction seems possible. On the Acropolis statues (see Plate) the undergarment, which only shows on the shoulder and about the feet, often receives a solid color. On the other garments only the borders or embroidery is marked out by color. The artist seems to have desired to avoid large masses of color, unless the conditions were such that a mass of color would form an effective contrast to the marble. In reliefs color is freely employed for details, and many accessories are rendered entirely in this way, especially in the earlier art, while in the Hellenistic period we find very low relief employed to assist the painter. The Greek attitude towards the use of color was very different from that which now prevails; but the statues from the Acropolis and the beautifully tinted Alexander sarcophagus at Constantinople show that Greek taste in this regard was at least as good as our own. Consult the article "Pictura,"

in Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891), and the article "Polychromie," in Baumeister, *Denkmäler des klassischen Altertums*, vol. ii (Munich, 1889).

HISTORY

In sketching the history of Greek art, it is convenient to distinguish the following periods (see *ARCHAEOLOGY*):

I. The Archaic Period, extending to about 480 B.C., the era of the Persian wars.

II. The Attic Period, from about 480 to 323 B.C., during which the centre of Greek life is Athens.

III. The Hellenistic Period, which ends with the Roman Conquest (146 B.C.).

IV. The Roman Period, which may be extended to the foundation of Constantinople (330 A.D.), though constructive Greek art ceased long before 330 A.D.

These divisions are in their nature arbitrary, and no sharp line divides one from the other.

I. The Archaic Period (till 480 B.C.). This period may be conveniently divided into two parts: (a) The era of the formation of types and schools, and (b) the period of developed archaism, from about 550 to 480 B.C.

(a) *Formative Period.*—The earliest Doric temples and other monuments of Greek art do not belong much before the year 700 B.C., unless Professor Dörpfeld is right in assigning the Heraeum at Olympia to a date not far from 1000 B.C. The evidence concerning the Heraeum is very uncertain; but, even if it is accepted, the building stands alone. (Consult Baedeker, *Greece*, pp. lxxiv–lxxv, 296–297, 4th Eng. ed., Leipzig, 1909.) The earliest sculptures in the round are probably not earlier than 650 B.C., though here any positive date is unattainable. All the evidence shows that the artists were not confined to any one part of Greece, but that a general activity developed throughout the Greek world, using much the same types, but treating them with certain differences. Much has already been accomplished in distinguishing the several local schools and identifying their products. Their characteristics, however, are so dependent on details that their discussion lies outside the scope of this article, and it will be more convenient to consider the works with reference to types rather than to schools.

Statues may be male or female, draped or nude, standing or seated. An examination of the monuments shows that not all the possible variations were adopted by these early artists. The standing figure, if male, is usually nude; if female, draped; the seated figures are generally clothed. The male standing figure bears a striking resemblance to the Egyptian statues in its pose, and the suggestion for them may have come from Egypt, with which the Greeks of the seventh century carried on an active trade; but the Greek artist, even at first, is no mere copyist, but endeavors to embody in the traditional form his own observations. The early statues—the so-called "Apollo" statues—stand firmly on both feet, with the left foot advanced and the arms close to the sides. Little by little we may observe greater freedom (the arms are worked free from the body, though the hands are still pressed to the thighs), and a greater care in modeling, which seeks to bring out the muscles and the bones, is manifest. Later in the period the type is modified, as in

such a figure as the "Calf-Bearer" of the Acropolis, where the position of the hands has been completely altered, and the artist is fast freeing himself from some of the established conventionalities. The draped female statues are scarcely more, at first, than slabs of stone carved into a rude outline of the human form. The head and long locks of hair, the arms at the sides, and the two feet side by side, just showing beneath the long robe, are the only details attempted. The body is clothed in a long garment, girded at the waist and hanging perfectly straight to the feet. Probably color indicated detail that has now disappeared. A good example is the statue of a woman dedicated by Nicanora to Artemis, at Delos. Later, more care is used in the treatment of the drapery, and the style begins which is best represented in the sixth century by the Acropolis "Maidens" (κόραι). The seated draped figures are best represented by the figures from Branchidæ (q.v.) in the British Museum. Draped in large mantles, whose stiff folds are barely indicated in low relief, their hands resting on their knees, they sit in their high-backed thrones, without life or dignity, though recalling in their pose some of the earlier Babylonian work.

While sculpture in the round is developing through modifications of stereotyped forms, a greater advance seems to have been made in reliefs, especially in those of an architectural character. These are typified by the metopes of the oldest temple of Selinus (q.v.), in Sicily, which, in spite of their ugliness, at least show some freedom in design. Even more interesting, though no more beautiful, are the remains of pediments in "poros" stone found on the Acropolis, belonging in part, at least, to a sixth-century temple of Athena. They are among the earliest specimens of Attic art and show it even then possessing characteristics of its own. Among these is the heavy build of the figures, which appears also in the "Calf-Bearer," and seems to cling to the Athenian school throughout the sixth century, if not longer. (Consult D'Ooge, *The Acropolis of Athens*, New York, 1908.) At the very end of this period a work survives which can at least be dated approximately—viz., the great temple of Artemis at Ephesus, which was rebuilt during the reign of Croesus (560-546 B.C.). The Ionic columns of this temple were adorned with sculptures in relief upon the lower drum, some of the fragments of which are now in the British Museum. They show an advanced technique and give promise of high future development. See DIANA, TEMPLE OF.

(b) *Developed Archaism*.—With the period of developed archaism come the beginnings of real beauty and charm in the products of Greek sculpture. True, there are still serious technical defects, but the artists are fast emerging from the trammels of formalism and already show much simplicity and devotion, combined with a true Greek grace and sense of proportion. The nude male type still clings to the old position, but the artist is now able to render the muscles better, to free the arms from the sides, and give some expression to the face. It is, however, in the draped female statue that the greatest advance is made, apparently by the Ionian artists of the Cyclades, especially of Chios. They developed the deep cutting of the folds of the drapery, and the change which this brought about is well indicated in the important series of statues discovered on the Acropolis of

Athens. The general pose is the same in most of the series. The figure rests squarely on both feet, one of which is slightly advanced. One arm is bent at the elbow, and the extended hand probably held a patera or flower. The other arm hangs at the side, and the hand draws up the long skirt, thus giving an opportunity for the introduction of diagonal folds to relieve the perpendicular lines. The drapery, which varies somewhat in the different figures, is carefully worked out and given much detail by the free employment of color. For the face in general not much can be said; the eyes and mouth still cause the artist trouble, and his attempts to secure expression too often produce only the exaggerations of the "archaic smile." At the end of the period, however, the skill of the artist has so far increased as to give us the beautiful heads of a boy and a girl, which in dignity and sweetness of expression compare favorably with many products of a later age.

In these female figures a close analysis can detect differences which warrant the belief that some are the work of Chian or island Ionian artists, probably brought to Athens by the tyrants Pisistratus and his sons; while others, such as the statue by Antenor (q.v.), seem to show, in their somewhat heavy build and plainness of conception, which holds aloof from over-elaboration and excess of ornament, the work of the native Attic school, which had taken up the refinements and improvements of the newcomers, but without loss of its earlier characteristics. To the same native school must belong the figures of Athena and a fallen giant from the old temple of Athena on the Acropolis. Interesting examples of the work of the Ionian schools have been found at Delphi, where the treasures of Siphnos (recently restored by the French) and Naxos show the adaptation of the female type to a new use in Greek architecture. The columns between the antæ of these buildings were formed of a lofty base on which stood a draped figure bearing on her head a lofty "polos," or headdress, which served as the capital, and furnished a suitable transition from the perpendicular lines of the column to the horizontal lines of the roof.

In general, the works of this period have not yet been classified in a thoroughly satisfactory manner. It seems clear that there were flourishing schools of sculpture in Asia Minor, Chios, Paros, and Naxos, and of bronze workers at Ægina and Argos, while at Athens there is a school with a well-defined local tradition. The study of the present is largely an endeavor to analyze minutely each new work and in this way to determine the characteristics of the different schools. This task is complicated by the cross currents of influence which tended to obliterate local differences and produce a thoroughly national type of art. On some of the characteristics of this early art, consult Lange, *Die Darstellung des Menschen in der älteren griechischen Kunst* (Ger. trans. from the Danish, Strassburg, 1899), and Lermann, *Alt-griechische Plastik* (Munich, 1907).

II. The Attic Period (480-323 B.C.). The Persian wars gave a tremendous impulse to Hellenic life, especially in the field of art. By the end of the archaic period the sculptor had obtained a mastery over his material, which enabled him to strive for new effects, and finally to produce the most perfect specimens of ancient art. This period may be divided into three parts: (a)

the transitional period, extending to about the middle of the fifth century; (b) the age of Phidias and his immediate followers, ending with the century; (c) the age of Praxiteles and Scopas, which may be considered to end with the death of Alexander. (a) *Transitional Period*.—The works of the transition still show the traces of the archaic period and the uncertainty as to some of the limits of the sculptor's art. In this period belong probably the Eginetan sculptures (q.v.), and certainly those of the temple of Zeus at Olympia (q.v.), and the metopes of the later temples at Selinus (q.v.); but original works are few, and we are largely dependent upon more or less certainly identifiable copies in marble of the bronze statues of the masters. Of these few originals one of the best—indeed, the finest example of an ancient bronze statue—is the charioteer of Delphi, part of the group dedicated to the god by Polyzelus, brother of Hiero, Tyrant of Syracuse, between 478 and 472 B.C., in consequence of a victory in the Pythian games. Full of grace and charm, yet with a trace of archaic hardness still visible, this work of an unknown artist conveys some suggestion of the qualities that must have marked the work of the great masters. For photographs of this statue and a discussion of it, consult E. A. Gardner, *Six Greek Sculptors* (London, 1910).
